# ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

**ac.**, acre(s).  
**agric.**, agricultural.  
**ambas.**, ambassador(s).  
**Amer.**, American.  
**anct.**, ancient.  
**ann.**, annual.  
**arron.**, arrondissement.  
**A.-S.**, Anglo-Saxon.  
**A.V.**, Authorised Version.  
**b.**, born.  
**Biog. Dic.**, Biographical Dictionary.  
**bor.**, borough.  
**bp.**, birthplace.  
**Brit.**, British.  
**C.**, Cer\*terade.  
**c.**, about.  
**cap.**, capital.  
**cf.**, compare.  
**co.**, county.  
**com.**, commune.  
**cu. ft.**, cubic feet.  
**d.**, died.  
**Dan.**, Danish.  
**dept.**, department.  
**dist.**, district.  
**div.**, division.  
**E.**, east; eastern.  
**eccles.**, ecclesiastical.  
**ed.**, edition; edited.  
**e.g.**, for example.  
**Ency. Brit.**, Encyclopedia Britannica.  
**Eng.**, English.  
**estab.**, established; establishment.  
**F.**, Fahrenheit.  
**fl.**, flourished.  
**fort. tn.**, fortified town.  
**Fr.**, French.  
**ft.**, feet.  
**Ger.**, German.  
**Gk.**, Greek.  
**gov.**, government.  
**Heb.**, Hebrew.  
**hist.**, history.  
**horticult.**, horticultural.  
**h.p.**, horse-power.  
**hr.**, hour.  
**i.e.**, that is.  
**in.**, inch(es).  
**inhab.**, inhabitant(s).

**is.**, island(s).  
**It.**, Italian.  
**Jap.**, Japanese.  
**jour.**, journal.  
**Lat.**, Latin.  
**lat.**, latitude.  
**lb.**, pound(s).  
**l. b.**, left bank.  
**long.**, longitude.  
**m.**, mile(s).  
**manuf.**, manufacture.  
**min.**, minute(s).  
**mrkt. tn.**, market town.  
**MS.**, manuscript.  
**mt.**, mount; mountain.  
**N.**, north; northern.  
**N.T.**, New Testament.  
**O.E.**, Old English.  
**O.F.**, Old French.  
**O.T.**, Old Testament.  
**oz.**, ounce(s).  
**par.**, parish.  
**parl.**, parliamentary.  
**pop.**, population.  
**prin.**, principal.  
**prof.**, professor.  
**prov.**, province; provincial.  
**pub.**, published; publication.  
**q.r.**, which see.  
**R.**, riv., river.  
**r. b.**, right bank.  
**Rom.**, Roman.  
**R.V.**, Revised Version.  
**S.**, south; southern.  
**sec.**, second(s).  
**sev.**, several.  
**Sp.**, Spanish.  
**sp. gr.**, specific gravity.  
**sq. m.**, square mile(s).  
**temp.**, temperature.  
**ter.**, territory.  
**tn.**, town.  
**trans.**, translated; translation.  
**trib.**, tributary.  
**univ.**, university.  
**urb.**, urban.  
**vil.**, village.  
**vol.**, volume.  
**W.**, west; western.  
**Wm.**, William.  
**yd.**, yard

The article ABBREVIATIONS contains a list of those in general use. See also ABBREVIATION (music) and ELEMENTS (chemical symbols).

**Nyasaland Protectorate**, strip of ter. about 320 m. in length and varying from 50 to 100 m. in width, lying approximately between lat. 9° 45' and 17° 16' S., and long. 33 and 36 E. Recent surveys puts the area at 17,949 sq. m. (land area 37,374 sq. m.). Pop. Europeans, 2,500; Asiatics, 3,350; natives, 2,300,000. N. P. comprises the W. shore of Lake Nyasa, with the tablelands separating it from the basin of the Loangwa R., and the region lying between the watershed of the Zambezi and Shire Rs. on the W., and the lakes Chiuta and Chilwa and the Ruw R. (an affluent of the Shire) on the E., including the mt. systems of the Shire highlands and Mlanje. N. P. is bounded on the N. by Tanganyika Ter., on the S. and E. by Portuguese E. Africa, and on the W. by N. Rhodesia. N. P. is administered under the Colonial Office by the

E.N.A.

NYASALAND: A MOTOR ROAD SKIRTING  
THE BASE OF MLANJE PEAK

governor, assisted by an executive and a legislative council, both consisting of nominated (as opposed to elected) members, the governor having the right of veto on ordinances. In 1937 a royal commission under Lord Bledislowe in-

quired into the possibility of closer union between the Rhodesias and N. P., but the chief obstacle to federation lies in the existence of large native areas calling for special treatment and so far no action has been taken. The policy of indirect rule has met with some success in N. P. Experience shows that tribal institutions have more vitality there than was believed, and that chiefs still exercise an authority which can be used to good purpose; but the system is still in the experimental stage, particularly in regard to financial responsibility. The Protectorate is divided for administrative purposes into three provs., each of which is in charge of a prov. commissioner. The chief tns. are Blantyre, with about 600 European inhab., Limbe, near Blantyre, and Zomba, the seat of the gov.

**Climate and Products.** The climate of N. P. in its essential features is similar to that of the rest of S.E. Africa within the tropics. The monsoon commences to blow strongly in Sept., and the first rains may be expected any time after mid Oct. From their commencement to the end of Dec. it is usual to experience violent thunderstorms and heavy precipitation in a few hours, followed by an interval of intense heat. Malaria is prevalent, especially after the rains, in many parts of the country and occasionally is contracted in unexpected places, even in the highlands. Leprosy is prevalent in N. P. and there are twelve clinics administered by missions and assisted by gov. grants. Medical services are well organised, with a large African staff and a number of Asiatic surgeons. There are 2 European hospitals, 15 native hospitals, and 100 rural dispensaries.

There is no mineral development in N. P. as there is in Kenya or Tanganyika, though there are unexploited bauxite deposits on the Mlanje plateau; and almost the whole of the £2,760,000 worth of exports of local products (1917) was derived from agriculture. Labour in E. Africa is attracted to mining in S. Africa and N. Rhodesia, the result being that the proportion of natives seeking work in other parts of the continent has created a problem of grave concern to the gov., leading, as it does, to a reduced taxable capacity and to detribalisation. Tobacco is the crop most favoured by Europeans. It was first planted in 1889 and exported in 1893, and is grown by Europeans and natives in a proportion of about one to five; in 1917 20,007,732 lb. were exported. Tea is cultivated, the acreage in 1917 being 20,788. Coffee, grown on 17,000 ac. in 1900, is now grown only on 21 ac. The acreage planted to cotton has declined owing largely to the depredation of pests. More interest is now being shown in the crop as a rotation for tobacco rather

than as the main crop. The most suitable areas for cotton on a large scale are at lower elevations where the climate is hot and trying for Europeans. Over 3,000,000 lb. were exported. Other crops include sisal, maize, ground-nuts, rice, pulses, and tung oil. N. P. is comparatively well wooded, the forests occupying 11·8 per cent of its area. The area of the forest reserves is about 2600 sq. m. and cover the chief catchment areas and watersheds. There are a number of African foresters and forest guards and forestry is for the most part administered by the native courts. The value of exported timber averages £25,000 annually.

**Communications.**—The port of entry to N. P. is Beira in Portuguese E. Africa, which is also the most convenient port of entry for Rhodesia. There is a 3-ft. 6-in. gauge railway system extending from Beira (Portuguese E. Africa) to Chipoka on Lake Nyasa (496 m.), crossing the Zambesi R. at Sena (199 m.) by the Lower Zambesi bridge and passing through Murrumbidgee, Port Herald, and Blantyre (353 m.). Main roads and 'carrier' roads are open all through the protectorate, the total mileage being 3400. N. P. is connected by telegraph overland with the Cape via Salisbury. Rhodesia and Nyasaland Airways operate regular services between Blantyre and Fort Jameson via Lilongwe and between Blantyre and Beira. There are large aerodromes at Chilika (11 m. from Blantyre), Zomba, and Lilongwe.

**Education.** The course for native authorities at the Jeanes School at Zomba represents a modern attempt to deal with the problem of training chiefs in their new duties. The attendance at European schools in N. P. has, however, diminished rapidly since 1935, when S. Rhodesia abolished all tuition fees and extended this privilege to children from N. P. In 1947 there were over 4000 native schools, and two secondary schools for Africans.

**History.** Livingstone, at the head of a gov. expedition, reached the S. shore of Lake Nyasa in 1859, and this visit resulted in the founding of various missionary societies. The activities of these bodies were followed in 1883 by the formation of the African Lakes Corporation, and two years later the first Brit. consul was sent out. Opposition by the new settlers to the slave trade carried on by Arab coastmen and natives settled at the N. end of Lake Nyasa resulted in a conflict with the Chief Mloli and the Yao chiefs. In 1889 the Brit. S. Africa Company applied for a charter to trade in the country, and in the same year a large expedition was sent out under Maj. A. de Serpa Pinto to explore the Upper Zambesi and Lower Loangwa, and Sir H. H. Johnston arrived at Mozambique as consul with the special duty of composing differences with the Arabs of the interior. Treaties were concluded with the Makololo chiefs and with the Yaos round Blantyre and, following a brief encounter between Serpa Pinto and Maluri, a powerful Makololo chief, the Brit. Gov., on Sept. 21, 1889, proclaimed a Brit. protectorate over the Shire dists.

Johnston, in his journey up the lake, induced the 'Jumbe' or sultan of Kota Kota to put his country under Brit. protection and arranged similar treaties with Mloli and other Arab and Wailonga chiefs. This work of Johnston was ratified in 1891 by an Anglo-Portuguese convention and, soon afterwards, a Brit. protectorate over the countries adjoining Nyasa was proclaimed. The protectorate of Nyasaland was confined to the Shire and Lake Nyasa dists., the rest of the ter. under Brit. influence being placed under the Brit. S. Africa Company. In 1891 there were expeditions against slave-raiding Yaos at the S. end of the lake, while the next few years brought much trouble in the way of slave-trading and constant raids; but by placing three gunboats on the lake, the dispatch of Sikhs from India, and the recruitment of native troops, the slave trade was abolished. In 1893 the name of the protectorate was changed to the 'Brit. Central Africa Protectorate,' but the old name N. P. was restored in 1897, by order in council amending the constitution. See H. L. Duff, *Nyasaland under the Foreign Office* (2nd ed.), 1906; W. P. Johnson, *Nyasaland: the Great Water*, 1922; S. S. Murray, *A Handbook of Nyasaland*, 1932; L. S. Norman, *Nyasaland without Prejudice*, 1931; and Lord Hailey, *An African Survey*, 1934.

**Nyborg**, seaport on the E. coast of Funen Is., Denmark, in the co. of Scandborg, 17 m. E.S.E. of Odense. The fortifications built by Christian IV. were destroyed in 1699. Pop. 9700.

**Nyctalopia**, defect in the vision of people who can see distinctly in a faint light only, and not in bright daylight. The term is sometimes applied to the opposite defect of vision, by which some people are unable to see distinctly save in light of great intensity; this is 'night-blindness,' and is inherited as a Mendelian dominant character.

**Nygaardsvold, Johan** (b. 1879), Norwegian statesman, b. at Hommelvik, Trondelag, son of a cottager. He worked as a saw-mill hand and farm labourer, and later on railroad construction in America for six years. Returning to Norway, he joined the Socialist party, and, in 1915, was elected to the Storting, of which he was president in 1934-35 (and of the Lagting in 1929). He became leader of the Labour party group in 1932 and formed a gov. in 1935, which was in office at the time of the Ger. invasion of 1940, and which directed the heroic flight of Norway against the Gers, until N. had to withdraw, with his ministers, to London; there he continued to hold office as Prime Minister and minister of public works until the liberation of Norway in 1945.

**Nyköping**, seaport and the cap. of Södermanland, Sweden, at the head of the Byfjord, on the Baltic, 98 m. S.W. of Stockholm. Fifteen national diets were held at N. in the thirteenth to the fifteenth centuries. It has a good harbour, and exports iron and zinc ore, timber, wood-pulp, and oats. There are engineering and textile manufs. Pop. 14,200.

**Nylghau, Nilgai, or Blue Ox**, large antelope, found in central India. The male is slate or dark grey, darkening with age, the legs are black; the female is fawn or reddish brown. On the throat is a white patch and below it hangs a tuft of dark hair. The male is over 4 ft. at the shoulders, but the back slopes down as the hind legs are shorter than the fore legs. The female is about a third smaller, and lacks horns, which in the male are black, short, and erect. Though in the jungle it is a wary animal, in the more cultivated districts it is very tame. Natives regard it as sacred. Its skin makes valuable leather.

**Nylon**, newly coined generic name for a whole class of entirely new materials. Already there are sev. 'nylons'; there will be many more. The name itself, which has no etymological significance, was invented by the Amer. firm (E. I. du Pont de Nemours Incorporated) in whose laboratories N. was first made. N. has no exact counterpart in nature, although its chemical composition is akin to proteins. It is a product with its own characteristics and can be made up into various forms: powders, solutions, sheets, strands, and yarns. The following definition of N. has been accepted at I.M. Patent Office: 'Nylon is a generic term for synthetic fibre-forming polyamides, i.e. organic condensation products which contain a multiplicity of structural units linked in series by amide or thioamide groupings, produced by a process of manufacture in which non-fibre-forming organic substances of lower molecular weight are converted into products of such high molecular weight as to be capable of being formed into filaments, which, on cold drawing, form a true fibre structure recognisable by X-ray examination.'

**Chemical Basis.** - The building up of very long chain-like molecules from short molecules, a process known as 'superpolymerisation,' can be effected in many different ways. A method in general use is to form a particular superpolyamide, '66' polymer, by heating adipic acid and hexamethylene diamine together; water is eliminated during the reaction. The resultant polymer is called '66' because each molecule of these reagents contains six carbon atoms. The raw materials from which the diamine and adipic acid for making '66' polymer are obtained include phenol from coal, oxygen and nitrogen from the air, and hydrogen from water; hence the popular, though over-simplified statement that N. is made from coal, air, and water.

**Manufacture.** - N. yarn, used for many different textile purposes, is manufactured by an extrusion process. The polymer chips are poured into a hopper and melted; the molten polymer is then pumped downwards through a spinneret, a metal disk containing fine holes. The thin streams of liquid forced through these holes are cooled by air currents and so become solidified into continuous filaments which are wound on to a cylinder. The yarn is next subjected to the process known as 'cold drawing,' mentioned in the Patent Office definition above. By this process

the yarn is drawn out to three or more times its original length. During this stretching operation, the long chain-like molecules which make up the filament become oriented, so that they lie mainly parallel to the fibre axis and close to one another. It is this drawing operation which gives to N. the properties of a textile fibre; before this takes place the filaments are simply extruded polymer. The yarn is now ready for further processing, which varies according to the particular purpose for which it is required.

British Nylon Spinning Ltd  
BOBBINS OF NYLON AWAITING FURTHER PROCESSING

**Properties.** - N. yarn has a combination of properties unique among textile fibres. One of the most notable is remarkable tensile strength combined with lightness in weight and a high degree of resilience. The tensile strength of N. yarns can be regulated during manuf., but N. is normally made into yarns considerably stronger than other textile fibres of the same dimensions. Compared with metal wires N. is twice as strong as the same size of aluminium wire. No other textile fibre in general use can equal N.'s elasticity. N. yarns are elastic up to about 8 per cent stretch, regaining their original length quickly. Above 8 per cent stretch a slight but permanent elongation occurs. Besides being strong and resilient, N. shows remarkable resistance to abrasion. This unusual durability has set new standards in the wearing qualities of a wide range of textiles. N. yarns have comparatively low moisture absorption, and therefore dry with unusual rapidity. The wet strength of N. is unusually high, approximately 85 per cent of its strength when dry. N. fabrics are particularly easy to wash and clean; dirt comes away rapidly from the smooth cylindrical fibres. N. yarns resist alkalis and hydrocarbons, soap solutions, oils, and petroleum. They are attacked by strong mineral and certain organic acids.

A special property of N. yarns is that fabrics made from them can be set to any desired permanent shape by heat treatment with boiling water or steam

under pressure. These heat-set fabrics show little or no shrinking or stretching. The melting-point of N. depends on the chemical composition of the particular N. concerned. Melting-point for most N. textile fabrics is approximately 180° F. N. yarn does not blaze when brought into contact with a flame; it fuses, forming a round hard bead. N. itself is not attacked by insects, micro-organisms such as bacteria and fungi, or mildew.

*Uses.*—N. first became famous as a yarn for women's stockings, but it is now used for over 150 different textile purposes, both domestic and industrial. N.'s particular combination of properties makes this yarn especially suitable for a wide range of uses. There is already a great variety of N. apparel fabrics, woven and knitted; many more are being developed. N. ropes and cords are well established. Other industrial uses include nets, filter cloths, heavy duty canvases, tyre cords, and transport upholstery.

*Centres of Manufacture.* All the N. yarn made in Britain is produced at Pontypool, Monmouthshire. The main development has been in continuous filament yarns, but N. staple is now also being produced in small quantities; this will extend the range and variety of N. products. N. yarns can be woven, knitted, or braided on the normal textile machinery, so they can be used on existing plants. *See also* PLASTICS.

*Nymphs*, in Gk. mythology, a class of female divinities of inferior rank, always depicted as beautiful maidens of eternal youth, connected with the forces of nature, and generally with some divinity of higher rank, Artemis, Apollo, Pan, and Hermes. They were divided into the Oceanids, N. of the open sea, and Nereids, N. of the inland seas; Naiads, who presided over rivers, brooks, and lakes; Oreads, N. of the mts. and grottoes, among whom was Echo; and Dryads or Hamadryads, who dwelt in the forests and trees. *See* J. H. Krause, *Die Musen, Grazien, Horen und Nymphen*, 1871, and F. G. Ballentine, *Some Phases of the Cult of the Nymphs*, 1904.

In zoology nymph means the immature form of an insect, e.g. dragonfly, resembling the adult except for its smaller wings, and possessing compound eyes; it must not be confused with a larva (e.g. a caterpillar) which has a form entirely different from the adult, and in which the eyes are simple.

*Nymwegen*, *see* NIJMEGEN.

*Nyon*, small tn. of the prov. of Vaud, Switzerland, on the W. shore of Lake Geneva, about 12 m. N. of Geneva. It stands at the junction of the railway to Geneva and Lausanne with the lines running into France. It has porcelain manufs. and a pop. of 8000. N. was the old Rom. colony of *Julia Equestris*. It

was seized by Bern in 1536 and retained under the treaty of Lausanne, 1564, after other tns. had been surrendered under that treaty, Bern engaging to maintain the old rights and liberties of Vaud. Here during the Sp. civil war was held a conference of Mediterranean and, later, Black Sea powers, called at the instance of Great Britain and France to deal with attacks made by submarines. These attacks in the Mediterranean were at first thought to be due to Franco's insurgents, but it soon became evident that they were made under the orders of the It. Fascist Gov. To defer to It. susceptibilities the Brit. Gov. consented to hold the conference not at Geneva, as originally intended, but at N., being a small tn. in the same neighbourhood. The conference opened on Sept. 11, 1937, but without the participation of Germany and Italy, both of which had been invited. In the resulting agreement Great Britain and France undertook between them to patrol the Mediterranean and thereby make that sea tolerably safe for shipping. These two govts. suggested that Italy should undertake the patrol of the Tyrrhenian Sea, but Mussolini rejected the offer and demanded that Italy should be taken into the scheme on a footing of equality with the major powers. The Fr. and Brit. Govts. at first ignored this demand, but, shortly afterwards, a tripartite conference assigned to Italy a zone between the It. and African coasts.

*Nyren*, John (1764-1837), famous early cricketer and writer on cricket, son of Richard N., also a famous cricketer, was a member of the Hambledon club, founded by his father, of Hampshire. He was a left-handed average batsman and a good fielder at point and mid-wicket. His reminiscences were pub. in *The Young Cricketer's Tutor* (ed. by C. Cowden Clarke, 1833, and by E. V. Lucas, 1907). Andrew Lang refers to him as the 'Herodotus of the early historic period of cricket.'

*Nysa*, *see* NISSESE.

*Nystad*, *see* UESIKAUPEKE.

*Nystagmus*, eye disorder, consisting of an oscillation of the eyeball accompanied by giddiness and a twitching movement. It is present in disease of the labyrinth or semicircular canals which control the balance of the body. Air pilots are specially tested for N. before being allowed to fly. *See also* under EYE.

*Nyx*, in Gk. mythology, personification of night, called Nox by the Romans. In the Hesiodic theogony N., with Erebus, is the offspring of Chaos; and N. and Erebus become the parents of Aether and Hemera, i.e. pure air and the day. N. is also held to be the mother of numerous recompense, Nemesis. She is represented as a winged goddess in a chariot and her residence is fabled to be in the darkness of Hades.

**O**, the fifteenth letter of the Eng. alpha-  
bet is the only vowel in the language  
which generally (but not always) corre-  
sponds in sound with the *o* of Ger., Fr.,  
and other European languages. Besides  
the name sound is in *one* a sound which  
is represented by a variety of spellings,  
though *o*man for *halfboy* etc. it has  
the short sound as in *of* and a third sound  
as in *none* which links it with *u*. Indeed  
A, S, as as well as *us* and *os* are often  
transcribed in modern Eng. by *o*. The  
N. Semitic alphabet which was the proto-  
type of the Gk. and thus of all the W.  
alphabets had no vowel; it was a purely  
consonantal alphabet (*see under* AFIKA,  
BER). The Gks. overcame this difficulty  
by using the Semitic *ayin* for *o* cutting  
a Semitic sound (a kind of guttural  
breath) which did not exist in Gk. The  
reason for using *ayin* for *o* is not quite  
clear at all, but it was the last letter  
still available for the purpose. The Gk.  
and the Lat. *o* as well as the *o* of all the  
European alphabets resemble in shape the  
early N. Semitic *ayin* much more than  
the *ayin* in modern Semitic alphabet  
(Heb. or Arab.). In the primitive Gk.  
alphabet the letter was used for *o*, *u*, and  
*o*. Later another symbol was devised for  
*u* namely *u* called *upsilon* (the fig. *υ*) in  
Gk. grammars to distinguish it from *o* or  
*omicron* (the small *ο*). Yet *omicron* and  
*omega* were not true pure *o* for *o* con-  
tracted to *u* (cf. *u* contracted  
form *ου* *u*) and *u* was really a *u* or  
whisk *u* was in open and *u*.

In chem. **O** is the symbol for oxygen  
and **Os** for osmium.

**O. Francois, Marquis d'** (1733-94)  
b. in Paris was superintendent of finance  
under Henry III. and Henry IV. and  
governor of Paris.

**Oahu**, *see under* HAWAIIAN ISLANDS.

**Oajaca**, *see* OAXACA.

**Oak**. But **O** without wide distribution  
throughout great parts of Europe and  
Asia is the best known and most im-  
portant of its genus (*Quercus*). *Pedunculata*  
(*R. b.*) or common Eng. **O** is the  
commonest **O** over the greater part of  
England, Ireland, and the Scottish Low-  
lands. Its acorns have long stalks and its  
leaves are stalkless or nearly so. *Sessili-  
folia* (*petraea* or *brannmast* **O**) bears dark  
fruits, short leaf stalks and long stalks  
while the undersides of the leaves are  
downy. It is harder than *Pedunculata*,  
and is better able to withstand drought.  
Other varieties occur but they are un-  
doubtedly hybrids between *Pedunculata*  
and *Sessiliflora*. Among foreign species  
may be mentioned *Querc. ilicifolia* the Holm  
**O** (*q.*) *Quercus cerris* the Turkey **O**  
(*q.*) with bristly cups for the acorns,  
*Quercus suber* whose bark yields the cork  
(*q.*) of commerce.

*Pedunculata* is predominant in forest on

heavy clayey soils. *Sessiliflora* is typical of  
forests on lighter, more sandy soils. The  
**O** once covered large areas of Britain from  
Leithshire southwards and has had a  
considerable influence on the development  
of the country for its timber was vital to  
shipbuilding in the formative years of the  
country's seaport. The last extensive  
planting occurred during the Napoleonic  
wars, but this stimulus to afforestation in  
Britain has ceased since the middle of last  
century. The **O**s are not remarkable for  
height. In close company they may attain  
100 ft. but in the open they do not exceed  
60 ft. 80 ft. But they are very massive  
with great earth-tugged bole, gnarled  
crooked branches and leaf spread of  
crown. They reach maturity certainly  
over 1000 years and perhaps more. The  
leaf of the **O** is oval with large rounded  
lobes and in autumn the tint changes  
from bronze to pale brown. The flowers  
are borne in small cups in stalk which  
later bear acorns each fruit little but the  
fruitful plant often covers 100 ft. for 1

throne in 1660. On this day oak-leaves or oak-apples are sometimes worn in memory of the king, because on Sept. 6, 1651, he took refuge in an oak-tree, when fleeing from his pursuers.

**Oakeley, Frederick** (1802-80), Eng. tractarian; youngest son of Sir Charles O., one-time governor of Madras. Educated at Christ Church, Oxford, he was chaplain-fellow of Balliol College, Oxford, 1827, and prebendary of Lichfield, 1830. He joined the Tractarian movement, and became incumbent of Margaret Chapel, London, into which he introduced ritualism (1839-15). In 1845 he followed Newman into the Rom. Catholic communion. He was an original canon of Westminster diocese from 1852 to 1880. O. trans. the Lat. hymn *Adeste Fideles* as 'O come all ye faithful' (1841). He pub. theological works before and after his secession.

**Oak Fern**, see POLYPODIUM.

**Oak-galls and Oak-apples.** No plant is more subject to the attacks of gall-producing insects than the oak, and the abnormal production of plant tissue takes many forms, which are remarkably consistent in their variety. The beautiful gall-wasp (*Cynips kollari*), for instance, invariably causes the marble galls on young oaks by laying its eggs, which hatch into the fat grubs found inside the galls. Another (*Dryophanta scutellaris*) causes the formation of small cherry-like galls on the under-surface of the leaves, usually along the midrib. A gall produced by *Cynips tinctoria*, found in S. Europe, was formerly used on a large scale in the manufacture of ink, but is now displaced by superior chemical processes.

**Oakham**, co. tn. of Rutland, England, in the vale of Catnase, 11 m. E.S.E. of Melton Mowbray. There is a school founded in 1584; it now accommodates about 300 boys, its constitution having been reorganised on public-school lines in 1875. The tn. is a centre for hunting. There are manufs. of boots and shoes and knitted garments. Pop. 3600.

**Oakingham**, see WOKINGHAM.

**Oakland**, city of California, U.S.A., co. seat of Alameda co., on the E. coast of San Francisco Bay, 6 m. from San Francisco. It is an important seaport, and ship-building, fruit-canning, and tanning are the chief industries. Manufs. include cotton and woollen goods, steel goods, etc. A Congregational seminary and a Rom. Catholic college are at O. Salt is mined, and there are clay pits and stone quarries. Pop. 100,000.

**Oak Park**, tn. of Illinois, U.S.A., in Cook co., 9 m. N.W. of Chicago, of which it is a suburb. Farming is carried on. Pop. 66,000.

**Oak Ridge**, settlement in Tennessee, U.S.A., given over to a section of the atomic bomb project, and officially known as the Clinton engineering works. The plant, which covers nearly 60,000 ac., was set up in 1943 for the production of plutonium, considerations governing the choice of site being its distance from the coast and the proximity of Tennessee Valley Authority water and power supplies. Pop. 48,000 (in 1945 78,000).

**Oaks, The**, see HORSE-RACING; RACE MEETING.

**Oakum**, hempen fibre made from old ropes, the best kind being produced from tarred ships' rope. It is used as a surgical dressing in emergencies, and for stopping leaks and caulking seams in ship construction. The name was once used to denote tow, a part of flax fibre.

**Oamaru**, chief tn. of Otago Prov., S. Is., New Zealand, situated on the E. coast and on the main N.-S. highway, 78 m. from Dunedin, and 152 m. from Christchurch. In 1853 the land on which the tn. now stands was acquired as a grazing run. It was proclaimed a municipality in 1866 with a pop. of approximately 1000. Most of the streets, which are planted with trees, are named after Eng. or Scottish rivers. Many buildings in the business portion of the tn. are built of O. stone, from the limestone quarries in the dist. The local stone deposits are the source of flourishing lime industries producing both carbonate of lime and burnt lime. There are four flour mills, a woollen mill, a freezing works, and engineering and joinery works in the dist. O. has a good harbour capable of handling overseas shipping. It has plentiful supplies of water, electric power, gas, and soft coal. Besides the primary schools there are four fine residential secondary schools. The surrounding dist. is a prosperous agric. community closely settled and generally well farmed. Pop. 8000.

**Oarfish**, genus of large spiny-finned teleostean fishes (*Regalecus glesne*), remarkable for its shape and internal organisation, the latter being undoubtedly that of a deep-sea fish. It is said that they are among the largest, if not the largest deep-sea fishes known, most specimens observed measuring 12 ft. in length, while some are recorded to have exceeded 20 ft. Like that of other members of this family the body of the O. is exceptionally elongated and compressed, and sword-shaped, but in the O. this feature is emphasised, for the length of the body is some fifteen-fold its depth. The O. has no scales on its body, it has a small mouth and large eye, and a compressed head like that of a herring; its very long and many-rayed dorsal fin, whose foremost rays are enlarged into a crest, extends from behind the head to the imperfect tail, which latter is apparently lost as useless at an earlier period of the life of the fish. The long slender ventrals, by which the O. is distinguished from the other ribbon fishes, become long paddle-tipped filaments. The range of the O. in the great depths of the ocean seems to extend over all seas from the Mediterranean and North Seas to the S. Atlantic, and from the Indian Ocean to the coast of New Zealand. For the past century and a half a number of specimens have been found stranded on Brit. coasts.

**Oases** (sing. Oasis). Isolated fertile regions within deserts, due to the presence of water. This may be due to springs, pools, or damp hollows in water courses usually dry, or water-courses from beyond the desert not yet dried up. They are generally arranged along the foot of a

range of hills or mts., or an outcrop of rock. Some are of large area, and form the homes of tribes. Many are being created by means of artesian wells.

**Oast-house**, building containing kilns for drying hops. The hops are placed on horse-hair covered floors, which are heated from below, and the O. is so constructed as to allow a constant draught of warm air to pass through and out at the top. Circular Os. with conical roofs are a feature of the hop-growing dists. of Kent, England.

**Oastler, Richard** (1789-1861), Eng. social reformer, b. at Leeds, was apprenticed to an architect, but became famous as the protagonist of the Ten Hours Bill in the campaign for factory reform. In 1830 children were employed in the worsted mills for thirteen hours a day with an interval of half an hour, and in the woollen mills fifteen hours with an interval of two hours. John Wood, the famous worsted spinner of Bradford, who was one of the earliest champions of the children's cause, declared to O., when urging him to embark on the crusade with which his name became so gloriously associated, that the factory children were worse off than the slaves in the W. Indies. The struggle, which was aggravated by the tremendous slump in hand-loom weaving through which parents were reduced to living on the passing of the Ten Hours Bill, which limited the actual work of all between nine and eighteen years of age to ten hours a day, exclusive of meal times. His was one of the chief names associated with this reform, others being John Fielden, Michael Sadler, and Lord Shaftesbury. O. also advocated the abolition of slavery and opposed Catholic emancipation. He continually wrote and spoke for the improvement of factory legislation, and contributed numerous articles to periodicals on the subject. He was imprisoned (1840-1844) for a debt arising out of his objection to the new poor law, but the debt was discharged by subscription. He pub. *Fleet Papers* from prison.

**Oates, Lawrence Edward Grace** (1880-1912), Brit. explorer, b. at Putney. He was wounded in the S. African war, and joined Capt. Scott's Antarctic expedition (1910), being one of the final party which reached the S. Pole. On March 17 O., who had been taken ill and feared that he would be a hindrance to his companions, deliberately left his tent to die. Scott in his diary commented: 'It was the act of a very gallant gentleman.' See E. R. G. R. Evans, *South with Scott*, 1921, and L. C. Bernacchi, *A Very Gallant Gentleman*, 1933.

**Oates, Titus** (1699-1705), Eng. conspirator, b. at Oakham. Son of an Anabaptist preacher, who had taken Anglican orders at the Restoration. O. was expelled from Merchant Taylors' school after a year and was sent down twice from Cambridge, first from Orlins and then from St. John's—of which college he afterwards claimed to have been bursar. Having taken holy orders, he held sev. curacies and a naval chaplaincy, from which he was invariably dismissed for vicious conduct.

The same thing happened also when he entered the Rom. Church. It was at this juncture, in 1678, that he concocted his story of a popish plot to murder the king, burn London, and slaughter the Protestants. It is said that the original inventor of the popish plot was Israel Tongue, holder of three benefices of the Church of England, who himself probably half believed in it; and that O. was first his tool and later sole actor in the melodrama. He perjured himself by making an affidavit before Godfrey, the magistrate, and in spite of the palpable inconsistencies in his evidence succeeded in creating a panic, which led to the execution of many innocent Rom. Catholics, and in securing for himself a pension of £600 and a suite of rooms in Whitehall. The duke of York and the queen were victims of his slanders. In 1685 he was found guilty of perjury and condemned to life-long imprisonment with floggings. He regained his liberty and pension on the accession of William and Mary in 1688. See J. Lingard, *History of England*, 1833-1835; P. W. Sergeant, *Leaves and Fakers*, 1926; and Jane Lane, *This Oates*, 1919.

**Oath**. An O. may be defined as a solemn declaration to a superior or divine being, or in the name of something held sacred, by which the declarant either undertakes to speak the truth or promises to do something in the future, on pain of calling down on his head divine or preternatural wrath. Os. of the former or assertory kind may be exemplified by the affidavit and the O. of a witness in a court of law, the latter or promissory kind by the O. of allegiance, by taking which a naturalised foreigner becomes a Brit. subject. By the Eng. law of evidence (*q.v.*) all oral testimony in any proceeding must be given upon O., except (1) under the Criminal Law Amendment Act, 1885, in the case of a child of tender years, where, in the opinion of the court, the witness does not understand the nature of an O., and generally, in prosecutions under the various Acts for the prevention of cruelty to children, unsworn evidence of children may be accepted; (2) under the Oaths Act, 1888, every person who objects to being sworn on the ground either that he has no religious belief or that the taking of an O. is contrary to his religious belief, may make a solemn affirmation in the prescribed form. The passing of the Oaths Act, 1888, was the result of the agitation of the celebrated Bradlaugh (*q.v.*), member for Northampton. The Act of 1888 effected the removal of the last of the tests for members of Parliament, the others being the O. of supremacy, the O. of abjuration, the O. of allegiance, and the declaration against transubstantiation. There were prior to 1888 other Acts making provision for the taking of Os. by Quakers, Rom. Catholics, and Jews, but the Act of 1888 abolished the necessity for any religious belief in taking an O., whether by a member of Parliament or any one else. At the present day the law courts still 'swear by Almighty God,' and kiss, or, since the Oaths Act, 1909, simply hold, a copy of

the N. T. Jews swear on a copy of the Pentateuch, and keep their heads covered; Scots witnesses affirm with the hand, up-lifted, while Chinese witnesses require a saucer to be broken before their consciences will permit them to give evidence.

**Oats** as a food are the richest of the cereals, containing the highest proportions of protein and fat. They are rich in vitamin B1 and carbohydrates, and are valuable for all classes of stock, while their value for human food has gained increased recognition. Boiled with water in the Scots fashion, oatmeal porridge is a substantial nutritious, and appetising dish. The origin of the cultivated species is unknown, none of them occurring in a truly wild state. The wild oat (*Avena fatua*) is supposed to be the original species. Two main races are recognised, viz. common O. (*Avena sativa*), with open spreading panicles, and Tartarian O. (*A. orientalis*), with contracted one-sided panicles. The white and black varieties of the latter are more productive in warm climates, and are favoured for their tall stiff straw. The varieties of the common O. differ chiefly in the colour and thickness of the husk, the shape of the grain, the period of ripening, the length of the straw, and the tendency to shed the grain when ripe. Other species are weeds. The bristled-pointed O. (*A. strigosa*) and the short O. (*A. brevis*) are sometimes, like the common O., grown as green fodder.

**Oaxaca**, state of Mexico, at the S. end of the isthmus of Tehuantepec. It is mountainous, broken in the interior, and tropical on the coast. The state is well watered, and mining and agriculture are the chief pursuits. Indian corn, coffee, sugar, cacao, wheat, fruits, tobacco, rubber, and indigo are produced. Area 36,370 sq. m. The cap. is O. de Juarez, an old stately city built by the Spaniards on the site of the Indian cap. It is situated in the central part of the state, on the Rio Verde, at the foot of the jagged peaks of the Sierras, that stand between it and the sea, at an elevation of 5000 ft. It is 288 m. S.S.E. of Mexico City, with which it is connected by a narrow-gauge railway. In 1943 a new 200-m. highway connecting O. with Matamoros (Puebla) was formally opened. The modern city remains even more Sp. and Indian than Guadalajara, with the descendants of Zapotec and Mixtec Indians in traditional costume and sandals in its modern streets, its early churches, and old houses. The church of Santo Domingo, with an interior which is regarded as the most superb example of Baroque decoration in Mexico, was founded by the Dominicans in the sixteenth century. Its ceilings and interior are covered with gold and polychrome reliefs of remarkable richness. La Soledad (temple to the Virgin, Our Lady of Solitude, O's patron saint), is another massive sixteenth-century building. The markets of O. are noted for pottery, blankets, and fruit and vegetables. Some 4 m. from the city are the ruins of Monte Alban, which was evidently once the cathedral of a whole Zapotec diocese, "a cathedral without a cathedral town" for

the Indians who lived in the valley. These famous ruins comprise and terraces, mounds, courts, tombs, and giant staircases, in process of being restored by archaeologists. The Mitla ruins in a vil. of the same name (the ancl. cap. of the Zapotec Indians) lie 26 m. from O. The Spaniards took the valley of O. in the sixteenth century, and O., a vassal of the Sp. crown, was given to Cortés, marquis of the valley of O. as a grant. As a Sp. city O. prospered from the vast agric. areas of the valley, and the precious metals of the mines. O.'s part in the political vicissitudes of Mexico is indicated by the fact that from its foundation in 1486 to 1876 it was besieged and taken seventeen times. Pop. (state) 1,193,000; (city) 29,300.

**Ob**, or **Obi** (Ostiak **As** or **Yag**, and Tatar **Omar**), riv. of W. Siberia, some 2200 m. long, and with a drainage area of over 1,100,000 sq. m. It rises in the Tomsk Region, at the confluence of the Biya and the Katun, which both rise in the Altai Mts. Its main trib., the Irtysh, rising in the W. slopes of the Mongolian Altai, flows swiftly in its course through the mts. In the main the O. follows a N. or N.W. direction, and finally, after receiving the Irtysh from the left and the Tobol, Tawda, and Tura from the right, reaches the gulf of O., a deep inlet of the Arctic Ocean. Between Semipalatinsk and Omsk the O. crosses steppe plains and, in this part of its course, receives no affluents. In the lower half of its course it divides into a number of constantly shifting channels, and here there are great areas of permanent and impassable thickets and marshlands on each side, while the actual banks of the riv. are littered with masses of gravel, stone, and rotting wood. Sandbanks which form in these channels in the summer impede navigation, and owing to the flatness of the land the current is slow and consequently in the autumn the water freezes quickly. In summer the tundra on each side of the mouth of the riv. offers a varied landscape, with flowers, turf, and moss, but great clouds of mosquitoes render existence difficult for man and beast. Around the gulf of the O. there are some small settlements, with a few hundred inhab. At Saltykard are the buildings of a large fish combine, an out-post of industry in an otherwise lonely region around the mouth of the riv. There has been an increase in the fur trade in the region of the lower O., but the difficulties of navigation, and the marshy nature of the land on both sides coupled with the lack of minerals, are incompatible with any great economic expansion in this region, and it is the Vangel rather than the O. which is being developed as the practicable highway into the centre of Siberia. At Barnaul the O. is a quarter of a mile wide; between Novosibirsk and Narin the width increases to half a mile, and at its confluence with the Irtysh it is 3 m. wide and very deep. The estuary is deep, and widens into a gulf about 30 m. wide. The head of navigation is at Kuznetsk, which can be reached by large riv. vessels in May-June. The riv. is free for

only 200 days at Kolyvan and 150 days at Odorsk.

**Obadiah** ('servant' or 'worshipper' of Jehovah), one of the twelve minor prophets. Nothing is known of his hist., and the book of O., though the shortest of the prophetic writings, is at the same time one of the most difficult and most interesting. Its twenty-one verses are directed against Edom because of her behaviour to Judah in the day of the latter's calamity, when Jerusalem was captured and lots cast over it. The book shows parallels with parts of Jeremiah too close to be due to coincidence. It seems likely that both were indebted to an earlier prophet whose work has perished. See G. W. Wade, *Micah, Obadiah, Joel and Jonah*, 1925, and G. A. Smith, *The Book of the Twelve Prophets*, 1928.

**Oban**, seaport of Argyllshire, Scotland, 30 m. N.W. of Inveraray. The little is. of Kerrera shelters the excellent harbour from the Atlantic gales, and also accounts for its almost land-locked situation. The picturesque situation at the foot of the hills and the proximity of the ruins of Dunolly and Dunstaffnage castles, Glencoe, and the is. of Staffa and Iona, have made the town a life centre for tourists to the W. The prin. manufs. are whisky and tweed; there is fishing. Pop. 6500.

**Obligato**, instrumental accompaniment in a musical composition, performing an important soloistic function. In Bach's Mass in B minor the bass aria *Quoniam* has a harp O.

**Obeah**, system of sorcery once prevalent among the Negro pop. of the W. Indian colonies, especially in Jamaica, and also in the S. U.S.A. It appears to have been introduced from Africa by Negroes who had been enslaved, and to these O.-men (or women) the blacks used to resort for the cure of disorders, obtaining revenge, conciliating favour, the discovery of a thief or adulterer, and the prediction of future events. The practice of Obi had become general towards the close of the eighteenth century, both in the W. Indies, and in the U.S.A., and there is evidence that the O. man exercised vast influence, and that he carried on a system of slow poisonings, the effects of which were attributed by his more ignorant fellows to the workings of the spells of O., and never to the more obvious effects of the scores of poisonous herbs growing in every pasture, and which may have formed the ingredients of the O. mixture. The system, which resembled other superstitions of savage peoples, may have originated in ant. religious practices in which sorcery bore a large part. To-day the force of O. has degenerated into a common form of witchcraft, not infrequently associated with devil worship (J. J. Williams). In any case, the O. man has a wholesome fear of the priest, and usually tries to avoid his presence. See E. Long, *History of Jamaica*, vol. II, 1771; *Report of the Jamaica Royal Commission*, 1886; H. J. Bell, *Obeah: Witchcraft in the West Indies*, 1889; R. T. Harbury, *Jamaica Superstitions or the Obeah Book*, 1895; R. H. Nassau, *Peltshian in West Africa*, 1901; R. S.

Rattray, *Ashanti*, 1923, and *Religion and Art in Ashanti*, 1927; E. M. Cook, *Jamaica: the Limestone of the Caribbean*, 1924; and, especially, J. J. Williams, *Foodoos and Obeahs: Phases of West India Witchcraft*, 1933.

**Oboid**, El (Africa), see EL OBEID.

**Obelisk** (Gk. *ὀβελίσκος*, diminutive of *ὀβελος*, a spit), four-sided monumental pillar with a pyramidal top. Corresponding to the Gk. *stela* and Rom. columns, they were placed in pairs by Egyptians at the entrance of temples or before gateways. Those that remain are of great antiquity. The Romans carried off sev. from Egypt, two of which, originally erected by Thothmes III. at Heliopolis, were taken by Augustus to Alexandria. These are popularly known as Cleopatra's Needles, one being brought to London in 1877 and the other to New York in 1879. The O. in Paris, one of a pair of Rameses II., which stood at Luxor, was presented by Mehmet Ali (1837). The Egyptians dedicated Os. to sun deities, and worshipped them. See J. G. Zoga, *De Origine et Usu Obeliscorum*, 1797; H. H. Goeringe, *Egyptian Obelisks*, 1882; Parker, *The Twelve Egyptian Obelisks at Rome*, 1879; and A. Erman, *Römische Obeliske*, 1917.

**Oberalp Pass**, mt. pass in Switzerland over the Alps, on the borders of the cantons of Uri and Glarons. It attains a height of about 6730 ft., and it connects Andermatt, above Göschenen, with the valley of the Vorder Rhine to Disentis. It forms with the Furka the chief route for tourists from the Simplon and Zermatt to the Engadine.

**Oberammergau**, vil. on the r. b. of the Ammer in upper Bavaria, situated 11 m. S.W. of Munich. The pop. is engaged mostly in wood and stone carving. At this vil. in an open-air theatre seating over 5000 people, a famous Passion Play is performed every ten years in fulfilment of a vow which was made in 1634 when the vil. was visited by a severe plague. This play draws visitors from all parts. Pop. 2300. See MIRACLE PLAYS; PASSION PLAYS.

**Oberbaden**, Switzerland, see BADEN.

**Oberelchingen**, see ELCHINGEN.

**Oberhausen** 1. Tn. of Rhineland, Germany, on the Kinseker 7 m. N.W. of Essen. It has important coal mines and iron works, and is noted for zinc smelting works, rolling mills, and manufs. of chemicals, glass, and porcelain. Pop. 191,300. 2. Mkt. tn. of Bavaria, in Swabia, on the Wertach. It is a N. suburb of Augsburg. It manufs. hosiery.

**Oberlin**, Jean Frederic (1740-1826), Abbatist pastor and philanthropist, b. at Strassburg, son of a teacher. He studied theology, and became Protestant pastor of Waldbach in the Steinhilf valley (Ban de la Roche), a backward, wild, mountainous dist. which had been devastated in the Thirty Years war. In its poverty it offered oppo for O.'s philanthropy, and he became known for his remarkable efforts to improve the lot of the people both spiritually and materially. He constructed roads and bridges, introduced an improved agric. system, built substantial cottages for the peasantry

founded an itinerant library, and estab. a number of vll. schools; he was in fact the founder of the first infant schools. He was closely associated with the Brit. and Foreign Bible Society in its efforts to supply the dearth of the Scriptures in a number of continental countries. *See* lives by Spach, 1866; E. Bodemann, 1868.

**Oberlin**, tn. of Ohio, U.S.A., in Lorain co., 30 m. S.W. by W. of Cleveland. Its college was founded in 1833. Pop. 4300.

**Obermaier**, Hugo (1877-1946), Ger. archaeologist. b. at Regensburg. He entered the Church in 1900, and in 1911 became prof. at the Institut de Paléontologie Humaine in Paris. In 1914 he became prof. at Madrid, and conducted prehistoric research in Spain and elsewhere on the older Stone Age and palaeolithic art. From 1938 to 1946 he was prof. at Freiburg, Switzerland. His pubs. include *Der Mensch der Vorzeit* (1912); *El hombre fósil* (1920, 1944; Eng. trans. 1921); *Buschmannskunstliche Felsmalereien aus Südrastafrika* (with H. Kuhn, 1930); and *The Cave of Altamira et Santillana del Mar, Spain* (with H. Breuil, 1935).

**Oberon** (Fr. *Alberon* or *Auberon*, and Ger. *Alberich*, rich elf), king of the elves. In England he is best known for the delightful part he plays with Titania, his wife, in Shakespeare's *A Midsummer Night's Dream*. There is really no resemblance between this haughty little fairy and the ugly dwarf, Alberich, who steals the Rhine treasure in Wagner's *Ring*. O. is first called the 'roi du royaume de la féerie' in the thirteenth-century metrical romance, *Huon de Bordeaux*. His name is the title of a masque of Ben Jonson (1616), an epic of Wieland (1760), and an opera of Weber (1826).

**Oberon**, outermost of the five satellites of Uranus, discovered by Herschel in 1787. It revolves in an orbit almost perpendicular to the plane of the orbit of Uranus, at a mean distance of 361,000 m. from the planet, the period being approximately 13 days 11 hr.

**Obesity**, abnormal excess of fat, almost amounting to a disease, accumulating principally in the thighs, abdomen, and neck. The accumulation of fat depends to a large degree on the health, but in a diseased state of the system the production and deposition of fat are increased. In some cases O. bears no proportion to the food taken, though it is often the result of food being excessive in quantities of certain constituents relative to the oxidising powers of the consumer. It may occur at any period of life, but more commonly prevails after the fortieth year. The predisposing causes are sedentary occupations, inactivity, too rich diet, etc. It is frequent in certain diseases such as anaemia, and in some forms of insanity. It may also be caused by disturbances of the endocrine organs, such as pituitary glands. Many systems have been recommended for the amelioration of this complaint, but treatment should be suited to individual cases. The main point to be considered is the careful supervision of diet and exercise, and the steady aim should be the gradual loss of a few ounces

during the week. All rapid reduction of fat should be avoided, as it is injurious to the system in other ways. The Banting system for the reduction of undue corpulence is perhaps the best known, and the most followed, consisting largely of the avoidance in diet of fat, sugar, and starches.

**Obidos**, tn. of Brazil. In the state of Pará, 690 m. up-riv. from the port of Pará. The tn. is situated on the N. shore of the Amazon and is the centre of a cacao coffee, tobacco, and sugar-growing area. Pop. 20,000.

**Obi Group**, *see* under MOLTREAS.

**Obi River**, *see* Ob.

**Obiter Dictum** (Lat. 'said by the way'), expression used specially to denote those judicial utterances and decisions in the course of delivering a judgment which, taken by themselves, were not strictly necessary for the decision of the particular issues raised. In the language of jurisprudence an O. D. is of 'persuasive' and not 'authoritative' efficacy, when cited by counsel in support of an argument. Maine (*Incident Law*) states that the anc. Rom. jurists, in the days when they were called upon to give *responses* or legal decisions on cases submitted to them, were in no way bound by the special facts of the case, but could multiply the data at pleasure, and so evolve a general rule from facts, both real and hypothetical. In other words, the formulation of legal principles of wide application was of greater importance than the mere settlement of the client's difficulties. But in the Eng. courts of to-day one of the most effective reasons that can be urged by counsel to prevail upon the bench to ignore a proposition contained in the law reports, is to show that it was not necessary or relevant to the decision of the matter in hand.

**Object**, *see* under SUBJECT AND SUBJECTIVE.

**Oblates**, in the Rom. Catholic Church, congregations of men and women, not professed monks or nuns, dedicated to the service of religion. The best-known congregation is that founded by Charles Borromeo, archbishop of Milan, in 1578, and now known as the O. of St. Charles. They form a community of priests who put themselves in the hands of the bishop to be used where and how he wishes. The title O. is also given to lay persons who follow a rule of life under the direction of a religious order, although living outside the monastery or convent.

**Obligation**, term used in jurisprudence (*q.v.*) to denote the binding force of a legal contract (*q.v.*). With the Rom. lawyers an O. could have its source in delict (tort or actionable wrong), as well as in contract. The Rom. maxim, 'A nude pact, given rise to no obligation, but might be the basis of an exception,' meant that there were some agreements not falling under the recognised heads of contract, which were not enforceable, but were available as defences. Some nude pacts were however, actionable, *e.g.* the *pactum constitutum pecuniae*, or agreement to pay what one already owed. 'Natural Ohs.'

were those which, devoid of a recognised legal force, had at least some moral claim to recognition, e.g. an agreement between a paterfamilias and any one in his power, like a son or slave.

**Obligation, Days of**, in the Rom. Catholic Church, days on which abstinence from servile labour and attendance at mass are commanded. They are (for England and Wales) the Circumcision, Epiphany, Ascension, Corpus Christi, SS. Peter and Paul, Assumption, All Saints, and Christmas Day. For Scotland, St. Joseph and the Immaculate Conception must be added, and for Ireland the feast of St. Patrick.

**Oblivion**, see LETHARGY.

**Obbock**, or **Obok**, Fr. colony of E. Africa, on the gulf of Aden, now called Fr. Somaliland (q.v.). The port of O. was acquired for France in 1862, but it was not till 1884 that it was actively occupied. It has been superseded by Djibuti.

**Oboe**, or **Hautboy** (Fr. *hautbois*), treble reed-woodwind instrument, provided with a double reed mouthpiece and a conical bore. It is made of ebony, silver, or boxwood and has fifteen keys, exclusive of two octave keys which assist the production of the higher notes. The normal compass is from B<sub>2</sub> below the staff to F<sub>4</sub> above, and includes all the semitones, the music is written in the G clef. The O. is popular in orchestras because of its exceptional technical efficiency and because of its rich, if somewhat penetrating, and varied tones. It descended from the cromorne, and was in full use by the sixteenth century, though it remained primitive until the eighteenth, and was not fully perfected until the nineteenth. Two O.s., together with two horns, were the most constant instruments in the orchestra, apart from the strings, in the eighteenth century. Bach was fond of the 'hautbois d'amour,' now almost obsolete. There is an eight ft. reed organ stop sometimes called the hautboy, and reproducing the tone of the O.

OBOE

**Obolus**, or **Obol** (Gk. ὀβολός), smallest Gk. coin, and also the smallest Gk. weight in common use. As a coin it was always equivalent to one-sixth part of a drachma, and was therefore worth about 1/625d., though the amount varied. As a weight it was again equal to one-sixth of a drachma, that is, to about 16 grains, although it fell to as low as 8.6 grains during the later Rom. empire.

**Obrecht**, or **Hobrecht**, Jacob (or

**Jacobus Obertus**) (c. 1450-1505), Dutch composer, was b. at Bergen-op-Zoom. He studied at Leuven Univ. and in 1479 became choirmaster at Bergen-op-Zoom. Director of the singing-school at Cambrai, 1481-85, he was teacher at Bruges, 1491-1496, though he must have resided at Antwerp, where he was appointed chapel master at the cathedral in 1491. Towards the end of his life he went to Italy, and was for a time at the court of Lorenzo de' Medici at Florence. His works include masses, motets, (2) a *Passion*, *chansons*, etc.

**Obregón**, Alvaro (1880-1928), president of Mexico; b. in Sonora of mixed Basque and Yaqui stock, worked as carpenter and farmer. After Madero was shot, O. joined Carranza against Huerta, 1913, defeated that president, and became minister of war; he defeated Villa in 1915. After Carranza's murder O. was president four years from Nov. 1 1920, and was succeeded by his nominee Calles, 1921-28. Calles procured O.'s re-election, July 1, 1924, but O. was assassinated sixteen days later.

**Obrenović**, Serbian dynasty founded by Miloš O., which held power in Serbia from 1815 to 1903, except the years 1842 to 1848. See V. Georgevich, *Das Ende der Obrenovićs*, 1903.

**O'Brien**, Kate (b. 1898), Irish novelist and playwright, b. at Limerick and educated at Trinity College, Dublin. Her first novel, *I don't my Clerk* (1931) won the Hawthornden and the James Tait Black memorial prizes. Her other novels include *The Ante-room* (1934) and *The Last of Summer*, shrewd pictures of Irish temperament with a background in co. Clare; *The Land of Spicers* (1941), an unusual novel and imaginative but somewhat marred by obscurity in the use of words; *Mary Lavelle* (1936); *Pray for the Wandering* (1938); and *That Lady* (1946), a distinguished novel based on the hypothetical relations of Anna de Mendoza, princess of Eboli, and Antonio Perez, secretary to Philip II. of Spain. Plays: *The Bride* (1927), *The Schoolroom Window* (1937); and *Distinguished Villa* (1926). Also the travel book, *Farewell Spain* (1937).

**O'Brien**, William (1852-1928), Irish journalist and patriot, leader of the 'All for Ireland' party, b. at Mallow, co. Cork. He estab. *United Ireland* in 1880, and ed. it with a view to popularising the aims of Parnell and the Land League. He represented S. Tyrone, 1885-86; N.E. Cork, 1887-92; Cork City and N.E. Cork, 1892. O.B. suffered continual imprisonments under the Crimes Act, in connection with the National League and Tenants' Defence League, 1887-91. At first an eager supporter of Parnell, he later veered round to the opposite side; but after he had sat on the Land Commission of 1903 he threw the whole weight of his influence into the scale of the conciliation policy, which looked towards the union of Irishmen of all creeds and classes. He represented Cork City again, 1910-18. At the election of 1918, he and his friends stood aside in favour of Sinn Féin. Among his later

books were *Evening Memories* (1920), and *The Irish Revolution and How it Came About* (1923).

**O'Brien, William Smith** (1803-64), Irish patriot, b. at Promolund, co. Clare, sat in the Imperial Parliament, and though a Protestant favoured Catholic emancipation. He joined O'Connell's Repeal Association, but in 1846 became leader of the 'Young Ireland' party, which had no scruples about the use of physical force. The result was that in 1848 he was sentenced to death for his leadership of an abortive rising. The sentence, however, was commuted, and in 1854 O.B. regained his liberty.

**O'Bradaigh (Broder), David** (fl. 1650-94), Irish poet, b. in Limerick, a Jacobite and violent enemy of protestantism and everything Eng. He was well versed in Irish hist. and literature, and the literary merit of his work is high. The bard of the Williamite wars, nearly all of his twenty extant poems, which are written correctly in the difficult Irish metre (*Dan díreach*), reflect contemporary events. One of them, for example, is a twenty-six-stanza political poem on Ireland's ills from 1641 to 1684; another was in praise of James II. and dispraise of William of Orange, being dated 1688; another was on the exile of the native gentry after the siege of Limerick; and another, perhaps the most popular of all, was one whose first line trans. means 'O trooper, if thy desire be to rouse out from home.' Some of the poems were printed and trans. in the *Catalogue of Irish Manuscripts*, by Standish Hayes O'Grady (Brit. Museum). His work was pub. in 3 vols. by MacElean, in 1910-17.

**Obscene Prints and Publications, see INDECENCY.**

**Obscurantists** (Lat. *obscurare*), term applied at the time of the revival of learning to those who were 'opposed to all new views, irrespective of their origin, by reason of religious prejudice.' The word 'obscurantism' is derived from the pub. in Germany in 1516-17 of *Epistolae obscurorum virorum* (q.v.) against some monks of Cologne. It is generally applied to opponents of progressive ideas. See also HUTTEN, ULRICH VON.

**Observants, see FRANCISCANS.**

**Observation**, mental act whereby the intellect becomes aware of sense data, existents, and universals. Awareness may be defined as a direct cognitive relation with an object. Sensory O. is limited to the direct acquaintance with sense data. When we see a colour or hear a sound our direct cognitive relation is with that colour or sound as such. It is only by a further mental act that we become aware of the objects which causes the sense data of colour and sound. This act is known as perception. Perceptive O., of which sense data are a *sine qua non*, is that form of awareness which we have of particular existent objects. Thus when we see the moon sensory O. makes us aware of light over a defined surface; it is by perception that we have a direct cognitive relation with the luminous object which by convention we call the moon.

Further, in the act of introspection we are often aware not only of certain objects, but also of those objects in various cognitive and conative relations with ourselves. We may perceive not only the moon, but also ourselves as perceiving agents; we may desire the satisfaction of some appetite and at the same time perceive ourselves as desiring. Awareness, however, is not limited to sense data and existent particulars. It extends also to universals, and to universal relations. We are aware not only of red objects, but also of redness; not only of an object preceding another, but also of before and after. Nevertheless, awareness of these universals does not of itself prove the existence of an object partaking of such universals. See also KNOWLEDGE.

**Observation, Errors of, see ERRORS.**

**Observatory**, institution for the scientific observation, by means of highly specialised instruments, of natural phenomena, the conditions of which cannot be controlled by the scientist. Os. are classed as astronomical, magnetic, meteorological, tidal, and seismic and volcanic. Astronomical Os. date from very early times if we include obelisks, pyramids, temples, and stone circles, all of which had undoubtedly astronomical uses. The Chinese Emperor Huang-Ti (2698-2598 B.C.) is said to have been responsible for the erection of a great O., but as it is now generally accepted that Chinese characters prior to about 800 B.C. are legendary, this statement should not be taken seriously. The O. at Alexandria, founded in the third century B.C., and associated with the names of Hipparchus, who carried out his observations between 161 and 126 B.C., and Ptolemy, who lived at Alexandria about the middle of the second century A.D., is usually considered the first, and continued until nearly the end of the second century. During the Middle Ages a number of Os. were founded in Muslim lands, amongst which may be noticed those at Damascus, Bagdad, Morágha, and Smarand. The first European O. was that erected at Nuremberg in 1427 by Bernhard Walther, a wealthy citizen, who had the co-operation of John Müller, known as Regiomontanus, a very capable astronomer. In 1561 Kassel O. was founded by William IV., landgrave of Hesse, and later Hven in the Sound, where the Dane, Tycho Brahe, inaugurated observational methods (1576-97) which proved invaluable to astronomers of later years. The first post-Galilean O. was that connected with the Univ. of Leyden (1632), and the needs of the art of navigation gave rise to the Paris O., completed in 1671, and to the Greenwich O., completed five years later; during this century Helvelius worked at his own private O. at Danzig, measuring stellar altitudes and making careful drawings of the moon. The Greenwich O. commenced magnetic and meteorological work in 1838 and special solar photography in 1873. It is a Royal O. presided over by an astronomer royal, as also is the O. of Blackford Hill, Edinburgh, founded in 1818 at Culston Hill and moved to its present site in 1896.

Herstmonceux Castle, Sussex, was chosen in 1946 as the home of the Royal O., Greenwich. Owing to the growth of London, astronomical observations at Greenwich were restricted by the impurity of the atmosphere and the glare of the sky at night; for this reason the removal of the O. from the London area became necessary for satisfactory observations. Some of the instruments are now at Herstmonceux, and it is expected that normal work will be in progress there in 1953.

Other institutions in Great Britain include Univ. O., Durham; Univ. O., Oxford (1875); Univ. O. and Solar Physics O., Cambridge, the former founded in 1820 and the latter removed from S. Kensington in 1913, both now under one director; Univ. of London O., Mill Hill; Imperial College O., S. Kensington; Norman Lockyer O., Sidmouth; Univ. O., Glasgow (1840); St. Andrew's O.; Liverpool O.; besides many private Os. In N. Ireland there is the Armagh O. (1791), and in Eire Dunsink O. (1785), now part of the Dublin Institute for Advanced Studies, and supported by the gov. of the republic. In the Brit. Commonwealth of Nations the following Os. may be noticed, but a full list is not given: Royal O., Cape of Good Hope; Radcliffe O., Pretoria; Union O., Johannesburg, and the Yale O. branch station; Bloemfontein O., branch of Harvard College O., and also the Lamont-Hussey O., a branch of the O. of the Univ. of Michigan. In Australia, New Zealand, and Canada there are Os. at Canberra, Sydney, Perth, Wellington (two), Ottawa, Victoria, Toronto (two), and Quebec.

A number of European Os. were damaged during the Second World War and work was temporarily suspended in others, but reconstruction has been in progress for some time. The list which follows is not complete, as this would involve too much space. In France there are Os. at Paris, Meudon, Marseilles, Nice, and Pic du Midi (a branch of Toulouse Univ. O.). In Germany at Bonn, Götting, Göttingen, Leipzig, Munich, Potsdam, Bergerdorf, Heidelberg, and Berlin; in Italy at Rome and also in the Vatican city, Milan, Naples, Pola, and in Sicily at Catania and Palermo; in Spain at Madrid and Barcelona; in Portugal at Lisbon; in Switzerland at Geneva and Zurich; in Hungary at Budapest and Kolossa; in Czechoslovakia at Prague; in Austria at Vienna and Kronsminster; in Holland at Leyden; in Belgium at Brussels; in Denmark at Copenhagen; in Norway at Oslo; in Sweden at Lund, in Poland at Cracow and Warsaw; in Latvia at Riga; in Estonia at Tartu (formerly Dorpat); in Finland at Helsingfors; in Russia at Leningrad, Pulkovo, Odessa, Moscow, Lwow, and Nikolaev; in Greece at Athens; and in Turkey at Istanbul.

America has a very large number of Os. and only a few can be noticed, amongst which are Yerkes O. at Williams Bay; Mt. Wilson Os. (two: 350 ft. and 5715 ft.); Lick O. at Mt. Hamilton (4210 ft.); Flagstaff O. (the famous Lowell O.) in Arizona;

Harvard Univ. O.; Leander McCormick O., Virginia; Naval O. at Washington; Delaware O., Ohio; Ann Arbor O., Michigan; Berkeley O., California. The 200-in. telescope is now working at Mt. Palomar, California, and great results are expected from it. In Mexico there is the National O. at Tacubaya and in S. America there are Os. at Caracas, Córdoba, La Plata, Quito, Rio de Janeiro, Santiago, and Montevideo. In other parts of the world there are a few more Os., amongst which may be noticed those at Hefwan, Tashkent, Hyderabad, Madras, Kodaikanal, Bombay, Kunning, Tsingtoo, Hong Kong, Kami-Tamakami, Kyoto, and Tokyo.

The modern tendency in astronomy has been specialisation but combined international work, especially on star cataloguing, is carried on. The Royal O., Edinburgh, does a considerable amount of work on spectrophotometry; Oxford Univ. O. specialises on solar work; Liverpool O. and Tidal Institute is concerned solely with tides; Imperial College O., S. Kensington, is used mainly for teaching students and carries out laboratory investigation of molecular spectra; Heidelberg, Potsdam, and many other Os. concentrate on astrophysics. The Dominion O., Ottawa, has recently devoted a lot of time to meteor investigation with the use of radar; the Lowell O. was specially built for planetary work, in particular on Mars.

Many large Os. have been estab. in comparatively recent times, and special developments have taken place in equatorial mountings. The tower telescope is a feature in these; this telescope does not move, but the light from the sun is fed into it by a coelostat. This is a mirror mounted in such a way that it turns on an axis parallel to the earth's axis, and at such a rate that it just counteracts the earth's rotation. The light is reflected on another fixed mirror, which then sends it downward to an object glass which forms an image in the laboratory at the base of the tower. Under the laboratory is a well into which the sunlight, directed upon a grating, is returned to the laboratory dispersed into spectra, where it can be examined. One tower at Mt. Wilson O. is 150 ft. high and a smaller one is 60 ft. high. The Astrophysical O. at Aretri (Florence) has a tower 80 ft. high and the Einstein tower of the Astrophysical O., Potsdam, is 50 ft. high. This tower was erected in 1921 and was named after the famous scientist. See also TELESCOPE.

*Magnetic Observatories.* The chief Brit. magnetic O. was the magnetic dept. of the Royal O., Greenwich, but this has been moved to Abinger. Two other magnetic Os. (under the control of the Air Ministry) have been estab. at Lerwick, Shetland Is., and Enderbun, Dumfries. There is an Admiralty Compass O. at Slough but the work there is mainly connected with the gyro-compass, not with the magnetic compass. The naval Os. in various countries devote particular attention to magnetic work, and important investigations on the subject have been made by polar explorers who have determined the

magnetic N. and S. poles, but not always with great accuracy in the case of the N. magnetic pole. Aerial observations in recent times have given the position of the N. magnetic pole with much greater accuracy than that found by previous investigators.

Meteorological Os., are referred to in the article METEOROLOGY and seismological Os. in the article SEISMOGRAPH AND SEISMOLOGY.

*The Nautical Almanac* pub. a list of astronomical Os. each year, but this ceased in 1911; it is hoped that the list will be continued in the 1952 and subsequent issues. *The American Ephemeris and Nautical Almanac* publishes a list every year.

'Observer,' one of the oldest London Sunday papers in existence, estab. in 1791. It was a comparatively obscure pub. until Wm. Inall Clement purchased a share in it some twenty years later, and organised it into the foremost Sunday paper. But though still a leading Sunday paper the *O.* of to-day is a radically different pub. from what it was in its earliest days, for it once relied for its success largely on its illustrations. Up to the time of Gladstone's Home Rule proposals the policy was Liberal, but thereafter it became Unionist. For long it was the only Sunday newspaper which pub. the latest foreign and home news of the previous Saturday. In 1905 the *O.* was bought by Lord Northcliffe (q.v.), who appointed J. L. Garvin as editor; the latter was retained when the paper passed to Viscount Astor in 1907, and under this regime the paper reached its present eminence. In 1912 Ivor Brown succeeded Garvin; Viscount Astor's son, David Astor, has been editor since 1948. Ownership of the paper is now vested in a trust. Its political policy is described as independent and non-party. Literary, dramatic, and musical criticisms are of a particularly high standard. The sales (1949) are over 400,000.

**Observer Corps, Royal,** uniformed civilian organisation under the operational control of R.A.F. Fighter Command which reports movements of aircraft and also gives aid by reporting the positions of aircraft in distress or which have crashed. Headquarters are at Bentley Priory, Stanmore, Middlesex. The corps was stood down on May 12, 1945, at the end of the war, but was reconstituted on Jan. 1, 1947, on a spare-time basis. In the Second World War its membership was 32,000, including 5000 women, and it had a network of 1420 posts reporting to forty operations rooms. Up to April 1941, when the title Royal was conferred upon it in recognition of its work in the battle of Britain, the corps was known as the Observer Corps. It was constituted as such in 1925, the members being special constables. In 1927 operational control passed from the War Office to the Air Ministry and in Aug. 1939 the Air Ministry also took over administration from the Home Office. To-day the R. O. C. forms a vital part of the first-line early-warning defence system of R.A.F. Fighter Command.

**Obsessional Psychoneuroses, see under PSYCHONEUROSES.**

**Obsidian,** dark-coloured vitreous lava or volcanic rock, of varying composition, resembling common bottle-glass. It is generally black, but may be brown, red, or grey, or a combination of these colours. All Os. have a low sp. gr. because they are acid rocks and non-crystalline, and their lustre is vitreous. When broken, *O.* shows a conchoidal fracture similar to that of glass, and yields sharp-edged fragments largely employed by primitive races for spear-heads, knives, arrow-points, etc. *O.* occurs in the Lipari Is., Iceland, Hungary, Mexico, the Yellowstone Park, New Zealand, Ascension, and the Caucasus. *O.* was worked as a gem-stone by the anc. Egs. and Romans, and at the present time it is sometimes cut and polished as an ornamental stone.

**Obstetrics** (Lat. *obstetrice*, midwife; from *obstare*, to stand before), that part of the science of medicine which deals with the care of women in respect of child-birth. It is therefore a div. of gynaecology, which deals with diseases of women, especially with those affecting the organs of reproduction. Midwifery was in the hands of women until about the sixteenth century; indeed, the interference of a physician in the process of child-labour was looked upon as immoral. The transference of the midwife's function to trained physicians owes a great deal to the rediscovery of podical version by the Fr. physician Paré in 1550. This operation consists in manipulating the foetus in the uterus so as to bring the feet to the outlet; by this means children were safely delivered who could not otherwise have been born. Other notable developments have been the invention of the forceps by the Chamberlens, Huguenot refugees settled in London; the administration of anaesthetics initiated by Sir J. Y. Simpson in 1847; and the diminution of cases of puerperal infection by the use of antiseptics. Modern obstetricians are concerned with the process of parturition and the varying conditions met with, the employment of operative or instrumental measures if occasion calls for them, the care of the woman during the puerperium, or period during which the uterus is regaining its normal size, and the supervision of the new-born child's welfare during that period. The name 'accoucheur' is used to denote a person specialising in *O.*

**Obwalden, see UNTERWALDEN.**

**Ocarina,** musical toy wind instrument of metal or terra-cotta, in shape resembling a goose's (It. *oca*) egg. It was introduced into England by travelling Ger. or Tyrolean musicians, and sounds somewhat like a flageolet. There are usually eight or ten finger-holes, a whistle-like mouthpiece, and a large internal cavity. Modern instruments have a row of keys. The Chinese *hauan* (c. 3000 B.C.) was perhaps its anc. prototype.

**O'Carolan, Torloach, or Carolan Turloagh** (1670-1738), Irish blind, b. at Newtown, Co. Meath. Became blind after an attack of smallpox in 1684. Patrons furnished him with a servant and horses, and he

wandered with his harp through Connaught. O. composed his own songs and melodies.

**O'Casey, Sean** (b. 1881), Irish dramatist, b. in Dublin. Reared in the Dublin tenements, which often serve as a setting for his plays. O. exploited the sheer comedy, coupled with intense tragedy, to be found by discerning eyes in those grim slum dwellings. He read omnivorously as a boy, and began to write in his early thirties. His Abbey Theatre career began in 1923. His *Junio and the Paycock*, produced in 1925, was a great success in London. It was followed by *The Plough and the Stars* in 1926. These plays estab. him as master of comedy and pathos on the grand scale, native in idiom and convincingly true. 'They suggest, in symbolic form, the tragedy of Ireland itself, where idealism and vainglory, vision and vice, poetry and profanity were inextricably mingled' (A. C. Ward). He was always an experimentalist and forsook the purely realistic theatre for fantasy, as shown in *The Silver Tassie* (1928), and *Within the Gates* (1933), both expressionist plays and propagandist. 'Van Gogh,' he said 'and particularly Cézanne, took from the extravagance of Cubism its possibilities and, uniting these with the greater possibilities of Realism and Impressionism, burst into a new art in painting. Now that is what I want to do in Drama.' To those who relish propaganda on social and political problems these later plays were welcomed as masterpieces, but to others the excessive use of symbolic types in place of individual characters seemed to render them inferior as drama to his early work. O. has long been settled at Totnes. Other works include *I Knock at the Door* (1939); *Pictures in the Hallway* (1942); *Drums under the Window* (1945); and *Inishfallen Fare Thee Well* (1949), all autobiographical; and also *The Shadow of the Gunman* (an early play, 1915); *Windfalls* (1934); *Essays on the Theatre* (1937); *Purple Dust* (1940); *Oak Leaves and Lavender* (1946); and *Collected Plays* (1949). See S. Gwynn, *Irish Literature and Drama*, 1936.

**Occam, William of, see** OCKHAM.

**Occasional Conformity.** The Test and Corporation Acts were designed to exclude non-Anglicans from certain public offices by making attendance at communion a condition of service. To evade this barrier many nonconformists adopted the practice of taking communion occasionally to satisfy the Acts. The Occasional Conformity Act of 1711 made this practice illegal, but was repealed in 1718. An ann. indemnity Act, to permit nonconformists to hold office was in operation from 1727 to 1829.

**Oocleve, Thomas, see** HOCLEVE.

**Occlusion.** absorption of a gas by a metal. Many solids are capable of occluding gases when in a molten state, and the gas so occluded is usually emitted on solidification. Certain metals, notably the platinum metals, have the property of absorbing gases without being fused, especially when the metal is in a finely

divided state. Platinum black, for instance, takes up 100 times its vol. of oxygen, and 110 times its vol. of hydrogen; palladium absorbs over 600 times its vol. of hydrogen; iron, cobalt, nickel, copper, silver, and gold exhibit the phenomenon of O. in a lower degree. The intimate contact of these gases when occluded leads to chemical combination, in which great heat is evolved. Thus a jet of hydrogen or coal-gas directed against platinum black causes the metal to glow, and the jet is speedily ignited. The large proportion of hydrogen occluded by palladium led to the supposition that a definite compound, palladium hydride, PdH, had been formed, but recent chemical opinion does not favour the suggestion.

**Occlusions, Cold and Warm, see under** METEOROLOGY.

**Occultation** usually refers to the concealment of a star or planet by the moon. By its eastward motion it eclipses the body, which disappears behind the E. limb and reappears at the W. In the first half of the lunation, the E. limb being dark and the star a mere point, the O. is sudden, forming a most accurate means of determining the moon's position, and thus assisting in ascertaining certain inequalities of a very complicated nature in the moon's mean motion. When the Greenwich time is known the long. of a place can be found by noting the instant of O. but the comparative rarity of these phenomena renders this method of little practical use at sea. The phenomenon is confined to a belt of 10° 17' wide in the heavens. The O. of its moons by Jupiter may also be used to determine long., but for various reasons great accuracy is not obtainable in this way.

**Occult Sciences, see under** MAGIC; NECROMANCY; WITCHCRAFT.

**Occupational Diseases.** There are few occupations entirely free from risk of disease. Even agric. and other workers are liable, in consequence of exposure to the weather and the sun's rays, to contract cancer of the skin (epithelioma). Writers, telegraphists, and typists are all liable to cramp of the hand, musicians may acquire callosities and emphysema, whilst clergymen, as well as housemaids, are said to be liable to inflammation of bursa associated with the knee joint. Clergymen also suffer from laryngitis, a disease which they share with teachers, singers, and public speakers. Medical men, in addition to the obvious hazards of infection, are reputedly prone to attacks of angina pectoris, perhaps in consequence of the nervous strain to which they are subjected. The industrial diseases proper are governed by the Factories Acts, the most recent being passed in 1937 and 1948; the provisions of these Acts are supervised by inspectors of the Ministry of Labour and by examining surgeons specially appointed for the purpose. Most large factories now have their own medical and welfare workers. Many such diseases are subject to compulsory notification by medical practitioners; compensation of diseases and injuries is governed by the Workmen's Compensation

Acts of 1925 16. Industrial diseases include anthrax, or wool-sorters' disease, which affects chiefly the lungs and spleen, and is often fatal; cat-skin disease, common in divers if they are released too suddenly from high pressures; cataract and emphysema, which occur in glass-blowers. Workers in mines, tunnels, and sewers are sometimes attacked by spirochaetal jaundice (Weill's disease) and by hookworm (ankylostomiasis, *q.r.*). Poisons which may affect workers include metals such as lead, arsenic, antimony, mercury, and nickel; non-metallic substances, as for instance phosphorus, carbon disulphide, and a large number of coal-tar products (benzene, aniline, tri-nitrotoluene, picric acid, etc.) used in dyeing and as explosives; gaseous poisons, *e.g.* chlorine, arsine, and the gases of coal-mines. Other very important *O. D.* are pulmonary tuberculosis, silicosis, and asbestosis, caused by the inhalation of foreign particles; also dermatitis, ulceration, and cancer of the skin induced by irritating chemicals, such as alkalis, paraffin, chromium salts, tars, oils, and the like. Finally mention should be made of the risks to operatives using radio-active substances in medical work and atomic bomb factories. See J. R. Currie and A. G. Meurns, *Hygiene* (3rd ed.), 1948.

**Occupational Therapy**, psychological treatment, the success of which depends upon the transference of the patient's focus of attention from his disability to an objective centre, in this case to some congenial occupation. It originated as a treatment in mental hospitals, but it is becoming increasingly important in both general and mental hospitals. In mental hospitals activities are devised to hold the attention of the patient, and to encourage him to concentrate. In general hospitals *O. T.* is used whenever possible in conjunction with physiotherapy to stimulate circulation and muscle tone, and it plays an important part in the treatment of traumatic injuries, arthritis, tuberculosis, and paralysis. Among the many crafts which serve both to stimulate the interest of the patient, and at the same time to exercise special muscles, are weaving, spinning, table weaving, joinery, book-binding, leatherwork, pottery, rug-making, country dancing, and other recreational activities. Throughout the course of treatment the occupational therapist works under medical direction. In the early stages in co-operation with the nurses and physiotherapists, in the convalescent stage with technicians and recreational training experts, and in the final stages with industrial psychologists and others. *O. T.* thus takes an important part in the eventual rehabilitation of the patient.

Experiments in *O. T.* were first carried out in Great Britain during the First World War, mainly by craft-workers untrained in the medical side. Between the two wars a group of people began to realise the importance of a specialised training for occupational therapists, and in 1930 Dr. Elizabeth Casson founded the Dorset House School in Oxford. Other

schools quickly followed, and the Association of Occupational Therapists was formed in 1936 with Sir Hubert Bond as president, and Mrs. Glyn Owens as first chairman. Membership is limited to those who hold the association's diploma, or that of an approved school obtained before the establishment of the association's examinations, the first of which was held in 1938. A fully qualified occupational therapist has a working knowledge of anatomy, physiology, psychology, and first aid, and also departmental management, general medicine, and surgery, together with some knowledge of either psychiatry, psychopathology, and *O. T.* applied to psychiatric conditions, or advanced anatomy and physiology, physical medicine, and orthopedics, according to specialisation. Added to this is a knowledge of at least ten crafts. See R. H. Finnegan, *Occupational and Physiotherapy*, 1948.

**Ocean and Oceanography.** *Os.* or surfaces of continuous water, as distinct from the enclosed and shallow seas, cover about 140,000,000 sq. m., comprising 71 per cent of the total surface area of the globe. Their mean depth is estimated at 2080 fathoms (12,480 ft.), as compared with the mean height of the land, 375 fathoms (2250 ft.).

**Distribution.** In the N. hemisphere the proportion of land to water is 2 : 3; in the S., 1 : 1.7. There is a 'land hemisphere,' however, centred on the bay of Biscay, in which the proportions are nearly equally distributed, and a 'water hemisphere' centred on the S.W. Pacific, in which the water covers an area ten times that of land. The arrangement of the *Os.* and the continents is an almost symmetrical alternation. The Arctic *O.* around the N. pole is antipodal to the high Antarctic continent. The S. circumpolar *O.* matches the almost complete ring of land round the Arctic basin.

The two great *Os.*, the Pacific and the Atlantic, cover sections of 150° and 90° respectively in the S., and then taper northwards between the continents to their shallow and narrow connections with the Arctic *O.* The Indian *O.* covers a sector of 120° in the S., and is enclosed by a semicircular sweep some 20° N. of the equator. An attempt was made to explain the rough antipodality of the great *Os.* and continental regions, as well as their shapes and symmetrical arrangement around the poles, in the well-known but now discredited Tetrahedral Theory (see MOUNTAINS).

**Importance.** The greatest influence of the oceanic bodies of water is that of moderating and regulating the climatic conditions of the earth. They are the great source and store of moisture brought by winds as cloud and rain to the lands. Their reactions with the sun's heat differ from, but delicately counterpoise, those of the land, and prevent the development of extremes of temp. in their bordering regions. In brief, proximity to the *Os.* determines to a very large extent the habitability, development, and even character of the pop. of certain regions,

e.g. the monsoon countries of S.E. Asia. The deep-sea fisheries centred off the banks or oceanic shallows are of vast importance, and the Os. also are of the greatest value as highways of commerce. The N. Atlantic O. may be regarded especially as one of the controlling factors in the supremacy and progress of the great W. European and Amer. peoples. Its contributing land margin is considerably more extensive than that of the Pacific or the Indian O., since much longer and greater rlys. drain into it. (For further special characteristics see PACIFIC, ATLANTIC, etc.)

**Temperature.** The mean ann. surface temps. of the O. vary from over 80° F. within the tropics to freezing point in polar seas. The surface temp. of the sea changes markedly from place to place,

usually felt to a greater depth than 300 fathoms, there is a lag in the seasonal change of temp.; and whereas in our lats. the hottest time of the year is June, the water, on account of the slow warming up of the sea, does not reach its maximum temp. until Aug. There is a further lag in the warming of the deeper water, until at about 50 fathoms there is a complete reversal of seasons. There the hottest time of the year is in Dec., and the coldest about May-June. Below 100 fathoms there is no seasonal change at all in temp., and, year in year out, the conditions are uniform. From this depth downwards the temp. gradually falls until in the O. abysses it remains constantly at somewhere near the freezing-point.

**Pressure.** The pressure in the sea varies with the depth. At every ten metres it is

WATER IN HEMISPHERE

LAND IN HEMISPHERE

In the tropics it is hot compared with the polar regions. The highest recorded temp. is 96° F. in the Persian Gulf, the lowest 28° F. in polar seas; and between these two extremes all temps. are to be found. Though the specific heat of sea water is less than that of fresh, it is still high, and therefore, as compared with land, the Os. remain cool in summer and warm in winter, accounting indirectly for the oceanic climate of marginal lands. There is very little daily variation, and, except in the temperate regions, only a small ann. range of temp. in the surface waters. The vertical distribution of temp. has some notable features in common throughout the Os. There is a rapid decrease of temp. to about 200 fathoms, with a further slower fall to about 1200 fathoms, after which only slight changes take place. The most striking fact is the uniformity of temps. at great depths in all lats., bottom temps. varying only from 30° F. in high lats. to 35-40° F. in the N. Atlantic and Pacific Os. The freezing-point of sea water is about 28° F. In enclosed seas like the Mediterranean, anomalous conditions arise as the result of the presence of submarine barriers. Owing to the fact that the sun's warmth is not

increased by one atmosphere, i.e. by one stone to the sq. in., in the great depths the pressures rise to 3 tons to the sq. in. Yet there is no part in the Os. in which animal life cannot be supported. The great pressures in the depths of the O. have a slight effect on the water's density, but, water being almost incompressible, the increase in density with depth is very small. It can in no way be sufficient to support a prevalent but utterly erroneous popular belief that, owing to the increasing density, objects sinking will find their own level before they reach the bottom, a level in which the density is the same as theirs, and below which they cannot sink because the density of the water becomes greater (see on this F. S. Russell and G. M. Yonge, *The Seas*, 1928). One of the effects of living at these great pressures is that when animals are brought up quickly in a trawl they break to pieces on account of the sudden reduction of pressure. In the laboratory small unicellular animals have been subjected to pressures of as much as 600 atmospheres without suffering any apparent harm.

**Light.** - The amount of light to be found at any depth of the O. depends on the altitude and strength of the sun, on the

weather conditions, and upon the turbidity of the water. It is seldom that all the light from the sun penetrates the actual sea surface; this only happens when the sun is vertically overhead and the sea perfectly calm. But the rays that do pass through the surface cannot penetrate to the bottom in very deep water. In the great Os, the darkness on the sea-floor, thousands of fathoms below the surface, is absolute, the light being absorbed completely by the water. But not all the different colours of which white light consists are absorbed to an equal extent; thus red rays are quickly absorbed but blue and violet light penetrate much further, while in clear O. waters, such as the Sargasso Sea, violet light may be present at over 500 fathoms, though its strength is necessarily very weak. An excellent example of the absorption of light by sea water is supplied by the celebrated cave at Capri called the Blue Grotto, within which everything is enveloped in the purest blue light. The explanation of this phenomenon is that the only light that can enter the cave itself has to pass first beneath the water which practically fills its narrow entrance. The blue colour of the sea is also due to the same phenomenon, for the colour of the water is due to the reflection of light upwards from the small particles suspended in the water; much of the remaining red and yellow light has become absorbed in this upward journey, and it is mostly the blue and green light which can survive to appear above the surface and so lend to the sea its typical hue. As all these rays of light are being absorbed in their downward passage it follows that the actual strength of the light is gradually being reduced as the water gets deeper. In the open O, the strength of light is too weak at 100 fathoms to support very much plant life, while below that depth few living plankton plants are to be found. None the less this upper layer of water, 100 fathoms thick, is sufficient to sustain a great mass of plant life that forms the sea's pasturage, and it is on the dead plants and organisms that have fed on them that the animals in the dark O, depths depend for their food.

**Composition and Salinity.** Oceanic water contains nearly 200 times the dissolved salts of fresh water. Its 'salinity' is usually expressed as the amount of dissolved salts contained in 1000 parts of water, an average value being about 35 per 1000, or 3.5 per cent. Regions of heavy rainfall, slight evaporation, or large ingress of fresh water have a low salinity. In the Baltic Sea, for instance, the salinity is very low, being always below 29 parts per 1000. Down at the mouth of the Baltic, however, where it meets the North Sea in the Skagerrak, there is a considerable rise in the salinity due to the mingling of more saline waters from the North Sea itself and from water borne round by the drift of the Gulf Stream which penetrates the North Sea off the N. of Scotland. Regions of the trade winds and permanent anticyclonic conditions show high salinity, but the enclosed seas, the Mediterranean

and the Red Sea, are highest. The most striking contrasts of salinity, however, are a surface feature only, and are greatly reduced in deeper waters. In the case of the Dead Sea riv. water has been pouring down for thousands of years into a comparatively small lake in which constant evaporation is taking place, and, as a result, the enormous salinity of over 200 parts per 1000 has been reached.

According to Dittmar's analysis of samples collected by the famous *Challenger* expedition, the composition of sea-salts is:

	Parts per 1000
Sodium chloride . . . . .	27.213
Magnesium chloride . . . . .	3.807
Magnesium sulphate . . . . .	1.658
Calcium sulphate . . . . .	1.260
Potassium sulphate . . . . .	0.863
Calcium carbonate . . . . .	0.123
Magnesium bromide . . . . .	0.076

35.000

It is now known, however, that this does not give an accurate representation of the dissolved substances, since they are present mainly as ions, one-tenth only of the solids being present as true salts. On the whole, therefore, there is an excess of bases over acids, so that sea-water has an alkaline reaction. Moreover, the actual composition of sea-water salts, i.e. the ratio of bases and acids, remains constant in all parts of the O, and at all depths away from contact with the shore and the bottom.

**Density.** This varies with both the salinity and the temp. on the surface. It also increases with depth from a mean of 1.025 at the surface to one of 1.028 at the bottom. Even small differences in density, however, have most important effects on oceanic circulation.

**Depth.** The greatest depth which has been sounded (Ger. cruiser *Jordan*, 1927) is 35,110 ft. some 10 m. S.E. of Mindanao, Philippine Is. The largest area is always that between 2000 and 3000 fathoms, 18 per cent in the Atlantic, 59 per cent in the Indian, and 65 per cent in the Pacific. Only 6 or 7 per cent exceeds 3000 fathoms, this comprising the trough or basin-like 'deeps.' These deeps are not numerous; there are fifty-seven, thirty-two of which are in the Pacific, five in the Indian O., nineteen in the Atlantic, and one lying partly in one and partly in the other of the latter two Os. Each deep is named after some well-known oceanographer or research ship. The deepest sounding in the Atlantic is 5227 fathoms off Puerto Rico. Elsewhere the 'abyssal plain' has a configuration of depressions, rises, and plateaux, though details are only imperfectly known. At the margins it rises through the 'continental slope' to the 'continental shelf,' a sill of very varying breadth with a maximum depth of 100 fathoms. This has a very great influence on the tides.

The deposits on the O. bottom have been classed as follows:

(1) *The Terrigenous*, including *Littoral*,

between high- and low-water marks, sands, gravels, muds, etc. *Shallow Water and Neritic*, less than 100 fathoms—the same plus organic remains. *Continental or Hemipelagic*: Blue mud, dark and slaty in colour, due to the formation of ferrous oxide and ferrous sulphide from the ferric oxide in the presence of decomposing organic matter. Shell fragments do not form a large percentage; red mud, in which the ferric oxide is sufficiently abundant not to be completely reduced, and green mud, really another variety of blue mud characterised by the abundance of the green mineral glauconite of land or organic origin; volcanic and coral muds and sands occur in the regions of volcanoes and coral formation.

(2) *The Pelagic or Deep Sea*. These are oozes due to siliceous and calcareous organisms, mostly microscopic. These are globigerina, very widely spread, especially in the Atlantic, pteropod, typical of the summits of rises, and diatom (microscopic plants), covering an Antarctic belt and part of the N. Pacific. Red clay is found in the deepest parts of the O., especially the Pacific, while a local variety, radiolarian ooze, is limited to the deeper parts of the Pacific and Indian O. Around the poles, especially in the Antarctic O., the surface waters contain vast numbers of diatoms, each of which is enclosed in a delicate case of silica, and it is these minute plant 'skeletons' which form the prin. constituent of the deposits in these regions, hence called diatom ooze. Another type of deposit, which is strictly a variety of globigerina, is called pteropod ooze; it is named from the predominance in it of the limy skeletons of swimming snails known as pteropods or 'sea butterflies,' which are commonest near the equator where this type of ooze is exclusively found, always in shallower water than globigerina ooze and, particularly, near coral is, and on submerged elevations far from land. Beneath a certain depth oozes with limy shells as their chief constituents are no longer found, all calcareous matter having been dissolved away. At the greatest depth of all even the silica of the minute animals known as radiolaria is dissolved and the deposits then consist exclusively of what Murray called 'red clay,' a true clay which has been formed by the prolonged action of the sea water on volcanic dust which is all that has remained after the long journey from the surface to the bottom. In this red clay are found spherules probably of meteoritic origin, and also the insoluble teeth of sharks and ear-bones of whales.

*Circulation*. The surface currents of the O. are due mainly to winds, though the shapes of land masses often control their direction. In each hemisphere great swirls (centred near Cancer and Capricorn) are formed by the agency of the trades and westerlies, clockwise in direction in the N. hemisphere and anticlockwise in the S. hemisphere. These induce minor counter-currents along the equator. In the Atlantic and Pacific warm currents run off to the N. and S.

along their W. sides, and cold currents flow from the Arctic and S. O. along their E. sides towards the equator. A belt current circles the globe in the 'Roaring Forties.' In the N. Indian O. the currents change with the monsoons. The influence of these currents, together with the winds above them, is the determinant of climate for oceanic land margins, a marked effect being that in the tropics, where the E. continental margins are warm and humid, the W. tending to desert conditions. The warm and cold branches in higher lat., produce climatic contrasts in similar lat., as, for example, between W. Europe and Labrador. Within the great 'whirls' are large areas of practically still water, covered with a mass of living, floating weed known as sargassum. In addition to the surface circulation (see further under ATLANTIC, PACIFIC, etc.) there are sub-surface currents which have only recently been investigated. These movements are in the nature of creeps affecting distinct zones or layers of water, differing in temp., salinity and density. There is a definite bottom creep of very cold saline water from polar regions to the equator. Slow and more or less vertical currents are set up by the 'welling up' of this water, compensated by downward movements of dense saline water near the tropics. There is still a great need, however, for a more complete and systematic study of O. waters and their circulation.

*Sea level*. The level is disturbed by high evaporation, rainfall, inflow of rivers, melting and formation of ice, heaving by prevailing winds, differences of barometric pressure, etc., and also by the gravitational attraction of large land masses. The waters of the Mid Indian O. are lowered 1500 ft. by the attraction of the mt. masses of the Himalayas.

Life in the O. is possible mainly because of the absorption of oxygen by sea-water, to the extent of about 8 c.c. per litre. That this dissolved oxygen is found in all sea-water, even in very deep areas, is due to its constant renewal by very slow vertical currents derived originally from the surface. Absolutely stagnant water does occur in the depths of the Black Sea and some Norwegian fjords—the oxygen content has long been removed and therefore no organic life is possible. (See further under BIOLOGY; BOTANY; FISH.)

*Scientific Oceanographical Investigation* received its great impetus in connection with the laying of submarine cables about 1855. Kieffer had in 1661 attempted a map of O. currents, but before that interest lay in the wind circulation. Saussure made observations of temps. at great depths in 1780, Rennell attempted a scientific account of the currents between 1742 and 1830, while Arctic exploration added to knowledge. Capt. Cook, Sir J. In Ross, and others took true deep-sea soundings, and Br. Blake in 1850 introduced a method of bottom-deposit at the same time. In 1857 H.M.S. *Cyclops* made observations of temp. with a self-registering sheathed thermometer. M. F. Maury pub. his *Physical Geography of the Sea* in 1856, the

result of investigations organised by the U.S.A. Hydrographic Office, and this led to similar research being undertaken by many countries. In England Forbes, Michael Sars, Wyville Thomson, and Carpenter gave a start to marine biology. Their work led to the dispatch of the great *Challenger* expedition by the Brit. Gov. for complete investigation of the O. This great voyage, 1872-76, led to a systematic scheme of oceanography and to great improvements in instruments and methods.

Other famous expeditions sent out by many nations include *Vorign*, Norwegian, in N. Atlantic, 1876-78; *Travailleur*, Fr., bay of Biscay, 1880-83; *Tingolf*, Dan., 1896; *Blake* and *Albatross*, Amer., Atlantic, Caribbean, and Pacific, 1877-1901; *Princess Alice*, Prince of Monaco, N. Atlantic, from 1888; *Vaidua*, Ger., Atlantic, Indian, and S. Os., 1898-99; *Siboga*, Dutch, Malay Archipelago, 1900; *Meteor*, Ger., S. Atlantic, 1925-27; *Albatross*, Swedish, Pacific O., 1917-48. The expeditions of the *Gauss*, *Helgoland*, *Scotia*, *Fram*, *Discovery*, *Discovery II*, etc., added immensely to the science of marine biology and to the knowledge of conditions, especially in Arctic and Antarctic waters. An International Council for the exploration of the sea and marine laboratories in many parts of the world have been estab.

**Methods and Instruments.** - The increasing study of the oceans has resulted in a great improvement of methods and instruments used in deep-sea work. For surface observations ordinary instruments can be used, but for sub-surface work special instruments, the actions of which can be controlled, have to be employed. Thus for temp. observations reversing thermometers, registering at any desired depth, are used. Samples of water for the determination of salinity are obtained by sending reversing water-bottles down to any required depth, these carrying sometimes reversing thermometers. A messenger consisting of a small metal weight is sent down the line to effect reversal. The Petterssen-Nansen water-bottle, however, is insulated and sealed by a small propeller, which is set in motion when the ascent begins, so that the unaltered temp. can be read off directly. Photometers are used for investigating the penetration of sunlight into the sea; the plates are exposed and covered again by sending down messengers. Many instruments are used for the measuring of the velocity and direction of currents. Drifting objects, like icebergs, wreckage, or drift bottles, give information regarding surface currents, but for direct measurements of under-currents Ekman's ingenious self-recording current meter is favoured. Hydrometers and densimeters are employed for the determination of density and relative densities of samples. One of the most important branches of oceanographical research is deep-sea sounding. A depth sounding on the *Challenger* with the stout hempen cable and lead took sev. hours. With the modern Lucas sounding machine an economy of time and more accurate results are achieved. Steel piano wire is run out from the drum until the sinker

touches bottom and becomes detached, when the depth is automatically recorded. The latest method, however, is by echosounding apparatus, with which continuous soundings can be taken by a ship under way. Depth is calculated by timing the echo, or sound wave reflected from the sea floor, produced by a controlled explosion in the ship's bottom. This apparatus, however, cannot replace the Lucas sounding machine, with which it is possible to obtain a specimen of the bottom deposit in closing tubes on a grab during the process of sounding. Dredges and trawls, up to 50 ft. span, are used for obtaining specimens of bottom life, while tow-nets and vertical nets and trawls, which can be opened or closed at desired depths, and which are made of extremely finely meshed silk, are used to capture animals and plants in intermediate waters. Many marine organisms are so small, however, that they have to be concentrated into drops for microscopic examination by large and hand centrifuges.

**Persistence of the Ocean Basins.** - There has been much discussion as to the persistence of the deep O. areas beyond the limits of the continental shelf. The absence of geological representatives on land of the deep-sea oozes led to the theory of persistence, particularly elucidated by Wallace, Lord Kelvin, and Jukes-Brown. They have, however, been recognised in such oceanic marginal lands as Barbados, Cuba, Borneo, and elsewhere. The distribution of plants and animals appears to require the non-persistence of Os, or the presence of 'land bridges' across present O. basins. Wegener has postulated the shifting of continents in the geological past by the splitting up of a large primeval continent and the drift of its parts towards the equator and towards the W. This continental drift theory is based on the well-established difference in the composition of the continental blocks and the O. floor. The former consist of lighter rock materials making up the 'sial,' and are supported in the denser materials of the O. floor termed the 'simu.' They may almost be compared to icebergs floating in water. See also HYDROMETER; NAVIGATION; RIVER; SEA; SOUNDING; TIDES; WAVES AND SWELL; WINDS.

Krumm, *Handbuch der Oceanographie*, 1907-11; J. Johnstone, *An Introduction to Oceanography*, 1923; A. Wegener, *The Origin of Continents and Oceans* (trans.) 1921; G. Schott, *Geographie des atlantischen Ozeans*, 1926; Sir J. Murray, *The Ocean*, 1928; F. S. Russell and C. M. Yonge, *The Sea - our Knowledge of Life in the Sea and how it is Gained*, 1928; E. O. Houlenger, *A Natural History of the Ocean*, 1935; T. A. Ryder, *Mother Earth*, 1941; F. D. Ommundsen, *The Ocean*, 1949; and F. G. Lane, *The Mysterious Sea*, 1949.

**Ocean Falls**, to the Brit. Columbia, Canada, 350 m. N.W. of Vancouver. There are large pulp and paper works. Pop. 2790.

**Ocean Grove**, summer and seaside resort, 55 m. S. of New York city by rail, in Monmouth co., New Jersey, U.S.A. It is noted for its Methodist camp meetings, and also for its concerts. Pop. 2900.

**Oceania**, general or collective name for the groups of is. in the S. and central Pacific Ocean or South Seas, comprising all those intervening between the S.E. shores of Asia and the W. shores of America. Physically O. includes all the is. from Australia to the Marquesas and the Low Archipelago, and from New Zealand to the Hawaiian group. The main divs. of the region are the three large is. Australia, Tasmania, and New Guinea, and the three is. groups Melanesia (*q.v.*), including the Solomon Is. (*q.v.*) and New Hebrides and New Caledonia, Micronesia (*q.v.*) including the Carolines and Ladrões, and Polynesia (*q.v.*), extending from New Zealand to Hawaii. The most important group is the Australian chain or chains stretching from New Guinea to Macquarie Is. and including the Papuan Is. and New Caledonia. The grouping into Melanesia, Micronesia, and Polynesia is a loose ethnic classification. Most of the small is. are coral atolls, though some are of volcanic origin. O. is divided among Britain, France, Japan, Australia, New Zealand, U.S.A., and Chile.

**Océanie Française**, see FRENCH OCEANIA.

**Ocean Island** is situated in the Pacific Ocean, 0° 52' S., 169° 35' E. In 1901 the is. was taken under Brit. rule, and in 1916 was formerly annexed to the Gilbert and Ellice Is. colony. It is very rich in high-grade phosphate; in 1921 the Brit. Phosphate Commissioners purchased the working rights from the Pacific Phosphate Company. The Jap. occupied the is. during the Second World War until 1945, deporting the pop., which numbered 2500. O. Is. is 6 m. in circumference.

**Ocean Steam Navigation Company**, see WHITE STAR.

**Oceanus**, deity of Gk. mythology. Homer pictures O. as a great belt of riv. sweeping round the earth, and as the father of all things, even of the gods. Herodotus and the later Gk. poets, like Euripides, identify him with the sea, and in after time he became synonymous with the Atlantic. Hesiod explains that he was the son of Uranus and Gaia, the husband of Tethys, and the father of all the great rivs., besides 4000 sea nymphs or Oceanids.

**Ocellus, Lucanus** (fl. c. 500 B.C.), Lucanian Gk., and member of the Pythagorean school, named from his bp., Lucania in Italy. He is said to have written various philosophical works, but the only one extant is his *On the Nature of the Universe*, in the Ionic dialect, maintaining the doctrine of the eternity of the world.

**Ocelot, Panther-cat, and Tiger-cat** are popular names applied to *Felis pardalis*, a species of Felidae found in tropical America. It is a beautiful animal, averaging in length from 2½ to 3 ft., and has a tail about 1 ft. long; the colour is usually tawny, with dark spots or bars. The O. is a good climber, and feeds for the

most part on birds caught in its native forests.

**Oc-Eo**, anct. city of Cochin-China, lay in what is now a treeless marsh, about 110 m. N.E. of Cape Cambodia, the southernmost tip of Cochin China. The remains of the city cover an area of about 450 hectares, bisected by a canal running away to an outpost 16 m. distant at Tac-Bo on the W. shore of the gulf of Siam. O.-E. flourished from the first to the ninth century A.D., its civilisation preceding that of the Khmers (sixth to fifteenth century), hitherto the earliest known civilisation of Indo-China. The site was dug by Louis Malleret in 1912-15. Inscriptions found on small objects are written in the Brahmi script of Sanskrit. Chinese influence developed over the centuries, and it seems clear that the city was part of the kingdom of Fu-Nan. There is evidence of contacts with the Greco-Rom. world, with the Sry thans of N. India, and with the Persians. Architecturally heavy masonry was supported on timber, which latter has collapsed with the consequent ruin of the whole structure. The bulk of the pop. was of Indonesian and Negro stock, ruled by an Indian, probably N. Indian, aristocracy. The reason for the decline of O.-E. is not certain, but may have been a change in the level of the land.

**Ochil Hills**, range of hills in Scotland, in Perthshire, Clackmannan, Kinross, and Fifeshire. They extend for about 25 m. from the Tay, near Perth to the bridge of Allan. The highest summit is Ben Clouch, 2363 ft. Coal, iron, copper, and lead are found, and rich pasture is afforded to sheep and cattle.

**Ochino, Bernardino** (1487-1564), It. reformer, was b. at Siena. A friar at first, he was vicar-general of the order of Capuchins, but, fearing the vengeance of the Inquisition for his heretical sermons, he fled to Geneva, and attached himself to Calvin. He confirmed his apostasy by marriage, and after travelling as a Protestant preacher, accepted from Crammer a prebend at Canterbury, and pub. in Lat. his spirited *Tragedy or Dialogue* against the pope. But his apology for polygamy and his attack on the Trinity brought him into utter discredit with the Reformers, and eventually he died a miserable death from plague in Moravia. See lives by K. Berath, 1892, and E. Negri, 1912; also A. Stückl, *Christus in Italien*, 1936.

**Ochra, Okro, Gobbo, or Gombo**, names for the pods of *Hibiscus Abolmoschus* (synonym *Abolmoschus esculentus*), a plant belonging to the family Malvaceae, which is cultivated as a food in the N.W. of India.

**Ochre**, name given to sev. varieties of native earths, which consist of a mixture of hydrated oxide of iron with silica and alumina. They range in colour from light yellow to brown. The incrustation of oxides of other metals, antimony, bismuth, nickel, etc., are also called Os., though they are not so important. Red and yellow Os. are prepared by grinding and washing, and are extensively used as

pigments. O. is found in sev. parts of England, notably in Anglesey and Devonshire; also in Canada, France, India, and S. Africa.

**Ochrida, Okhrida, or Orid**, tn. of Yugoslavia, on the frontier between W. Macedonia and Albania. 28 m. N.W. of Monastir, on Lake O. It was the seat of a Bulgarian bishopric. There is a Rom. fortress and other anct. buildings. Pop. 10,000.

**Ochs, Adolph Simon**, see under 'NEW YORK TIMES'.

**Ochterlony, Sir David** (1758-1825), Brit. soldier, b. in Boston, Massachusetts. He joined the Indian Army in 1777, and first distinguished himself as the defender, with a small garrison, of Delhi against Holkar's invading army of 20,000 (Oct. 7-16, 1804) until the siege was raised by Lake's army. He held the Sikhs in check on the N.W. frontier, and eventually concluded a treaty of peace with their leader, Ranjit Singh (1808). In 1811, in the campaign against the Nepalese, he captured the fort of Nalagur, and followed up this success by taking Malaun, which was defended by the gallant and skilful Amar Singh, whom O. permitted to march out with his arms and colours and personal possessions. O. was made K.C.B., and, later, baronet, and given a large pension by the E. India Company (1815). Later, taking the field against the Ghurkhas he advanced on Khatmandu, and defeated them decisively at Hariharpur. The Nepalese then ratified the treaty which previously they had rejected (1816). For these services O. received the thanks of Parliament, and the award of the G.C.B. His last campaign was against the Maratha chiefs, and the Pindaris, and he succeeded in dividing the two major bodies of the Pathan forces without striking a blow (1818). O. was a skilful soldier and diplomatist, and had a great knowledge of Indian character, languages, and social life. A column was erected to his memory in Calcutta. See C. MacFarlane, *Our Indian Empire*, 1844; J. C. Marsham, *History of India*, 1867; and Sir G. Dunbar, *A History of India*, 1941.

**Ochus**, see ARTAXERXES III.

**Ocimum**, genus of half-hardy annuals and shrubs (family Labiatae), bearing whorls of white flowers. *O. basilicum* is the sweet or common basil, which is grown in kitchen gardens. See BASIL.

**Ockham, or Occam, William of** (b. c. 1290-1300; d. c. 1349), called 'Doctor Singularis et Invincible', Eng. schoolman, was born at O., Surrey. He probably studied at Oxford as a member of the Franciscan house there, but not, as has often been stated, at Merton College. In Paris he became associated with the celebrated Marsiglio of Padua, on whose political opinions he exercised considerable influence. Like his master, Denis Scotus, whose rival in philosophy he afterwards became, he belonged to the order of Franciscans. O.'s eminence rests on his work in logic, in philosophy, and in political theory. In the first two he strongly influenced the opinion of his day, while in the last he deeply agitated the Church.

In his political writings he supported the secular power as against the claims of the papacy, and was cited before a papal court in consequence. In philosophy he revived the tenets of nominalism in a modified form. The *Dialogus* gives the most complete expression of his religious views. He must not be confounded with Wm. de Ockham, archdeacon of Stow in 1302. See further under KNOWLEDGE. See E. A. Moody, *The Logic of William of Ockham*, 1935.

**Ockingham**, see WOKINGHAM.

**O'Comhraide, Eoghan**, see O'CURRY, EUGENE.

**O'Connell, Daniel** (1775-1847), 'The Liberator,' Irish patriot and orator, b. at Carhen, near Cahirciveen, co. Kerry. In 1798 he was called to the Irish Bar. As a lawyer he displayed an exceptional gift for examining witnesses, whilst his vigorous and earnest oratory exercised a powerful influence over the jurymen, as later over the House of Commons, to which he was returned in 1828. The year 1829 saw the emancipation of the Irish Catholics, a reform which would never have come so soon had it not been for O'C. In 1841 O'C. began his second and greater agitation, this time for the repeal of the union. Peel was then at the head of a Tory Cabinet, and O'C. realised that the Catholics of his country would win nothing from a Tory gov. The activities of the Catholic Association were revived, and huge mass meetings were everywhere organised. O'C. felt confident of success, when he was condemned to prison on a charge of sedition (1844). A few months later he was set at liberty, but a shattered constitution and a devastating famine combined to defeat his ends.

See lives by W. Fagan, 1817; M. Cusack, 1872; J. O'Rourke, 1875; J. Hamilton, 1888; and D. Gwynn, 1929; see also J. O'Connell (ed.), *Life and Speeches*, 1846; W. J. Fitzpatrick (ed.), *O'Connell's Correspondence*, 1888; R. Houston, *Daniel O'Connell: his Early Life and Journal*, 1906; and M. MacDonagh, *O'Connell and the Story of Catholic Emancipation*, 1929.

**O'Connor, Feargus Edward** (1791-1855), Irish agitator and Chartist, b. in Ireland, was called to the Irish Bar, but it is as a politician he became notorious. He was an active supporter of the Reform Bill of 1832, and was returned to Parliament for co. Cork. After being unseated for lack of the required property qualifications he allied himself with the 'physical force' Chartists. From 1847 he sat in the House of Commons for Nottingham. He was in 1852 declared to be insane, and was placed under control.

**O'Connor, Thomas Power** (1818-1929), Irish journalist and politician, b. at Athlone. He entered journalism as a junior reporter on *Saunders' Newsletter*, a Dublin Conservative journal. He became a sub-editor on the London *Daily Telegraph*, but gave this up for an appointment in the London office of the *New York Herald*. In 1880 he entered Parliament as member for Galway, and became a prominent personality in the Parnell

party. In 1885 he ceased to represent Galway, and became M.P. for Scotland div. of Liverpool. He remained so for the rest of his life, becoming Father of the House on the death of Campbell-Bannerman. He was made privy councillor 1924. 'Tohy M.P.' of *Punch* christened him 'Tay Pay'; and he founded and ed. *T.P.'s Weekly*, *M.L.P.*, the *Star*, and the *Weekly Sun*. His pubs. include *Lord Beaconsfield: a Biography* (1879); *Gladstone's House of Commons* (1885); *The Parnell Movement* (1886); *Napoleon* (1896); *In the Days of my Youth* (1901); *Memoirs of an Old Parliamentarian* (1929); and numerous essays and articles. See life by Hamilton Fyfe, 1934.

**Oconto**, city of Wisconsin, U.S.A., in O. co., on the O. R., at the entrance into Green Bay, 25 m. N.E. of the head of the bay. A centre for the lumber trade. Pop. 5400.

**Ocotea**, or **Oreodaphne**, genus of tropical Amer. trees (family Lauraceae), bearing long alternate leaves and racemes or panicles of small green flowers. *O. bullata* is sometimes grown in the greenhouse. *O. opifera* exudes a volatile oil.

**Ocotlan**, part of Mexico, on Chapala Lake. Fruit and cereals are shipped. Pop. 15,000.

**Octahedrite**, see ANATASE.

**Octane** ( $C_8H_{18}$ ), is the name given to those hydrocarbons of the paraffin series which contain eight carbon atoms. There are eighteen compounds having this formula, many being known. The normal  $O$ ,  $C_8H_{18}$ , is a colourless mobile liquid, sp. gr. 0.702 at 20° C., boiling point 125.5° C., and is found in petroleum. It may be obtained in the pure state by heating octyl iodide with zinc and dilute hydrochloric acid. It may also be synthesised by heating *n*-butyl iodide with sodium. Iso-octane (8-methylheptane) is a colourless liquid, boiling at 116° C., and has a sp. gr. of 0.7035; it may be synthesised by the action of sodium on a mixture of propyl and isomyl iodides, and fractionally distilling the product.

**Octane Number**, percentage of an octane (2, 2, 4, trimethylpentane) in a mixture of this octane with *n*-heptane which behaves, as far as 'knocking' in an internal combustion engine is concerned, with a petrol to be characterised by the *O. N.* The octane shows little tendency to 'knock' but the heptane has a very low resistance to it. Hence a petrol with a high *O. N.* will not 'knock' easily.

**Octave**, interval in music comprising eight notes of the diatonic scale, called the tonic, supertonic, mediant, subdominant, dominant, submediant, leading note, and *O*. It has six tones or twelve semitones. The *O*, of any note always has exactly double the number of vibrations per second of that note, giving the ear an effect of unison. There are usually seven *O*s. in the piano-forte. In ecclesiastical usage the *O*. of a festival is the period of eight days including and following the festival, or the seventh day after it. Thus New Year's Day is the *O*. of Christmas Day.

**Octavia**: 1. Sister of the Rom. emperor Augustus. She first married Marcellus, consul, in 50 B.C., and on his death became the wife of Mark Antony (40 B.C.), who, however, forsook her in a short space of time for Cleopatra, which led to the war between Antony and Augustus. *O*. was noted for her beauty and womanly virtues. She d. in 11 B.C. 2. Daughter of the Emperor Claudius and Messalina, b. c. A.D. 10, and wife of Nero, who in A.D. 62 divorced her on account of her being barren, and later accused her of unfaithfulness, and had her put to death in A.D. 62.

**Octavian**, see JOHN (popes), *John XII*.  
**Octavo**, term used in bookbinding for a book or sheet of printed paper which has been folded three times, or one-eighth of its original size, and so forming eight leaves or a section of sixteen pages. The word *O*. is generally abbreviated to 8vo, and certain sizes of books are classified as foolscap 8vo, demy 8vo, royal 8vo, crown 8vo.

**Octet**, composition for eight instruments, usually in sev. movements, and in some kind of sonata or suite form. An *O*. may also be vocal, but would not then be given the name *O*. as a title, and it would probably be merely an incidental section for eight voices in a larger composition.

**October** (Lat. *octo*, eight), originally the eighth month of the old Rom. calendar, the year beginning in March. It retained its old name in the Julian calendar, but then became the tenth month with thirty-one days. The Slavs term it 'yellow month', from the falling of the leaf, and an old name for it in Germany was 'wine month.' In England it has long been the chief month for brewing. The prin. eccles. feasts celebrated during the month are those of St. Luke on the 10th and St. Simon and St. Jude on the 28th.

**October Revolution**, see under COMMUNISM; RUSSIA. *History*.

**Octomeria**, genus of small epiphytal orchids, bearing yellow, purple, and white, spotted with red, flowers. They are grown in moist fibrous peat and sphagnum in the warm greenhouse.

**Octopus**, name for large numbers of tetrabranchiate cephalopods, with eight arms and without the internal shell or 'bone' which is found in the mantle of many cephalopods. The body is oval or rounded, and the suckers are generally sessile. They are widely distributed on the shores of almost all temperate and tropical seas, and do not attain the great size of some of the decapod cuttles. The mature females are extraordinarily prolific, and may lay as many as 50,000 eggs in the course of a few days. The eggs resemble grains of rice in appearance, but are translucent and are attached to a common stalk in clusters of about 1000 each. These are fixed to a rock or stone, and, as Aristotle knew, the period of incubation is fifty days. The female watches over them with ceaseless attention the whole time. *O*s. spend the day-time lying hid in the shadow of rocks, but are more active at night. Their

powers of colour change have often been observed.

**Octroi**, term used with special reference to the system of duties imposed on different articles coming into different Fr. dists. or municipalities. In effect it is a kind of inland tariff. The system was abolished for a short time during the revolution, but shortly afterwards re-established, and it still flourishes. Farming-out has now for long been as strictly regulated as the scale of rates. By an Act of 1816 only such articles as are intended for local consumption are dutiable, with the exception of various necessities of life. The system is also in vogue in parts of Italy and the Iberian peninsula.

**O'Curry, Eugene** (known in Irish as **Eoghan O'Comhairde**) (1796-1862), Irish scholar, son of a farmer, b. at Dunaha, co. Clare. He was first employed in the topographical and historical section of the Irish Ordnance survey, and in 1854 was appointed prof. of Irish hist. and archaeology at the Rom. Catholic Univ. of Ireland. His *Lectures on the Manuscript Material of Ancient Irish History* (1861) is one of the best accounts of Irish medieval literature. He trans. the anct. Brehon laws, the *Book of Lismore*, etc.; three vols. of his lectures entitled *On the Manners and Customs of the Ancient Irish*, ed. by W. K. Sullivan, were pub. in 1873.

**Odal**, see ALLODIUM.

**Oddfellows**. There is much in common between Oddfellowship and Freemasonry (*q.v.*), although the institution of the former is not above two centuries old. The registered offices of the largest friendly society order of O. in the world, the famous Manchester Unity Independent Order of O., are situated in Manchester. This society with the Grand United and sev. other orders of O., have long appropriated to themselves the once generic name of 'O.' The fundamental principle of Oddfellowship, according to its own laws, was the obligation to render assistance to every member who might apply for it in sickness, distress, or other misfortune. The Manchester Unity Independent Order of O. was estab. in 1810. Its objects are similar to those of most other societies (see FRIENDLY SOCIETIES). Any respectable person not under sixteen nor over fifty may be proposed for membership by a subscribing member. There are also juvenile and female lodges and members. The contributions are graduated according to the age of the member, and benefits are payable throughout life or until pension age, according to the insurance effected. The total membership (1948) was 960,000 and the funds £32,600,000. Management is by lodge and dist. meetings, officers and grand officers, and boards of directors.

Oddfellowship was introduced into the U.S.A. from the Manchester Unity in 1819; the Grand Lodge of Maryland and U.S.A. was formed in 1821. Connection was severed with the Manchester Unity in 1842, and the U.S.A. order rivals in influence the Manchester Unity, the two orders now having inter-fraternal arrangements. The first Canadian lodge was

opened as a branch of this in 1843 at Montreal, Canada. There are many lodges in Australia, New Zealand, South Africa, and other Brit. Dominions. The Amer. order has its headquarters at Baltimore and consists of a sovereign grand lodge and various grand lodges and subordinate lodges in the different states. Other organisations flourish in France, Switzerland, Denmark, Norway, and Sweden.

**Ode** (Gk. ὁδῆ, a song), rhymed or rarely unrhymed lyric, usually exalted and stately in style, often in varied or irregular metre, and generally between fifty and two hundred lines in length. It originally meant any lyrical piece adapted to be sung and derives from the Gk. choir-song or choral-O. Pindar, the master of the O., developed it in a consciously elaborate form. Modern poets follow the lyrical O. of Sappho and Alcaeus. In the modern use of the word, Os. are distinguished from songs by not being necessarily in a form to be sung, and by embodying loftier conceptions and more intense emotions. The language of the O. is therefore concise and energetic, and the highest art of the poet is called into requisition in adapting the metres and cadences to the varying thoughts and emotions. Hence the changes of metre and versification that occur in many Os. Among the highest examples of the O. are the Song of Moses and sev. of the psalms. Dryden's *Alexander's Feast* is reckoned one of the first Os. in the Eng. language. Other examples are Gray's *Bard*, Collins's *Ode to the Passions*, Burns's *Scots wha hae*, Coleridge's *Dejection*, Shelley's *Ode to a Skylark*, and Wordsworth's *Intimations of Immortality from Recollections of Early Childhood*. The master of the Fr. O. may be said to be Ronsard (*q.v.*), who abandoned Pindar and imitated the poets of the Alexandrine school (a collection of whose works had just been pub. by Henri Etienne in the belief that they were those of Anacreon). Mention may also be made of Andre Marie de Chénier, whose best-known Os. are the *Pindare*, *Jeux de Paume* and an eloquent one addressed to Charlotte Corday; Victor Hugo, whose *Odes* (1822) won for him the protection of Chateaubriand and the favour of the king; and the *Odes Panamboliques* of Théodore de Banville (1857). Os. may vary from the 'florid and scrupulous' O. *To Mistress M. R. Comuel concerning her Choice* by Richard Crashaw, which is remarkable for its superfluous lack of sympathy, to the esoteric Os. of Gray, and from the O. on political themes, which attracted Coleridge, to one which is in effect an essay in the realm of mystical vision, such as may be found in the work of Patmore. Collins's *Ode on the Popular Superstitions of the Highlands* (1788) shows a taste as exquisite as that of Gray, and is important in the hist. of the early Romantic movement in Eng. literature and for its revival of imagination as an element in our poetry. He shows a truer sense of song in his Os. than does Gray, and perhaps they have best been described by Wordsworth, 'bright, solemn, and serene.' Gray's Os. are noted for their ornate

words, often chosen for the memory of their use by earlier writers. His *Pindaric* Os. (not to be confused with the fustian *Pindarique Odes* (1656) of Abraham Cowley), which are framed in a metre which follows the strophe and anti-strophe of Pindar, have for their theme the hist. of England and of poetry, and are among the most perfect of his poems, though by no means the most popular. His *Progress of Poesy* has been called the forerunner of the Romantic movement, an honour which, however, he shares with Collins. Wordsworth's *Intimations of Immortality* is an epitome of his philosophy, in which he uses the Platonic concept of our pre-natal existence as a premise, a mystical intuition of a life which can be revived only for a few fleeting moments in the presence of nature. Shelley's *Ode to the West Wind* and *Skylark* are among the least characteristic of his poems, but are remarkable for their poetic ecstasy or fervour; more characteristic of his political views and passions is his *Ode to Liberty*, written in 1820. Keats's three great Os., *To a Nightingale*, *On a Grecian Urn*, and *To Melancholy*, apart from their intrinsic beauty, are remarkable as revelations of the tender and pensive melancholy which was his characteristic view of life. All are written with great felicity of expression, and with a rare balance of direct narrative and suggestion, and all of them are illustrations of the theme that knowledge gained by imagination is truer than that derived from argument. Coventry Patmore's *To the Unknown Eros* is a series of Os. which show some power of mystical vision, and have a subtle music of their own. Francis Thompson's Os., like most of his poetry, are also full of mystical vision, but his art is less mature than that of Patmore though, in his own sphere, e.g. in *Orant Ode* and *From the Night of Foreboding: an Ode after Easter*, he is far more poetically rich even if mannered.

**Odell, Jonathan** (1737-1815), b. in New Jersey, was one of the Amer. loyalist colonists who made himself celebrated as a satirist whose verses were directed against those who led the war for independence. He studied at Princeton, entered the medical profession, and then became a minister with a par. at Burlington, New Jersey. After the outbreak of hostilities between the Amer. colonists and England, O. voiced the feelings of a large number who remained true to their allegiance to the Brit. Crown. In 1776 he wrote an ode in celebration of King George III.'s birthday, and had to escape to New York, where he became chaplain in the royal army. He continued to put his muse to the service of England, his best-known production being *The American Times* (1780). After independence was won by the colonists he remained unreconciled, and went to Nova Scotia, where he and his descendants took a part in the public life of that settlement.

**Odell, Thomas** (1691-1749), Eng. dramatist, b. in Buckinghamshire. He wrote political lampoons for Walpole, and estab. a theatre in London in 1729. In 1738 O. was deputy-licensor of the stage.

His plays are *The Chimera* (1721, anonymously); *The Patron* (1729); *The Smugglers* (1729); and *The Prodigal* (1744).

**Odessa**, see ELMINA.

**Odenburg**, see SOPRON.

**Odenaalsrust**, tn. of the Orange Free State, S. Africa, 40 m. S.W. of Kroonstad. In April 1916 gold was found, the assay result of 23,047 in.-dwt. being the greatest ever recorded in S. Africa; Sir C. Oppenheimer described it as 'the most significant happening to S. Africa since the finding of diamonds in Kimberley and gold on the Witwatersrand.' (Nothing approaching this borehole assay had ever been recorded in gold-mining in S. Africa—Rand ore, for example, running at about 250 in.-dwt.) A dozen mines may be estab. in the dist. Regional development for the whole area is planned, including a large irrigation scheme. See S. D. Jacobsen, *Free State and New Rand Gold*, 1910.

**Odenkirchen**, tn. of Rhineland, Germany, 21 m. S.W. of Düsseldorf, on the l. b. of the Niers. Pop. 1,000.

**Odense**, tn. and seaport of Denmark, and cap. of the is. of Funen, on the Odense R., 87 m. S.W. of Copenhagen. O. manufs. gloves, cloths, chemicals, and tobacco, and exports agric. and dairy produce. The tn. is a bishop's see. King Canute IV. and other kings are buried in the cathedral, and it was the bp. of Hans Christian Andersen. Pop. 76,000.

**Odenwald**, mountainous region of Hesse, Baden, and Bavaria in Germany, extending for 50 m. between the Neckar and the Main. It is well wooded, and many old castles crown its heights. The chief summits are Katzenbuckel (2057 ft.), Neunkircher Höhe (nearly 2000 ft.), and the Krähberg (1965 ft.).

**Oder** (Lat. Viadua), one of the prin. rivs. of Germany and Poland rises near Kozlau in Moravia, Czechoslovakia, and enters Silesia at Oderberg after a course of some 60 m. After traversing Brandenburg in a N.W. direction, it crosses Pomerania, and empties itself into the Stettiner Haft. Length 500 m. Various tns. on the O. were involved in the Russian advance on Silesia and Brandenburg in 1915. Among those which saw the most desperate fighting were Glogau (Glogów), Breslau (Wrocław), Kustrin (Kostrzyn), Stettin (Szczecin), Oppeln (Opole), see further under EASTERN FRONT; RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

**Oderisius** (d. 1105), lt. divine, was educated at Montecassino, where he became a Benedictine and after various eccles. offices, abbot. A poet, and a patron of scholars, he mediated between the crusaders and Alexius, the Gk. emperor.

**Odesca'chi**, Benedetto, see INNOCENT (popes), Innocent XI.

**Odessa** (Gk. Odessus), important city and seaport of the Ukrainian S.S.R., cap. of the region of the same name. One of the chief business centres of the Ukraine, and the prin. commercial port on the Black Sea, it has an excellent and spacious harbour, open to navigation all the year (O. Bay only freezes in hard winters), and lies between the Dnieper and the Dniester 32

m. N.E. of the mouth of the latter, near the Rumanian frontier. It is connected by railways with Leningrad, Moscow, Kharkov, the Ukrainian cap., Warsaw, Jassy, etc., and carries on steamer communication with other Black Sea ports, the Danube, Istanbul, and Marseilles. It has five harbours, the Quarantine, New, Pratique, Cabotage, and Petroleum, of which the four first are each protected by two breakwaters, and the last by one. Facilities include a repairing yard, a floating dock, two patent slips, and four floating cranes. In addition, recent land reclamation has provided greater dock accommodation. The chief export is grain; others are vegetable oils, wool, flax, sugar, hemp, cattle, pulp wood, and timber. Oil is imported from the Caucasus. The industries of the tn., which is well laid out, and contains handsome buildings despite the great damage it sustained when it changed hands during the revolution, include flour milling, oil-refining, metal-working, tanning, and the manuf. of jute, agric. machinery, and chemicals. There is cultivation of silk and the vine in the d. st. It has a custom house, and was made an open port by the Soviet Gov. to stimulate flagging trade. It is the seat of a univ., and the headquarters of the army of the S.

O. was first settled by the Gks., who formed a colony here. Uninhabited then for a long period, the region was possessed in turn by Lithuanians, Poles, and Tartars. The Turks here built a fortress in the eighteenth century, which was captured by the Russians, to whom the area was ceded in 1791. Two years later a Russian fortress was constructed, and immediately after the advantages to Russia of an ice-free port being realised, the tn. was constructed. During the Crimean war (1854) it was bombarded by the Brit. In 1905 it suffered from a naval mutiny and riots. The Turks bombarded it sev. times during the First World War, and it was captured by the Gers. in March 1918. In 1920 it fell to the Bolsheviks. The old residences of the bourgeoisie and noblesse situated on the outskirts and overlooking the sea in the residential dists. were converted into sanatoria and rest-houses. Here was the so-called Stalin bread-factory, one of the largest in Russia, devoted to baking a rather coarse type of brown bread. The machinery was part Eng. and part Russian. Pop. 601,000. See also EASTERN FRONT in THE SECOND WORLD WAR.

Odessos, see VARNA.

Odets, Clifford (b. 1906), Amer. playwright, b. at Philadelphia, of Lithuanian origin. After early career as an actor, he became associated with the Group Theatre in New York in 1930, and his first play *Awake and Sing* was produced by the group in 1935. In the same year he made his name with a one-act play, *Waiting for Lefty*, written for the New Theatre League. The play, based on the New York cab strike of 1934, was sensational for its social implications. Other plays include *Till the Day I Die* (1935); *Paradise Lost*

(1935); *Golden Boy* (1937); *Night Music* (1940); and *Clash by Night* (1941).

Odeum, or Odeon (Gk. ὀδεον), among the ancients, the name for a public building devoted to performances of vocal and instrumental music. The O. was smaller than the dramatic theatre, and usually roofed in. The oldest known in Greece was the Skias at Sparta (c. 600 B.C.). The O. of Pericles on the S.E. slope of the Acropolis was completed about 455; that of Herodes Atticus or Regilla on the S.W. slope of the Acropolis was built about A.D. 160. Domitian built the first in Rome.

Odger, George (1820-1877), Eng. trade unionist, was a shoemaker. In 1862 he became secretary of the London trades union. He made five attempts, all unsuccessful, to enter Parliament. In 1861 O. organised the meeting which resulted in the formation of the Working Men's International Association, the president of which he became in 1870.

Odhreir, Norse mythology, the name of the cauldron containing the magic potion, the mead of poetry, prepared by the dwarfs, Fjalar and Galar, from honey mingled with the blood of Kvasir, the wisest of men. The potion conferred wisdom, knowledge of runes and magic charms, and the poetic faculty on those who drank it.

Odo, St. (c. 962-1049), Fr. divine, was b. of a noble family of Mercur in the Auvergne. In 991 he became abbot of Cluny, and under his rule the Clunian houses increased from thirty-seven to sixty-five. Known throughout Christendom for his liberality to the poor he was a friend of popes and princes, and the promoter of the feast of God, and instituted in 1031 the ann. commemoration of the faithful departed.

Odion-Barrot, s.v. BARROT, CAMILLE HYACINTHE ODION.

Odin, Woden, Wotan, or Wuotan, supreme god of Teutonic tribes, identified under Rom. influence with Mercury, whose day was teutonic'd into 'Woden's Day' (Wednesday). O. is regarded as the source of wisdom and valour, and the patron of culture and heroes. In Norse mythology O. held a high place among the 'Aesir' or secondary gods. He was, in all probability, originally a storm-god, his name signifying 'mad' or 'the raging one,' and he is attended by two ravens and two wolves, and rides the horse Sleipnir. He was a god of war, the leader of hosts, giver of victory, in whose name the old tribes took possession of Britain, from whom both the royal houses of the rival kingdoms of Deira and Bernicia claimed descent, the great chief of Valhalla, and especially the god of those who were hanged, the gallows being known as his steed. Mimir, his uncle and keeper of the magic cauldron, Odhreir (q.v.), gave him to drink from the potion in it, but O., by a trick possessed himself of it. The first war of the world began by his hurling his spear, Gungnir, into the ranks of the Vaulr (gods of the atmosphere). O. could assume what form he chose from snake to eagle and, like certain gods in other mythologies, often visited earth in

disguise. O. was one of the three sons of Borr, the son of Borí, said to have been flicked out of the salt ice-block by the cow Audhumla; his wife was Fríggja and his son Balder.

**Odó: 1. Of Beauvais, St.** (801-880), gave up a military career to become a Benedictine at Corbie, becoming tutor to the sons of Charles Martel. He became bishop of Beauvais in 861, and his reforms had great influence on the whole church of N. France. He mediated between Hincmar of Rheims and Pope Nicholas I. **2. Of Cluny, St.** (c. 879-912), Fr. abbot, was b. in Maïue. In 909 he became a Benedictine at Baume, and in 927 became abbot of Cluny. Under his gov. the monastery began to exert its influence throughout France and in Italy. O. greatly enhanced the prestige of the Benedictine order. **3. The Good, St.,** Genc. bi-shop (d. 959), was b. in E. Anglia of Dan. parents. He became a bishop in Wessex, and was at the battle of Brunanburh (q.v.). He became archbishop of Canterbury in 912, was prominent in the legislative measures of King Edmund and Edgar, and prepared the way for the monastic restoration under St. Dunstan, Oswald (O.'s nephew), and Æthelwold.

**Odó: 1. Saxon archbishop of the tenth century,** who is said to have abetted Dunstan in separating Queen Elgiva from Edwy. Having burned her face to mar her beauty, he banished her to Ireland. Later, when she returned, he had her mutilated and thrown into prison to die. **2. (c. 1036-97),** bishop of Bayeux, half-brother to William the Conqueror and co-regent of England with Wm. Fitzosbern during the king's absence in Normandy in 1067. After the revolt of Edwin and Morcar had been suppressed, when William placed Normans in the chief posts, Kent was assigned to O., who thenceforth was one of the leading barons; but, for conspiring against Wm. Rufus, he was expelled in 1088. **3. Of Cambrai (1050-1113),** Fr. bishop, was b. at Orleans. In about 1090 he founded a Benedictine community at Tournai; in 1105 he was made bishop of Cambrai, but refused to receive secular investiture, and died in exile. He was one of the most learned Fr. scholars of the eleventh century. **4. Of Cheriton (d. 1217),** Eng. preacher and fabulist, illustrated his sermons, completed in 1219, by excerpts from the bestiaires and older collections of fables. Some of these he issued separately as *Parabola*. **5. Of Lagery, see** ULRAN (poises), *Urban 11.*

**Odoacer, Odoacar, or Otokar** (c. 435-493), was a Ger. captain of mercenaries and, in deposing Romulus Augustulus, a youth of seventeen, he estab. in 476 a Ger. kingdom on It. soil in place of the imperial gov. He took the title of king of Italy, and reigned till his power was overthrown by Theodoric, king of the Goths, A.D. 493.

**O'Donnell, Leopold, Duke of Tetuan** (c. 1809-67), Sp. general and statesman, b. at Santa Cruz, Teneriffe, of Irish extraction, entered the army at an early age, fighting for the queen against the Carlists in the Civil war (1833). In 1840 he sided with the queen mother, Maria Christina,

and shared her exile in France. He became the enemy of Espartero, whom he drove from power in 1843, but two years later was appointed minister of war under Espartero, and in 1859, as Prime Minister, led an expedition against the Moors, for which he received his dukedom.

**O'Donovan, John (1809-61),** Irish historian and archaeologist, b. in co. Kilkenny, Ireland. He prepared a trans. of the Breton laws, and was actively engaged on the Ordnance survey of Ireland. In 1832-36 he wrote a trans. of the *Annals of Ireland by the Four Masters*, pub. 1848-51. He also trans. and ed. for the Irish Archaeological Society *The Banquet of Dun nan Gaeh and the Battle of Magh Rath* (1812). In 1845 he pub. a grammar of the Irish language.

**Odontoglossum,** a genus of orchid, most of which can be successfully grown in a cool house, and which, on account of the beauty of their flow. and their general grace, are the most popular of hid genus. Most of them are natives of S. America. The flowers are borne on a long spike from 1 to 4 foot in number, and in a few species the spikes are branched and bear a hundred or more bloom. The colours are chiefly brown, yellow, or white, and are often spotted.

**Odontornithos** (Gk. *ōōn*, tooth, and *bird*), name applied to a group of birds found only in the fossil state, which were characterised by having true teeth in their jaws. The extent of the term varies with different ornithologists, but it usually includes the important genera *Hesperornis* and *Ichthyornis*, both of which belong to the Cretaceous period.

**Odoric** (1286-1331), It. monk, b. at Pordenone or Portenau in the Friuli. He became a missionary, and travelled over the greater part of Asia. An account of his journey is contained in his *Life and Travels*, pub. after his death. See G. Venni, *Elogio storico alle gesta del Beato Odorico*, 1761.

**Odour, Perception of, see** NOSE.

**Odoven,** com. in the prov. of Drenthe, Netherlands, 9 m. S.E. of Assen. Pop. 10,000.

**O'Dowd, Bernard** (fl. 1903-12), Australian poet. His verse includes *Darwinward* (1903); *The Silent Land* (1906); *Dominions of the Boundary* (1907); and *The Bush* (1912).

**O'Duffy, Eoin** (1892-1944), Irish politician and soldier, b. in Monaghan, educated as an engineer. He played a leading part in the Sinn Féin movement, and was for a time chief of the Irish Republican Army, which he had joined in 1917; but on the signing of the treaty establishing the Irish Free State he broke away from de Valera, who, on coming to power in 1933, dismissed him from the post of chief commissioner of the civil guard to which he was appointed by de Valera's predecessor, Cosgrave. On a visit to Rome he met Mussolini, became an admirer of Fascist ideas, and formed a so-called National Guard, the Blueshirts, later renamed the National Corporate Guard, on semi-Fascist lines, the organisation being dissolved by de Valera as a subversive body.

In the Sp. civil War he led an Irish brigade to fight for Gen. Franco, but it returned after a few months. His book, *The Crusade in Spain*, appeared in 1938.

**O'Dwyer, Sir Michael** (1864-1940), Brit. administrator, educated at St. Stanislaus College, Tullamore, and Balliol College, Oxford. He entered the Indian civil service in 1885 and, in a long administrative career, held the posts of resident at Hyderabad (1905); agent to the governor-general for central India (1910), and governor of the Punjab (1913-19). His term of office in the last post coincided with a stormy period in the political life of the Punjab, and during the last year of his governorship the Amritsar incident occurred in which sev. hundreds of people were killed following an order given by Gen. Dyer to open fire on crowds which had congregated for political demonstrations (see AMRITSAR). One sequel was that the nationalist press demanded the impeachment of the governor of the prov., but O'D. was further employed as a member of the Escher Committee on Indian Army administration and organisation. He was a consistent opponent of the Indian constitutional reforms, holding that they would be disadvantageous to the Moslem pop. In his book, *India as I Knew It* (1925), he gave an account of the period during which he was governor of the Punjab, and defended his attitude at the time of the Amritsar incident. He was assassinated at the Caxton Hall, Westminster, by an Indian.

**Odysseus**, see ULYSSES.

**Odyssey**, see HOMER.

**Oecumenical**, or **Ecumenical** (through Lat. from Gk. *oikoumenikos*, universal, from the whole inhabited world), term applied to the decisions of the whole Christian Church as embodied in the general councils from that of Nicea onwards (see COUNCILS). The Apostles' Creed, the Nicene Creed, and that commonly called the Creed of St. Athanasius are spoken of as Ec. symbols, being held throughout the whole Church. The Rom. Catholic Church considers a council Ec. if summoned by the pope from the churches in communion with Rome.

**Ecumenius**, bishop of Trikka in Thessaly, supposed to have flourished in the ninth or tenth century. To him are attributed sev. commentaries in Gk. on books of the N.T., on the Gospel, Acts of the Apostles, Pauline Epistles, and Catholic Epistles. His works were pub. at Paris in Gk. and Lat. in 1631.

**Edema**, see under DROPSY.

**Edenburg**, see SOPHON.

**Edipus**, Gk. mythology, was the son of Laius, king of Thebes, and of Jocasta. His father having been warned by an oracle that he would perish at the hands of his offspring, Ec. was exposed on Mt. Cithaeron, whence he was rescued by a shepherd of King Polybus of Corinth. The child was brought up at Corinth as the king's son. When he had grown up he was told by the Delphic oracle not to return home as he must inevitably be the murderer of his father and the husband of his mother. He consequently fled from

Corinth, and on his way to Thebes slew Laius in a quarrel, being ignorant of the identity of his antagonist. Ec. then delivered the country from the Sphinx, and was rewarded with the hand of Jocasta, by whom he had Eteocles, Polyneices, Antigone, and Ismene. As a punishment for this incest Thebes was devastated with a plague, and the oracle declared the country could only be delivered by the expulsion from it of the murderer of Laius. Ec. made careful inquiries, and discovered to his horror that he was the guilty man. Jocasta hanged herself, and Ec., having put out his eyes, left Thebes, led by his daughter Antigone, and died at Colonus, near Athens. His tragic host. was set forth by Euripides, Aeschylus, and Sophocles

EDIPUS AND THE SPHINX

From a vase painting

see also trans. by Sir G. Murray, *Edipus at Colonus*, 1918; in 1905 his *Edipus Tyrannus* was performed in London in a trans. by W. B. Yeats called *Edipus Rex*.

**Edipus Complex**, see under PSYCHO-ANALYSIS.

**O.E.E.C.**, see ORGANISATION FOR EUROPEAN ECONOMIC CO-OPERATION.

**Oehenschlaeger, Adam Gottlob** (1779-1850), one of the leading Dan. romantic poets, b. in Copenhagen. The first of his tragedies was *Haakon Jarl* (1807), followed by *Correggio* (1809). His *Digte*, which appeared in 1803, marked the commencement of a new era in Dan. literature. Two years later he pub. two vols. of *Poetiske Skrifter* and then travelled on the Continent for four years. In 1810 he returned to his native place, and was appointed to the chair of aesthetics in the Copenhagen Univ. Other pubs. include *Helge* (1814); *Nordensqader* (1819); and *Dina* (1842); the most successful of the later tragedies. In 1830-31 he pub. his autobiography, and in 1850 his reminiscences. See lives by Arentzen, 1879, and Y. Nielsen, 1879.

**Oelwein**, banking city of Fayette co., Iowa, U.S.A., 14 m. N. of Independence. It has machine shops and agric. interests, and manufs. cloth, chemicals, and boots. Pop. 8500.

**Enone**, in Gk. mythology, the daughter of the riv.-god Cebren and wife of Paris, son of Priam, king of Troy, who afterwards deserted her for Helen. Ovid, in *Heroides* v., gives a description of her grief on finding herself abandoned. See also Tennyson's *Enone*.

**Enothera**, genus of hardy annuals, biennials, and perennials (family Onagraceae), natives of America. *O. biennis* is the fragrant, yellow-flowered evening primrose which has so long been grown in gardens that it has become naturalised. Some other species are, like it, night-flowering, but many, notably *O. fruticosa*, bloom only in the day. 'Spats' or mutations of *O. laamarchiana* were studied by de Vries and used as the foundation for his theory of evolution by mutation. A number of species are now incorporated in the genus *Gutelia*.

**Oerebro** (Sweden), see ÖREBRO.

**Oersted**, Hans Christian (1777-1814), Dan. physicist, b. at Rudkøbing. He was appointed prof. of physics at Copenhagen in 1806. His greatest discovery was the result of experiments on the magnetic needle with the electric current, described in his *Experimentum circa Effectum Confluxus Loci et in Aëre Magnetum*. The O., the unit of magnetic field strength, was named after him. He also pub. a *Manual of Mechanical Physics* and wrote numerous studies in chemistry, popular science (especially *The Soul in Nature*, 1856), metaphysics, etc. Most of his works have been trans. into Ger. See life by J. C. von Rauch and P. W. Forchhammer, 1853.

**Oesel**, or **Saaremaa**, is. in the Baltic, at the entrance of the gulf of Riga, belonging to the Estonian S.S.R. It is 15 m. long, and covers an area of 1000 sq. m. The coasts in the N. and S. are very bold and steep. Arensburg, on the S.E. coast, is the only tn. of importance. O. is noted for its small breed of hardy ponies, similar to those of Shetland. The coast fisheries, especially of seals, are important. In 1939 it became a Russian military base, by a pact of assistance. Pop. 51,500.

**Œsophagus**, see GULLET.

**Estridae**, family of dipterous insects, consisting of large hairy flies with very short antennae enclosed in a cavity in the fore part of the head, with rudimentary mouth-parts. The larvae are nearly all parasitic on mammals, and the perfect insects are well known as the obnoxious bot-flies. The larvae of *Estrus oris* infest sheep; those of *Gastrophilus equi* pupate in horses; while the larvae of *Hypoderma lineata* and *H. bovis* are found in cattle.

**Œstrous Cycle** and **Œstrogens**. The Œ. C. is the reproductive cycle of female animals, especially mammals. On one or more occasions during the breeding season the female is receptive to the male and is said to be 'on heat'; this is the period of *œstrus* and is accompanied by ovulation, i.e. the discharge of an egg from the ovary. *Œstrus* is preceded by a period known as *pro-œstrus*, when the vagina swells and becomes increasingly vascular, in preparation for coition, and it is followed by the period of *post-œstrus*, when the uterus

hypertrophies ready to receive the egg if fertilisation has occurred, so that post-œstrus then merges into pregnancy. If fertilisation has not taken place, *œstrus* is succeeded by the resting period of *anœstrus*, preparatory to a repetition of the whole Œ. C. The menstrual cycle of women corresponds to the Œ. C. of other mammals, but it is distinguished particularly by the bleeding of menstruation which is absent or inconspicuous in other species.

The changes occurring in the Œ. C. are brought about by a hormone or *œstrogen* produced in the ovary, and responsible also for the development of the secondary sexual characters (as for instance the breasts) at puberty. The *œstrogen* produced by the ovary is *œstrin* (or *œstrone*) with the formula  $C_{15}H_{12}O_2$ , but other similar synthetic compounds such as stilboestrol have now been prepared and are useful in medicine, e.g. for treating the disorders of the menopause when there is a deficiency of natural *œstrin*.

**O'Faolain**, Sean (b. 1900), Irish author, b. in Dublin; educated at the National Univ., Dublin, and Harvard Univ., becoming commonwealth fellow in U.S.A., 1926-28. He remained lecturing in Amer. univs. until 1933, when he returned to Ireland to devote himself to writing. His first vol. of stories, *Midsummer Night Madness*, was pub. in 1932, followed by the successful novel, *A Nest of Simple Folk*, in 1933. In addition to these and other stories of Irish life, he is known for his biographies of Irish revolutionary figures: Constance Markievicz (1931), Daniel O'Connell (*King of the Beggars*, 1938), and De Valera (1939).

**Offa**, Mercian king of the eighth century. He succeeded Ethelbald in 755, and, having slain Lulubert, king of the E. Angles, took possession of his kingdom. To atone for his crime he gave title to the church, made a journey to Rome, instructed the tax called Peter's Pence, and built the monastery at St. Albans. He became overlord of all England save Northumbria. The foundation of a third Eccl. archbishopric, at Lichfield, was due to O. See also OFFA'S DYKE.

**Offaly**, or **King's County**, inland co. prov. of Leinster, Ire. It is bounded on the W. by the R. Shannon. The surface on the whole is flat, the N. part being occupied by the Bog of Allen, but the Slieve Bloom Mts. lie along the border between King's Co. and Queen's Co., the greatest altitude being 1732 ft. The soil is not very fertile, being either deep bog or gravelly loam, but there are some rich pastures near the Slieve Bloom Mts., and grazing dists. on the borders of Westmeath, which are chiefly used for sheep. Oats, barley, rye, potatoes, and turnips are grown, and cattle, sheep, pigs, and poultry bred. The chief tns. are Tullamore (co. tu., pop. 5900) and Parsonstown or Birr. The co. has an area of 771 sq. m. and a pop. of 52,000.

**Offally**, see KING'S COUNTY.

**Offa's Dyke**, great earthwork made about A.D. 785 between Dee and Severn by King Offa of Mercia as a boundary

between the Eng. and the Welsh. It is laid out and constructed with exceptional engineering skill to take every advantage of natural features of the land. It consists of a large rampart and a ditch, the latter normally on the Welsh side.

**Offenbach, Jacques** (real name **Jakob Levy Eberst**) (1819-80), Ger.-Fr. composer, b. at Offenbach-on-Main. His father was cantor at the synagogue of Cologne, but he was sent to Paris early in his youth, studying at the Conservatoire in 1833-37, perfecting himself in cello playing and then playing in the orchestra of the Opéra-Comique even before he left the Conservatoire. In 1849 he became conductor at the Théâtre Français. In 1853 he produced his first operetta, *Le pito*, and during a quarter of a century he turned out nearly 100 light stage pieces. In 1855 he took over the management of the Théâtre Comte and renamed it the Bouffes-Parisiens. This lasted until 1861, whereafter he had no theatre of his own until 1873, when he managed the Théâtre de la Gaîté until 1875. In 1876-77 he was in U.S.A., but returned to Paris, where alone he found that his success was permanent. His only large-scale opera, *Les Contes d'Hoffmann*, occupied him for many years, but he left it not quite finished at his death, and it was revised and partly scored by Giraud. He has been styled the creator of opera bouffe. His works include *La-ta-clan* (1856); *Orphée aux enfers* (1858, revised 1871); *Geneviève de Brabant* (1859, revised 1875); *Chanson de Fortunio* (1861); *La Belle Hélène* (1865); eighty-nine operettas including *Barbe bleue* (1866); *La vie Parisienne* (1866); *La Grande Duchesse de Gérolstein* (1867); *Robinson Crusoe* (after Defoe) (1867); *La Périochole* (1868); *L'île de Tulipatan* (1868); *Princesse de Trébizonde* (1869); *L'art-à-à* (1869); *La jolie Parfumeuse* (1873); *l'oyage dans la lune* (after Verne) (1875); *Whittington and his Cat* (1875); *Le Docteur Oz* (after Verne) (1877); *La Foire de Saint-Laurent* (1877); *Madame Facart* (1878); *La Fille du lamhour-major* (1879); *Les Contes de Hoffmann* (1881); and ballet *La Papillon* (1860). Another opera, *The Goldsmith of Toledo* (after Hoffmann) (produced in 1919) is a pastiche from sev. operettas, especially *Le Corsaire noir*.

**Offenbach, tn.** of Hesse, Germany, on the l. b. of the Main, 5 m. S.E. of Frankfurt. The manufs. include aniline dyes, carpets, machinery, fancy leather goods, etc. The tn. owes its prosperity to the settlement of Huguenot refugees in the seventeenth century. Pop. 81,100.

**Offenburg, tn.** of Baden, Germany, 26 m. from Baden. It is a railway junction, and manufs. glass, textiles, and cigars. Pop. 18,000.

**Offensive Trades.** This expression as used in the Public Health Act, 1875, denotes certain specified trades, namely, those of a blood boiler, bone boiler, fellmonger, soap boiler, tallow melter, or tripe boiler, and also any other noxious or offensive trade, business, or manuf. In dists. to which Section 51 of the Act applies O. T. will include any trade, busi-

ness, or manuf. which the local authority declares by order confirmed by the ministry to be an offensive trade. To estab. (see below) an offensive trade in an urb. dist. without the written consent of the dist. council renders the offender liable to a penalty of £50, and a daily penalty is incurred by those who continue without such consent to carry on an offensive trade estab. since 1875. Estab., in this context, was the subject of legislation in 1925. The Public Health Act of that year made special provision to meet the case of trades estab. after being declared O. T. With the object of abating nuisances from O. T., the Public Health Act, 1875, provides that if the medical officer of health or any ten inhab. of a dist. or two legally qualified medical practitioners certify to the urb. dist. council that any melting-place, soap-house, slaughter-house, etc., is a nuisance, and dangerous to the health of the inhab., the council must proceed summarily against the owner or occupier (or even the foreman or other employee) for penalties; which penalties, on subsequent conviction, may be increased to £200. An action may also be brought in the high court for nuisance (*q.v.*). Local authorities also have statutory powers for regulating alkali and chemical works.

**Offertory** (Lat. *offertorium*, a place of offering; an oblation), in the Rom. Catholic Church, that part of the mass in which the unconsecrated bread and wine are offered to God; the name is also given to the prayers and antiphon which accompany the offering. In the Church of England the name is applied to the O. sentences appointed to be read by the minister after the creed or sermon at the communion, while the alms of the people are being collected. In recent times the name has been transferred to the alms themselves. See under COLLECTIONS AT CHURCHES.

**Office, Holy**, or more completely the Congregation of the Holy Office of the Inquisition, forms a dept. of the Rom. curia for the examination of books and the trial of eccles. offences. See INQUISITION.

**Office Management**, art of organising the clerical work entailed in commercial undertakings, gov. depts., local authorities, and other organisations large and small. The office manager fills a position calling for great skill and variety of talent in that he must arrange for the work to be performed in the best way possible in the circumstances, and obtain the optimum output from his staff. From this it follows that he must give careful consideration to personnel, working conditions, office appliances, clerical routines and forms, and incentives, as well as to both departmental relations and the function of each individual. The office manager must first and foremost consider his personnel in order to produce an efficient and happy staff who will do the work well. Careful selection is necessary for each job, fair salary rates should be fixed, known opportunities for promotion should be open to all, and good working and welfare conditions are of first importance. From the point of view of the work to be

carried out the manager must devise suitable routines and systems which will enable it to be dealt with in the most speedy and efficient manner. Office work usually consists of gathering, collating, and recording data, mainly of a financial and statistical nature, but also comprising information of other kinds. Correspondence both with other organisations and the public and also with other depts. of the organisation must be dealt with, either as part of a routine or, if its importance requires, with individual attention. Outgoing mail must be prepared, sorted, and distributed. In order to deal with all the work efficiently the office manager should have a good knowledge of office and accounting machinery, of which the most important are the typewriter, duplicator, addressing machine; also the various accounting machines, such as posting, adding, and calculating machines (*q.v.*), and the large sorting and tabulating machines. It is the function of the O. M. to co-ordinate work, staff, and machinery into an organisation which operates smoothly and performs the work required of it as efficiently as possible. From this it will be apparent that the principle of div. of labour is resorted to in the modern office. Clerical routines are broken down into their component parts, and repetitive operations are grouped together. A girl employed, for example, on typing only will have a greater output than another employed on a variety of duties. Another problem is that of authority. The office manager should establish a definite chain of responsibility from himself downwards, so that each individual knows both the nature of his duties and to whom he is responsible. As far as feasible the office should be organised according to functions rather than in depts., though in practice it may not be possible to carry this out entirely. The above brief outline will give an idea of the scope and intricacy of O. M. Its importance may be gauged from the fact that His Majesty's Treasury has set up an organisation and methods dept. to investigate, improve, and simplify the office work of all the depts. of the Brit. civil service. See C. C. Parsons, *Office Organisation and Management*, 1917; L. Galloway, *Office Management: its Principles and Practice*, 1918; W. Campbell, *Office Practice*, 1932, 1918; L. Dicksee and Sir H. Blain, *Office Organisation*, 1917; and H. W. Simpson, *Modern Office Management*, 1918.

**Officer.** This term when it stands alone is always held to refer to an O. holding the king's commission. The active army list contains the names of all Os. currently serving. But the status of O. holds good even after retirement from the active list. Os. whilst on full pay are forbidden to hold any municipal office, exempted from jury service, either coroner's, grand, or common juries, and may not become directors of any company. Special permission must be granted before an O. on the active list can leave the country. Although any O. can be dismissed at His

Majesty's pleasure, nevertheless it is only after trial by a general court martial that an O. can be punished. The term field O. includes colonels, lieutenant-colonels, and majors, Captains, lieutenants, and second lieutenants are called company Os. See also ARMY, *Army Pay*; RANK; SERGEANT; WARRANT OFFICER.

The *Officers' Training Corps* was an organisation among the univs. (senior branch) and schools (junior branch) whereby students received training in military drill, weapon training, signalling, map-reading, elementary tactics. Its purpose was to supply Os. by direct commission to the Territorial Army, Territorial Army Reserve of Officers, and Reserve of Officers. The O.T.C. is now replaced by the senior and junior training corps, whose aim is to supply a groundwork of military education, and thus shorten the time spent in elementary training during military service.

**Officers' Mess.** see *Under Mess.*

**Officers' Training Corps.** see TRAINING CORPS.

**Official List.** see STOCK EXCHANGE.

**Official Receiver, or Liquidator.** see under BANKRUPTCY; COMPANY; and COMPANY LAW.

**Official Secrets.** The Official Secrets Act, 1911 (which repeals and re-enacts with amendments the Act of 1889), makes it a felony punishable with penal servitude to approach or enter any 'prohibited place' for any purpose prejudicial to the safety or interests of the State; to make any sketch, plan, model, or note calculated to be useful to an enemy; or to obtain or communicate to any other person any information which might be or which is intended to be useful to an enemy. It is not necessary to show that the offender was guilty of any particular act tending to show a purpose prejudicial to the State, and he may be convicted if, from his conduct or known character, it appears that his purpose was prejudicial to State interests. The Act also provides that any person who communicates to any unauthorised person information that has been entrusted to him in confidence by any person holding office under the Crown is guilty of a misdemeanour. The repealed Act of 1889 was passed after a Foreign Office official had disclosed a confidential diplomatic document. The law was strengthened in 1911, following a proposal by the Committee of Imperial Defence. The law was further strengthened by an Act of 1920 which makes it a misdemeanour to do certain things, either in order to gain admission into a prohibited place or for any purpose prejudicial to the safety or interests of the State. These acts include the unauthorised use of a naval, military, air force, or police uniform or one which resembles an official uniform; forging or tampering with passports or military or naval passes or permits; personating some office-holder or person to whom an official code or pass has been issued, or being in unlawful possession of any die, seal, or stamp belonging to a gov. dept., or a die, etc., so resembling an official die as to be

calculated to deceive; or retaining an official document without authority to retain it; or allowing any other person to have possession of an official document issued for the use of the accused alone; or communicating a secret official code word or password; or being in unlawful possession of any such code or password. The fact that a person has been in communication with or attempted to communicate with a foreign agent, whether in Great Britain or abroad, is evidence that he has, to the prejudice of the safety and interests of the State, obtained or tried to obtain information which is calculated or intended to be useful to an enemy, and this evidence may be adduced in proceedings under Section I. (Spying) of the prin. Act (1911). The secretary of state has power to compel, by warrant, the production of telegrams from any person who owns or controls any telegraphic cable or wireless business, when it is expedient in the public interest to compel production; and any person who carries on the business of receiving postal packets must be registered and is subject to regulations which require him to keep books giving the names and addresses of persons for whom packets are received and any instructions received as to the delivery. The Act also gives to chief officers and superintendents of police and others somewhat exceptional powers of investigation in cases under the Act.

**Offset printing, see under LITHOGRAPHY.**  
**O'Flaherty, Liam** (b. 1897). Irish author. b. in the Arran Is., co. Galway; educated at the National Univ., Dublin. He served with the Irish Guards during the First World War; after being invalided out he took part in the Irish revolution of 1917. After the war he entered the merchant service and travelled widely. His first novel, *Thy Neighbour's Wife*, was pub. in 1924, followed by *The Black Soul* in 1925 and a vol. of short stories, *Spring Sowing*, in 1926. With *The Informer* and *Mr. Gilhooley*, novels of Dublin low life, both pub. in 1926, he estab. his reputation as a powerful realistic writer, but the romantic side of his nature found expression in his idyllic short stories, many of which were descriptive of life in the Arran Is., where he was b. Other novels include *The Martyr* (1927); *The Assassin* (1928); *The House of Gold* (1929); *The Puritan* (1932); *Hollywood Cemetery* (1935); *Famine* (1937, a novel of the potato famine of 1846); and *Land* (1946, an adventure of the Fenian rebels). *Two Years* (1930), *I Went to Russia* (1931), and *Shame the Devil* (1934) are autobiographical books.

**Offertingen, Heinrich von** (c. 1170-1250), famous minnesinger (q.v.).

**Ogam, or Ogham.** This term, spelt in Old Irish *Ogam* or *Ogum*, of uncertain origin and meaning, has been applied to a peculiar form of cryptic language, and more especially to a curious script, employed by the anct. Goidelic Celtic pop. of the Brit. Isles. Of the nearly 400 inscriptions still preserved, over 260 were found in the S. co. of Ireland (mainly in Kerry and Cork), fifty-five in the rest of Ireland, about forty in Wales, one in

Cornwall, two in Devon, one in Hampshire (at Silchester, marking the E. limit of their distribution), about ten on the Isle of Man, and about twenty-five in Scotland. There are sev. stones with O. inscriptions in the National Museum, Dublin, and in the Brit. Museum, of which that from Llywel, Brecon, bearing the name 'Macutrenas' is the best-known. The great majority of these inscriptions belong to the sixth century A.D. but some belong to the fifth and some to the seventh century. The inscriptions found in Ireland are, with one exception, written in O. alone (in Celtic) while the inscriptions found in Wales are usually bilingual (Lat.-Celtic) and written in Rom. characters and O. script. A Runic-O. inscription was found on the Isle of Man. The inscriptions found in N.E. Scotland and in the N. Isles, chiefly on the Shetlands, are written in a variety known as 'Pictish Oghams'; they are assigned to the anct. Picts, who according to some scholars spoke a non-Celtic and non-Indo-European language.

The O. inscriptions contain very little besides proper names, but these are of great value for the light they throw upon the early Celtic tongue. Indeed, in orthography and the inflection of nouns, these inscriptions reveal a stage of the Celtic idiom much earlier than that of the earliest preserved MS. literature, which, partly belonging to the sixth century A.D., is contemporary with them. The O., for instance, still makes use of letters *q*, *e*, *ng*, unknown to the MSS.; the anct. inscriptions supply us with *magui*, the genitive of the word which has yielded the word *mae*, 'son.' The direction of writing was either vertical (to wards) or horizontal.

THE OGAM CHARACTERS

The peculiar O. alphabet consisted of twenty letters, divided into four groups or *acemes*, and represented by strokes, from one to five in number, arranged in various positions about a central stem-line. The place of this chief line was sometimes filled by the edge or araise of the object (usually stone or other squared hard

material), on which the letters were cut. The letters of the first *aceme* (*b, l, r* or *f, s, n*) were placed under the line (assuming this to be horizontal); the second *aceme* (*h, d, t, c, q*) above it; the third *aceme* (*m, g, ng, z, r*), diagonally through it; and the fourth *aceme* (*a, o, u, e, i*) intersecting it at right angles, or by notches. There were five other characters *forfeda*, which were a little more complicated. They are generally interpreted as diphthongs (*ea* or *eo*, *oi*, *ia* or *io*, *ui*, and *ae*), which according to some scholars have often a consonantal value in the inscriptions (a kind of guttural *k, p, x*, etc.).

This alphabet was the basic O. script. There were sev. secondary varieties, such as the 'bird O.' (*En-O.*), 'herb O.' (*Lus-O.*), 'colour O.' (*Dath-O.*), 'church O.' (*Cult-O.*), 'pig O.' (*Muc-O.*), 'son O.' (*Moc-O.*), and many others.

The use of the cryptic O. scripts continued until the Middle Ages, and the late fourteenth-century *Book of Ballmote* (ed. by R. Atkinson, 1887; see also Calder, ed. of *Auricept na n-Eces, the Scholars' Primer*, 1917) reproduces the earliest keys for translation. See J. Rhy's *Lectures on Welsh Philology* 1879; J. MacNeill, 'The Irish Ogham Inscriptions,' *Proceedings of the Royal Irish Academy*, 1909; R. A. S. Macalister, *The Secret Languages of Ireland*, 1937; J. Vendryes, 'L'Écriture oghamique et ses origines,' *Revue Celtique*, 1941; D. Diringer, *The Alphabet*, 1949.

**Ogasawara Jima**, see BONIN ISLANDS.

**Ogden, Charles Kay**, *b.* 1889, Eng. linguist; educated at Cambridge, director of the Orthological Institute. In 1926, with I. A. Richards of Harvard, he began research on Basic English (*q.v.*), on which he has pub. sev. works. (Other pub. include: with I. A. Richards and J. Wood, *The Foundations of F-Structure* (1922), *Boothum's Theory of F-Structure* (1932); with I. A. Richards, *The Meaning of Meaning* (1941), *The ABC of Psychology* (1944).)

**Ogden**, city of Utah, U.S.A., and co. seat of Weber co., on the Weber, 35 m. N. of Salt Lake City. Pop. 14,000.

**Ogdensburg**, city and riv. port of New York, U.S.A., in St. Lawrence co., on the St. Lawrence R. Pop. 16,000.

**Ogee**, moulding, formed by two curves, the upper convex and the lower concave, called also the *ogiva reversa*. In Ft. the ribs which in Gothic vaulting cross the vault diagonally are known as ogive ribs, and the adjective is also frequently applied to arches in a way that makes it practically synonymous with Gothic.

**Ogerius**, **Oggere**, or **Oggieri**, see OGGERI LE DANOIS.

**Oggione**, **Oggionno**, or **Uggione**, **Marco da** (c. 1470-1510), It. painter, *b.* near Milan. He studied under Leonardo da Vinci, and made sev. copies of his 'The Last Supper,' one of which is in the Royal Academy. He also executed frescoes for the church of S. Maria della Pace at Milan, the two best being 'The Marriage at Cana' and 'The Assumption,' both of which are now in the Brera.

**Ogier le Danois** (It. **Uggero**, **Oggero**, **Oggieri**; Lat. **Ogerius**), hero of an anct. Fr.

romance whose story is probably a contribution from the store of Norman tradition, Hoiger, or Olger, Danske being the national hero of Denmark. He figures in Ariosto's *Orlando Furioso* and other romantic tales and poems. According to some authorities, his surname was bestowed on him because he came from Denmark. Others say that he took it after having conquered that country; while yet others say that O. was a Saracen who turned Christian, and as they wrote to him from home *tu es damné*, for having changed his religion, the Fr. barons called him in jest O. *Danné* and he himself insisted on being so called when he was christened. This surname agrees with the assertion that he was condemned by Charlemagne. Kiehlitz advanced the opinion that O. is the Heli of the Edda, and in this view Panzer concurs. He is also identified with the Frankish warrior, Ottokar (or Autkar). See also C. Voretzsch, *Über die Sage von Ogier dem Danois*, 1891; P. Paris, *Recherches sur Ogier le Danois*, Bibliothèque de l'École des Chartes.

**Ogilby** (incorrectly *Ogilvy*), **John** (1600-1676), Scottish miscellaneous writer, *b.* near Edinburgh. He accompanied Stratford to Ireland and was made deputy-master of the revids, but his fortunes being ruined by the Civil war, he returned to England. Having learned Lat. he trans. Virgil into Eng. verse (1649-50), and being successful in this attempt turned to Gk., and pub. his *Iliad* in 1660. He was entrusted with the 'poetical part' of the coronation of Charles II. in 1661.

**Ogilvie, Sir Frederick Wolff** (1893-1949), Eng. scholar and administrator, *b.* at Valparaiso. Educated at Balliol College, Oxford, from 1920 to 1926 he was a fellow and lecturer at Trinity College. Until 1934 he was prof. of political economy at Edinburgh Univ., when he became president and vice-chancellor of Queen's Univ., Belfast. In addition to membership of sev. councils and committees O. was director-general of the R.B.C. from 1935 to 1942, his term of office being marked by the inception of the forces programme and the expansion of the overseas service. Knighted in 1942, he joined the Brit. Council, and in 1944 became principal of Jesus College, Oxford.

**Ogilvie, John** (1797-1867), Scottish lexicographer, *b.* in Banffshire. In 1824 he entered Aberdeen Univ. and in 1831 was appointed mathematical master in Gordon's Hospital. He compiled the *Imperial Dictionary* (1850, supplement, 1855); *Comprehensive English Dictionary* (1863); and the *Students' English Dictionary* (1865).

**Oglethorpe, James Edward** (1696-1785), Eng. general and philanthropist, the founder of the state of Georgia, was *b.* in London. He served under Prince Eugene, and distinguished himself in the campaign against the Turks, 1716-17. In 1722 he became M.P. for Haslemere, and in 1729 was chairman of the parl. committee on debtors' prisons. In 1732 he obtained a charter for settling the colony of Georgia in America as a refuge for paupers and a

barrier for Brit. colonies against Sp. aggression. He met with some opposition, however, in the administration of his colony, especially by his prohibition of Negro slavery and rum, and he also had difficulties with the Wesleyans and Whitefield. But a noteworthy fact is that he defended his colony against the Spaniards by allying himself with the Indians. He wrote *A New and accurate account of the provinces of South Carolina, Georgia, etc.* (1733), and *An Important account of the late expedition against St. Augustine* (1712). Returning to England in 1743, he took part against the Jacobite insurrection of 1745 and was accused of misconduct, and although acquitted his life as a soldier was at an end, and he did not return to Georgia. He was a friend of Dr. Johnson, Boswell, Goldsmith, Burke, and Walpole, and Pope has immortalised his name in the couplet:

'One, driven by strong benevolence of soul,  
Shall fly like Oglethorpe from pole to pole.'

**Ogmore and Garw**, urb. dist. and tn. of S. Wales, in Glamorgan-shire, 4 m. S.W. of Bridgend. Coal is extensively mined. Pop. of dist. 22,700.

**Ogowé, Ogowai, or Ogoway**, riv. of W. Africa, in Fr. Equatorial Africa, rising in lat. 3° S., a little to the S. of Ngauo. Its direction is N. to W., and then S.W., receiving sev. tribs. on both sides, including the Lolo and the Ivindo. It enters the Atlantic by a delta after a course of 750 m.

**O'Grady, Standish James** (1816-1928), Irish historian and novelist; b. at Castle-town Berhavan, where his father was Protestant rector. Educated at Tipperary Grammar School and Trinity College, Dublin, where he graduated in 1868. He was called to the Bdr, but soon gave up the law. He pub. *History of Ireland* (1878-1880). Among his books of historical romance are *The Dog of Stars* (1893); *In the Wake of King James* (1896); *The Flight of the Eagle* (1897); *In the Gates of the North* (1901, 1921); and *Finn and his Companions* (1921). He also ed. Sir Thomas Stafford's *Pacata Hibernia* (1896). He owned and ed. *Kilkenny Moderator* and *All-Ireland Review*.

**Oguljin**, tn. of Croatia, Yugoslavia, 60 m. S.W. of Zagreb. Pop. 9000.

**Ogyges**, or **Ogygus** (*Ogygys*), son of Boeotus and one of the Boeotian aborigines. He was king of the Hecenes, the oldest inhab. of Boeotia, which was visited during his reign by an inundation of Lake Copais. This flood is usually called after him the Ogygian.

**O'Higgins, Bernardo** (1778-1842) Chilean patriot, soldier, and statesman, generally known as the Liberator of Chile, natural son of Ambrosio O'H., also an administrator and soldier, of Irish birth. He led the Chilean patriot forces against the Sp. royalists (1810), and was made commander of the patriot army (1813) in succession to Juan José Carrera, who had been made general-in-chief in 1811. Carrera's republican troops twice defeated

Gen. Parola's forces, but were themselves defeated in 1813. The following year O'H., with Carrera, was also defeated, at Rancagua, and both leaders fled the country. They received the support of the Buenos Aires, levied an army in La Plata, and marched against the royalists, whom they completely defeated at Chacabuco (1817), and O'H. became dictator of Chile. The republicans were, however, severely defeated at Cancharayda, but this defeat was soon followed by the final defeat of the Spaniards at Maipo, the victory which sealed the independence of Chile. O'H.'s progressive administration after a few years was ended by a popular revolt in 1823, and he retired to Peru.

**O'Higgins, Kevin Christopher** (1892-1927), Irish politician, was b. at Stradbally, the son of Dr. T. Higgins, assassinated in 1923. Educated at Clongowes, St. Patrick's College, Carlow, and the National Univ. of Ireland, he was articled to his uncle, Maurice Healy, a solicitor, but did not serve out his time. He joined Sinn Féin, and took part in the Easter rebellion of 1916; whilst in prison as a result, he was elected M.P. for Queen's Co. He became minister of justice and vice-president of the executive council in Cosgrave's Gov. of 1922, establishing the civil guard and combating rebels by executions. In June 1927 O'H. was made minister for external affairs also, but in July was murdered near Booterstown on his way to mass. See life by T. de Vere White.

**O'Higgins**, prov. of central Chile, takes its name from Bernardo O'H. (q.v.). Colchagua lies to the S. and Santiago to the N. The Andes traverse the E. portion. Gold is mined, cattle reared, and wine, fruit, and wheat produced. Rancagua is the cap. Area 2745 sq. m. Pop. 200,300.

**Ohio**: 1. One of the United States of America, known as the Buckeye State, bounded N. by Michigan and Lake Erie; E. by Pennsylvania and W. Virginia, from which it is separated by the Ohio R., which also forms its S. boundary, separating it from W. Virginia and Kentucky; and W. by Indiana. The Ohio R. forms its boundary for 436 m., and its lake shore is 230 m. O. has no considerable elevations, being highest in the centre and sloping thence to the lake in the N. and to the Ohio R. in the S. It is drained by numerous rivers, among which are the Great and Little Miami, Scioto, and Muskingum, affluents of the O.; and the Maumee, Sandusky, Huron, Vermilion, Cuyahoga, and Ashtabula, which empty into Lake Erie. The coal-beds of E. O. are of great extent, with abundant deposits of iron ore. This has led to enormous expansion of iron and steel industries, and, as a consequence, the building of great machine-making plants and automobile factories. The state ranks second in iron and steel products. Over 10,000,000 tons of pig iron are produced annually. Cleveland, and the neighbouring cities of Canton, Youngstown, Middletown, and Steubenville, are the great steel and iron centres. Akron manufs. automobile tyres and other rubber products. The output of automobiles in

Toledo and Cleveland is second only to that of Duluth. Petroleum and natural gas, sandstone, and limestone are produced. Clay, silica, cement, and salt are also produced, as well as bricks, tiles, clothing, furniture, spirits, and woollen and cotton goods. The soil is rich everywhere; the climate is temperate, with a liability to a cold in winter reaching sometimes below zero. The forests, which still cover large portions of the state, are rich in oak, black walnut, maple, etc. Horse-rearing, cattle-breeding, and dairy farming are important industries. The chief agric. productions are Indian corn or maize (138,000,000 bushels in 1917), rye, oats (19,000,000 bushels), hay, winter wheat, sorghum, tobacco, hemp, peaches, apples, grapes, cattle, sheep, and swine. The wool-clip in 1917 yielded 9,000,000 lb. A large commerce is carried on by the O. R., the lakes, two canals which connect Lake Erie and the O. In 1918 there were 325 airports and landing fields. Railway mileage is nearly 9000. The state is organised in eighty-eight cos. The legislature consists of a House of Representatives of 133 members and a Senate of thirty-three members, both Houses being elected for two years. Two senators and twenty-three representatives are sent to Congress. The chief ins. are Cleveland, 867,300; Cincinnati, 458,000; Columbus (cap.), 323,000; Toledo, 278,200; Akron, 239,700; Dayton, 215,600; Youngstown, 167,700; Canton, 110,100; Springfield, 71,700; Lakewood, 68,500; Cleveland Heights, 57,000; Hamilton, 19,900; 12.5 per cent. of O.'s pop. are foreign-born, and there are great numbers of Ger. ancestry. Among the institutions of higher learning are O. State Univ., at Columbus with 28,000 students; W. Reserve Univ. at Cleveland, 9000; Cincinnati Univ., 7700. O. has superseded Virginia as the mother of presidents. Five men born in O. were elected as presidents while still O. men. Two others, elected as presidents of the state, were born in O. The prehistoric mound-builders left many remains in O., the most impressive being Serpent Mound, 1300 ft. long, in Adams co. O. was first settled in 1788 and organised and admitted as a state in 1803. Area 11,222 sq. m. Pop. 7,788,000. See J. W. Taylor, *History of State of Ohio*, 1841; W. D. Howells, *Recollections of Life in Ohio*, 1888; R. G. Randall and W. J. Ryan, *History of Ohio* (5 vols.), 1912; E. H. Roseboom, *A History of Ohio*, 1931; Federal Writers' Project, *The Ohio Guide*, 1940; and E. C. Wittke (ed.), *History of the State of Ohio* (6 vols.), 1941-42.

2. Riv. of U.S.A., second largest affluent of the Mississippi, formed by the union of the Allegheny and Monongahela at the W. foot of the Alleghenies, at Pittsburgh, in Pennsylvania, and flows W.S.W. 950 m., with a breadth of 1200 to 4000 ft., draining, with its tribs., an area of 202,400 sq. m. In its course it separates the N. states of O., Indiana, and Illinois from the S. states of Virginia and Kentucky. The prin. tns. upon its banks are Cincinnati, Louisville (where there are falls), Wheeling, Maysville, and Pittsburgh and Cairo

at its source and mouth. It is navigable from Wheeling, 100 m. below Pittsburgh. It is the channel of a vast commerce, which it shares with its chief branches, the Tennessee, Cumberland, Wabash, Green, etc.

Ohlau, see OTLOWA.

Ohlenschläger, see OEHLENSCHLÄGER.

Ohlgs, formerly Merscheid, tn. of the Rhineland, Germany, 17 m. N. of Cologne. There are weaving and dyeing works. Pop. 25,000.

Ohm, Georg Simon (1787-1854), Ger. physicist, b. at Erlangen, became prof. of experimental physics at Munich in 1852. He announced his law of the theory of the voltaic current in 1825, and pub. *The Galvanic Circuit worked out Mathematically* in 1827. See life by W. Gerlich, 1930.

Ohm, see ELECTRICITY AND MAGNETISM. (3) CURRENT ELECTRICITY, *Electromotive Force and Resistance*.

Ohmmeter, apparatus for measuring electrical resistance by direct pointer deflection in terms of ohms and megohms (a megohm is equal to 1,000,000 ohms). There are sev. types of Os., one consisting of two fixed coils with a third coil fixed at right angles to the other two and carrying a pointer which moves freely over a graduated scale, these coils being of high and low resistance. For testing the insulation resistance of cables, some type of magneto generator is combined with the instrument. Os. are employed both for the measurement of conductivity, e.g. of armature conductors and the like, and for the insulation of lighting systems, motor windings, etc. The principle of measurement is the same in both cases, but the resistance to be measured in the first case is very low, often no more than one-thousandth of an ohm, and in the latter case is rarely less than 1,000,000 ohms.

Ohm's Law, in electricity, states that the resistance of a conductor in ohms is equal to the potential difference between its ends in volts divided by the current flowing in it in amperes. Thus if a potential difference of 80 volts is applied to the ends of a conductor whose resistance is 40 ohms, a current of 2 amperes will flow through it.

Ohnet, Georges (1848-1918), Fr. author; b. in Paris, was educated at the Lycée Bonaparte. After 1871 he was editor successively of *Le Pays* and *Constitutionnel*. In collaboration with Denayrouze O. wrote his play *Reina Sarpi* (1875). *Serge Panine* appeared as a novel in 1881. *Le Maître de forges*, a novel afterwards famous as a play, appeared in 1882. O. was popular with lovers of romance.

Ohonamoochi, Onamuchi, or Okuni-Nushi, the earth-god of Jap. mythology, sometimes identified with Daikoku, god of wealth. His great shrine was at Kitzuki, in Idzumo, and was the second in importance in Japan. He was son of Susanoo-o, gc. of the underworld, and resigned his throne in favour of the present emperor's ancestors.

Oich, Loch, lake of Inverness-shire, Scotland. It is 4 m. long and 1 m. broad, with a depth of 150 ft. The loch is drained by the R. O. into Loch Ness at Fort Augustus,

and forms part of the Caledonian Canal. The loch is famous for its trout and salmon fisheries.

**Oidium**, name given to the conidial form of various ascomycetous fungi (Erysiphaceae) which give rise to what are popularly known as mildews and moulds. In this stage the white cobweb-like mycelia produce simple conidiophores, from which the conidia quickly germinate and grow in chains, covering the host as with a mealy powder. The life-cycle is completed in the autumn, when ascocarps, or perithecia, arise as small black points on the mycelium and produce spores which usually remain dormant through the winter and germinate in the following spring. In cases where the life-cycle is known the fungus is placed in its proper genus, but where the ascocarps are still undiscovered, the use of the term generically is still adopted.

**Oil**, see OILS AND FATS; OIL WELLS; PETROLEUM.

**Oil and Petrol Engines**, see INTERNAL COMBUSTION ENGINES; MOTOR CARS; MOTOR CYCLES; MOTOR BOATS; and MOTOR SHIPS.

**Oil-beetle**, name given to any species of *Meloe*, a genus of (cantharidae (q.v.), on account of the oil-like matter which it exudes.

**Oil-bird**, see GUACHARO.

**Oilcake**, richest and most concentrated of cattle foods, manufactured from oil-bearing seeds after they have been crushed to extract some of the oil. The cakes in most common use in Britain are those prepared from linseed, cotton seed, and soya beans. Linseed cake contains from 10 to 12 per cent of oil, and if fed in moderate quantities is the best stock food of its kind. Decorticated cotton cake is made from cotton seed after the husk has been removed, and is valuable for fattening bullocks and dairy cows. Undecorticated cotton cake, made from the whole seed, is generally given to cattle fattening upon grass. Soya-bean cake, a recent introduction, is valuable for all classes of stock.

**Oil City**, city of Pennsylvania, U.S.A., in Venango co., at the mouth of the Oil Creek, at its junction with the Allegheny R., 52 m. S.E. of Erie. It is one of the chief oil centres in the state. The city has been three times partially destroyed by flood and fire. Pop. 20,100.

**Oilcloth**, see FLOORCLOTH; LINOLEUM.

**Oil-drop Experiment**, see under ELECTRON; MILLIKAN, ROBERT ANDREWS.

**Oil Fish**, see GYOLOMYXA.

**Oil Fuel**, see FUELS, Liquid Fuel.

**Oil of Vitriol**, see SULPHURIC ACID.

**Oil Paint**, see PAINTS; PIGMENTS.

**Oil Painters**, Royal Institute of, was founded in 1883, and achieved the prefix Royal in 1909. Ann. exhibitions are held at galleries in Piccadilly, London.

**Oil-painting**, see under PAINTING.

**Oil Rivers**, see NIGER.

**Oil Rivers Protectorate**, former name of the Niger Coast Protectorate. It was given to the new protectorate proclaimed over the coastal area of Nigeria following the Berlin Act, 1885, and it included most of

the present coast, but not Benin or the country to the W. Though the protectorate was proclaimed with due solemnity no steps were taken to make it effective or to establish any useful form of administration, the reason for this laxness being that Great Britain had been forced by the Berlin Conference and the influence of Bismarck to take a step very much against its inclination and policy. In 1891 the gov. created a compromise administration of consuls and vice-consuls, who were appointed to the various rivers, with powers like those of a modern dist. officer, under a commissioner and consul-general. An armed constabulary was raised and commanded by Brit. officers with armed launches to patrol the creeks. In 1893 the name of the protectorate was changed to Niger Coast Protectorate. See further under NIGERIA.

**Oils, Essential**, see ESSENTIAL OILS.

**Oils and Fats** are either glyceric esters of the fatty acids (animal and vegetable oils) or hydrocarbons (mineral oils). In the former, the relative proportion of solid and liquid glycerides determines whether the substance is a fat or an oil at ordinary temps. Oils may be colourless to yellow, are not miscible with water, and have a sp. gr. of less than 1, and will be considered here as: (1) Mineral or hydrocarbon oils. This class includes natural essential oils, mainly of vegetable origin, mineral oils like petroleum, oils obtained by distillation, coal tar oils, shale oils, bone oils, etc. (2) Fatty oils, which may be saponifiable (i.e. hydrolysed by caustic alkalis or not). Saponifiable oils, etc., include glycerides and some essential oils, whilst non-saponifiable products include fusel oil, camphor oils, cholesterol, phenol, cresol, and many others. (1) *Hydrocarbon oils* are obtained either by the distillation of oil-bearing shales (Scotland) or from the petroleum of America, Russia, etc. The Scottish oils are mainly paraffins (q.v.), the Russian petroleum is composed chiefly of naphthenes, while the Amer. petroleum consist of paraffins, with olchines and naphthenes. For commercial purposes crude petroleum is distilled and fractionated. Thus are obtained colourless oils used as solvents (petroleum ether), cleaning oils and oils for varnishes, burning oils (kerosene), and lubricating oils. (See PETROLEUM.) These minerals are chemically more or less inert, and are unaffected by acids and alkalis at ordinary temps. (2) *Fatty oils* are obtained from animal fats and seeds of plants by pressure or extraction by volatile solvents. These fats and oils are chiefly composed of tristearin, tripalmitin, and triolein, and are easily decomposed to glycerol (q.v.) and the fatty acids (see FAT). They are soluble in ether, benzene, and chloroform, and are only slightly soluble in alcohol (except castor oil, which is soluble). The fatty oils are divisible into three groups: (1.) *Drying oils*. These when exposed to the air absorb oxygen and harden. Such oils are valuable as painting oils, e.g. castor (dehydrated), linseed, poppy-seed, and flax-seed, (2.) *Non-drying oils* are used for lubricating

purposes. Such are butter, lard, tallow, olive, palm, whale, seal, coco-nut oil, and castor (in natural state). (iii.) *Semi-drying oils*, intermediate between (i.) and (ii.), e.g. rape, colza, castor, croton, and grape-seed oils. Boiled with caustic alkalis, fats and oils of this series undergo saponification, and are used in the manuf. of soaps (q.v.). Stearin is used in making candles, as also are palm oil and tallow. Castor oil is used in certain types of lubrication, e.g. aviation, and in medicine, while some of these fats and oils are used as foods, viz. butter, lard, and coco-nut oil, and others as burning oils—colza and sperm oils.

The examination of oils and fats is a highly technical matter and involves such observations and determinations as taste and smell, colour, refractive index and dispersion, fluorescent effects, spectroscopic work and behaviour under polarised light, solubility in various solvents, heat of combustion, conductivity, melting point, sp. gr., viscosity, and complete chemical analysis, including the water content. In some cases *flash point* (q.v.) is a useful piece of information. Another important factor is the *iodine value*. Thus in Hübl's test the alcoholic solution of mercuric chloride and iodine in alcohol is made. Then a solution of the oil under test is made up in chloroform and the iodine solution added to it. Excess of the latter solution is used and after adding potassium iodide solution the amount of the excess of iodine is found. From the results the amount of iodine absorbed by a known weight of the oil is then calculated. The Reichert value of a fat is obtained by heating 2.5 gm. of the fat with 5 c.c. of pure alcohol and 6 c.c. of strong KOH solution. After heating on the water-bath the soap produced is extracted with 70 c.c. of boiling water and sulphuric acid of the proper strength to neutralise the alkali added. The liquid is distilled till 50 c.c. have come over. The distillate is neutralised by decinormal alkali. The number of c.c. used gives the Reichert value. The Maumene test depends on the heat produced when a fixed oil is mixed with sulphuric acid. Comparisons are made with standard cases.

**Oil-Shale**, see *under* SHALE OIL.

**Oil Ships, or Oil-tank Steamers** (Oil Tankers), form one of the classes of vessels which are expressly built with a view to the requirements of a certain class of cargo, and can under ordinary circumstances be used for no other. As early as 1863 there were sailing ships on the Tyne with specially constructed tanks for the carriage of oil, but the *Vadreland*, which was probably the first steamship designed to carry oil, was built by Messrs. Palmer in 1872. Another early steamship of this type was the *Zoroaster*, built in Sweden in 1877, in which the O. tanks were separate from the hull; later vessels were built in which the plating of the hull itself formed the tank. The size of O. steamships varies in accordance with the length of journeys required, etc.; for long journeys vessels of from 6000 to 12,000 tons are found to be the most economical. The

*Pinna* was a good example, being 420 ft. long, 52 ft. broad, 22 ft. deep, and accommodating 9000 tons of O. in twelve large tanks formed by one longitudinal and seven transverse bulkheads. A later development is the O.-tank vessel fitted with internal combustion engines instead of steam. The biggest of these ships can carry 16,000 tons of liquid cargo. It is important in vessels of this class that the free surface of the O. should be as small as possible. The world demand for O. in recent times has led to extensive building of O.-carrying vessels, and since 1926 the number of such ships has rapidly increased. Many of them are motor driven, the largest being the *C. O. Stillman*, a twin-screw ship of 16,000 tons built in 1928 for the International Petroleum Company. She had a length of 565 ft. In 1930 there were 1462 engine-driven ships and 200 sailing ships. At the outbreak of the First World War there was under 1,500,000 gross tons of O. tankers. When war again broke out in 1939 the total had grown to nearly 11,000,000 tons. Great Britain had the greatest number, being followed by America, Norway, Holland, Panama, Japan, Italy, France, Germany, and Sweden. An O. tanker may be easily recognised because the funnel and machinery are aft and the bridge just forward of amidships. All the hold space, 400 ft. long in the largest tankers, is divided by two steel structures running parallel with the centre line of the ship. These are the fore and aft bulkheads, and the three long trough-like spaces thus formed are further subdivided by cross divs. or transverse bulkheads. There may be a dozen of these, making about thirty individual tanks, into which and out of which O. must be moved by pumps with the greatest possible speed. These pumps control the flow of O. in each of the three lines of compartments, and some of them are able to pump 2800 gallons of fuel a minute. Other pumps keep the air pure to prevent explosions. See Sir A. Hurd (ed.), *Britain's Merchant Navy*, 1925-29; R. W. Morrell, *Oil Tankers*, 1931; and P. Kerr, *Tank Strapping*, 1939.

**Oil Wells.** The word 'oil' is applied in this case to rock oil or petroleum, which is found in various places at lesser or greater depths in the earth's crust. It most commonly occupies the pore spaces between the grains of sedimentary rocks. Two factors are essential to hold the petroleum in its reservoir. Firstly a suitable impervious 'cap' rock or seal to prevent its escape into higher layers, and, secondly, a 'structural' or 'stratigraphical' closure to trap the oil and prevent its further movements within the layer. The deposits are usually associated with water and gas—the water, being the heaviest, occupying the lower part of the structure. The method used in the recovering of petroleum from these natural reservoirs is by the sinking of wells.

The art of well-drilling dates back to 221 B.C. when it was first practised in China, where brine wells as deep as 3500 ft. have been drilled with equipment of a very primitive nature. The first well

sunk with the definite object of obtaining oil, using other than hand power, was drilled at Titusville in 1859 by Col. Drake. Nowadays before a well is sunk the country is first surveyed geologically, and this surveying of a country unknown as far as its oil possibilities are concerned can be divided into two parts. It is first necessary to know if geological, especially stratigraphical, conditions are such as to have favoured the generation of oil. Then if it is considered that conditions are favourable, the region must be examined for structures in which oil could accumulate. After geologists and geophysicists have found what appears to be a favourable location for drilling, the prospect is sometimes further checked by drilling a number of small diameter wells (see BORING), usually with a very light drilling rig known as a core drill. The first well in an oilfield is usually known as a 'wild-cat,' the old-time wells having been often located by pure guesswork or superstition. Hence the present-day colloquial meaning of 'wildcat'—'highly speculative.' All wells drilled with the object of discovering a new structure, a new pay zone, or of extending the productive area of known pay zones are 'exploratory' wells. Those wells extending a known field are 'extension' or 'outstepping' wells. Wells drilled for deeper pay sands in the same field are 'vertical exploration' wells, while those drilled within the known boundaries of a proven field are known as 'exploitation' or 'development' wells. In modern drilling the first structure of the drilling rig to be built is the derrick, this being, in the case of permanent wells, a structural steel tower which for wells which it is expected will reach a depth of 10,000 ft. is 136 ft. high, plus an additional 13 ft. for the 'gin pole,' which is installed over the top to facilitate the installation of the 'crown block' (pulleys). The 30-ft.-square derrick floor, which is surfaced with boards and stands 8 to 14 ft. off the ground, is the working platform for the crews. The hoisting winch or 'draw-works,' by which the drill pipe, casing, and tubing is handled, is driven by three or four engines installed behind it. The hoisting equipment consists of the crown block on top of the derrick and a travelling block which moves up and down the derrick by means of the hoist and a multiple cable arrangement. The original 'percussion' system has been superseded by the 'rotary' method, involving the use of a rotary table. The rotary table is a heavy steel table, mounted on ball or roller bearings with a bevel gear under its outer rim. This is set over the centre of the well and rotates the drill pipe. A large diameter bit is used for drilling, and a special type of mud is injected into the hole to facilitate the operation. When the hole has reached a depth of 50' to 300 ft., steel casing is inserted and cemented in to prevent the sides caving in and water seeping through, this performance being repeated from time to time as the depth increases. Just before the 'cap' rock is pierced a system of high-pressure valves, called a 'Christmas tree,' is installed to control the flow

FLOWING WELL: COMPONENT PARTS

of oil. The old spectacular days when wells flowed over the top of the derrick when being brought into production are

gone, and bringing in the modern well is usually a controlled and orderly procedure. Generally the oil is forced to the top naturally, but after natural flowing conditions stop it is necessary to install additional equipment to lift the oil, usually done by mechanical pumping. The oil is then conducted through pipes, often hundreds of miles long, to the refinery. The deepest well at present has reached a depth of over 17,000 ft. See also PETROLEUM. See A. Beeby Thompson, *Oilfield Development and Petroleum Mining*, 1916; J. E. Brantly, *Rotary Drilling Handbook*, 1936; A. Holmes, *Principles of Physical Geology*, 1944; and W. F. Cloud, *Petroleum Production*, 1946.

**Ointment**, fatty substance of the consistency of butter, generally containing some medicinal agent, and intended to be applied to the skin for curative purposes. The fatty basis may be any substance sufficiently plastic, without any injurious action on the tissues and not liable to putrefaction; that most generally used is purified lard with an admixture of wax, the usual proportion being eighty parts of lard to twenty of wax. A harder O., used for conveying liquid antiseptics, is made up of f. or parts of solid paraffin, one of wool fat, and five of liquid paraffin. A soft O. base in general use consists of eleven parts of solid paraffin, five of lanolin, and thirty-four of liquid paraffin.

**Oirat**, Autonomous Region of the R.S.F.S.R., situated on the Mongolian frontier, with the Altai Ter. to the N., the Kazakh S.S.R. to the W. and S.W., and the Khakais Autonomous Region to the E. About 45 per cent of the pop. are Russian immigrants, the rest being Os. and Tartars, with some Kalinuck groups of Mongol descent. Settlements consist of small wooden houses, where home handicrafts are still carried on. The pop. is chiefly rural, and there are few significant settlements, except the cap., O. Tau, a fair-sized tn. with hydro-electricity. There are large herds of cattle, roads have been built, and the butter industry flourishes. O. is in the Altai-Sayan mt. system, and its scenery resembles that of Switzerland. Area 93,000 sq. kilometres. Pop. 161,000.

**Oirat Tau**, cap. of the Oirat Autonomous Region (q.r.). Pop. 12,000.

**Oisante**, see ANATANI.

**Oise**: 1. Dept. in the N. of France, is bounded on the E. by the dept. of Aisne, and on the W. chiefly by that of Seine-Inférieure. It produces an immense quantity of vegetables and manufs. hardware and textiles. Cap. Beauvais. Area 2872 sq. m. Pop. 396,700. 2. Riv. of France, an affluent of the Seine, rises in the N. of the dept. of Ardennes, and flows S.W., joining the Seine at Compiègne-Sainte-Honorine after a course of 150 m., for the last 75 of which it is navigable.

**Oisin**, see OSSIAN.

**Oita**, seaport tn. of N.E. Kinshin Is., Japan, 100 m. from Nagasaki, in the dept. of the same name. Silk yarn is produced. Pop. (tn.) 61,700, (dept.) 980,400.

**Ojibways**, or **Ojibseways**, see CHIPPEWYANS.

**Oka**: 1. Riv. of Siberia, Asiatic Russia, rising in the Sayan Mts. between China and the Irkutsk Region, and flowing N.E. through a wild mt. region for a course of about 400 m., to join the Angara at Bratsk. 2. Riv. in central Russia, rising in the Orel Region, and flowing after many windings in a N.E. direction, for a course of about 900 m. in all, to join the Volga at Gorky. Its basin has an area of about 120,000 sq. m., and the traffic on it is very considerable, over 2,000,000 tons of corn, salt, metals, timber, etc., being loaded annually for shipping in the riv. ports of its basin.

**Okapl**, native name of the species of Giraffide discovered by Sir Harry Johnston in 1901 in the Semliki forest, Belgian Congo; it is known technically as *Orcapia johnstoni*. This giraffe-like animal differs from its allies in having a rather short tail, a short, thick neck, no external horns, but vestiges of horns are to be found on the frontal bone. The coloration of the O. is curious; the limbs bear long, dark stripes, the back and sides are reddish-brown, while the limbs and part of the head are of a creamy colour. Very little is known of the habits of the O. beyond that they live in pairs in dense forests. The only pair of their species in Europe is in the London zoo.

**Okavango River**, see CUBANGO.

**Okayama**, tn. of Honshu, Japan, cap. of prefecture of same name, 72 m. W. of Kobe. It has a fine castle and beautiful gardens. Silk and cottons are produced. Pop. 166,100.

**O'Keefe** (O'Keefe), John (1747-1833), Irish dramatist and actor, b. in Dublin, whose plays enjoyed considerable popularity in London. They include comedies, farces, and operas, such as *The Agreeable Surprise* (1781); *The Poor Soldier* (1783); *Wild Oats* (1791); and *Modern Antiques* (1791). He wrote the popular song *I am a Friar of Orders Grey* (this occurs in his opera *Merry Sherwood*). His *Recollections* appeared in 1826. See lives by R. W. Babbcock, 1937, and Adelaide O'Keefe, 1937.

**Okehampton**, municipal bor. and murt. tn. of Devonshire, England, 21 m. W. of Exeter, on the N. margin of Dartmoor, at the junction of the E. and W. Okeant. There are picturesque ruins of a late Norman keep and of O. Castle. Pop. 3900.

**O'Kelly**, Sean Thomas (Seán Tomas O'Ceallaigh) (b. 1882). Irish journalist and political leader; educated at O'Connell School, Dublin; Republican M.P. for N. Dublin (1918-24). One of the founders of Sinn Féin (q.r.), with Arthur Griffith (q.r.) he was Speaker of the first Dail Eireann in the Irish Free State (1919-31). O. was successively Irish envoy to Paris and Rome, 1919-22, and to the U.S.A., 1924-26; vice-president of the executive council and minister for local gov. and public health, 1932-39; minister of finance and of education, 1939; member for Dublin N. of the Dail from 1927 to 1945; proprietor and editor of the *Nation* (Dublin); general secretary of the Gaelic League; vice-president of the Fianna Fail

party. He succeeded the Gaelic scholar, Dr. Douglas Hyde, as president of Ireland, being installed on June 25, 1945.

**Oken, Lorenz** (1779-1851). Ger. naturalist, b. at Hohlsbach, Swabia. His real name was Okenfuss. In 1802 he pub. a work entitled *Grundriss der Naturphilosophie, der Theorie der Sinne, und der darauf gegründeten Classification der Thiere*, first of a series of works of the same nature. In 1828 he was appointed prof. at Munich, and four years later at Zürich. See memoirs by A. Ecker, 1880, and C. Guttler 8184; and M. Pfannenstiel and R. Zannick, *Lorenz Oken und J. W. Goethe*, 1941.

**Okhotsk, Sea of**, inlet of the N. Pacific in the E. of Siberia. From Nov. to April it is ice-bound.

**Okhrida, Okhrid, or Orid**, see OKRIDA.

**Oki Islands**, group of is. lying N. of the prov. of Izumo, and a former Jap. possession. There are, in all, four is., Dago being the largest; chief tn. Saigo. The group has a coastline of 182 m. and covers an area of 130 sq. m. Pop. 31,800.

**Okinawa, Pacific Is.** of the Ryukyu group, 325 m. from the Jap. mainland, the centre of a former Jap. prefecture, and an air base. It is long and narrow, with an irregular coastline and peninsulas projecting W. and E. Length from N. to S., 65 m.; maximum width, 10 m.; area 485 sq. m. For the Amer. capture of O. in 1945 see PACIFIC CAMPAIGNS or FAR EASTERN FRONT IN THE SECOND WORLD WAR.

**Oklahoma** (Choctaw Indian word meaning red people), S.-central state of the U.S.A., called the Sooner State, bounded on the N. by Kansas, E. by Missouri and Arkansas, W. and S. by Texas. One narrow strip touches New Mexico and Colorado on the W. Area 69,919 sq. m., including 643 sq. m. of water. The surface is principally an upland prairie, and large portions are very fertile, though others are bare and arid. O. rises in the W. to an elevation of 4000 ft. and there are mts. in the S.W. It is well watered by the Red, Canadian, and Arkansas Rrs., with their affluents. The chief mt. ranges are the Wichita Mts. in the S. part of the state; the Chautauque Mts. in the central portion; and the Ozark Mts., extending half-way across the state. O. is noted for its diversity of crops, corn, cotton, wheat, oats, maize, potatoes, etc., being extensively cultivated. The first named represents over two-thirds of the acreage and value. Yields in 1947: maize, 22,000,000 bushels; wheat, 104,000,000; oats, 83,000,000; grain sorghums, 5,000,000. Soil erosion is serious. Between 1935 and 1940 the number of farms declined by 15.9 per cent (33,600), and between 1940 and 1945 by nearly 15,000, or another 8.3 per cent. Large-scale commercial farming is the prevailing form, though there is still some subsistence farming. The state also possesses an abundance of fine timber, and wool is produced. Petroleum, coal, rock-asphalt, limestone, and gypsum are found, the value of the total mineral output for 1946 being \$326,000,000. In 1947 over 111,000,000 barrels of petroleum were produced. Petroleum refining is the

chief industry, output being valued at \$226,000,000. Indians, wards of the nation, received (in 1930) over \$36,000,000 in royalties on oil discovered in their lands. About 280,000,000 gallons of natural gasoline and 345,000,000,000 cubic ft. of natural gas were produced in 1945. The state has a Senate of forty-four members and a House of Representatives of 114 to 120 members elected for four and two years respectively. O. sends two senators and eight representatives to Congress. The state was a part of the Louisiana Purchase. From 1866 onward the Indian country, as it was known, became gradually settled by the purchase of Indian lands by the gov. Organised as a ter., 1890, and admitted as a state, 1907, it was originally known as Indian Ter. because on the great reservations were settled Cherokees, Creeks, Choctaws, Chickasaws, and Seminoles. Their descendants remain a large part of the present pop. of O. The chief cities are O. City (the cap.), 267,000; Tulsa, 180,200; Muskogee, 32,300; Enid, 28,000; Shawnee, 22,000; Lawton, 18,000; Ardmore, 17,000; Ponca City, 16,800; Bartlesville, 16,300; and Okmulgee, 16,000. Pop. of the state 2,352,000. See Edna Ferber, *Cimarron*, 1936; Federal Writers' Project, *Oklahoma: a Guide to the Sooner State*, 1941; G. Foreman, *A History of Oklahoma*, 1912; A. Debo, *Prairie City*, 1943; and M. James, *The Cherokee Strip*, 1947.

**Oklahoma City**, cap. of O, U.S.A., on the N. Fork of the Canadian R. It is a new city settled in 1889, and has many handsome buildings and tree-lined streets. Its univ. was founded in 1911. It does an important trade in cotton, cattle, horses, and other stock, and has stock-yards and tanning factories. Pop. 267,000.

**Okuni-Nushi**, see OKUNOSUCHI.

**Olaf I. (Olaf Trygvesson)** (969-1000), king of Norway. On being proclaimed king in 995 he began the conversion of the country to Christianity, built the first churches, and founded the see of Nidaros, formerly Trondheim. He entered into quarrels with both Sweden and Denmark, and finally met his death off the is. of Svold, near Hugen, where he was waylaid and defeated by the combined Swedish and Dan. fleets. After his death he remained the hero of his people.

**Olaf II., the Saint** (955-1030), revered early Norwegian king. He wrested the throne from Eric and Earl Svein (Svend Jarl) in 1015, and then endeavoured to terminate paganism with severity, which caused his subjects to seek protection in the ters. of Canute. O. was, however, dethroned by Canute in 1028, but in 1030 he returned with 4000 men, and gave Canute battle at Stiklestad, near Drontheim, where O. was defeated and slain. O. was proclaimed patron saint of Norway in the succeeding century.

**Öland**, long and narrow Swedish is. in the Baltic, separated from Sweden by Kalmar Sound. It is 85 m. long and 10 m. at its broadest, and covers an area of 519 sq. m. It is well wooded in parts, and has good pasture ground for cattle. There are good fisheries all round the

coast; cement and alum works; and grain and sandstone are largely exported. Borgholm, on the W. coast, is the cap. and only tn. Pop. 27,000, of whom some 10,000 are in Borgholm.

**Olaus Petri**, see **PETRI**.

**Olaux**, typical genus of the family Olacaceae, consists of about thirty shrubs and trees inhabiting tropical regions of Asia, Africa, and Australia. The species are smooth evergreens, and have a disagreeable odour. *O. Zeylanica* is the malla-tree of Ceylon, the leaves of which form an ingredient of curry.

**Olbens, Heinrich Wilhelm Matthäus (Matthias)** (1758-1810), Ger. physician and astronomer, b. at Arbergen, near Bremen, studied medicine at Göttingen (1777-80). His new method of calculating the orbit of a comet, set forth in *Abhandlung über die leichteste und bequemste Methode die Bahn eines Kometen zu berechnen* (1797, 1864), won him fame. He discovered the asteroids Pallas (1802) and Vesta (1807), and the O. comet of 1815. See Borkhausen, *Biographische Skizzen verstorbener Bremischer Ärzte*, 1814; Erman, *Brüderwechsel zwischen Olbens und Beesel*, 1852; and *Gesammelte Werke* (Schilling's ed., 1894-1900, 2 vols., and a 3rd later vol.).

**Old Age Pensions. History.** - The Eng. O. A. P. scheme does not rest upon either voluntary or compulsory contribution on the part of the recipients of pensions. The inherent defect of a contributory system, apart from the fact that it constitutes an insurance and not a pension scheme at all, is that very few people of those who are now in receipt of O. A. P. could possibly have set aside from their exiguous earnings anything by way of provision for old age.

The question of O. A. P. had been discussed for some time before the passing of the Act of 1908, and not only were various proposals submitted to the Royal Commission on the Aged Poor, which sat in 1895, but the different recommendations of the commission formed the subject of sev. Bills in Parliament, which were considered by parl. committees in 1899, 1900, and 1903. The apparent dilatoriness of the legislature was due to a variety of causes, the chief of which were the preoccupation of Parliament with the Boer war and the protracted discussions over the principle of contribution. Moreover legislative experiments in one country are bound to have their effect upon other countries; and with the fact before them that the O. A. P. systems already in vogue in New Zealand, Denmark, New S. Wales, Victoria, and Germany rested upon a contributory basis, voluntary or compulsory, the House of Commons proceeded with the greater caution. As a fact, the estimated cost of £7,440,000 for providing pensions to persons over seventy was under the mark, for the cost in 1911-12 was £12,450,000. The cost for the financial year 1940-41 had risen to nearly £50,000,000 (though from these amounts must be deducted the saving to the rates consequent on the automatic removal of the pauper disqualification for old age pen-

sioners). The scheme put forward by Chaplin's committee in 1899, and practically adopted by the select committee of 1903, was a contributory one, and though some of its proposals were adopted by the Liberals in 1906, its root-principle of contribution was rejected by Lloyd George (chancellor of the Exchequer) on the ground that any contributory scheme would practically exclude women altogether, apart from the fact that the majority of working men could not deflect from their weekly earnings a sufficient sum of money to make adequate provision for old age, in addition to that which they were then making for sickness, infirmity, and unemployment. The age limit, too, was a thorn in the side of departmental committees. Most of the bills relating to pension schemes, and all the committees that considered the subject, set that limit at sixty-five years, and the same limit was fixed by the statutes governing the grant of pensions in New Zealand. It was estimated in 1903 that if the age limit were raised from sixty-five to seventy the number of pensioners would be reduced by nearly 44 per cent, which on the estimated figures would have meant 357,000 old age pensioners. The actual number of pensioners in Great Britain in March 1912 was 942,160, or about one person out of every forty-four of the total pop. The total number of O. A. P. in force in 1931 was about 930,000. The great majority of the pensioners were in receipt of the full pension of 5s. (or 10s. under the later Acts), those in receipt of lesser sums being for all practical purposes a negligible quantity. Of the pop. of seventy years of age or over about four in every five persons now draw O. A. P., to the extent of, in all, approximately £1,000,000 weekly to some 2,000,000 pensioners, comprising roughly one-third non-contributory Act and two-thirds contributory Act State O. A. P. It is obvious from these figures that the fears of the different committees were not groundless. But, indeed, no one conversant with poor law statistics could have failed to appreciate the fact that the cost would be heavy, for of the entire pop. of sixty-five years and upwards in the United Kingdom more than one-quarter were (1899) in receipt, or had been in receipt, of poor law relief. The Acts of 1908 and 1911 were subsequently amended in various particulars by the Acts of 1919, 1924, and consolidated by the 1936 Act. The chief provisions are given below.

**Statutory Conditions for obtaining Pensions, and Disqualifications.**—(1) The claimant must have attained the age of seventy. (2) The claimant must for at least ten years up to the date of receipt of any sum on account of pension have been a Brit. subject (a condition which, formerly, disqualified women who married aliens); b. this condition does not apply in the case of a woman who satisfies the pension authorities that she would, but for her marriage when an alien, have fulfilled the condition. (3) The claimant must, if a natural-born Brit. subject, have, since attaining the age of fifty years, have

had his residence in the United Kingdom for an aggregate period of not less than twelve years; and, if he is not a natural-born Brit. subject, that he has had his residence in the United Kingdom for an aggregate period of twenty years. (Residence abroad in the service of the Crown, temporary absence not exceeding three months at any one time, all periods spent abroad by any person during which he has maintained or assisted in maintaining any dependant in the United Kingdom, absence on board a registered Brit. ship, and residence in the Channel Is. or the Isle of Man by a person born in the United Kingdom, are all regarded as residence in the United Kingdom for the purposes of the Act.) The rates of pension given to persons of seventy years of age, are as follows:

(a) Where the claimant is one of a married couple living together in the same house; then, where the combined means of husband and wife (with a deduction not exceeding £78 from the combined means other than earnings) do not exceed £52 10s. a year, the rate of pension is 10s.; £52 10s. to £63, 8s.; £63 to £73 10s., 6s.; £73 10s. to £84, 4s.; £84 to £94 10s., 2s.; £94 10s. to £99 15s., 1s. Where the combined means exceed £99 15s. there is no pension. If each spouse is pensionable, each would receive the above rate of weekly pension.

(b) In other cases than the above; then, where the yearly means (with a deduction not exceeding £39 from means not derived from earnings) do not exceed £26 5s. a year, the rate of pension is 10s.; £26 5s. to £31 10s., 8s.; £31 10s. to £36 15s., 6s.; £36 15s. to £42, 4s.; £42 to £47 5s., 2s.; £47 5s. to £49 17s. 6d., 1s. Where the yearly means exceed £49 17s. 6d. there is no pension. Under the Old Age and Widows' Pensions Act, 1940, however, the above specific pension rates may be supplemented in case of needy pensioners (other than blind persons, for whom different statutory provision is made) by additional allowances. These allowances are payable, through the Post Office, by the Assistance Board (created in 1941) under the supervision of the Ministry of Health, the burden being thereby transferred from local authorities to the Exchequer. They are payable in accordance with the Supplementary Pensions Regulations, subject to the provisions of the Determination of Needs Act, 1941, under which the family means test was replaced by a test which only takes household needs into account.

It has been estimated that the cost of the O. A. P. scheme as enlarged by the provisions of the Act of 1940 will rise to nearly £87,000,000 by 1950. The Assistance Board announced in 1941 that it would increase supplementary pensions to pensioners not needing continuous medical attention or nursing to ensure them an income of 30s. a week, thereby enabling them to live in hostels to be estab. and maintained by voluntary organisations. The State had therefore accepted the view that social legislation should not be confined to money payments and legal safe-

guards, but should seek the good social life of its citizens.

*Calculation of Yearly Means.*—In calculating the ann. means of a claimant for a pension, account will be taken of the following items: (a) Five per cent on his capital in any shape or form (in the words of the Act of 1911, 'one-twentieth part of the capital value of any property belonging to him') and whether that capital be invested or not, but this valuation is subject to the exclusion of the first £25 of the capital value; the yearly value of the next £375 of the capital value of such property will be taken to be one-twentieth part of the capital value; and the yearly value of so much of the capital value of the property as exceeds £400 will be taken to be one-tenth of the capital value. (b) The cash income he may reasonably expect during the succeeding year (exclusive of O. A. P., interest on investments, and sums accruing from the profitable use of property not personally used by him); this, in the absence of other evidence, will be taken to be the income actually received during the past year. In calculating income no account will be taken of any amounts received during a period of not more than three months in any year by a person, or by the husband or wife of a person, as the case may be, under a medical certificate, as sickness benefit from a friendly society or a trade union. (c) The yearly value of any benefit or privilege (e.g. an easement (q.r.), fuel allowance, right of common (q.r.)). In calculating the means of a person who is one of a married couple living together in the same house, the means are taken to be one-half of the total means of the couple, and where either of the couple, or the couple jointly, is or are entitled to any property, each of them is deemed to be entitled to one-half of the property. Where the husband is separated from the wife, any sum he has paid to her under a separation order will be deducted in calculating his means. The basis of assessment of property capable of investment is the income that might be derived from it if it were invested; but a claimant is not bound to convert his capital into an annuity, and his income must not be estimated on the assumption that he ought to do so. Under the Act of 1908, if it appears that the claimant has directly or indirectly deprived himself of any income or property in order to qualify for an old age pension, or in order to get a higher rate of pension than he otherwise would be entitled to, such income or property will nevertheless be taken to be part of his means.

*Mode of Applying for Pensions—Pension Committees.*—The authority for dealing with claims is the local pension committee appointed by the bor., co., or dist. council. The form of claim for a pension may be obtained by the claimant free of charge at any post office at which he desires the pension to be paid to him. When filled up the form is to be delivered by the claimant either to the postmaster or the pension officer of the dist. The postmaster must give the claimant all the

assistance he can in cases of doubt. The pension officer is appointed by the Treasury, and is the local officer of review, or the supervisor of inland revenue. His function is to investigate the claims sent in and to report on them to the pension committee which body then investigate the claims themselves and give their decision upon them. Before deciding adversely on a claim they give the claimant an opportunity of being heard in support of his application. There is an appeal from the committee's decision to the Ministry of Health. Where the pension is allowed the pension officer gives the pensioner a book of pension orders enabling him to get payment at the post office. A question may be raised at any time during which a person is drawing a pension as to whether he is properly qualified or whether his means are such as to entitle him to payment at a particular rate. If a later decision of the committee reverses a former decision so as to give the pensioner a lower rate or no pension at all, he will not in the absence of fraud on his part have to repay any sums received by way of pension. Conversely the committee may at any time decide to give a higher rate of pension to a person if his circumstances have so changed as to warrant the higher rate. A person who knowingly makes false statements for the purpose of obtaining or continuing to obtain a pension either for himself or any other person renders him self liable to imprisonment not exceeding six months with or without hard labour.

**Contributory Old Age Pensions.**—Under the Widows' Orphans' and Old Age Contributory Pensions Act 1925, all contributors to the national insurance scheme who were between sixty-five and seventy years of age on Jan. 2, 1925 or who have reached that age of sixty-five since that date are entitled to an old age pension of 10s a week irrespective of their means. The chief conditions are that they have been continuously insured for not less than five years immediately prior to Jan. 2, 1925 and have paid at least 10s contributions. A similar pension is payable to the wife of a contributor entitled to such a pension as from the date her husband receives his pension. Under the Old Age and Widows' Pensions Act (Part II) 1940 wives of contributory pensioners are admitted to pension at the age of sixty (under the Act of 1925 the age was sixty-five), and similarly the pension age for insured women is sixty. Such contributory pensioners payable up to the age of seventy are, thereafter, continued on an O.A.P. irrespective of means as applied to other old age pensioners under the 1908 24 Act. By an Act of 1932 (which came into force on Jan. 2, 1930) similar pensions are payable to all widows over fifty-five years of age of men of the insurable class who died or reached the age of seventy before Jan. 4, 1926 (the date when the 1925 Act came into force). The date of commencement of these pensions was July 1, 1930 in the case of widows who were over sixty on that date and Jan. 1, 1931, in the case of those who were

then between fifty-five and sixty years of age. The Old Age and Widows' Pensions Act, 1940 provides that O.A.P. and pensions to widows over sixty may be supplemented in case of need, by the Assistance Board. Under a later Act (1945) widow pensioners under sixty were made eligible for supplementary pensions if they have children in respect of whom an allowance is being paid. Provision is also made to insure persons to preserve their rights to pensions by becoming voluntary contributors after migration to the dominion. An old age pension is not payable to any man so long as he is entitled to a civil war pension under the above Acts. Neither than one old age pension which is under the Act of 1925 or the Old Age Act 1908 24 is payable to any man.

In 1942 there were 4,000,000 old age and contributory pensioners as well as 860,000 widows in receipt of pensions, of whom 720,000 drew at a value of the contributions paid by their husbands. In that wartime year some 1,000,000 old age pensioners were again receiving benefit and under 250,000 wives were receiving benefit. Some 600,000 persons were in receipt of contributory pension and the amounts payable varied widely. The effects of the Old Age and Widows' Pensions Act 1940 and the Determination of Needs Act of 1941 were far-reaching. In addition to some 270,000 cases of supplementary allowances to old age pensioners taken over from the local authorities by the Assistance Board some 700,000 had by 1942 received supplementary pensions and including 100,000 cases included under the Determination of Needs Act the board was then paying supplementary pensions in 1,100,000 cases representing 1,300,000 pensioners. The total amount paid to old age pensioners had by that year reached £125,000,000 a year of which, however, non-contributory pensions accounted for only £12,000,000 while contributory pensions were £8,000,000 and supplementary pensions £5,000,000. The total cost to the Exchequer increased tenfold that of the original old age pension scheme introduced before the First World War. In 1946 the total cost of O.A.P. payable was £2,300,000,000, and £185,000,000 under the Contributory Pensions Act and £44,000,000 the amount paid in 1946 at an anticipated £59,412,000. Pensioners in 1946, totaling 1,174,000, expenditure upon them being £1,710,000.

**Blind Old Age Pensions.**—Subject to inability to do any work in which eyesight is needed, the blind are under an Act of 1920 entitled to a pension of up to 10s a week at the age of fifty, but by the Act of 1936 the age was reduced to fifty on registration (which is optional), of the 74. In England and Wales, 13,280 were over forty, and therefore eligible for pensions.

**Dominions Schemes.**—Under the Old Age Pensions Act, 1921, Canada persons of seventy years of age and upwards whose income from other sources is less

than \$365 a year, are entitled to a pension, the maximum rate being \$20 a month. This amount is lessened by the amount of private income. Originally the Dominion Gov. reimbursed each prov. participating in the dominion scheme to the extent of one-half of the prov. expenditure for O. A. P. An amendment passed in 1931, however, provided that the dominion contribution should be increased to 75 per cent of the prov. disbursements, and this allocation became effective from Nov. 1, 1931. The Dominion Old Age Pensions Act is now operative in all provs. and in the N.W. ters. The total number of pensioners as at Dec. 31, 1941, was 186,831, and the Dominion Gov.'s contributions from the inception of the Act of 1927 to Dec. 31, 1941, was \$231,040,822. The administration of the Old Age Pensions Act was transferred to the Dominion Dept. of Finance in 1935. By an amendment to the Act in 1937, provision was made for the payment of a pension to every blind person who complied with certain conditions which are very similar to those prescribed in the Brit. scheme.

In Australia an O. A. P. system was introduced by the Commonwealth Invalid and Old Age Pension Act, 1908, which became operative on July 1, 1909 (invalid pensions were first paid from Dec. 15, 1911). The rate of pension under the original Act was £26 per annum, the limit of income of the pensioner (including pension) being £52. The rates have, however, been changed from time to time; thus in 1937 the ann. pension rate was £52, and the limit of income £54 10s. Provision was made by the Financial Relief Act, 1933, for an ann. review of the rate of pension, based on the cost-of-living index number, and under that Act the maximum rate of pension was fixed at £52 and the minimum at £15 10s., but the latter figure was changed in 1936 to £16 10s. In 1916 an old age pension of 32s. a week was first paid to pensioners who became inmates of benevolent asylums. This rate was increased from time to time, and in 1937 was 6s. a week. Asiatics, generally, are not eligible for invalid or old age pensions, unless born in Australia, but by an amending Act of 1926 pension rights were extended to Indians who were born in Brit. India. The maximum pension now payable to a blind person in Australia is £52 per annum and the limit of income is £227 10s. a year. In 1948 there were 302,851 O. A. P. in force. The number of invalid pensioners in 1948 was returned at 73,073. The actual sum disbursed in old age and invalid pensions in the financial year 1947-48 (apart from the cost of administration, etc.) was £36,526,000.

In New Zealand earlier legislation was superseded by the Social Security Act, 1938, which had two main objects: (i.) to substitute for the system of non-contributory civil pensions a system of monetary benefits on a contributory basis; (ii.) the inauguration of a system of medical and hospital benefits and other related benefits. The various classes of pensions superseded by these new benefits

were O. A. P., widows' pensions, invalidity pensions, etc., and four new classes of benefits were introduced, including universal superannuation benefit, sickness benefit, etc. Every person over sixty-five, who satisfies the required residential qualifications, is entitled to a superannuation benefit without conditions as to income or property. The rate of benefit is £10 a year, with increments of £2 10s. a year up to a maximum rate of £78 a year (which can, therefore, not be reached until 1968). Again, every person who has reached sixty is entitled to an 'age benefit,' subject to residential qualifications and also to a character qualification (mainly relating to desertion and failure to provide maintenance). The basic rate for this benefit is £78 a year subject to any increase that may be granted on account of dependants or to deductions on account of income or accumulated property. Invalids' benefits are payable at a basic rate of £78 a year for a married man and £52 for a single person, and the benefit is payable irrespective of age, except that the applicant must be sixteen years or over. An 'emergency benefit' may be granted by the Controlling Commission (which controls the Social Security Dept.) to any person who, by reason of age, disability, or domestic circumstances is unable to earn a livelihood for himself and those dependent on him, and who is not eligible for any other monetary benefit. The amount is at the discretion of the commission.

Provision for O. A. P. in the Union of S. Africa is made by an Act of 1928, as amended in 1931 and 1937. It applies to white (European), persons, and to coloured persons (excluding Asiatics and aboriginal natives) of sixty-five years of age and over in the case of a man and sixty years of age and over in the case of a woman, domiciled and resident in the union, with means not exceeding a prescribed amount. The maximum amounts payable are £72 per annum to a white person, £36 to a coloured £30 to an Indian, £12 to a native. In 1948 white pensioners totalled 66,956, and received £4,206,180; coloured totalled 33,405, and received £410,198; Indians totalled 5008, and received £115,860. Provision for the payment of pensions to blind persons was made by an Act of 1936.

See W. H. Wickwar, *The Social Services: a Historical Survey*, 1936, and A. Wilson and G. S. Mackay, *Old Age Pensions: an Historical and Critical Study*, 1941.

Old Bailey, name of a street in the city of London, and commonly applied to the central criminal court (q.v.). The street, which is one of the most ancient parts of London, is situated in the city liberty of St. Sepulchre's and par. of Smithfield; but neither street nor court bears the slightest resemblance to the older street and tribunal of the same name. The district itself, even if ever to be associated with the horrors of public executions and the evidences of early notions of criminal justice, boasted trees and water some 750 years ago, at a time when the neighbourhood had even then for long been a place

of the dock and galleys. For we are told that in Cow Lane there was formerly a large pool called Smithfield Pond, or the Horse Pool, and to the S.W. of this stood the gallows or public place of execution, which with naive irony was denominated the 'Elms,' from the great quantity of such trees growing in that neighbourhood. Smithfield's rural simplicities, however, soon yielded to streets and large wooden buildings, and the gallows were moved further W. The O. B. itself was, according to some antiquaries, a corruption of 'Balchill,' an eminence on which stood the bale or bailiff's house, wherein was held a court (called by Stow 'the court of the chamberlaine,' see *Survey of London*, 1603) for the trial of malefactors. These conjectures, however, introduce needless confusion, for the name merely indicates that the 'Old Bailey' stands in what was the 'bailey' of the city wall. The word 'bailey' would seem to be derived from O.F. *baillie*, palisade, enclosure, perhaps from the Med. Lat. form *ballium*, meaning the courts or wards of a castle formed by spaces between the circuits of defences surrounding the keep. The name 'bailey' in this context is then retained after the disappearance of the castle and its defences. Newgate became early the common jail for London and Middlesex, and the sessions at the O. B. have from time immemorial been held under the commission of jail delivery (q.v.) for Newgate, and of oyer and terminer (q.v.) for the city (see CENTRAL CRIMINAL COURT). Up to 1906 the sittings of the central criminal court were held in the old court-house, or the O. B., but a handsome new building designed by E. W. Mountford replaced the old premises in that year, and now occupies practically the whole site of what once was Newgate prison. The interior of the new court, which has sometimes and without regard to fact, been termed the New Bailey, is lofty and imposing, and over a great part of the vaulted ceilings are brilliantly coloured frescoes.

**Old Believers**, see RASKOLNIK.

**Old Beni-Hassan**, see BENI-HASSAN-IL-QADIM.

**Oldbury**, tn. of Worcester-shire, England, 5 m. W.N.W. of Birmingham, on the Birmingham canal. It has iron and steel industries, tube, chemical, aluminium, and brick and tile works. With Halesowen it forms a hot constituency in Worcester-shire. Pop. 53,100.

**Old Calabar**, see CALABAR.

**Old Castile**, see CASTILLA LA VIEJA.

**Oldcastle**, Sir John, Lord Cobham (d. 1417), Eng. nobleman of Herefordshire, who helped to suppress the Welsh rising under Owen Glendower, and then fought for Henry IV. in France (1411). As a supporter of the Wyclifites or 'Lollards' he was condemned as a heretic by Archbishop Arundel (1413), but escaped to Wales. He was captured later and hanged and burnt. O. wrote *Twelve Conclusions*, and other works. He is supposed to be the original of Shakespeare's Falstaff. See J. Halliwell-Phillips on Shakespeare, 1855 65, and J. Gardner and J. Spedding, *Studies*, 1881; also *Fas-*

*ciculi Zizaniorum* (Rolls Series); J. Foxe, *Acts and Monuments of the Church*, 1562, 1841; T. Gapey, *Life and Times of the good Lord Cobham*, 1843; and A. M. Brown, *The Leader of the Lollards: his Times and Trials*, 1848.

**Old Catholics**, section of the Rom. Catholic Church in Germany and Switzerland that first announced itself in Munich in 1870, upon the declaration of the dogma of the infallibility of the pope. The prime movers were Fr. Dollinger and Prof. Friedrich, supported by over forty profs. of the univ. The movement did not, however, develop to any considerable extent.

**Old Colony State**, see MASSACHUSETTS.

**Old Contemptibles**, name given to members of the original Brit. Expeditionary Force, which went to France in 1914.

**Old Dominion**, see VIRGINIA.

**Oldenbarneveldt**, Jan van (1547-1619), see BARNVELDT.

**Oldenburg**, former grand duchy of N. Germany, and after 1918 a republic, consisting of three distinct and widely separated parts, viz. the prov. of O., the principality of Lubeck, and the principality of Birkenfeld. The collective area of these parts was 2482 sq. m., and the total pop. 2,200,000. O. now forms a gov. dist. of Lower Saxony, and is divided into Friesland, Weser-Marsch, Ammerland, Delmenhorst, O., Cloppenburg, and Vechta. The pop. in 1916 was 747,400. The prin. tys. of O. are the Hunte, flowing into the Weser, and the Hase and Lehe flowing into the Ems. The country is flat, belonging to the great sandy plain of N. Germany. Agriculture, beer-brewing, and the rearing of cattle constitute the chief sources of wealth. There are numerous distilleries, breweries, and tanneries, and the manuf. of tobacco, bricks, and coils is carried on. O. (pop. 78,900) is the cap.

O. was a constitutional ducal monarchy, hereditary in the male line of the reigning family. The ter. was in fact, times occupied by the Teutonic race at the Chauci, who were subsequently merged with the more generally known Frisii, or Frisians. In 1180 the counts of O. and Delmenhorst succeeded in establishing independent states from the ters. of Henry the Lion, which fell into a condition of disorganisation after his downfall. This family continued to rule O. till 1918, giving, moreover, new dynasties to the kingdom of Denmark, the empire of Russia, and the kingdom of Sweden. See G. Rithing, *Oldenburg in Geschichte*, 1911, and D. Kehl, *Oldenburg*, 1925.

**Old English**, see under ENGLISH LANGUAGE and ENGLISH LITERATURE.

**Old English Sheep-dog** ('Boottail'), formerly much used, and developed to a high degree of intelligence, by shepherds and drovers in the S. cos. of England and Wales, but now a favourite show dog. The hard, shaggy coat should be free from curl, and have a dense waterproof undercoat. Its colour may be any shade of grey, grizzle, blue, or blue merle, with or without white markings. The head should be big and square with a long, strong jaw, black nose, and small eyes; the ears should

be small and covered with wavy hairs. The forelegs are straight, and the feet small and round. The body should be square and short and the hind quarters high and heavy. The tail ought to be about a foot long and puppies that are born with one should be docked when not more than four days old. Exercise for the breed is essential and no dog suffers more from neglect chained up. Many in times of the great intelligence of

OLD ENGLISH SHEPDOG

typical specimen of the breed are related and they are valuable equally as stock or sport dogs and companions and house dogs.

**Old, or White, English Terrier.** Old terrier breed which after the Kennel Club's abolition of clipping became very rare. In spite of the fact that it is the only terrier so called. The head should be long narrow and flat with a sharp tapering muzzle, in scull jaw pronounced stop and thick nose. The eye should be small and thick set fairly close together. The ears formerly prick, should be round and flat. The rather long neck should be muscular. The forelegs straight and the hind legs comparatively thick and muscular. The whelp tail should be curly. The coat must be close hard short and glossy and pure white, colours such as blue not being favoured. The ideal weight is between 10 and 15 lb.

**Oldfield, Anne** (1831-1900) commonly known as 'Annie', was a famous actress in London. She made her debut in 1850 and in 1864 played the part of Lady Betty Modish in *Gibber's Career*. Her husband who was the original representative of some six, five characters in the play and comedy, and soon came to be recognised as one of the most brilliant actors of the day. Her chief success were *Lady Townshill*, *Sylvia*, *Mrs Sullivan* and *Sophomore*. See E. J. Johns, *The Palmy Days of Anne Oldfield*, 1898.

**Oldfield, Josiah, Esq.** dietetic consulting physician and fruitarian. He at Shrewsbury educated at Newbold Oxford St. Bartholomew's, and Lincoln's Inn. He left a legal practice to take up medicine and founded the Humanitarian Hospital of St. Francis of which he was senior physician and chairman. In 1903 he took a similar post at the Lady Margaret

Humanitarian Hospital. Having adopted the fruitarian diet he has pub many books and pamphlets including *Eat and Get Well*, *Eat and Keep Young*, *Healing and the Conquest of Pain*, *The Mystery of Birth*, and *The Mystery of Marriage*. He advocates the adoption of a fruitarian diet for humane and aesthetic reasons. In 1901 O founded the Society for the Abolition of Capital Punishment. During the First World War he raised and commanded a casualty clearing station and a field ambulance.

**Old Forge**, bor and township of Lackawanna Co. Pennsylvania, U.S.A. on Lackawanna R. 11 m S.W. of Scranton. Pop. 11,800.

'Old Glory,' flag of the U.S.A. formed of thirteen horizontal stripes, alternately white and red, and in the upper quarter next the staff union of five pointed white stars on a blue field, one for each state of the union.

**Oldham**, par. municipal and co. bor. of Lancashire, England, 6 m N.E. of Manchester. The town is pleasantly situated on a hill and its growth is a marvel during the last century. The centre gives it a modern appearance. This growth is principally due to the close proximity of the Lancashire collieries and the extensive cotton mills. Dating from the latter half of the eighteenth century. It was incorporated as a bor. in 1841. Its main buildings are a town hall, Westminster hospital, an infirmary and museum, central free public library and blue coat school. The Alexandra park was opened in 1860. Manufactures: fustians, velvets, cords and uniforms. It has large foundries in china works, and collieries in the near neighbourhood. It is one of the chief centres of the cotton spinning industry and textile machinery is made. It has efficient gas and electricity undertakings, an abundant supply of water and excellent transport facilities. There are numerous parks and recreation grounds and an excellent study centre. In addition to elementary and grammar schools there are well equipped technical, commercial and art schools. O. returns two members to Parliament. Pop. 120,300.

**Old Monkland**, see Monkland.

**Oldoway Man**, human skeleton discovered towards the end of 1913 in the Rift valley by Dr Hans Reck of Berlin Univ. at the N.W. end of Lake Kyoga in the Oldoway dist. of Tanganyika (then German E.A.) in deposit rich in fossil remains of a pleistocene fauna. The country here bordering on Lake Kyoga and Lake Natron is parched scrubland but according to Sir Arthur Keith there is ample geological evidence from the fossil remains that this was not always the case. The Oldoway fossilised skeleton was found lying beneath 10 ft of intact strata and in such a position as seems to justify the inference that the man had become immersed when Oldoway was a marsh or lake and that subsequently sedimentary deposits had formed over the body. The Munich anthropologists, T. L. Mollison and W. Giesler, described (1929) the O.M. as tall (5 ft 10 in.) powerful, long and narrow headed (20 in. min.) long faced

(132 mm) and long nosed (51 mm) Dr. Reek thought that the lower incisor teeth had been filed or chipped, as is still customary with many African peoples, but Mr L. S. B. Leakey, the Cambridge anthropologist, saw no sign of artificial shaping of the lower incisors. The face is described as like those which are still seen among tall members of the Hamitic races of N. L. Africa and in the opinion of the Munich anthropologists the O. M. represents an ancient Hamitic type. See Sir A. Keith, *New Discoveries relating to the Antiquity of Man*, 1931.

**Old Point Comfort**, watering place of Elizabeth City co., Virginia, U.S.A., at the mouth of James R.

**Old Red Sandstone**, name given to the succession of sandstones, shales and thin bands of concretionary limestones, which lie between the Silurian and carboniferous rocks. These rocks were laid down in isolated basins or lakes to the W. and N. of Europe. To the S. marine conditions prevailed, and thus two types of strata comprise this geological system, viz. fresh water or lacustrine deposits (the O. R. S. proper) and marine deposits or Devonian. The O. R. S. attains a thickness of about 20,000 ft. in Scotland and is subdivided into lower, middle, and upper groups. Enormous masses of contemporaneous felsitic andesitic and dioritic lavas and tuff occur within the O. R. S. of central Scotland, some owing to the Cheviot, Pentlands Hills, Siddons, and O. R. S. The fauna of the period is recorded by fossils such as *Late sp. of the Cheviots*, *Dipterus*, and *Leptodus* giant crustaceans and a few much plants (*P. dipterus* is also found in Norway). In the O. R. S. of N. America (New Brunswick) yield plant remains and occasional remains of coal.

**Old Saum, see SAUM**

**Old Testament, see under Bible**

**Old Town**, in of Penobscot co., Maine, U.S.A., on an is. in Penobscot R., 10 m. N. E. of Bangor. Pop. 8000.

**Old Vic**, theatre in Waterloo Road, London S.W.1. In 1818 a theatre was opened on the site and named the Coburg. In 1819 and 1820 James Brindley Booth gave Shakespearean plays, and in doing so ignored the royal patent which restricted classical plays to theatres holding the patent, as a result the manager was prosecuted at the first trial the management of Drury Lane theatre, and heavily fined. The later name of Royal Victorian Hall given rise to the popular title of O. V. and the theatre was relegated to the role of 'coffee music hall'. From this it was rescued in 1880 by Emma Cons, who staged concerts and popular plays with a moral. Regular Shakespearean performances became a feature from 1914 onwards under the management of Lilian Baylis, niece of Emma Cons, as well as opera. An association with Sadler's Wells in 1941 brought into being the title Vic Wells.

Bomb damage led the O. V. company to transfer itself to Burnley in 1941 and a

series of tours by sev. companies was undertaken, assisted by the Council for the Encouragement of Music and the Arts, and by an exemption from entertainment tax for non profit-making companies. A great reorganisation took place in 1914 in collaboration with C. M. A. (later the Arts Council), and from that year a permanent repertory company gave performances of the classics at the New Theatre in London, in addition companies were maintained at Liverpool and Bristol. Its present work (1941) is organized around the O. V. Theatre Company, directed by Sir Laurence Olivier. Sir Ralph Richardson and Mr John Burtchell. As well as London performances, tours are undertaken in Europe, America and the British Dominions and in the provinces. Two main companies are envisaged and subsidiary enterprises were introduced in 1916 to the benefit of a children's theatre, the Young Vic, an experimental theatre at the Central O. V. House in Waterloo Road, and a repertory centre, the National Theatre, Committee concerned to co-operate with the O. V. whereby the latter is to provide the theatre of the future and the former the site and staff of a national theatre on the lines of the Theatre of the O. V. is in the nature of dramatic production. See Sir J. Williams, *The O. V. Theatre*.

**Oldys William** (1696-1761) English antiquary and naturalist writer. He became librarian to Lord O. and a post he continued for about 10 years and North's king of arms. American works on the collection of *Figures* (1717), *The Life of Sir Walter Ralegh* (1718), *The First Discovery* (1717-8), and *The History of the O. V. (1714-15)*. He also wrote several lives in the *Journal of the O. V. and General History*, a collection by J. Yonck, 1862 reprint of the *Notes and Queries*.

**Oleaceae**, family of trees and shrubs of which *Olea* (Olive) is the typical genus.

**Olea Europaea**, see OLIVE

**Olean**, in of California, U.S.A. New York, U.S.A., on Altamont 10 m. S.S.1. of Buffalo, rich in oil and natural gas. Pop. 22,000.

**Oleander** (*Verum Oleandra*) of Rose Bay, a handsome evergreen shrub, native to the family Apocynaceae with beautiful flowers, rather like carnations, in various shades of pink, red, and white. One of the most easily grown greenhouse plants. Its large willow-like leaves are branched and have a powerful and disagreeable odour, and are poisonous to human beings and animals. The physiological effects are similar to those of digitalis. The O. was known to the Greeks as *rhododendron neron* or *rhododendron*. See *Flora* 120.

**Oleandra**, genus of evergreen tropical ferns with creeping shoots, jointed stems, and entire, lanceolate or strap-shaped fronds. They are grown in the stove house in hanging baskets or on pillars and walls in a layer of sphagnum or peaty soil held in place by a wire netting. They need abundance of water from March to

Sept., and a temp. of about 70°. The rest of the year a temp. of 60° and moderate watering are sufficient.

**Olearia**, genus of evergreen flowering shrubs, bearing in summer a profusion of daisy-like flowers as well as ornamental foliage. *O. haastii* is the New Zealand daisy bush, and is often grown on sunny borders and rockeries, especially near the sea. *O. myrsinoides*, with holly-like leaves and white and yellow flowers, is the hardiest species.

**Olefant Gas**, see ETHYLENE.

**Olefine**, in chem., a hydrocarbon of the ethylene series, having the general formula  $C_nH_{2n}$ . The simplest O. is ethylene itself,  $C_2H_4$ . This was originally called olefant gas or oil-forming gas, since it readily combines with chlorine to form an oily liquid, ethylene dichloride,  $C_2H_4Cl_2$ , 'Dutch liquid.' The name O. is derived from olefant gas.

**Oleic Acid**, glyceride triolein acid, found in most natural vegetable and animal fats, the chemical compound being known as olein. A practically colourless oily liquid at ordinary temps., it becomes yellow and rancid when exposed to air and light.

**Oleiro**, see CRDITERO.

**Olenellus**, fossil genus of trilobite, belonging to the Lower Cambrian and characterised by an elongated tail (pygidium) which was used to anchor the organism to the ground. See TRILOBITES.

**Oleosa**, see MULLER.

**Oleograph**, name given to a picture done in oil colors by a chromolithographic process, the print being mounted on canvas and varnished to imitate an original oil painting.

**Oleomargarine**, see MARGARINE.

**Oleron**, Isle of, is. of the Atlantic Ocean, off the S.W. coast of France, and part of the dept. of Charente-Maritime. Its maximum length is 13 m., breadth 7 m., and it covers an area of 66 sq. m. The surface is generally fertile, and it produces corn and wine. It has four towns, Le Château d'Oleron, St. Pierre, St. Georges, and St. Trojan-les-Bains. Pop. 15,100.

**Oleron**, Judgments of, code of maritime laws in use in W. Europe during the Middle Ages. It is said to have been originated by Eleanor of Guienne, wife of Henry II. of England, towards the middle of the twelfth century, at O., part of the duchy of Aquitaine, which came into the possession of the Fr. Crown in 1370, and to have been introduced into England in the reign of Richard I., with some amendments and additions. See SEA LAWS.

**Olfactory Nerve**, see NERVOUS SYSTEM, Cranial Nerves; NOSE.

**Oliga**, St. (c. 890-969), wife of Igor, prince of Kiev. On his death in 945 she ruled as regent for her son Sviatoslav. In 958 she was baptised at Constantinople, and was after her death canonised in the Gk. Orthodox Church, her commemoration day being July 11. She made great, but unsuccessful, efforts to introduce Christianity into Russia, a task achieved by St. Vladimir, her grandson.

**Olhão**, seaport of Portugal, in Faro prov., 6 m. E. of Faro. There are noted

sardine fisheries and canneries. Pop. 14,500.

**Oliaros**, see ANTIPAROS.

**Olibanum** (Gk. *ἀλαβαν*, frankincense), gum-resin yielded by various species of the genus *Boswellia*, found in Somalia.

**Oligarchy** (Gk. *ὀλιγαρχία*), 'the government of the few,' was the name given to that form of constitution amongst the anc. Gks. where a portion of the community were in possession of power, e.g. the govts. of Thebes, Megara, and Corinth. In anc. times, although it was acknowledged that an 'aristocracy' often developed into an O., the two were distinguished, 'O.' signifying the government of the wealthy, who were looked upon as directing their efforts towards their own aggrandisement and the maintenance of their own power and privileges, while 'aristocracy' meant the rule of the best people for the public good.

**Oligocene System**, geological epoch which elapsed between Eocene and Miocene time. In Britain the O. formations are only met with in the Hampshire basin, where they consist of thin-bedded sandstones, clays, marls, and limestones, known collectively as a fluvo-marine series. They are subdivided into the Hadden, Osborne, Bembridge, and Hamstead beds. The subdivisions, lower, middle, and upper, of the O. in France, Belgium, Switzerland, and N. Italy, have been named after places of typical development, as Turgian (from Turgais), Stampian (after Etampes), and Aquitanian (Aquitania) respectively. In the Paris basin the system is represented by lacustrine marls with the gypsum of Montmartre forming the lower O., followed by lacustrine and marine marls. The highest beds are the sandstones of Fontainebleau and the fresh-water limestones of Orleans (Beauce). The Gr. O. are remarkable for their deposits of lignite and brown coal. In N. America the Vicksburg beds (orbitalitic) occurring in Alabama and Florida, the White River beds of S. Dakota, and the Red Bluff of the Mississippi dist., are of O. age.

**Oliphant**, Mrs. Margaret, *née* Wilson (1828-97), Scottish authoress, b. at Wallyford, near Musselburgh. She produced her first novel, *Pasquas in the Life of Mrs. Margaret Wallyford*, in 1849, following this by *Cuthbert and Merkleland* in 1851. The last named met with such great success that on coming to London in 1852 she was invited to contribute to *Blackwood's Magazine*, contributing from that date until her death over 200 stories and articles. She wrote *Katie Stewart* (1853); *Quiet Heart* (1854); *Zulee* (1856); and *The Athelings* (1857). Previous to this, she had, in 1852, married her cousin, Frank Wilson O., who was an artist in stained glass. She wrote in all about 100 books, the best known of which are (fiction) *Memoirs and Resolutions of Adam Graeme of Mossyragh* (1852); *Miss Marjoribanks* (1866); *Whitladies* (1875); *Eglie Ogilvie* (1886); *The Marriage of Elmor* (1892); and her biographies of R. B. Sheridan (1883); Edward Irving (1886); and Laurence O. (1891). See Mrs. A. L. Coghill, *The Autobiography and Letters of Mrs. Oliphant*,

1899, and Lady Anne Ritchie. *From the Porch*, 1913.

**Oliva:** 1. Tn. of Spain in the prov. of Valencia. 40 m. S.S.E. of Valencia. It contains an anc. palace and manufs. linen cloth. Pop. 8000. 2. Mkt. tn. of Poland, 4 m. N.W. of Danzig. Pop. 6000.

**Olive** (*Olea europaea*), slow-growing tree, with undivided leaves and axillary clusters of green flowers followed by pendulous, lustrous, blue-black oily fruits. While green and unripe, the fruits are bottled or pickled in brine. O. oil is extracted by pressure from ripe fruit. The tree has been cultivated since a remote period, especially on the borders of the Mediterranean Sea, and the cultivated forms exhibit great improvement in the size and oiliness of the fruits compared with the tree in its wild state. The wood is soft, but takes a high polish, and is used for making small fancy articles.

**Olive Branch Petition**, final effort made by the Amer. colonists in 1775 to conciliate the Eng. Gov., after the outbreak of hostilities in the war of Amer. Independence. The petition was not allowed to be presented, and the only answer given to the appeal was a large increase of land and sea force in a declaration in Parliament to take stern measures against the 'conspirators and insurgents' in America.

**Oliveira Martins, Joaquim Pedro de** (1815-94), Portuguese historian, b. at Lisbon. He began life as an engineer, but before very long devoted himself to literature. Elected to Parliament in 1886, he held a succession of posts in the gov., including that of finance minister in the crisis of 1892, but resigned in the same year. His many works include *Historia da Civilização Iberica* (trans. *A History of Iberian Civilisation*) (1879); *Historia de Portugal* (1879); *O Brazil e as Colonias portuguesas* (1880); *Historia de Republica Romana* (1885); *Os filhos de João I.* (trans. *The Golden Age of Prince Henry the Navigator*, 1891); *A Inglaterra da hoje* (trans. *The England of To-day*, 1893); *Cartas Consulares* (posthumous, 1894); and *O Principe perfeito* (posthumous, 1896).

**Olivento**, olive-green coloured hydrous arsenate of copper with phosphorus. It occurs in orthorhombic prisms, but is also found fibrous and globular or earthy (h. 3, sp. gr. 1.4). The crystalline variety is found in Cornwall and Devon, and at Alston Moor in Cumberland. It has a vitreous lustre and breaks with a conchoidal fracture. The fibrous variety is also called wood-copper or wood-arsenate.

**Olive Oil**, fixed oil expressed from the fruit of the O.-tree, *Olea europaea*, of the natural order Oleaceae. The O.-tree has been cultivated from the earliest times in Greece, Italy, S. Spain, Asia Minor, and other Mediterranean countries, and has been introduced into Mexico, Chile, Peru, the S. states of America, Australia, China, S. Africa, etc., though the chief supply of the oil still comes from the Mediterranean coast. The fruit is pressed to a pasty consistency, enclosed in woollen bags, and subjected to considerable pressure. This yields oil of the first quality; second and

third grades are yielded by subsequent pressings. O. O. is used for culinary purposes; for the toilet; in medicine as a laxative, a nutritive food, an emollient in external applications, etc.; and in the arts for the manu. of soap, etc. It consists chiefly of olein and palmitin.

**Olive, Princess**, title assumed by Mrs. Olvin Serres (q.v.).

**Olive**, see ROSE AND.

**Olive**, George, see OXIONS, OLIVER.

**Oliver**, Isaac (c. 1556-1617), miniature painter, probably b. in England, and though of Fr. origin, was regarded by his contemporaries as an Englishman. He painted many portraits, and was exceedingly expert in his miniatures. Among his works are the portraits of James I. and his family, Sir Philip Sidney, and the family of Sir Kenelm Digby.

**Olives**, Mount of, called also Mt. Olivet, is only once mentioned by this name in the O.T. (Zech. XIV. 1), though it is elsewhere spoken of under other titles. The Arabic name is Jebel al-Tur. It is situated to the E. of Jerusalem, from which it is separated by the valley of the Kidron or valley of Jehoshaphat. The name is frequently applied to the range of hills of which it forms one. To its N. is the Sepulchre, the site of the encampment of the Romans, under Titus. The 'Prophecy' is a hill to the S. of Olivet proper, and the outlying spur of the range to the S. is known as the Mt. of Offence. The Mt. of O. is connected intimately with the life of Jesus, for on the W. slope lay the Garden of Gethsemane. The Mt. of O. is 2680 ft. above sea level, and on its summit are many churches and convents, the most anc. being the small octagonal church of the Ascension (fifth century). Others are the Orthodox convent of Galilee; a modern Russian convent with a conspicuous view-tower, and the church of the Paternoster, this last being a Ger. Protestant hospice built by William II. in 1910, and used as the gov. house by the Palestine administration up to 1927, when an earthquake rendered it uninhabitable. See works on Syria, Palestine, and Jerusalem by A. P. Stanley, J. L. Porter, W. McO. Thomson, Barclay, etc. (See Illustration, p. 116.)

**Olivier, Sir Laurence Kerr** (b. 1907), Eng. actor, producer, and manager, b. at Dorking, son of the Rev. G. K. Olivier. He was educated at St. Edward's School, Oxford. First appeared on the public stage as Katherine in *The Taming of the Shrew* in a special boys' performance at the 1922 Stratford Shakespeare Festival. In the next seven years he toured in plays and sketches with Ruby Miller and Lena Ashwell, and spent three years in the Birmingham Repertory Company. His performance for the Stage Society as Stanhope in *Journey's End* heralded his long line of professional leading parts, the most celebrated of which have been Hamlet (d. Vic, 1937); Romeo (1939); and Richard III. (1948). He has played in America (first in 1929), toured the Continent (1945), and Australia (1948). He has made many films, two of which he also produced and directed: the prizewinning *Henry V.* and *Hamlet*. In 1930 he married

Jill Esmond who obtained a divorce in 1940, his second wife Vivien Leigh played Juliet in his Romeo in his 1939 production. During the Second World War he was a lieutenant in the Fleet Air Arm but was released in 1941 to co-direct the Old Vic Theatre Company with John Burrell and Ralph Richardson at the New Theatre. He was knighted in 1944.

**Olivier of Rimsden, Sydney Olivier,**  
1st Baron (1871-1941) 1st and 2nd sons of a  
colonial administrator and writer, son of a  
clergyman. Educated at Lausanne, Ton  
bridge School and Corpus Christi College,  
Oxford, he entered the Colonial Office in  
1892, and thereafter held a succession of

closed pot and is always very highly seasoned with pepper and garlic. Compare the *Fr. pot pourri* and the Scottish hotel patch.

Olmütz, see Orlovic

**Olmütz, Convention of** Austro-Prussian  
Treaty of 1810 by which after the up-  
heavals of 1818-19 the influence of  
Austria in Germany was revived at the  
expense of Prussia. To the latter the  
convention was known as the humiliation  
of Olmütz.

**Olney, Richard** (1810-1877) Amer-  
ican statesman and lawyer born in Oxford,  
Massachusetts. In 1833 he was attorney  
general of the U.S.A. In 1851 he became

Olivine, *see* (CHRYSOIDE) IGNEOUS  
ROCKS

*Olla podrida* (literally putrid pot) so called from its miscellaneous contents, is a stew made of meat, fish, poultry, vegetables, and other ingredients very common in Spain. It is cooked in a

Secretary of state in President Cleveland's cabinet. He drafted the famous message of 1895 insisting that Great Britain must submit to arbitration the long standing boundary dispute between Venezuela and British Guiana. O retired in 1897.

Olney 1 In of Buckinghamshire on the Ouse 1 mi from London Wm Cooper the poet was a resident from 1767 to 1786 and the house he lived in containing various relics is still extant 10p 2700 City and Co. of Richmond Illinois U S A There are various manuscripts Pap 7800

**Olomouc** (Ger. *Olmitz*) in of Moravia (Czechoslovakia) on an is. of the R. Morava and formerly a fortress of great strength. O. is the seat of an archbishop. The most noteworthy edifices are the cathedral, a fine old building and the church of St. Maurice completed in 1412 with its celebrated organ. The noble hall (1774) the lofty column on the Oberring, sev. fine fountains in the squares, and the splendid archiepiscopal palace and chapter house all contribute

towards the picturesque aspect for which O. is distinguished. Beer, malt, sugar, and starch are manufactured. Pop. 62,500.

**Oloron**, see ERYMANTHUM.

**Oloron**, or **Oloron-Sainte-Marie**, tn. of France, in the dept. of Basses-Pyrénées, on the Gave d'Oloron, 15 m. S.W. of Pau. Its church of Ste Marie is in the transition style from Romanesque to Gothic. It manufs. flour, leather, and woollen goods. Pop. 10,500.

**Olowa** (Ger. **Ohlau**), tn. of Poland in lower Silesia, on the O., 16 m. S.E. of Wrocław (Breslau). Pop. 3000.

**Olstyn**, see ALLSTERN.

**Olten**, tn. of Switzerland, in the canton Solothurn, on the R. Aar. It is a railway junction, with workshops, and has manufs. of iron, wire, linen, cotton, and shoes. It has also a central book-trade supply depot for the publishers of Switzerland. Pop. 13,000.

**Olenitza**, tn. of Rumania, 35 m. S.E. of Bucharest, on the L. B. of the Danube, at the confluence of the Argesul. It is a river-port. Pop. 10,400.

**Olts Missoo**, see BIV LAKE.

**Olympia** (Ὀλύμπια): 1. Name given to a plain which contained the temple and sacred grove of Zeus Olympius, situated in the Peloponnesian dist. Pisatis, belonging to the Eleans, at the point where the Cladeus runs into the Alpheus. It was of great importance from very early times. Besides the temple of Zeus Olympius, there were sev. sacred edifices and other public buildings in the sacred grove and its immediate neighbourhood. The grove itself (ἱεράριον), which is described by Pindar as being well wooded, was bounded on the W. by the Cladeus, on the S. by the Alpheus, and on the E. by the Stadium. In the centre was a grove of planes, and the whole Altis was surrounded by a wall (said to be the work of Hercules) in which were sev. gates; the most important being the Pompe Entrance in the middle of the W. side, through which all the processions passed. To the right of this entrance stood the Olympium, or the temple of Zeus Olympius, a magnificent building, designed by the architect Libon of Elis, and second only to the Parthenon. The temple contained the 'Cultisteanus,' or wild olive tree, which furnished the garlands of the Olympic victors. In front of the Heraeum and Pelopon, and equidistant from both, was the Great Altar of Zeus (22 ft. high), and between the altar and the temple of Zeus stood the Column of Phœnix. Besides those already mentioned there were the stadium and the hippodrome. These two formed the place of exhibition for all the Olympic contests, and probably formed a continuous arc from the circular end of the stadium to the farther extremity of the hippodrome. The stadium, which was about 210 yds. long, was used chiefly for foot races, and had two entrances, the Pompe and the Secret, the latter being only used by the Hellanodict or Judges, while the hippodrome was used for chariot races and horse races. 2. City, cap. of the state of Washington, U.S.A., on Budds Inlet, about 50 m. from

Seattle. It contains the capitol, a magnificent edifice built in native sandstone, in which is the state library. The chief industry is lumbering, but fishing and mining are also carried on; water power is supplied from the Deschutes R. Pop. 12,000.

**Olympiad**, period of four years between each celebration of the Olympic Games. 776 B.C. was reputed to be the first year of the first O. O. began to be reckoned from the victory of Coræbus (776 B.C.), the first victor in the games after their suspension for eighty-six years; but Timæus of Sicily, who placed 261 B.C. as the first year when regularly arranged events according to the conquerors in each O. His practice was followed by Polybius, Diodorus Siculus, Dionysius of Halicarnassus, and others, but the last O. ended A.D. 394, for the Olympic Games were abolished in that year during the reign of Theodosius the Great. For converting O. into years B.C., multiply the number of O. that have actually elapsed by four, and deduct the number thus obtained from 750. For converting O. into years A.D., go through the same process as before, but subtract 750 from the number obtained by multiplication. But seeing that the Olympic Games (q.v.) were celebrated about mid-summer, and that the Attic year began at about the same time, it is necessary to reduce the year B.C. by one if an event happened in the second half of the year. The method of calculation by O. was, however, only used for literary purposes, and never adopted in everyday life.

**Olympias** (d. 316 B.C.), wife of Philip II. of Macedonia, and the mother of Alexander the Great, was the daughter of Neoptolemus I., king of Epirus. Philip, on account of disagreements, separated from her and married Cleopatra. She left him to live with her brother Alexander, king of Epirus, whence she contrived the death of her husband. She returned to Macedonia on the accession of her son Alexander; but during his absence she caused great trouble to the regent Antipater, and on the death of her son in 323 B.C. was forced to retire again to Epirus. Here she remained until 317, when she became for a short time mistress of Macedonia; but she was forced to surrender eventually to Cassander, Antipater's son, and being condemned without a hearing, was put to death in 316 B.C.

**Olympic Games**. *The Ancient Greek Games*.—The O. (or Olympian) G., the chief national festival of the Gks., were held once every four years and were celebrated in honour of Zeus. They occupied five days, and consisted of two parts: the presentation of offerings, and the contests. At first the contest consisted of a simple running match held in the stadium, but about 724 B.C. the *diablos*, or double course, was introduced, in which the runners had to make a circuit of the goal and return to the starting-point. Later came the *dolichos*, or long race, and in 708 B.C. the *pentathlon* was introduced, a five-fold contest, consisting of leaping, running, throwing the quoit, wrestling, and

throwing the javelin. Wrestling and boxing, too, were combined in the *pankration* (618). In 680 chariot racing in the hippodrome was introduced and though this was twice as long as the stadium it had to be traversed about ten times in both directions (at first with four horses, after 500 with mules and after 408 with two horses). There were also races in unium and those in which the horsemen had to leap from their horses and run beside them with the bundles in their hands. Besides competitions between heralds and trumpeters. The contests were open to all freemen (of pure Hellenic descent who had not incurred any personal disgrace) but all barbarians and slaves were excluded (The Romans, not being reckoned barbarians were allowed to take part). Women too were excluded and were not even allowed to watch the games, there being but one exception, the mistress of the meter. The supervision of the contests was in the hands of the Hellenic officers who were appointed by popular election from the citizens themselves. At the end of the contests a sacrifice was made by the victors wearing their crowns and a banquet was held in the Prytaneum of the Altis during which a song of victory composed by an eminent poet was chanted by choral bands. Authors, poets, orators and artists also used the opportunity afforded by the assembling of so vast a crowd to make themselves known by the recital and exhibition of their work.

**The Modern Olympic Game.** The revival of the O. G. was due to the energy and persistence of the Frenchman, the Baron Pierre de Coubertin who with the support of C. Herbert of the Eng. Amateur Athletic Association and W. M. St. John of the Amer. Athletic Union initiated an international congress at which France, Great Britain, U.S.A., Sweden, Italy, Spain, Greece, Russia and Belgium were represented. The congress met at the Sorbonne in June 1894 and the International O. G. Committee was appointed with Baron de Coubertin as president. The first modern Olympiad was held at Athens in 1896 and it was decided to hold the games every four years in parts of the world to be chosen by the Olympic Committee, but to satisfy Greek sentiment an intermediate minor Olympic was held at Athens in 1906. The second Olympiad was celebrated at Paris in 1900 but the games did not create a world wide interest. The third Olympiad (1904) at St. Louis, U.S.A. was, like its predecessors distinguished by Amer. success but several nations, including Great Britain were unable to send teams. The first well represented Olympiad was the fourth Olympiad, held at London in 1908. In this Olympiad weight lifting, polo, lawn tennis (omitted after 1921) and Association football (omitted after 1924) were introduced. Cycling, rowing, gymnastics, and wrestling, omitted since 1896 were revived. Rugby football was also included, but dropped in 1928. Swimming and hockey are two other popular events nor must the literary, artistic and musical competitions be forgotten. The fifth

Olympiad was held at Stockholm in 1912, but the sixth Olympiad to be held at Berlin did not take place owing to the First World War. The seventh Olympiad was held at Antwerp and the eighth at Paris where the Finn Nurmii distinguished himself. The ninth Olympiad at Amsterdam in 1928 saw the return of a (ex term excluded since the First World War and also the introduction of athletic events for women. England and the dominions had their most successful post war team while America was undominated.

THE OPENING OF THE 1915 OLYMPIAD

The left relay runners arriving at Wembley Stadium in union with the Olympic flame. Behind them is the Olympic mesage in the words of Baron de Coubertin

in the held events. Nine Olympic records were broken in 1928. The tenth was held at Los Angeles in 1932 and the eleventh at Berlin in 1936. This latter was used as a propaganda display for the National Socialist regime and there were expressions of racial prejudice when Negroes won some of the events. The twelfth Olympiad was held in London in 1948 the proceedings being opened by the arrival of a torch carried in relay from Greece. The following athletic events took place (men): 100, 200, 400, 800, 1500, 5000, 10,000, 20,000, 50,000, 100,000, 10,000 and 50,000 metres walks, 100 and 100 metres relay, steeplechase, high jump, long jump, hop, step and jump, pole vault, weight, discus, hammer, javelin, 110 metres hurdle, 100 metres hurdle, decathlon (women): 100 and 200 metres, 100 metres relay

80-metres hurdles; high jump; long jump; weight; discus; javelin. Other contests were basket ball; boxing, of various weights; canoeing, over sev. distances; cycling, over sev. distances; equestrian, of sev. types; fencing, individual and team, with épée, foil, or sabre; Association football; gymnastics, individual and team; hockey; rowing, sculls, pairs, fours, and eights; a modern pentathlon, comprising riding, fencing, shooting, swimming, and running; shooting, with pistol and rifle; swimming; diving; water polo; weight lifting; wrestling, free style and Greco-Rom.; and vaulting. The women's 200 metres, long jump, and weight, were new events. New Olympic records were estab. as follows: men's 800 metres, M. Whitfield (U.S.A.), 1 min. 19.2 sec.; men's 5000 metres, G. Beiff (Belgium), 14 min. 17.6 sec.; men's 10,000 metres, E. Zatopek (Czechoslovakia), 29 min. 59.6 sec.; 10,000 metres walk, J. F. Mikaelson (Sweden), 15 min. 13.2 sec.; men's weight, W. M. Thompson (U.S.A.), 56 ft. 2 in.; men's discus, A. Consolini (Italy), 173 ft. 2 in.; men's 110-metres hurdles, W. K. Porter (U.S.A.), 13.9 sec.; men's 100-metres hurdles, R. B. Cochran (U.S.A.), 51.1 sec.; women's 80-metres hurdles, E. E. Blankers-Koen (Netherlands), 11.2 sec.; women's high jump, A. Coachman (U.S.A.), 5 ft. 6 in.; women's javelin, H. Bauma (Austria), 149 ft. 6 in.; modern pentathlon, Capt. W. Grut (Sweden), 16 points; men's 100-metres free-style swimming, W. Rie (U.S.A.), 57.5 sec.; men's 200-metres breast-stroke swimming, J. Verdeur (U.S.A.), 2 min. 39.3 sec.; men's 100-metres free-style swimming, W. Smith (U.S.A.), 1 min. 11.0 sec.; men's 500-metres relay swimming, U.S.A., 8 min. 16.0 sec.; women's 200-metres breast-stroke swimming, N. van Nijet (Netherlands), 2 min. 57.2 sec.; women's 100-metres free-style swimming, A. Curtis (U.S.A.), 5 min. 17.8 sec.; women's 100 metres back-stroke, K. Harup (Denmark), 1 min. 14.4 sec.; women's 100-metres swimming relay, U.S.A., 1 min. 29.2 sec.; feather weight lifting, M. Fayad (Egypt), 7524 lb.; light-weight lifting, I. Shams (Egypt), 7931 lb.; middle-weight lifting, F. Spellman (U.S.A.), 8394 lb.; light heavy-weight lifting, S. A. Stanczyk (U.S.A.), 920 lb.; heavy-weight lifting, A. Davis (U.S.A.), 9974 lb. In the men's 100-metres race, A. S. Wint (Jamaica) equalled the Olympic record at 16.2 sec.

A winter-sports pentathlon was held at St. Moritz, Switzerland, in 1948, twenty-eight nations sending nearly 1000 competitors. The thirteenth Olympiad is planned to be held at Helsinki in 1952.

The games are controlled by the International Olympic Committee, on which about fifty nations are represented. The equipping of each team is the work of the national committee, i.e. in Great Britain, of the Brit. Olympic Association. See also ATHLETICS. See F. A. M. Webster, *The Evolution of Olympic Games*, 1914, and *Olympic Cavalcade*, 1948.

**Olympiodorus**, names of two philosophers of the Neoplatonic school, natives of Alexandria. O. the elder (fifth cen-

tury A.D.) was teacher of Proclus. Of the writings of O. the younger (sixth century A.D.) are extant a life of Pluto, an attack on Strabo, and scholia on the *Phaedo*, *Alcibiades I.*, *Philebus*, and *Gorgias*.

**Olympus**, anc. name of sev. chains of mts. The most famous (now called Elymus) was on the frontiers of Thessaly and Macedonia. Its highest peak of 9751 ft. above the sea level, and is snow-capped for nine months of the year. O. was regarded by the Gks. as the abode of the gods, and as having the palace of Zeus at its summit.

**Olynthus**, anc. tn. of Chalcidice, and the most important of the Gk. cities on the coast of Macedonia. It was at the head of a confederacy of all the Gk. tns. in its neighbourhood, and maintained its independence, except for a short interval when it was subject to Sparta, till it was taken and destroyed by Philip (347 B.C.). The Olynthian orations of Demosthenes urged Athenians to send assistance to the city when it was attacked by Philip.

**Olyphant**, coal-mining tn. of Lackawanna co., Pennsylvania, U.S.A., on the Lackawanna. Pop. 9200.

**Omacatl**, Mexican god of joy and festivity (the name signifies 'two roads'). He was worshipped only by those who came under his direct influence, i.e. the rich who could render homage to him in splendid banquets. The idea of communion which appears to have justified the religious feasts of the Mexis was apparently present in these banquets to the Mexican Bacchus.

**Omagh**, mkt. tn., cap. of co. Tyrone, N. Ireland, on the Strule. Its castle now in ruins was besieged in 1509 and 1641. Milling and shirt manufs. are carried on. Pop. 6000.

**Omaha**, co. seat of Douglas co. and chief commercial city of the State of Nebraska, U.S.A., is on the r.b. of the Missouri R., 20 m. N. of the mouth of the Nebraska R. The city is well built on the sloping banks of the rlv., and has many fine edifices, including the Creighton and O. Unvs., the court house, and the Coliseum. It is an important railway centre, with an airport, and has extensive manufs. of machinery, linseed oil and white lead, with brewing and distilling. Smelting of zinc, lead, copper, gold, and silver is carried on, and slaughtering and meat-packing are thriving industries. S. Omaha, formerly a separate city, was incorporated with O. in 1911. Pop. 223,500.

**Omaha Beach**, code-name of the stretch of beach from the Vire R. to Port-en-Bessin, where the U.S. 5th Corps landed on D-Day 1944, in the Second World War.

**Omahas**, tribe of N. Amer. Indians, who inhabit a reservation in E. Nebraska, U.S.A. They are of Sioux stock, and originally dwelt in Minnesota.

**Oman**, Sir Charles William Chadwick (1860-1946), Eng. historian, b. at Muzafarpur, Indin. In 1883 he was made a fellow of All Souls College. In 1905 a member of the Brit. Academy and Chichele prof. of modern hist. at Oxford, retiring from the latter post in 1946. Conservative

M.P., Oxford Univ., 1919-35, he was made K.B.E. in 1920. From 1917 to 1921 he was president of the Royal Historical Society, and in 1927 president of the Royal Archaeological Institute. A specialist in military hist., among his writings are *A History of Greece* (1888); *A Short History of England* (1895); *A History of the Art of War in the Middle Ages* (1898, 1921); *A History of the Peninsular War* (1902-11), a work of the greatest authority; *A History of England before the Norman Conquest* (1910); *Castles* (1926); *Napoleonic Studies* (1929); *A History of the Art of War in the Sixteenth Century* (1937); and *On the Writing of History* (1939). His daughter Carola (b. 1897) is also a historian, well known for her life of Nelson (1917).

**Oman** (and Muscat), independent sultanate in the most E. portion of Arabia, consisting of a strip of maritime ter., bounded on the N.E. by the gulf of O. and on the S.W. by the deserts of the interior. Inland the sultanate extends to the fringes of the Nub' al Khali desert. Area 82,000 sq. m. At a distance of from 20 to 40 m. from the coast a chain of mts. runs parallel to it, which reaches in its highest ridge (called Jebel Akhdar), an elevation of nearly 3000 ft. There are some fertile tracts, but the greater part is a waste of sand. The Umm al Samin quicksands, skirting the t. r. of the Drua, is a vast swamp running N.W. to S.E. for 90 m., and is about 45 m. at its broadest. The coastline between Muscat and the prov. of Dhofar is barren and forbidding.

Dhofar is a fertile prov., of which the chief ts. are Salalah and Murba. The chief products are pearls, dates, sugar cane, and fruit. Trade is mainly in the hands of the Indians, some of whom are Brit. subjects. Rice, sugar, and coffee are the chief imports. There are no industries of any importance. Muscat is the chief port (pop. 4500). Muscat is the starting point for trade routes inland. Other ts. are Kalba, Hagar, and Boher. A new treaty of commerce and navigation between Britain and the sultan was concluded in 1939. The pop. is estimated at 1,500,000.

**Oman, Gulf of**, extension of the Arabian Sea to the N.W., between Makran (Persia) and O. It leads to the Persian Gulf through the strait of Ormuz, and has a width of 200 m. at its entrance.

**Omar** (d. 644), Moslem caliph from 634 to 644. He subdued Egypt, Palestine, and Syria, and defeated the Persians, and was the first to have the title of Commander of the Faithful. He introduced the new Arabian calendar. *See also* OMAR, MOSQUE OF.

**Omar**, inv. of W. Siberia *see* OB.

**Omar Khayyám** (c. 1031-c. 1130), Persian poet, mathematician, and astronomer, b. at Nishapur, the cap. of Khoresan. He was a pupil of Inám Muttaki, an aged Sunni teacher. O. K. revised the calendar under the sultanate of Malik Shah, and became famous throughout the E. as a mathematician; a work on algebra was known in Europe. His name is now inseparably connected with the *Rubáiyát*,

a long poem in quatrains, forming a medley of love and tavern songs, tinged with Sufi mysticism and with the melancholy of E. fatalism. A trans., or rather a paraphrase, of this poem was pub. in Eng. by Edward Fitz-Gerald in 1859. The authenticity of many of the quatrains has been questioned. *See* F. Wapoko, *L'Alphabet d'Omar Alkayyám*, 1851; Heron-Allen, *Facsimile of the Manuscript in the Bodleian Library*, 1898; eds. of the *Rubáiyát* by Winfield (who pub. a new Eng. version in 1882 and 'the first critical version of the text' in 1883) and John Payne, the poet, who produced another trans. in 1898; Pierregard, *Sufi Interpretations of the Quatrains of Omar Khayyám*, 1902; life by J. K. M. Shirazi, 1905; O. Rothheld, *Omar Khayyám and his Age*, 1923; A. G. Potter, *Bibliography of the Rubáiyát of Omar Khayyám* (eds. in foreign languages), 1929; essay by L. Housman and biography of Fitz-Gerald by G. F. Munro in Collins's ed. of *The Rubáiyát*, 1947.

**Omar, Mosque of, or Dome of the Rock**, mosque in Jerusalem on the supposed site of Muhammad's ascent to Heaven, or, from the Jewish point of view, of the uncompleted sacrifice of Isaac. It was built by O. (d. 644), the second successor of the prophet. *See also* MOSQUE.

**Ombre**, or 'The Man,' game of cards in vogue by the Spaniards. It is played by three persons with a pack of forty cards, the 8, 9, and 10 being dispensed with, and each player is dealt nine cards by threes. Each deal constitutes a game, and one hand plays against the other two, the solo player being called the 'O.' The game is described by Pope in his *Rape of the Lock*.

**Omdurman**, tr. of the Anglo-Egyptian Sudan; is on the l. b. of the Nile, facing Khartoum. It is a trading centre and a pilgrim's resting place, and was the chief tn. during the regime of the Mahdi. On Sept. 2, 1898, Brit. forces under Kitchener, advancing up the Nile after the victory at Abbara, encountered the forces of the Khalifa. During the battle the 21st Lancers delivered the last full-scale cavalry charge of modern warfare. Anglo-Egyptian losses were about 500; the Dervish casualties amounted to 10,000, as well as 5000 prisoners. Winston S. Churchill took part in the cavalry charge, and describes the operations in *The River War*, 1899. Pop. 116,100.

**O'Meara, Barry Edward** (1786-1836), Irish surgeon to Napoleon in St. Helena. He entered the army in 1801 as assistant-surgeon, served in Sicily and Calabria, and in 1807 went with Gen. Fraser to Egypt, but was dismissed from the army the same year for participating in a duel. After this he served as a naval surgeon, and in 1815 accompanied Napoleon to St. Helena. Here he remained for three years, but being accused by Lowe of intriguing with Napoleon, was recalled. He pub. *Napoleon in Exile* (1822), in which he attacked Sir Hudson Lowe's treatment of Napoleon, and *Observations upon the Authenticity of Bourrienne's 'Mémoires'*. He has been eulogised as 'the stiff surgeon' by Byron in his *Age of Irony*.

**Omelet** (the anglicised form of *Fr. omelette*) is a kind of thin pancake. It is made with eggs beaten up lightly, with the addition of milk, herbs, flour, cheese, mushrooms, ham, bacon, fish, or game, and salt and pepper for seasoning, according to the requirements, and cooked in a buttered pan. For sweet O.s. sugar is used instead of pepper, and fruit added.

**Omen**, name applied by the ancients to signs which were supposed to indicate good or bad fortune, e.g. the appearance of snakes, the flight of birds. See AT GUR; DIVINATION; ORACLE.

**Omer, Saint** (c. 595-c. 670), *Fr.* bishop. b. in the ter. of Constance, became a monk at Luxeuil. Later he became bishop of Thérouanne, his see including the present Pas-de-Calais and Flanders, in Belgic Gaul. To propagate the faith St. O. enlisted many monks, and a great number of abbeys were built. The saint himself was the co-founder of Sithin, and round this abbey grew up the tn. now known as St. O.

**Omer, St.** (France), see ST. OMER.

**Omis**, port of Dalmatia, Yugoslavia, 12 m. S.E. of Split (Spalato), is noted for muscatel wine. Pop. 10,000.

**Ommanney, Sir Erasmus** (1814-1904), Brit. admiral, b. in London. He took part in the battle of Navarino (1827), for which he received a medal. He discovered the first traces of the fate of Sir John Franklin in 1850, and for his scientific researches he received the Arctic medal, 1851, was made F.R.S. in 1865, and knighted 1877, being advanced to admiral the same year.

**Ommiads**, see OMAYYADS.

**Ommayyads**, Arabian family of Mecca, the first Arabian caliph dynasty, founded by Muawiyah, 661-80. Under them the Arabi realm extended to China and Spain. Between 756 and 1031 their empire still included the independent emirate of Cordova in Spain. See CALIPH.

**Omnibus** (Lat. 'for all'), name of a public conveyance which has undergone considerable modifications from its early form. The forerunner of the O. was the vehicle that made journeys in Paris from March 18, 1662, going at fixed hours, and with a fixed charge of five sous, but as this was only 'pour la plus grande commodité et liberté des personnes de mérite,' and soldiers, pages, lackeys, etc., were forbidden, it was not, strictly speaking, an O. The present system, by which no one is excluded, was begun in the time of Charles X.; the first O. to run in London was that started in 1829 by M. G. Shillibeer, which ran from the 'Yorkshire Stingo' at Paddington to the Bank, at a fare of one shilling. These early O.s., or 'buses,' as they were soon termed for convenience, were drawn by three horses abreast, and carried twenty-two inside passengers. They were later superseded by smaller vehicles, which carried twelve inside passengers. Outside seats along the centre of the road were the next improvement. Many of the larger tns. of the United Kingdom followed London's example in the matter of horse O.s. The London General Omnibus Company, which was founded in 1856 as *La Compagnie Générale des Omnibus de Lon-*

*dres*, became the largest of such companies, though the London Road Car Co. (which introduced the use of tickets) was at one time powerful. The first 'double-decked' motor bus was licensed by the police in 1904, and the last horse buses disappeared seven years later. The motor buses of the metropolis were taken over in 1933-35 by the London Passenger Transport Board (g.r.), which became the London Transport Executive in 1948. The latest type of bus is luxuriously upholstered and offers a considerable measure of comfort and silence. All prov. tns. have services, and the O. has become a link in the

SHILLIBEE'S BUS OF 1824

local and long-distance transport services of most countries. After the 1930s trolley-buses (see ELECTRIC TRACTION) replaced trams in many tns.

**O'Morgar, Malachy**, see MALACHY, ST.

**Omotoki**, see IMOSHIMI.

**Omphale**, Gk. mythology, the masculine but attractive queen of Lydia, to whom Heracles was bound a slave for three years. He became enamoured of her, and led an effeminate life spinning wool, while O. wore the lion's skin and was lady paramount.

**Omphalodes**, genus of annuals and perennials (family Boraginaceae), bearing racemes of white or blue flowers. *O. infolius* (Venus's navelwort) is a white flowered ann., often grown in garden borders. *O. Lucilia* (rock N.) is a blue-flowered perennial of considerable value in the rock garden. The plants prefer a partly shaded position.

**Omphalopsychol**, see HESYCHASTS.

**Omsk**, tn. of the R.S.F.S.R., cap. of the region of the same name, s and at the confluence of the Om and the Irtysh. It is situated at the junction of highways to Chkalow (Orenburg), E. Siberia, and Turkistan, whilst steamers run to Tobolsk and Semipalatinsk. The prin. public buildings are the cathedral, the former governor-general's palace, and the fortress; there is an agric. institute and a medical school. The seat of the W. Siberia Geographical Society is also here. It is a trade centre, and industries include brick and pottery making, brewing and distilling, and the manuf. of silk, tobacco, oil, and soap. Near the tn., in the wooded

steppe, there is a state cattle farm, which occupies some 12,000 ac. Pop. 280,800. On, see HELIOPOLIS.

**Onager**, or *Equus onager*, species of mammal in the family Equidae, is the best-known wild ass of Asia (it is now included in the subgenus *Isinus*). It occurs in the steppes of W. and central Asia, and so closely resembles *E. hemippus* of Syria (which was considered specifically distinct by Geoffrey St. Hilaire) that it is thought probable they belong to the same species. The O. is a swift-footed animal, sandy in colour but with a dark stripe running down its back.

**Onagraceae**, family of herbs and shrubs bearing red, white, yellow, blue, or purple axillary or terminal flowers, and opposite or alternate simple leaves. *Knuthera* and *Fuchsia* are among the genera.

**Onamuchi**, see OMAMUCHI.

**Onas**, see under FURGIANS.

**Onatas of Aegina**, Gk. sculptor (bronze and statuary) who flourished in the middle of the fifth century B.C.

**Ondes Musicales**, electrophonic instrument invented by Maurice Martenot of Paris in 1929. It produces notes from the air graded according to the chromatic scale by a special device. It has a warbling note, which keeps in tune with the other orchestral instruments. Honegger used the O. M. in his *Jeune d'Arc*.

**Onega**: 1. Tn. and seaport of the Archangel Region of the R.S.F.S.R., 90 m. S.W. of Archangel. It lies at the mouth of the O. R., at the head of O. Bay, an inlet of the White Sea. The inhab. are mostly occupied in the timber trade, but fishing is also engaged in. Pop. 5000. 2. Lake in the N. of Russia, lying partly in the Leningrad Region and partly in the Karelo-Finnish S.S.R. After Ladoga, the largest lake in Europe, it is 59 m. in greatest breadth, and about 150 m. in length. Area 3800 sq. m. Its only outlet is the R. Svir, which flows S.W. into Lake Ladoga. Lake O. communicates by canals with the Volga and thence with the Caspian Sea on the S.; with the Dvina, and thence with the White Sea on the N., and with the Vytegra by the Murmanskaya canal-system; the Stalin Canal lies along its S. shore, from the Svir R. to Vytegra, and assists navigation. The lake is rich in fish. Commerce is chiefly confined to the Stalin Canal.

**Onehunga**, maritime bor. of N. Is., New Zealand, 6 m. from Auckland, of which it is a suburb. There is a regular steamship service to and from New Plymouth, Wellington, and other ports. O. is of historic interest in that it was originally settled by military pensioners from England, and had the first lady mayor in the Brit. Empire (1894). Constituted a bor. in 1877. Pop. 16,500.

**Onaida**, one of the tribes forming the Iroquois nation.

**Oneida**: 1. City of Madison co., New York, U.S.A., situated at a height of 110 ft. above the sea, on the O. Creek, 26 m. W. of Utica. The prin. manufs. are furniture, wagons, engines, and machinery. The vil. of O. Castle, to the S.E., forms the gathering-place of the O. Indians,

whilst the headquarters of the co-operative O. community (see NOYES, JOHN HUMPHREY) are also to the S.E. Pop. 10,200. 2. Lake in New York, 6 m. to the N.W., of O. city, between the cos. of Oswego, O., Onondaga, and Madison. It is 20 m. long by 5 m. wide, and is drained by the O. R. into Lake Ontario.

**O'Neill, Eugene Gladstone** (b. 1888). Amer. dramatist, the first of international repute, b. in New York City. His father was James O'N., a well-known actor, who was celebrated in America for his star part in the old melodrama of *Monte Cristo*. O'N. studied at Princeton and Harvard, and then for a number of years led a most adventurous and varied existence. He went on a gold-hunting expedition to Honduras, spent sev. years in central and S. America, and worked as a sailor for two years. Returning to the U.S.A. he worked for a short time as a reporter, played a minor role in his father's company, and then spent months roaming the dock region of New York City. Stricken with tuberculosis, while in a sanatorium he wrote some one-act plays which were pub. at his father's expense. Upon restoration to health he went to Harvard Univ., and took a course in dramatic writings. *The Moon of the Caribbees* and *Six other Plays* was pub. in 1919. In the same year appeared *Beyond the Horizon*, his first full-length play. This won the Pulitzer prize in 1920, an honour later gained by two other of his plays. His early one-act dramas had been filled with realism. *Emperor Jones* (1921) was a clear break with realism, being rather an experiment in expressionism. The central figure, after whom the play is named, is a Negro who has made himself by sheer brute strength monarch of the ex-slaves in a W. Indian is. There is a revolution against him. In eight short episodes the audience is shown the change from the proud emperor to the timorous, superstitious black, lost in the jungle whither he has fled from those who seek his life. Out of O'N.'s knowledge of the docks and the sea grew *Anna Christie* (1922), another study in realism, which achieved great success both in New York and in London. *The Hairy Ape*, which appeared in the same year, is a second drama of expressionism. *Desire under the Elms* (1923), reverts to realism, being a tragedy of passion played out on a New England farm. *The Great God Brown* (1925) has been acclaimed as one of the finest imaginative productions in Amer. literature. Here O'N. showed his growing distaste for mere naturalism and his increasing employment of symbolism. The same is true of his *Lazarus Laughed* (1927): Lazarus died and returned to life with the knowledge of what death is and its place in the larger purpose. *Strange Interlude* (1928) is one of the strongest of all his dramas. Edmond Dujardin, the Frenchman, discovered the interior monologue for literature, and was followed by James Joyce in his *Ulysses*; O'N. adapts the interior monologue to the stage. Running to nine acts, and taking five hours to play, it is a test of the patience

and attention of the audience. Though its construction may appear fantastic and unreal, in actual presentation it is singularly effective. His concern is with human beings caught up in the currents of life, and struggling against the forces of evil. He deals largely with the depressed classes, and especially with the colour problem, though his *Mourning Becomes Electra*, produced in London in 1938, was a powerful and sombre modern psychological study of the Electra (Oedipus) complex. His *Days without End* (1934) is a modern miracle drama. In 1936 he was awarded the Nobel prize. Later works include *The Iceman Cometh* (1946). See studies by S. K. Winther, 1934, and R. D. Skinner, 1935; also J. W. Krutah, *The American Drama since 1918*, 1939.

O'Neill, Hugh, see TYRONE, EARL OF; IRELAND.

O'Neill, Shane, second Earl of Tyrone (c. 1530-87), Irish chief and rebel, oldest legitimate son of Con O. (1484-1559) (who was made earl of Tyrone by Henry VIII. in 1542). After much civil strife he was recognised as chief by Elizabeth on her accession, but the recognition was revoked. During his life Ulster was the scene of constant war. He was again acknowledged chieftain of Tyrone in 1582, but with a reservation of the rights of Hugh (who succeeded to the title in 1587); made a treaty with the Eng. at Drumcree (1583); captured the chief of the MacDonnells (1585); invaded the Pale (1586); burned Armagh (1586); was defeated by the O'Donnells at Letterkenny in 1587, and murdered by the MacDonnells at Cushendun.

Onesonta, vil. of New York, U.S.A., in Otsego co., on the l. b. of the Susquehanna, 73 m. S.W. of Albany. Pop. 11,700.

Onesimus, St., disciple of St. Paul, under whose influence he came after robbing and running away from his master Philemon, a citizen of Colossæ. See Paul's Epistle to Philemon.

Ongtong, see under LORD HOWE ISLAND.

Onion (*Allium Cepa*), bulbous-rooted plant (family Liliaceæ), probably a native of central or W. Asia, and cultivated from a remote period. By successive sowings and by careful storage, Os. may be had all the year round. Usually two main sowings are made; the chief, early in spring, to produce Os. for autumn and winter use, or for storing. The other sowings are made towards the end of the summer, for transplanting in the spring, a system by which larger and earlier bulbs are obtained which are seldom, if ever, attacked by the O. fly. In ordinary gardens the thinnings from the autumn sowings usually provide a sufficient supply of the green or spring Os. used in salads. Any except stagnant soils will grow Os. if well manured and if rotations of crops are followed, but only a deep, rich loam produces the heaviest crops. The growth of large Os. for competition at shows is very popular. Unlike much exhibition produce, their mild flavour makes them generally preferable in the kitchen to those less carefully

grown. The best Os. for pickling are small, hard bulbs produced from April sowings on rather poor, dry, sunny land.

Onions, Charles Talbot (b. 1873), Eng. philologist; educated at King Edward VI. School and Mason College, Birmingham. He entered the teaching profession, and then in 1895 joined the staff of the *Oxford English Dictionary*, of which he became joint editor in 1914. He continued his association with the dictionary until 1933, and was also editor of three editions of the *Shorter Oxford English Dictionary* in 1933, 1936, and 1944. He was a lecturer in Eng. literature at Oxford Univ., becoming fellow of Magdalen College in 1923, and in 1927 was appointed reader in Eng. philology. He was awarded the C.B.E., 1934. His valuable *Shakespeare Glossary* was first pub. in 1911.

Onions, Oliver (b. 1873), pseudonym of George Oliver. His first book, *The Complete Bachelor* (1901) was written through the encouragement of the Amer. humorist-illustrator and editor Frank Gelett Rogers. His first novel was *The Odd-job Man* (1903). In *Little Devil Doubt* (1909) he attacked the 'yellow press.' Then appeared *Widdershins* (ghost and mystery stories) (1911) and, among others, *The New Moon* (1918); *Peace in our Time* (1923); *Ghosts in Daylight* (1924); *The Spite of Heaven* (1926). These were followed by the trilogy *In Accordance with the Evidence*, *The Debt Account*, and *The Story of Louie*, which were rewritten under the title *Whom God has sundered* (1926). The best known of his later stories are *The Collected Ghost Stories of Oliver Onions* (1935); *The Hand of Cornelius Voyt* (1939); *The Story of Ragged Robin* (1945); and *Poor Man's Tapestry* (1946), a poetic story of the Wars of the Roses for which he received the James Tait Black Memorial prize. His short stories are mainly ghost, mystery, and crime stories. O. is the husband of Berta Ruck (b. 1878), novelist, whose books include *His Official Fiancée* (1914); *The Unkissed Bride* (1939); and *Half-past Kissing Time* (1931).

Onitsha, tn. of S. Nigeria, on the E. bank of the Niger, at the beginning of the delta region. Its position renders it an entrepôt for the trade of the dist. Pop. 18,000.

Onkelos, see TARGUM.

Onklons, see under MOUND DWELLINGS. Onnes, Heike Kamerlingh (1853-1926), Dutch physicist; b. at Groningen, where he was educated and became Ph.D. He was for some time director of the physical laboratory at Leyden. O. produced a temp. of -268° C., to liquefy helium, and made discoveries as to effect of low temps. upon resistance to electric currents. He received the Nobel prize for physics in 1913.

Onobrychis, genus of leguminous herbs or shrubs with pinnate leaves and axillary spikes or racemes of purple, red, or white flowers. *O. montana* is grown on the rockery; *O. sativa* is the well-known and handsome fodder plant, sainfoin (q.v.).

Onomatopoeia (Gk. *ōnōma*, name, and *poieō*, to make), term in philology applied to the formation of words by an imitation

of the sound associated with the thing designated; e.g. hiss, whizz, plop. It is now considered that its part in the growth of language has been small.

Onomichi, port of Honshu, Japan, on Inland Sea. It manufactures fancy mats, and saké is produced. There are forty-eight Buddhist temples. Pop 42,000.

Onslow Bay, on the S E coast of N Carolina, U S A. It receives the Newport, New, White Oak, and other rivers.

Ontake, sacred Jap mt in the Jap Alps, with a fourteenth century Shinto shrine at the summit. Altitude 11,000 ft.

Ontario, S E. prov. of the Dominion of Canada separated from the U S A by the St. Lawrence R. and the Great Lakes of Superior, Michigan, Erie, Huron, and O. It is that section of the Dominion which is contained between the Great international lakes and Hudson Bay, and between the W boundary of Quebec and the E limits of Manitoba. Its most S point is lat N 41° 41' and its most N, lat N 66° 48'. Until 1912 its total area was 260,862 sq m. In that year the prov was extended by Act of Parliament to include the E portion of Keewatin as far N as Hudson Bay, and its area now amounts to 412,582 sq m of which its water area of 49,300 sq m forms the unusually large percentage of 11.9. The area is thus about equal in extent to the combined areas of the six New England states of the U S A. The pop is 4,297,000 of the whole Dominion. The pop increased by 2,110,000 between 1871 and 1938. The W portion of Keewatin is now included in the prov of Manitoba. The Canadian portions of the Great Lakes cover an area of 40,354 sq m. The N W point of the prov is close to Port Nelson on Hudson Bay, and its N E boundary is formed by James Bay, an extension of Hudson Bay. The surface is of an undulatory character, in parts well suited to agriculture, with low ranges of hills extending westwards towards Lake Huron. The prov is watered principally by the St. Lawrence and Ottawa Rs, and their numerous tributaries. The largest lakes exclusively in O are Nipissing, Simcoe and Nipigon. The climate of O is healthy and bracing but in most parts colder in winter and warmer in summer than that of Great Britain. At Toronto the temp ranges from 89° F to 13° F, giving a mean temp for the year of 44° F. The rainfall averages 35 in annually. The soil of the arable areas is exceedingly fertile, and over 9,000,000 ac are under crops, the chief being oats, wheat, barley, and maize the minor crops include rye, peas, mixed grain, sugar beets, potatoes, and turnips. Agric production in 1946 was valued at over \$746,000,000. Dairy farming and cattle raising are engaged in. Fruit farming, especially in the Niagara dist, is carried on extensively, and splendid apples and peaches are grown. General farming also a most important primary industry is carried on under unusually favourable conditions. The tobacco plant is extensively cultivated.

O. is rich in minerals, the prin being gold, nickel, silver, cobalt, bismuth, ar-

senical ore, zinc, and lead. Huge deposits of low grade iron ore exist. The value of mineral production in O. in 1939 was \$24,049,000. Gold represented \$112,115,000 of the prov's production in 1939 and with other metals, of which nickel, copper, silver, arsenical ore, and cobalt are the chief, made up over 70 per cent of the total for the prov. In 1947 the total value of mineral production was \$249,623,703. The nickel for the Sudbury dist amounts to 90 per cent of the world's production. Mining is a thriving industry in the Sudbury, Cobalt, Kirkland

View from the canal

#### ONTARIO WELAND CANAL

A grain boat leaving the canal to enter Lake Ontario

Lake and Porcupine dists. Copper in malts is exported, and the production of metallic copper was 312,000,000 lb in 1939. Coal has not yet been discovered in any appreciable quantity, though lignite is being raised in the James Bay region but the means of obtaining it is rendered comparatively easy owing to the excellent system of canalisation and lake communication with the coal bearing dists outside the prov. The iron and steel industry in O is chiefly dependent on imported ores, but a high Bessemer grade iron ore deposit has been developed in O. Commercial production of iron ore, however was reported in 1930 from Michipicoten. The Atikokan dist W of Sarnia Lake contains some 15,000,000 tons of high sulphur magnetite, but no discoveries have been made in O of deposits of iron ore which do not require special treatment before being charged to the blast furnaces.

The deposits of high-grade mica and other essential war minerals proved valuable for the Brit. market when its feldspar supplies from Scandinavia were cut off. Development work for the production of asbestos was begun in 1941. The greater part of the Canadian production of common salt comes from wells in S.W. O. Gypsum is mined in Paris, O. Lumbering is an important industry, and the productive forests, which cover 174,000 sq. m., yield spruce, pine, birch, poplar, and other valuable timber. Fur production is valued at over \$4,000,000 annually. The petroleum wells in the S.W. of the prov. produce a steady supply of oil. The fisheries, which are valued at over \$3,000,000 a year, yield cod, salmon, bass, herring, lobsters, and mackerel. O., of all the Canadian provs., is the centre of the country's manufacturing life, owing to its abundant water-power resources and its proximity to the coal-fields of Pennsylvania. There are forty-seven hydro-electric power systems, using Niagara and other falls. The manufs. are numerous and varied; agric. implements, railway rolling stock, and textiles being the most important; but during the Second World War there was a rapid increase in the output of many kinds of munitions and other secondary manufs. essential to the Allies' war effort, such as aero engines, and aeroplane construction generally. The output equals that of the rest of Canada. There is great activity in the canning and pork-packing industries.

In respect to post-war planning schemes it is an important commentary that in a young country like Canada, in parts of its wealthiest prov., O., soil erosion, desertification, and loss of water resources should have become extensive. The Ganaraska R., selected as a considerable area for post-war development, drains about 75,000 ac. and the water reaches have been seriously deforested, with wind and water erosion continuing after the destruction, so that a considerable portion of the upper part of the Ganaraska watershed is now unfit for successful agriculture. Its reforestation and other conservation methods will, however, be supplemented by dams for flood control. Spring flooding on the W. of S. O. is a very serious ann. danger, causing substantial loss to municipalities along their shores.

O. is well equipped with a variety of educational institutions, and has sev. univs. and colleges of importance. In recent years there has been in Canada a tendency to lengthen the period of compulsory attendance, and this tendency has been most marked in O., where in 1919 an Act was passed providing that children from eight to fourteen years of age must attend full time, and that young persons from fourteen to sixteen, who have not reached univ. matriculation standard, must attend full time; those exempted owing to their occupations must attend part-time classes. The operation of this Act has greatly increased the attendance in O. secondary schools. The average number of pupils attending educational institutions is over 700,000. The O. agric.

college and experimental farm at Guelph were estab. in 1874 to train young farmers in the science and practice of agriculture and to conduct experiments for the benefit of the prov. The Kemptville agric. school and farm had grown rapidly in importance before the Second World War. The horticultural experiment station at Vineland in the centre of the Niagara fruit belt is the most important station in Canada for work on the special problems of the fruit and vegetable grower. Other similar institutions are the Ridgetown experimental farm in the S.W. peninsula and the New Liskeard demonstration farm in N. O. The leading denominations in O. are United Church of Canada, Rom Catholics, Church of England, and Baptists, in the order named.

The ordinary revenue and expenditure in the years immediately preceding the Second World War balanced at about \$90,000,000. In 1918 the gross interin figures were revenue, \$199,850,000; expenditure, \$165,811,000. The estimated wealth of O. at upwards of \$10,000,000,000 represents about one-third of that of the whole dominion.

The prov. has a separate Parliament and administration, with a lieutenant governor at its head, assisted by ninety members (elected for five years), forming a Legislative Assembly which has power to control its own affairs, but must not conflict with the policy of the central administration of the dominion, to which are sent eighty-two members and twenty-four senators. The Executive Council consists of thirteen members, nine holding portfolios. Besides the regular depts., certain commissions have been created for specific purposes: these include the Niagara Falls Park Commission, Railway and Municipal Board, Hydro-Electric Power Commission, and Timiskaming and N. O. Railway Commission. The cap. is Toronto (695,300). Other important cities are Ottawa (the seat of government) (164,300); Hamilton (179,600); Windsor (118,500); London (87,319); Brantford (52,000); and Kingston (25,000). There is railway communication to all parts of the prov. Before the war of Independence the country was sparsely inhabited by roving tribes of Indians; but on the close of the war of 1783 thousands of Brit. loyalists crossed over into Canada, and this portion was called Upper Canada, a name it continued to bear until 1867, when it was renamed O. It is the premier prov., and is considered the most flourishing in the dominion. See also CANADA. See A. H. D. Ross, *Ottawa, Past and Present*, 1927; E. C. Guillet, *Early Life in Upper Canada*, 1933; F. Landon, *Western Ontario and the American Frontier*, 1941; and *Western Ontario*, 1943; R. L. Jones, *History of Agriculture in Ontario, 1613-1880*, 1946; and O. Bureau of Statistics and Research, *A Conspectus of the Province of Ontario*, 1947.

Ontario, Lake, lake of N. America, forming part of the S. boundary of the above prov., situated between lat. 43° and 44° N. and long. 76° and 80° W. Its length is 135 m., and its mean breadth is

about 50 m.; its depth ranges from 15 to 120 fathoms. The St. Lawrence R. forms its outlet on the N.E., while in the S.E. it receives the waters of Lake Erie, by means of the Niagara R. and the Welland Canal. Its area is over 7000 sq. m., and it contains sev. is. at its E. end. The lake abounds in fish, and it is noted for its Oswego bass. The chief Canadian ports on its shores are Toronto, Hamilton, Kingston, Port Hope, and Coburg, while Oswego, Sackett's Harbor, and Charlotte are the chief Amer. Stornis are prevalent on the lake, whose coasts are studded with lighthouses.

Onteniente, tn. of Spain, in the prov. of Valencia, on the Clariano, 45 m. S.W. of Valencia. Pop. 14,000.

Ontology (adapted from a Late Lat. word, *ontologia*, from the Gk. *on*, *ontos*, the present participle of the verb *einai*, to be, and *logos*, word or science), the name given to that branch of philosophy which deals with the problem of being, that is with reality in the abstract. The name given to the science by Plato was 'dialectic', whilst Aristotle's 'first philosophy' was akin to it. Though the name *O.* is not now used so much, it may be said to be that study which deals in a comprehensive manner with the ideas of reality, being, existence, etc., in their application to the objects of scientific thought. A great part of metaphysics has been bound up with these questions, though, of course, in the dawn of philosophy the possibility of objective reality was not questioned. Wolff was the first philosopher to use *O.* as a technical term. He divided theoretical philosophy into that which deals with being in general (subjective or objective) and that which deals with particular entities. The former he called *O.*, whilst the latter was divided into psychology, cosmology, and natural theology, according as the entities were the soul, the world, or God. The theory that the nature of knowledge itself is the first study of philosophy, and that not until a conclusion has been come to on this does the nature of being admit of study, has of late years superseded Wolff's theory. Thus with the evolution of metaphysics *O.* has been relegated to a secondary place. See articles on PHILOSOPHY, PSYCHOLOGY, METAPHYSICS, etc., and on the various religious systems, all of which have some ontological basis. See J. MacTaggart, *Nature of Existence*, 1927; G. Santayana, *Rein of Essence*, 1928; C. G. Stone, *The Social Contract of the Universe*, 1930; E. Meyerson, *Identity and Reality*, 1930; W. Ehrlich, *Ontologie des Daseins*, 1910; L. De Raeynacker, *Philosophie de l'être*, 1946; and P. Coffey, *Ontology and the Theory of Being*.

Onus Probandi (Lat., burden of proof). In the law of evidence the general rule is that the burden of proving any fact alleged lies on him who pleads such fact, not on him who denies or 'traverses' it; e.g. if A alleges that he sustained personal injuries by reason of B's negligent driving of a motor car, it is on A to give at least prima facie evidence of B's negligence before B can be called upon to give re-

butting evidence. The general rule is best expressed in Stephen's words, that the O. P. lies on that party against whom judgment would be given if no evidence were produced on either side. Of course, as a trial proceeds, the burden may be, and usually is, shifted from the party on whom it originally rested to his opponent by reason of his proving facts which raise presumptions in his favour. Following the general rule, the burden of proving facts alleged by way of *confession and avoidance* (*q.v.*) lies on him who alleges such facts; and the burden cannot be shifted by pleading what is really a *confession and avoidance* in the form of a 'traverse' (*q.v.*) or direct denial. See also EVIDENCE.

Onychium, small genus of evergreen ferns with finely divided, graceful fronds. *O. auratum* needs stovehouse culture; *O. japonicum* is more hardy, but must be kept somewhat dry in winter. It is easily increased by div. of its numerous crowns.

Onychophora (Gk. *onyx*, claw, *phora*, to bear), class of the phylum Arthropoda (i.e. insects, crustaceans, and other invertebrates with jointed legs), includes sev. genera, but the term *Peripatus*, estab. by Gudding (1826), is still commonly used as the generic name for all. He included it in the Mollusca, but Moseley (1874) proved conclusively its arthropod structure. The characteristics of the class are the presence of air tubes, tracheae; a dermomuscular body wall; paired excretory ducts, the nephridia; and a body composed of many similar segments bearing 'feet.' The head is joined directly to the body and bears

PERIPATUS

single pairs of antennae, jaws, and oral papillae; the openings of the tracheae are scattered over the body. The jaw muscles are striated. Malpighian tubules are absent. *Peripatus*, of which there are many species, is found in the S. continents, Malay, New Zealand, and the E. and W. Indies. It looks somewhat like a caterpillar of medium size, and lives in damp places under the bark of trees. In its heart and lacunar circulation, small ocelum and hemocoel, salivary glands, the presence of tracheae, the modification of its anterior appendages as mouth parts, and its regular ecdysis, *Peripatus* resembles the Arthropoda. It differs from them in the absence of exo-skeleton and external segmentation; the soft cuticle and muscular body wall; the segmentally arranged nephridia with ciliated tracts. In these and other characters it resembles the Annelida (segmented worms), and may be regarded as providing the 'missing link' between the two groups.

Onyx, chalcedony composed of alternating white and black or dark brown layers. These colours are often modified by artificial staining in order to enhance the value of the stone for ornamental purposes. It was highly valued by the

ancients and used for cameos. The term 'O. marble' was at one time applied to alabaster. A variety of O. is sardonyx, which contains alternating bands of dark red carnelian (sometimes called sard). The best varieties of O. are obtained in India.

**Oodnadatta**, tn. of S. Australia, N.W. of Lako Eyre, on the railway from Port Augusta to Alice Springs. Pop. 100.

**Ookiep**, mining tn. of Namaqualand, Capo Prov., S. Africa, 92 m. E.S.E. of Port Nolloth. Copper ore is mined in the dist. Pop. 2000 (100 whites).

**Oolite**, or **Roestone**, limestone which is composed of small rounded grains, which show in their section under the microscope a concentric shell arrangement. Each grain shows also a radial structure, and under polarised light should give a black cross if a true spherule. The concentric layers of the grain are gathered round a nucleus, which may be a quartz granule, a piece of shell, or other organic body. Some modern Os. (as at Carlsbad) are probably due to algae (*Girardinella*) which secrete lime from the surrounding waters and build up these radiate and fibrous grains. The Os. are well developed in the Jurassic system, the entire varieties being called **peastone** or **pisolite**.

**Oology**, science relating to birds' eggs, their identification, classification, etc. The general characteristics of birds' eggs are a shell composed chiefly of carbonate of lime with smaller quantities of phosphate of lime and magnesia, a membrane enclosing the food material, the white or albuminous food material, the yolk or yellow portion, and the minute germ from which the living organism develops. Some shells have an outer glazed layer like porcelain glaze, as in the ostrich egg; others have a chalky outer layer, as in the eggs of cuckoos, cormorants, and grobes; yet others have a translucent outer layer as in the kingfisher's egg. Eggs are also identified by their shape; those of the plover are pear-shaped, those of the sandpiper cylindrical, those of owls are spherical, while the majority have the familiar shape of the hen's egg. Colour, or pigmentation, occurs in wide variety, both in individuals and in different species. The uniform tints or ground colouring may be brownish, blue, yellow, brick-red, or green; superposed on this may be lines or spots or both of different colour or different intensity, while the eggs of rails and plovers often exhibit double spots; that is, strongly marked spots superposed on a wider area of paler hue. It may be mentioned that a special licence is necessary for the collection of wild birds' eggs, as they are now almost everywhere protected by law.

**Oorial**, see **URIAL**.

**Oort** (or **Noort**), Adam van (1557-1641), Dutch painter, b. at Antwerp. Among his pupils was Rubens. He had considerable ability, especially as a colourist. He became a member of the guild of St. Luke in 1587.

**Oostende**, see **OSTEND**.

**Oosterbeek**, vil. of the Netherlands, 3 m. W. of Arnhem, was the 1st Airborne Div.

headquarters in the Arnhem battle. A memorial was unveiled in 1948 to the Brit. troops, most of the dead being buried in a nearby cemetery.

**Oosterhout**, tn. of N. Brabant, Netherlands, 5 m. N.E. of Breda. There is trade in agric. produce, manufs. of pottery and tiles, tanning and sugar-refining. Pop. 15,000.

**Oostkamp**, tn. in W. Flanders, Belgium, 4 m. S. of Bruges. The inhab. are mainly engaged in agriculture, cattle breeding, and manufs. of linen. Pop. 7700.

**Ootacamund**, tn. in the Nilgiri hills dist., Madras, India; summer headquarters of Madras Gov. The chief sanatorium of S. India, it is situated at an altitude of 7500 ft. Pop. 29,900.

**Ooze**, see under **OCEAN AND OCEANOGRAPHY**.

**Opacity**, that property of a body which prevents light passing through it. Newton explained this property by the unequal densities of the particles of the body, the light being so irregularly reflected and refracted that ultimately it becomes absorbed. On the wave theory of light it is explained as being due to the fact that the pores between the particles of the body stop the vibrations of the ether.

**Opal**, see **SUN-PISS**.

**Opal**, hardened colloidal condition of silica, usually containing a small percentage of water. It is found disseminated in veins and nests through rocks, and is also formed from the siliceous waters of some hot springs (geysers). In colour, O. is white, grey, yellow, red, etc., the colours varying according to the position in which the stone is held. Precious O., which exhibits a delicate play of colours (opalescence), is found in Hungary, Mexico, Queensland, New S. Wales, and S. Australia, and for jewellery is cut with a convex surface. Large stones are difficult to procure for jewellery, owing to the multiplicity of flaws with which they are intersected. Fine O. found in Mexico gives fire-like reflections. **Hydrophane** is an opaque white or yellow variety, which becomes translucent and opalescent on immersion in water. Wood O. is wood replaced by silica, the grain of the wood being preserved. It has a variety of colours, and is used for ornamental purposes. **Hyalite**, a transparent glossy variety of O., occurs in stalactite form. **Menilite** occurs in concretionary forms in shaly deposits, and is sometimes called liver O. **Float-stone** is a tuberos or porous siliceous mass which floats on water. **Tripoli** infusorial earth is related to O.

**Opava** (Ger. **Troppau**), cap. of Silesia, Czechoslovakia, on the O. R., a trib. of the R. Oder. It manufs. textiles and machinery, and beet sugar. Pop. 35,000.

**Opencast Mining**, see under **MINING**.

**Open Field System**. O. F. S. of farming was in vogue during the time of William I. The arable and of the manor farms consisted of three large open fields, one for wheat or rye (the bread crop); another for barley, for barley cakes and beer (the drink crop); and the third ploughed to rest the soil (fallow). The fallow field in the

next year would be sown for wheat, while the barley field would become fallow, so that every three years each field would in turn be rested. The fields were divided into strips of 1 ac. or  $\frac{1}{2}$  ac., and were separated by low ridges of unploughed turf, instead of by hedges, thus being open, as opposed to the enclosed field of to-day. Laxton in Nottinghamshire and Yarnton in Oxfordshire are farmed in some degree on similar lines to-day, and at Eton certain meadows are thrown open during Aug., Sept., and Oct. to the cattle of the villagers under the care of a 'hayward.' See further under COMMONS AND ENCLOSURES.

**Open Hearth (Siemens) Steel Process,** see under IRON AND STEEL.

**Openshaw**, dist. of Lancashire, England, included in the city of Manchester, is a manufacturing area, with textile, engineering, and chemical works. The Manchester-Stockport canal traverses the dist.

**Open Spaces.** Statutory recognition of the hygienic value of O. S., especially in developing dists., is a matter of comparatively recent legislation. The earliest legislation under this description is to be found in the Recreation Grounds Act, 1859, which was passed to facilitate grants of land near populous dists. for the regulated recreation of adults and as children's playgrounds. The object of the Public Improvements Act, 1860, was to assist municipal hors. and pars. of over 500 inhab. in acquiring land for recreation or to enhance the amenities of their dists. The Town Gardens Protection Act, 1863, was passed for the protection of gardens in squares, etc., which had been allowed to fall into neglect, but it is an Act of limited operation. Power of keeping order in royal parks is given to the commissioners of works by the Parks Regulation Act, 1872, as amended in 1926. The London Parks and Works Act, 1887, provided for the maintenance of certain public parks (these include Victoria, Battersea, and Kennington Parks, the Chelsea Embankment, and the Bethnal Green Museum Garden) in the metropolis, a duty which has since devolved on the L.C.C. By the Parks Regulation (Amendment) Act, 1926, the definition of a 'park,' as contemplated by the prior Act of 1872, is extended so as to cover all O. S. under the control of the commissioner of works, except such as did not come under the Act of 1872 before 1926. It thus includes all parks, gardens, recreation grounds, O. S., and land invested in and under the control of the commissioner, and the latter authority is empowered to make regulations for the public use of such places. By the London Squares and Enclosures (Preservation) Act, 1906, a number of squares and gardens were protected from being built upon. The Metropolitan Open Spaces Acts, 1877 and 1881, applied only to the metropolis. These Acts, and the Open Spaces Acts of 1887 and 1889, enabled urb. and rural dist. councils to secure existing O. S. for the use of the public. By the Open Spaces Act, 1906, which repeals and consolidates all the

previous Acts on the subject, and extends powers as to O. S. to co. and par. (as well as to urb. and rural dist.) councils, an open space is defined as 'any land, whether enclosed or not, on which there are no buildings, or of which not more than one-twentieth part is covered with buildings, and the whole or the remainder of which is laid out as a garden, or is used for purposes of recreation or less waste and unoccupied.' The Act provides that trustees (or any one else) having in their control an open space or any interest in an open space, may, subject to the consent of two-thirds of the owners and occupiers of houses fronting the open space, or who are liable to be rated for its maintenance, convey the open space either out and out, or for a term of years, to the local authority with a view to its preservation and regulation as a public garden or open space. There are also analogous powers as to securing, for the public benefit, land which is used for recreation by the inhab. of certain houses, or over which the right of enjoyment by way of exercise and recreation has been already secured by covenant only to the owners or occupiers of houses round or near the open space. Further, the owners of a disused burial ground may convey or lease the same to a local authority, so as to give the public access to it, and the local authority may then lay out and improve the ground. But games or sports may only be played on disused burial grounds under an episcopal licence, if the ground be consecrated; if not, under the sanction of the body from whom the ground was taken over. Particulars as to tombstones or monuments proposed to be removed must be registered, and notice of any such proposal given to persons interested. The Act also empowers local councils to appropriate land already under their control for use as an open space. Having acquired ground for an open space the local authority is bound to keep it in a decent state; and may not only enclose it with railings and gates, and drain, level, light, and otherwise improve it, but may make by-laws for its regulation. Urb. dist. councils and co. councils are empowered under the Open Spaces Act, 1906, and the Public Health Act, 1875, to acquire and maintain or contribute to the maintenance of public walks or pleasure grounds. Dist. councils may borrow for the purposes of the Open Spaces Act in the same way as they may borrow under the Public Health Act, 1875 (see LOANS, PUBLIC).

The L.C.C. has power to exchange land in the metropolis for O. S., to provide lands for sports grounds and swimming baths, to acquire lands for public walks and pleasure grounds; to contribute to the expenses of local authorities for similar purposes, and to enclose O. S. to provide dancing places in O. S. under their control, and to flood and enclose O. S. for skating. These powers are given by the L.C.C. (General Powers) Acts, 1905, 1921, 1923, and 1926.

As many anct. monuments are situated in O. S. we may conveniently include under this title the Ancient Monuments

Consolidation and Amendment Act, 1913, which recognises the principle, now to be found implicit in all recent town and country planning Acts, that the nation has an interest in ancient monuments apart from the interests of the legal owners of the monuments. The regulations under town-planning legislation state that draft plans and maps of town-planning schemes should show what provision is being made for O. S., recreation grounds, and playgrounds.

The term O. S. is also used in a cognate but technically distinct sense in connection with building by-laws framed under the London Building Acts and the Public Health Acts, such by-laws having for their object the enforcement on builders of the obligation to keep a proscribed space about buildings so as to secure a free circulation of air. See W. G. Lumley, *Public Health Acts* (6 vols., 11th ed.), 1939-46.

Opera, drama of any description with musical setting for voices and orchestra. The modern art-form arose in Italy about 1600, but its origins go back much further, through the medieval mystery plays to the Attic drama, in which music played an important part. Perhaps the first essay in the direction of O. was the song-play of the thirteenth century; *Robin et Marion*, a song-play by the eminent trouvère, Adam de la Halle, has claims to be regarded as the first comic O. Late in the sixteenth century an aristocratic Florentine circle of musicians and literary men known as the Camerata, reacting against the current polyphonic musical style and attempting to revive the principles of Attic drama, began to write dramatic works in a new declamatory style—recitative. The leaders were the composers Peri and Caccini and the poet Rinuccini. The first known It. opera is *Dafne* (1597) by Peri and Rinuccini; the first of which the music survives complete is *Euridice* (1600) by the same collaborators; this libretto was set by Caccini two years later. A different approach was through the madrigal. Vecchi's *Amfiparnaso* (1597), a series of madrigals not intended for the stage, yet approaches dramatic form. The first great master of O. was Monteverdi, whose *Orfeo* was produced at Mantua in 1607. His madrigals had already gone a long way in dramatic expression; he now enriched a dramatic text by greatly strengthening the orchestral and harmonic elements, and foreshadowed the later aria in his attempts at sustained melody. The distinction between recitative and melody or aria became clearer in his successors Cavalli and Cesti, but the balance of music and drama was lost; the It. love of vocal and scenic display usurped the functions of dramatic characterisation. The subjects were still generally classical, but comic episodes were introduced as a diversion.

In 1637 the first O. house was opened at Venice. O. soon spread to other It. towns, then to Paris (c. 1645), Vienna, and Germany, where it flourished in Hamburg. The Fr. O. was founded in 1669 by the poet Perrin, and the first Fr. O., by Perrin and Caribert, was produced there in 1671.

But it was the It. Lully who, incorporating the native ballet, established the tradition of Fr. grand O., continued in the next century by Rameau. Like the Venetians, Lully worked under the patronage of the court, which his Os. were designed to glorify. In England the foundations of a native O., based on the masque, were laid by Purcell; but owing to his early death *Dido and Aeneas* (1689) remains a solitary pointer to the Eng. O. that might have been. Elsewhere O. remained It. in form, style and language. By the end of the century the leading influence was the Neapolitan school under Alessandro Scarlatti, followed later by Porpora, Pergolesi, and Cimarosa. With the aid of the poets Zeno and Metastasio the form became rigidly standardised; Scarlatti was responsible for the *du capo* aria, the two kinds of recitative, *secco* (accompanied only by the harp-chorus) for the rapid transaction of dialogue, and *stromentato* (accompanied by the orchestra) for more dramatic moments, the rejection of the chorus, and the separation of the monumental *opera seria* from the more racy *opera buffa*. Scarlatti himself with his great melodic and expressive powers was able to animate this style, but with lesser composers it soon deteriorated into empty vocal display. Even the lyrical and dramatic genius of Handel could not preserve it; his most important dramatic experiments were made in his Eng. oratorios, which are really Os. in disguise with the great asset of a chorus. The important reforms of Gluck were in essence a return to the principles of Monteverdi. He opposed the tyranny of the singer, and especially of the *castrato*, who always sang the chief male parts in It. *opera seria*, and concentrated on dramatic expression and characterisation. His new style was first prominent in *Orfeo* (1762), and fully developed in the Os. he wrote for Paris from 1774, in which he adopted the Fr. emphasis on ballet and chorus. Meanwhile a popular O. of contemporary life with spoken dialogue had appeared in various local forms: ballad O. in England (*The Beggar's Opera*, 1728); *opera comique* in France; *Singspiel* in Germany. At first a reaction from the classical-dynamic *opera seria* of the court, this led directly to the romantic and national O. of the next century. The cosmopolitan Mozart wrote masterpieces in all the current forms: *opera seria* (*Idomeneo*); *opera buffa* (*La Nozze di Figaro*); and *Singspiel* (*Die Zauberflöte*); and made great advances in characterisation and orchestral detail. The Ger. romantic O. of Weber stems partly from Mozart and the *Singspiel*, partly from the ethical Fr. grand O. of the revolutionary period under Cherubini and Spontini (the Paris stage, continually dominated by foreigners, has always kept its tradition). Beethoven's *Fidelio* springs from the same stock. The distinctions between aristocratic and popular O. now began to disappear, and the centre of the operatic world shifted to Paris, where Meyerbeer in grandiose political Os. and Auber in *opera comique* led the field, presently joined by Offenbach in

operetta. In Italy the singer still reigned supreme, but the brilliant wit and vivacity of Rossini and the melodic charm of Donizetti and Bellini give their Os distinction. Ger. dramatic music is dominated by Wagner. Influenced by Weber, whose remarkable *Euryanthe* (1823) is the source of sev. innovations generally attributed to Wagner, and also by Meyerbeer, he evolved a new form which he called music-drama. This has little in common with traditional O., and finds its closest parallel in the symphonic poems of Liszt—with the stage action superimposed as a key to the musical thought. Wagner's genius, instrumental and symphonic rather than vocal and dramatic, thus found its perfect expression; but the conviction expressed in his many writings that he was revolutionising O. by returning to the principles of Gluck and Attio drama misled his successors. A misunderstanding of Wagner lies at the heart of even the best later Germ. Os., such as Humperdinck's *Hänsel und Gretel*, Wolf's *Der Corregidor*, and the various output of Richard Strauss. Meanwhile traditional O. progressed rapidly in Italy and France. Verdi, beginning with crude melodrama and vocal extravagance in the Donizetti manner, in his last Os., *Otello* (1887) and *Falstaff* (1893), reached a music-dramatic balance on the highest level, such as It. O. had not known since Monteverdi. His successors of the *verismo* school, Mascagni and Leoncavallo, sacrificed musical values to dramatic sensationalism; and Puccini marred an individual musical and dramatic talent by crudely assaulting the emotions of his audience. In France the striking if imperfect dramatic genius of Berlioz has always been neglected. Gounod attempted, only with partial success, to bridge the gap between the outworn conventions of Fr. grand O. and *opera comique*. Bizet gave the latter a blood-transfusion in *Carmen* (1875), but died before he could follow up his success. The many operas of Massenet and Saint-Saëns are more notable for craftsmanship than creative power. Far more original is Debussy's single O., *Pelléas et Mélisande* (1902), a masterpiece of impressionistic suggestion that has found no true successor. Russian O., largely founded on a rich folksong tradition, began with Glinka and Dargomizsky and reached its height in Moussorgsky's *Boris Godunov* (1874). Borodin's *Prince Igor* (1890) has an opio grandeur; Rimsky-Korsakov's Os. are remarkable for fantasy, melody, and orchestral colour, rather than characterisation. Tchaikovsky combined the native Russian with the Fr. tradition. Czech O. was formed by Smetana out of folksong and the Liszt-Wagner symphonic style; he was followed by Dvořák, whose gifts were more lyrical than dramatic, and Janáček, an original melodist with strong dramatic gifts, who rejected all intellectual elements and aimed at a naturalistic utterance. Falla and Granados in Spain and Bartók in Hungary have made interesting experiments in O. Most remarkable of modern continental Os. is Alban Berg's *Wozzeck* (1925), in which late romantic naturalism

is combined with the atonality of the Schoenberg school. In England O. has only recently been freed from a certain moral stigma; there are promising signs of a true school of Eng. O. The operettas of Sullivan were distinguished by wit, melody, and delicate scoring. In the twentieth century the strongest influences have been Wagner (Delius, Boughton), and folksong (Holst, Vaughan Williams), but the recent Os. of Britten show a stronger dramatic gift and a broader appeal. See R. A. Streetfield, *The Opera* (5th ed., revised by E. J. Dent), 1925; F. Howes and P. Hope-Wallace, *A Key to Opera*, 1939; E. J. Dent, *Opera*, 1940; and D. J. Groux, *A Short History of Opera*, 1947.

**Opera Glass**, or Galileo's Telescope, instrument used for obtaining a magnified image of some distant object. It consists essentially of two lenses, a converging lens as objective, and a diverging lens as the eye lens. The objective lens L would form a real inverted image B of the distant object A. But before this image is formed

OPERA GLASS

the rays fall on the diverging lens M, which renders them divergent so that they appear to come from the image C which is erect. C is the image which is seen by the observer. The fact that the image seen is erect, and that the telescope is comparatively small in size, makes it extremely useful as an O. G.

**Operational Calculus.** In mathematics 'operations,' such as addition, subtraction, integration, differentiation, etc., are represented by symbols. During the nineteenth century it was realised that the symbols or 'operators' were themselves susceptible to manipulation, irrespective of their operands. This led to a branch of higher mathematics called symbolic logic, of which the O. C., invented by an engineer, O. Heaviside, is an example. Heaviside's methods were at first looked on with suspicion by the purists, as being not rigorous enough, but his work was of great practical application, especially in electrical engineering, and the O. C. has now been reconciled with other theories such as the calculus of finite differences and been shown to derive logically from the earlier Laplace transformations. See N. McLachlan, *Theory of Complex Variables*, 1930, and *Modern Operational Calculus*, 1948.

**Operation Overlord**, see OVERLORD

**'Operation Pluto,'** see under PIPE-LINE.

**Operation Sealion**, the (Ger. plan for the invasion of Britain (1940). (Ger. plans for invading Britain begun in Nov. 1939, were intensified in July 1940, when Hitler was faced with the first major check to his strategy. Seeing that Britain showed no

signs of coming to terms, he decided to undertake a landing operation, and the Ger. staff were given until mid Aug. to prepare it. The Ger. leaders, who were apprehensive of the proposed operation through fear of the R.N., thought it essential that the Ger. Air Force should accept the double role of both destroying the R.A.F. and preventing the Brit. Navy from attacking a landing force, and Goering (q.v.) was confident that the Ger. Air Force would be equal to these tasks. But the Ger. Naval High Command took the view that, even if the Luftwaffe had defeated the R.A.F. in the battle of Britain, it would still have been incapable of carrying out its second task; but it is probable that, if the R.A.F. had been defeated, the landing operation would have been launched. So far as it went the general plan of O. S., as it was called, was for landing two armies with twenty-five divs. in all, between Folkestone and Eastbourne and Brighton and Selsey Bill. Ten divs. were to be landed to form the initial bridgehead, and after eight days an advance was to be made to the first objective, a line running from the Thames estuary along the hills S. of London to Portsmouth, and others were to be made to cut London off from the W. as quickly as possible. Parachute troops were to be used to capture Dover, and a third army might possibly be used for a landing in Lyme Regis Bay if necessary. But later orders showed that Hitler was most reluctant to take a decision, though on Sept. 3 directives were issued to prepare for embarkation at Rotterdam, Antwerp, and Le Havre, and D-Day was fixed for Sept. 21. Again, however, Hitler postponed the operation, and orders were given to disperse concentrations of craft in view of allied air attacks, and on Oct. 12 the operation was called off until the spring, the fact being that the battle of Britain had resulted in the failure of the Luftwaffe to carry out the first of its tasks, the destruction of the R.A.F. In July 1941 Hitler again postponed the operation until the spring of 1942 on the assumption that by that time the Russian campaign would be completed. The project does not seem to have been seriously considered again, and was finally cancelled in Jan. 1942.

It was widely believed in Britain that a Ger. invasion attempt was actually launched in 1940, a belief based partly on the fact that a number of Ger. bodies were washed up on the S. coast in Aug.-Sept. 1940, and partly on the knowledge that the 'invasion imminent' signal was issued by Brit. general headquarters, Home Forces, on Sept. 7, 1940. The facts were that in Aug. 1940 the Gers. were embarking their army in the barges in harbours along the Fr. coast, but there is no evidence that they ever left harbour as a fleet to invade Britain. Bombing raids on those harbours were carried out by the R.A.F., and some barges were sunk. During the ensuing six weeks some thirty-six bodies of Ger. soldiers were washed up at scattered points along the coast between Cornwall and Yarmouth. A report on possible Ger. action was considered by the

Brit. chiefs of staff on Sept. 7, 1940, and as this report indicated that Ger. preparations for invasion were so advanced that it could be attempted at any time, the chiefs of staff, taking into account the Ger. air attacks against aerodromes and aircraft factories, agreed that the possibility of invasion had become imminent, and that the defence forces should stand by at immediate notice. The official Brit. statement on Ger. plans, made in the House of Commons on Nov. 18, 1940, was based on captured Ger. documents and interrogation of Ger. prisoners of war (see Hansard, Nov. 18, 1940). It would appear that there was little enthusiasm amongst the Ger. naval chiefs for 'Sealion,' and no real understanding by the army of the difficulties inherent in cross-Channel invasion. See A. Martienssen, *Hitler and his Admirals*, 1948.

*Opercularia*, genus of herbs or subshrubs (family Rubiaceae) with small globular heads of white flowers. *O. aspera* and *O. hispida* are sometimes grown in greenhouses, requiring a soil composed of equal parts of sandy loam, fibrous peat, and leaf soil.

*Operculum* (Lat., a lid), in botany, the term which is used in speaking of the lid of the capsule of mosses. It forms a cover for the peristome, and falls off when the spores are ripe. In fishes (q.v.) it is the cover over the gills.

*Ophicleide* (Gk. *ὄφις*, a serpent, and *κλειρ*, a key), obsolete brass wind instrument of the bassoon type, but more closely related to the serpent, whose coarse tone it had. It was probably invented by a Fr. musician named Fricot settled in London, c. 1790, and called bass horn. This, however, was actually the Russian bassoon, whereas the *O.* descended from the cornett family. It resembled the bassoon in shape, but was thicker and more uncouth, had eleven or twelve keys, a mouthpiece like that of the trombone, and a compass of about three octaves. Mendelssohn wrote for the *O.* in *Elijah* and *Midsummer Night's Dream*. Also a 16-ft. reed organ pedal stop of powerful tone.

*Ophidia*, see SNAKES.

*Ophiopogon*, or *Snakeshead*, genus of perennials (family Hæmodoraceae) with long narrow variegated leaves, and racemes of white or lilac flowers. They are natives of the Himalayas and Japan.

*Ophir*, region celebrated in ant. times for its fine gold. It is frequently mentioned in the O.T., and it was from *O.* that gold and precious stones were brought by Solomon's sailors. Its position has been the subject of much dispute. Suggested localities are Zimbabwe, in Mashonaland; Abhira, at the mouth of the Indus; Suhara, in Goa; Mt. O., in Johore; and S. Arabia.

*Ophites* (Gk. *ὄφις*, a serpent), or *Naasenes* (Heb. *nachash*, a serpent), early sect of Gnostics who, in addition to the usual doctrines which they held in common with the other sects, taught that special veneration should be paid to the serpent, the introduction of knowledge into the world being due to the serpent that tempted Eve. They are referred to by

Hippolytus, Irenæus, Origen, and other early Church writers. See GnosticisM.

Ophiuchus, see SERPENTARIUS.

Ophiuroides, see BRITTLE-STARS, and ECHINODERMATA.

Ophrys, genus of hardy terrestrial orchids with beautiful flowers, many of which bear a remarkable resemblance to insects. *O. apifera*, the bee orchid, is about a foot tall, and has three to six bee-like flowers in a loose spike. Other Brit. species are the fly orchid (*O. muscifera*) and two rare spider orchises.

Ophrysia, see under PHEASANT.

Ophthalmia, inflammation of the eye. This term is not now in general use, the inflammation being related to the affected part or parts of the eye. *O. neonatorum* is a form of purulent conjunctivitis which sometimes attacks newly born babies.

Ophthalmology (Gk. ὀφθαλμος, eye; λόγος, discourse), the science of the eye, its anatomy, physiology, visual functions, and diseases (for anatomy and physiology see EYE). Emmetropia is the condition of normality in vision. Hypermetropia (long sight) is the condition in which the clear image of a distant object would lie in a plane behind the retina, and is corrected by convex lenses. Myopia (short sight) exists when the image of a distant object lies in a plane in front of the retina, and may be corrected by concave lenses. Astigmatism is that condition where no single undistorted image of a distant object exists, but two separate line foci at right angles to each other are present. This defect is corrected by cylindrical or toroidal lenses. Presbyopia is that condition produced by loss of accommodation to a degree that objects within the normal reading distance cannot be viewed with comfort (usually from the age of forty-five onwards). This is corrected by a convex reading addition to any existing distance correction required.

FIG. 1. DIRECT METHOD: SELF ILLUMINATED

Cataract is any opacity of the lens of the eye, and is generally not congenital. It may be caused by the excessive heat of furnaces and welding arcs, by senescence, concussion, or as a secondary condition in certain types of general disease. Some forms of cataract are small and non-spreading, and operation is not necessary for these; where operation is necessary this cannot be performed until the cataract is 'ripe.' Opacities occur also in the vitreous humour and may impair vision. Abnormalities in the general health are usually associated with the inflammatory conditions of iritis, keratitis, conjunctivitis, choroiditis, retinitis, and optic neuritis. Glaucoma is a serious disease,

caused by the development of excessive pressure within the eye. Trachoma, common in the E., is a severe form of conjunctivitis. *O.* deals also with affections of the lachrymal gland, orbit, eyelids, and eye muscles. In all cases, before any form of treatment is applied, it is important that the affection should be correctly diagnosed.

See J. Meller, *Ophthalmic Surgery*, 1923; W. Stewart Duke-Elder, *Recent Advances in Ophthalmology*, 1927, and *Textbook of Ophthalmology*, 1932-40; T. H. Shastid, *Outline History of Ophthalmology*, 1927; H. Neame and F. A. Williamson-Noble, *Handbook of Ophthalmology*, 1939, 1944; and A. Sorsby (ed.), *Modern Trends in Ophthalmology* (second series), 1948.

Ophthalmoscope, optical instrument designed for examining the surface of the retina of the human eye, invented by Helmholtz (1851). Since his time many types of Os. have been designed (using Helmholtz's basic principles), and with the modern instruments the structure and health of the corneal, aqueous, crystalline lens, vitreous, and retina may be investigated. An estimate of the refractive error of the eye may also be made with the *O.* There are two methods of viewing the retina, direct ophthalmoscopy and indirect ophthalmoscopy.

**Direct Method** (Fig. 1).—The instrument will include in the handle the source of light, C, and behind the mirror D a battery of lenses will enable the observer A to focus the structures of the eye described above. In modern instruments it is usual to include a convex lens system between the source C and the mirror D, and the mirror D may then be a plane mirror.

**Indirect Method** (Fig. 2).—In this method the source C is behind the eye B, and the mirror D will consist of a concave retinoscope and the light is focused by the

FIG. 2. INDIRECT METHOD

convex lens E. By this method the observer A may only view a small magnified area of the retinal surface. Other parts of the eye may not be examined by this method.

Ophthalmoscopy enables the practitioner to observe the only part of the vascular system functioning which can be made visible, hence its extreme importance in diagnosis of the health of the eyes and the whole body. An adaptation of this instrument enables one observer to use both eyes with a binocular *O.*; another permits a number of observers to receive demonstration of a specific eye; incorporation with a camera enables photographs of the retinal fundus to be taken.

**Opie, Amelia** (*née Alderson*) (1769-1858), Eng. novelist, b. at Norwich. Her husband was John O. (q.v.), the painter. She pub. *Simple Tales* in 1806, and many novels, including *The Dangers of Coquetry* (1790); *Adeline Mowbray* (1804); and *Valentine's Eve* (1816). See C. L. Brightwell, *Memoir of Amelia Opie*, 1855, and J. Menzies-Wilson and H. Lloyd, *Amelia: the Tale of a Plain Friend*, 1937.

**Opie, John** (1761-1807). Eng. painter, b. at Harmony Cot, near St. Agnes, Cornwall, son of a carpenter, whose real name was Oppy. He evinced such skill in taking portraits that Dr. Wolcot (better known as Peter Plunder), the Truro physician, took him into his house and afterwards (1780) to London. He soon became famous and, in 1782, received a commission from the king, and advanced rapidly as a fashionable portrait painter, among his subjects being Johnson, Burke, and Fox. He was also an historical painter. He became an associate of the Royal Academy in 1787, and, in the following year, a member. His tomb in St. Paul's is near that of Sir Joshua Reynolds. His work, while not aiming at ideal beauty or refined poetical conception, is characterised by energy of style and vivid realism. Two of his pictures, 'William Siddons' and 'The Assassination of David Rizzio,' are in the National Gallery, London. See A. Earland, *John Opie and his Circle*, 1911.

**Opinicus** (heraldry), fabulous animal borne as a charge, having the head and wings of a griffin or eagle, a short tail like that of a camel, and the body of a lion. It is sometimes represented without wings. It forms the crest of the Barber Surgeons of London.

**Opitz, Martin** (1597-1639). Ger. poet, b. at Bunzlau, Silesia. In 1625 he was crowned poet laureate at Vienna by the Emperor Ferdinand II. A patent of nobility was conferred on him in 1629, in the title of von Boberfeld. In 1630 the burggraf of Dohna sent him on a mission to Paris, where he met Grotius. He became historiographer to Ladislaus IV. of Poland in 1638. His poems are more reflective than imaginative, and are rather cold and formal. See studies by F. Gundolf, 1923, and H. Max, 1931.

**Opium** is obtained by drying the juice of the unripe capsules of the poppy (*Papaver somniferum*). The plant is extensively cultivated in India, Asia Minor, Egypt, Persia, and China. Sown in Nov. in rich loose soil, the poppy-heads are ready to be operated upon by the end of Feb. O. has a bitter nauseous taste, and a heavy narcotic odour. Its properties as a drug are due to the alkaloids which it contains, viz. morphine, narcotine, thebaine, narceine, iodine, etc. These alkaloids are either free or combined with such acids as meconic, lactic, or phosphoric. O. also contains gum, saccharine matter, fat, and water. The habit of eating O. is very prevalent, especially in the Far E. Its use is usually begun to relieve pain or sleeplessness, and after a month's use the individual becomes a confirmed O.-eater. If taken in excess O. poisoning is set up,

and the victim suffers from dyspepsia and nervous attacks. After a large dose of O. the person lies in a state of coma. Respiration is slow and noisy, the pulse is often slow but full, and the eye pupils contract. The skin also becomes pale and livid, and covered with a cold perspiration. For O. poisoning an emetic or coffee is given, and the patient is kept moving if possible. For smoking O. a pipe of peculiar construction is required, and the effects are much the same as in the case of O. eating. As a medicine, O. is taken in cases of great pain or sleeplessness. It is also invaluable in cases of diabetes, diarrhoea, and heart disease; and is usually given in the form of laudanum, a tincture prepared by dissolving O. in dilute alcohol.

The O. traffic was a great source of revenue to India, but of late years attempts have been made to stop the traffic. In 1906 the Chinese Gov. prohibited the use of O. in schools and the army, and ordered all habits to be registered and their allowances gradually decreased. O. is produced in India under special gov. supervision in the United Provs., and under special arrangements in the central India, Rajputana, and Gwalior States, and is bought in its crude condition from the cultivators in the United Provs., and from the durbars of the states concerned by the gov. at fixed rates. It is disposed of by the gov. (a) by issue to the excise dept. for local consumption under revenue regulations and by export in small quantities to Adeu, Fr. and Portuguese settlements in India, Nepal, and Zanzibar (b) by supply to the medical dept. in India, and by export to the United Kingdom for sale to chemists. The gross revenue from O. in 1915-46 was £742,000. Formerly most of the exported O. went to China, but in 1907 the Indian Gov., in furtherance of the efforts of the Chinese Gov. to suppress the cultivation and use of O. in China, decided gradually to reduce the amount exported to China, and as from 1917 its export was entirely prohibited. In 1928 the gov. of India announced its intention to restrict the export of O. otherwise than for medicinal purposes. Exports of provision O. to foreign countries ceased at the end of 1935.

In 1948 the Permanent O. Board in Geneva expressed grave concern at the presence of Iranian opium in the illicit traffic in many parts of the world.' In 1949 the World Health Organisation convened a conference of E. Mediterranean countries on the subject. O. is an important crop in Turkey, in the Afyon Karahisar and Konya dists.

**Opium War**, name given to hostilities between Great Britain and China in 1840, following the destruction of Brit. ships taking opium to China. The war resulted in the cession of Hong Kong and the treaty ports. See E. H. Parker, *The Chinese Opium War*, 1888, and H. B. Morse, *The International Relations of the Chinese Empire* (vol. I.), 1910.

**Opland**, inland co. of Norway, including the prosperous Gudbrandsdal valley, which runs to Lake Mjosen in the S.E..

and takes the chief road to the coast. The land is high in the N., and low in the S. Pop. Lillehammer. Area 9608 sq. m. Cap. 153,200.

Opobo, port of S. Nigeria, near the mouth of the O. R., 80 m. W.S.W. of Old Calabar. Pop. 12,000.

Opole (Ger. Oppeln), tn. of Upper Silesia, Poland, on the r. b. of the Oder, 42 m. N.N.W. of Radbórz (Ratibor). The manufs. are cement, lime, machinery, and cigars, and there are railway repair shops. O. was captured by Russian forces under Gen. Konev on Jan. 24, 1945. The church of St. Adalbert was founded at the end of the tenth century, and there is a fifteenth-century castle. Pop. 52,800.

Opón, tn. of Cebu, Philippine Is., opposite Cebu city. It is noted as the place where Magellan died in 1521. Pop. 23,000.

Oporto (Portuguese Lat. Portus Cale; O Porto, the port), city of Portugal, in the prov. of Minho, on the N. bank of the Douro, 3½ m. from the Atlantic and 209 m. by railway N. of Lisbon. Leixões is the seaport for O. It has been secured from storms by two great jetties and is served from O., 5 m. away, by both standard and narrow-gauge railways. The city has sev. public squares, the largest being the Praça da Liberdade, containing a bronze statue of Dom Pedro IV. All over the city are fountains and well-laid-out promenades, among the latter being the fashionable Sunday promenade in the crystal Palace gardens. Many of the Coueses of O. date from the sixteenth century. The streets of the old tn. are narrow and tortuous, although there are sev. good modern boulevards, notably the Rua dos Clerigos, the streets of Santo Antonio and Santa Catarina, and the Rua das Flores. This last named, which may be described as the Regent Street of O., can show some very fine examples of the local gold and silver filigree work. The cathedral, which must originally have been a noble edifice, but has been infamously modernised, stands near the bishop's palace. It has a fine interior, including a solid silver altar and retable. The church of Sao Francisco, near the Bolsa (Exchange) is a mass of beautiful carvings of the fifteenth-sixteenth centuries. The Clerigos Church has the highest spire in the country (246 ft.) and was built in 1748. The spire dominates the city from every point. Some 400 yds. to the S. of the Praça da Liberdade is the bridge of Dom Luiz Primeiro, crossing the Douro in a single span of 560 ft. at a height of 120 ft. There is another bridge higher up the gorge, and both were built by Eiffel, the engineer of the Eiffel Tower, Paris. It was from the monastery between these two bridges that Wellington launched his attack against Soult. There is a univ., founded in 1911, and also a special college for music. O. is one of the four military regions of Portugal. O. is the centre of the port wine trade. Apart from the shipping mostly carried on from Leixões, other industries include spinning and weaving, sugar refining, distilling, and tanning, and the manuf. of pottery,

tobacco, and paper. In anct. times the site of O. was occupied by the harbour-tn. Portus Cale, afterwards Porto Cale, from which has been derived the name of the kingdom, Portugal. It was an important city during the supremacy of the Moors. In 1808 it was taken by the Fr.; but in the following year it was retaken by an Anglo-Portuguese force under Wellington. Pop. 265,000.

Opposum, word derived from the Amer. Indians, and applied to the various members of the marsupial family Didelphyidae. Fossil forms have been found in different parts of the world, but the only living Os. occur in N. and S. America. In habit all are arboreal, except *Chironectes minimus*, an aquatic species, and nocturnal; in diet they are carnivorous or insectivorous. The number of digits is invariably five, and there are fifty teeth; the tail is usually long and prehensile, and the pouch is frequently absent. The chief genus is *Didelphys*, and consists of twenty-three species, varying in size from that of a cat to a rat. The commonest of these is *D. virginiana*, which occurs in the U.S.A. It has coarse, yellowish hair tipped with brown or black, a scaly tail, hairy at the tip, short legs, and a pig-like snout. The young are carried by the mother in her pouch. The young of *D. dorsaigera* have the interesting habit of curling their tails round their mother's, and being borne about in this fashion. *Chironectes*, the water O., or yapock, has completely webbed feet, and lives upon fish.

Oppeln, see OPOLE.

Oppenheim, Edward Phillips (1866-1946), Eng. novelist and short story writer, b. in London and educated at Wykeston grammar school, Leicester. His departure from school for the family leather business is amusingly told in his autobiography, *The Pool of Memory* (1941). He began with a novel, *Expatriation*, at an early age and then, after sev. failures, entered into an agreement with the *Sheffield Daily Telegraph* for the first serial rights of six novels at £250 each. Altogether O. wrote some 150 books and, besides being one of the world's most prolific authors, he was among the best writers of 'thrillers.' Trans. into most European languages, he was especially popular with Ger. readers until he exploited Ger. hostility to Britain. But his story of espionage, *The Kingdom of the Blind* (1917), was an excellent vindication of his soundness of view, as against the Ger. propagandists who charged O. with fomenting bad feeling between the two countries. His *Nobody's Man* (1923), a departure from his thriller genre, is a clever 'take-off' of 'politicians.' Other books which were particularly favoured by his large public were *Mysterious Mr. Saltin* (1898); *The Double Life of Mr. Alfred Burton* (1914); *Mr. Grex of Monte Carlo* (1917); *The Double Traitor* (1918); *The Great Prince Shan* (1922); *Prodigals of Monte Carlo* (1926); *The Channing Syndicate* (1927); *The Glenilton Murder* (1929); *The Million Pound Deposit* (1930); *Gallows of Chance* (1934); *The Strange Boarders of Palace Crescent* (1934); *Bird*

of *Paradise* (1936); *Dumb Gods Speak* (1937); *A Pulpit in the Grill-Room* (1938); and *Advice Limited* (1939). He also collaborated in two plays: *The King's Cup*, produced at the Adelphi in 1909, and *The Eclipse*, at the Garrick in 1919. The first named was of the cloak and rapier type; the second a musical comedy. After the First World War he settled in S. France. His later books included *The Shy Plutocrat* (1941), and *Mr. Mirakel* (1942).

Oppenheimer, Sir Ernest (b. 1880), chairman of De Beers Consolidated Mines Ltd., and many other S. African and Rhodesian mining companies, and one of the world's leading industrialists. He began his career at the age of seventeen in the London office of A. Dunkelsbuhler and Company where he gained his early experience of the diamond world. In 1902 he was sent to S. Africa in connection with the firm's interests in Kimberley. In 1908 he was elected a member of the city council and became mayor in 1912, which office he held till 1915. He was largely responsible for the raising of the 2nd Kimberley Regiment at the outbreak of the First World War and during the Second World War devoted himself to the services of the Red Cross and other welfare organisations. In recognition of the services rendered to S. Africa over a number of years he was knighted in 1921, and from 1924 to 1938 he sat as S. African party member for Kimberley in the Union Parliament.

Oppenheimer, John Robert (b. 1901), Amer. physicist, son of a Ger.-Jewish immigrant and successful textile exporter. He graduated from New York's Ethical Culture School, where he had an intensive course in chem. At Harvard, where he graduated in three years, he studied under the physicist P. W. Bridgman and the philosopher A. N. Whitehead (q.v.). At twenty-one he went to England to study under Lord Rutherford and Sir J. J. Thomson at Cambridge Univ., and also went to Göttingen where he earned his Ph.D. at twenty-three with a brilliant paper on quantum mechanics, and concluded with still further study at Leyden and Zürich. From 1928 he taught science at the California Institute of Technology and the Univ. of California, winning a great reputation, and developing at that Univ. an outstanding school of theoretical physics. In March 1943 he was chosen by the U.S. Army to head a new scientific laboratory from which emerged the first atomic bomb. O. became chief executive of a \$60,000,000 company with 4500 workers, including such eminent physicists as Enrico Fermi and Niels Bohr, though he had never even been chairman of a physics faculty. It was recognised, however, that apart from his knowledge of physics, he had the capacity to make people pull together and work at fever pitch. Subsequently he was appointed to a small board of seven members to suggest U.S. policy on the future of atomic energy, and was responsible for much of the writing and many of the ideas, in a resulting report, which was co-

signed by David Lillenthal, chairman of the U.S. Atomic Energy Commission and Dean Acheson, the then under-secretary of state, and which called for an international atomic development authority. He is president of the Amer. Physical Society, and director of the Institute of Advanced Study, near Princeton.

Oppert, Julius (1825-1905), Ger. Assyriologist, b. of Jewish parents at Hamburg. He made a special study of ancient Persian, and in 1847 pub. his *Lautsystem des Altpersischen*. In 1857 he became prof. of Sanskrit at Paris, and he was employed on various philological missions by the Fr. Gov.

Oppian, name of the author of two didactic poems in Gk. hexameters. Modern criticism has estab. the fact that the poems are by two writers of the same name. *Halieutica*, a poem of about 3500 lines, on fishing, dedicated to Aurelius and his son Commodus, was probably written by a native of Anazarba or Corycus in Cilicia, who flourished in the reign of Marcus Aurelius (161-180). *Cynegética* (2150 lines), on hunting, is dedicated to Caracalla, which places its date after A.D. 211, and its author was probably a native of Apamea or Pella in Syria.

Ops, Rom. nature goddess, wife to Saturn, and mother of Jupiter. As her name indicates, she was symbolical of plenty and fertility, and a protectress of all things connected with agriculture. Most of her temples and festivals she possessed in common with Saturn, and on the Capitol she shared the honours with her son Jupiter.

Opsonins (Gk. *ὀψωνία*, to obtain food). The capacity of the white blood corpuscles to absorb and digest invading bacteria (phagocytosis, q.v.) was shown by Douglas and Sir Almoth Wright in 1903 to depend on the presence of O. in the blood serum: white corpuscles washed free from serum are unable to carry out phagocytosis. In addition to normal opsonin, which has a generalised action on all bacteria, special O. or bacteriotropins are formed against specific bacteria as a result of immunisation. The opsonic index of a patient is the ratio of the number of bacteria ingested by a white corpuscle in the patient's serum to the corresponding number for normal serum; it varies between about .5 and 2, being high in patients who have been immunised or are convalescing from a disease.

Optical Glass, see under GLASS.

Optical Illusion, see ILLUSION; MIRAGE. Optician. An 'ophthalmic O.', according to the National Health Service Act of 1946, is a person having the prescribed qualifications in optics (q.v.), including the measurement of errors of refraction, in orthoptics, and in the fitting and supply of optical appliances. A 'dispensing O.' is a person having the prescribed qualifications in the fitting and supply of spectacles.

Optic Nerve, see EYE.

Optics, science that deals with the phenomena of light and vision. O. is usually divided into three branches: (1) physical O., for which see LIGHT

(2) physiological O., see VISION; and (3) geometrical O., with which the present article is concerned. It is a matter of everyday experience that we cannot see round corners, a fact that suggests that light may travel in straight lines. The suspicion is strengthened by taking a number of opaque screens punctured by a small pin-hole and arranging them so that a straight line can be drawn from a source of light through the pin-holes to the eye. The source of light can then be seen, but if one of the screens is shifted slightly, no light enters the eye, showing that, to a very close approximation at least, light travels in straight lines. Refined apparatus shows that this is only an approximation, however (see DIFFRACTION), but for all practical purposes it is assumed that light does travel in straight lines, and the straight lines of light are called rays of light. When light strikes the surface separating two media, one or both of two things may happen: viz. (1) the light may be reflected at the surface; (2) the light may be refracted into the second medium (in each case some absorption of light takes place). The two laws governing the first of these events are known as the *Laws of Reflection*: (a) the incident ray, the reflected ray, and the normal to the reflecting surface at the point of incidence lie in the same plane; (b) the angle of incidence is equal to the angle of reflection. The *Laws of Refraction* are: (a) the incident ray, the refracted ray, and the normal to the surface separating the two media at the point of incidence lie in the same plane; (b) the ratio of the sine of the angle of incidence to the sine of the angle of refraction is a constant for two given media and is known as the refractive index of the second medium relative to the first. The ratio is actually the ratio of the velocity of light in the first medium to its velocity in the second (the ratio varies for different coloured lights).

The function of geometrical O. is to reduce the behaviour of all types of mirrors, plane, spherical, paraboloidal, etc., and of all types of refracting bodies, plane, spherical and cylindrical surfaces, lenses, prisms, and systems of lenses, to simple, general terms derived from the application of the laws of reflection and refraction to the case under discussion, making use of the propositions of Euclidean geometry. Some of the results are summarised below.

**Plane Mirror.**—The image of a point is as far behind the mirror as the object is in front of it, and the line joining the object and image is normal to the mirror.

**Spherical Mirror.**—If the radius of the sphere of which the mirror is a small portion is  $r$ , then the position of the image of a point object on the axis of the mirror

is given by the equation  $\frac{1}{v} + \frac{1}{u} = \frac{2}{r}$ , where

$u$  is the distance of the object from the mirror, measured along the axis, and  $v$  is the distance of the image from the mirror, measured along the axis. All these distances are reckoned positive if measured in the direction opposite to the incident

light, negative if measured in the same direction as the incident light. (Convention of signs.)

**Spherical Lens.**—The position of the image of a point on the axis of a lens is given by the equation

$$\frac{1}{v} - \frac{1}{u} = (\mu - 1) \left( \frac{1}{r_1} - \frac{1}{r_2} \right)$$

where  $v$  and  $u$  are respectively the distances of the image and object measured from the centre of the lens,  $\mu$  is the refractive index of the material of the lens relative to the surrounding medium,  $r_1$  and  $r_2$  are the radii of curvature of the front and back surfaces of the lens respectively. All the distances are measured in accordance with the convention of signs given above. See also REFLECTION, REFRACTION, and other articles on various branches of light. See T. Preston, *Theory of Light*, 1912; A. S. Ramsey, *Geometrical Optics*, 1914; E. Holmbyard and F. Barraclough, *Heat, Light and Sound for Beginners*, 1931; R. A. Houston, *Treatise on Light*, 1938; W. J. Humphreys, *Physics of the Air* (3rd ed.), 1940; R. A. Sawyer, *Experimental Spectroscopy*, 1943; B. K. Johnson, *Practical Optics*, 1945; and W. E. Williams, *Applications of Interferometers*, 1947.

Optimism (Lat. *optimus*, best), word having both a strictly philosophical and a popular sense. The well-known doctrine of Leibnitz, in his *Essais de Theodicee* (1710), that 'everything is for the best in this best of all possible worlds,' may be taken as the extreme of the optimistic philosophical doctrines. Leibnitz did not mean that everything in the world was perfect; but while admitting the existence of evil he maintained that the monads, of which he believed the universe to consist, strive after ultimate perfection. Therefore of all the infinite number of possible worlds which presented themselves to the mind of the Creator, the existing one was the best possible. The evil which Leibnitz admitted to be in the world he divides into three kinds: metaphysical, physical, and moral. The explanation of the two first named, that one is unavoidable in a created being, while the other is a punitive and admonitory agent, is much more satisfactory than that of the last; it is that problem which Leibnitz's system, like many others, fails to solve. The milder form of O., which believes that on the whole the universe is advancing towards a better state of things, is more properly called meliorism or evolutionism. Generally speaking, a teleological view of the universe connotes some form of O. which is found in conjunction with idealistic rather than materialistic theories. In the popular sense of the word O. means the belief that 'there is a soul of goodness in things evil,' and that whatever exists is right in some inscrutable fashion, or can be made the means of good. Alternatively O. may simply mean the habit of 'looking on the bright side of things,' which naturally springs from a belief in the ultimate triumph of good. See B. A. W. Russell, *A Critical Exposition of the*

*Philosophy of Leibniz*, 1900, and E. Westernmark, *The Origin and Development of Moral Ideas*, 1917. The opposite of O. is pessimism (q.v.).

**Optional Clause**, otherwise Article 36, paragraph 2, of the Statutes of the Court of International Justice (see also INTERNATIONAL JUSTICE, COURT OF). The statutes, in the original draft, gave the court compulsory jurisdiction in certain classes of disputes as between all members of the League of Nations, the chief of which concerned the interpretation of treaties, any question of international law, and the nature or extent of reparation for the breach of an international obligation. But in the final draft there was substituted a clause which members could adopt by declaring that they would recognise as compulsory *ipso facto* and without special agreement, in relation to any other member accepting the same obligation, the jurisdiction of the court in the above noted classes of disputes. This is the O. C. In 1910 there were thirty-eight states adherent to the O. C. (Germany did not renew her signature, and Japan withdrew from the court in the same year), including Great Britain, the dominions, and other leading countries. In 1940 Britain renewed for a further five years its acceptance of the jurisdiction of the permanent court, under the same reservations as previously, and with the further reservation that it was not prepared to accept the court's jurisdiction in disputes arising out of events occurring at a time when His Majesty's Government are involved in hostilities.

**Opuntia**, genus of succulent trees and shrubs (family Cactaceae). They are natives of America, and some species, on account of their value as fencing plants in hot dry countries, have been introduced into S. Africa and Australia, where they have rapidly spread, and by reason of their formidable poisonous spines have tended to become a serious plague. The spines can be removed and the Os, chopped up like cultivated roots as food for cattle. There are, however, a few spineless species, of which *O. cochinitifera* is the best fodder plant.

**Opus** (Lat., work). Its abbreviation Op. is used as a prefix to enumerations of a composer's works. Its lt. equivalent, *opera*, at first had the same meaning, but is now used almost exclusively in its later specific sense.

**Opus operatum**, in theology, term introduced by the schoolmen to express the manner in which the sacraments are efficacious. Certain general dispositions may be necessary in the receiver, but it is not these dispositions which render the sacrament effective. The reception of sacramental grace and its degree depend, indeed, upon the state of the receiver, but is caused by the outward sign instituted by Christ. Thus Bellarmine says: 'When we say the sacrament confers grace *ex opere operato*, our meaning is that grace is conferred by virtue of the sacramental act, instituted by God to this end, and not by the merit of the minister or of the recipient.'

Opwijk, tn. in the prov. of Brabant, Belgium, 11 m. N.W. of Brussels, mainly engaged in agriculture. Hops and flax ear largely cultivated. Pop. 8200.

**Oracle** (Lat. *oraculum*, from *orare*, to speak), place at which a deity answers the questions of his votaries through the mouth of his inspired minister, or the response given. Recourse to Os. is found among most of the nations of the ant. world, but the practice is specially studied with reference to the Gk. examples. Such methods of divination may be divided into three main classes: (1) that which depends on an examination of certain phenomena interpreted according to rule; (2) that in which the O. is delivered in frenzy by an inspired priest or priestess; (3) direct revelation in dreams, or by intercourse with spirits. To the first class belong all methods of divination by animals and the examination of their entrails when sacrificed. The second class were also common in Greece, though few of the oracular shrines were really famous. The best known, then as now, was the O. of Apollo, at Delphi. An account of the procedure here may be taken as showing the main features of the method. The O. was pronounced by a prophetess, the Pythia. After preparing herself by ceremonial purifications by drinking the sacred waters of the Castolis and by chewing the leaves of the sacred laurel, she took her seat on the sacred tripod over a hole in the floor of the cave, through which, according to ant. writers, vapour ascended, throwing her into an ecstasy. Her ravings were taken down by the priests, who put them into the form of hexameter verse. The Delphic O. was famous throughout the Gk. states, and many interesting accounts of the answers received there are given.

**Oradea Mare**, formerly Grosswardein, tn. of Rumania in S. Bihar, near the Hungarian border, and until 1918 part of Hungary, lies on the Körös 150 m. S.E. of Budapest. It was ceded in 1940 to Hungary, and returned to Rumania after the war. Reputedly founded in 1080 by St. Ladislaus, it contains an old fortress and many public buildings, including two bishop's palaces since it is the seat of both Rom. Catholic and Gk. Catholic bishops. Pottery and distilling are carried on. Pop. (mainly Magyar) 92,900.

**Oradour-sur-Glane**, small tn. in the dept. of Haute-Vienne, France, 15 m. N.E. of Rochechouart. It was the scene during the Second World War of one of the worst of all Ger. atrocities, when about 800 inhab. were massacred, only some seven or eight escaping the Ger. fury. Alleging, without foundation, that an arms dump had been found there, the Gers., on June 10, 1944, shot all the men of the tn. in a barn in batches of twenty. The women and children were driven into the church, the doors of which were locked after a large case of explosives had been deposited inside. This case exploded soon afterwards and, when the building was in flames, Ger. soldiers heaped chairs and benches on the imprisoned victims, on whom the roof then collapsed. Meanwhile Ger. soldiers drenched all the houses

and barns with some incendiary substance and set the whole place ablaze. The bishop of Limoges condemned the atrocity and summoned the people of Limoges to a memorial service in Limoges Cathedral on June 16. When the service, attended by thousands of people, was held, time-bombs were discovered in the crypt of the cathedral. These had been put there by members of the Vichy militia. It is said that the Gers. had intended to burn not O., but Oradour-sur-Vayre, which is in a dist. where there was serious fighting between the men of the *maquis* (Fr. resistance forces) and the Gers. First confirmation of this terrible episode was afforded by the fact that the regional prefect and the bishop of Limoges visited O. and described the tn. as no more than a collection of charred ruins and charred bodies.

**Oræfa Jökull** (the frozen mount of solitude), volcano, and the highest mt. of Iceland, situated in the S.E. of the country, and adjoining Vatna Jökull on the S. It reaches a height of 6426 ft. Eruptions occurred in 1341, 1362, 1598, and 1727. It was first ascended in 1891.

**Orange**, Alfred Richard (1873-1934), Brit. journalist, b. at Dacre, Yorkshire, educated privately and trained as a teacher. He taught under Leeds council till 1906, and came to London as a journalist in 1906. With Holbrook Jackson he took over the editorship of the *New Age*, which under his direction soon became a forum for the views of the best-known journalists, as well as for O.'s weekly commentary, noted for its incisive dialectic, its wide vocabulary, and its consistency in outlook and policy. O. wrote two books on Nietzsche (*Friedrich Nietzsche: the Dionysian Spirit of the Age*, and *Nietzsche in Outline and Aphorism*), whose principles he applied to sociology in his propaganda for national guilds. After the First World War he became a protagonist of the Douglas Social Credit plan until he gave up the editorship of the *New Age* (1932). For two years he lectured in America on literature and psychology and on his return to England in 1932 founded the *New English Weekly*, in which he advocated financial reform on Douglas credit principles. An *Alphabet of Economics* appeared in 1917. See memoir by P. Malret, 1936.

**Orakzais**, Pathan tribe of N.W. India, inhabiting the mts. of Tirah, on the Kohat border. Their origin is obscure. Risings among them were put down by the Brit. in 1856, 1868, 1869, 1891, and by the Tirah expedition under Sir Wm. Lockhart in 1897-98.

**Oran**: 1. Most westerly dept. of Algeria, divided into the four arrons. of O., Mostaganem, Sidbel-Abbes, and Tlemcen. The dist. is fertile and rich in minerals. Area 23,450 sq. m. Pop. 1,023,460. 2. Cap. of above dept., a fortified seaport standing at the mouth of a small stream, at the foot of the Sainte Croix, 70 m. N.E. of Tlemcen. It is a Fr. naval station and has a moderately good harbour, and there is an excellent one at Mers-el-Kebir, 3 m. distant. Most of the

tn. is modern and well built after the Fr. style. It is a centre of the wine industry, and has a large export trade in grain, wine and spirits, livestock, hides and wool, and esparto grass. The climate is healthy though hot. It was in the hands of Spain during 1509-1708 and 1732-92, when it was abandoned after being largely destroyed by earthquakes. It was occupied by France in 1831.

In July 1940, after the Hitler-Pétain armistice, the Brit. Gov. gave a six-hour ultimatum to Fr. ships at O. They were offered, but rejected, conditions which were intended to prevent Germany and Italy from seizing them. A Brit. battle squadron under Adm. Somerville (g.r.), attacked them, assisted by aircraft. One Fr. battleship was sunk and another damaged, one battle cruiser was damaged, and two destroyers and a seaplane carrier were set on fire and sunk. There were only slight Brit. casualties (July 3). The Pétain Gov. broke off diplomatic relations with Britain as the result of this action. On July 6 It. ships were bombed at O. U.S. troops landed near O. on Nov. 8, 1942. Pop. 194,700.

**Orange**, properly the fruit of *Citrus Aurantium*, a species with many varieties which are divided into two main groups. (1) the sweet O., and (2) bitter, Seville, or bigarade O. There is a sweet O., a Maltese variety, the pulp of which is entirely acidless, but this is of no commercial importance. The original home of the O. was probably the Burmese Peninsula and S. China, and its culture gradually spread W. till it reached Italy, Spain, and Portugal in the sixteenth century. It now flourishes in most parts of the world where soil and climate are suitable, a single tree producing, when mature, 10,000 or more fruits. Commercial production of the O. is carried on in California and Florida, U.S.A. The quality of the fruit is not indicated by the external appearance; e.g. the W. Indies produce a pale but juicy and finely flavoured O. which is on sale in Britain in the last three months of the year. From Christmas onward the Denla Os. from Spain and the attractive seedless fruit from California are the best obtainable. For summer consumption considerable imports arrive of Naartjes, a delicious S. African mandarin O. The O. can be grown in suitable well-ventilated and well-lighted structures with less trouble than grapes, and the overgreen character and fragrance make it a plant worth growing, apart from the fruit. O. leaves have medicinal value, and the flowers are distilled to yield neroli oil and neroli camphor.

**Orange**: 1. City of Essex co., New Jersey, U.S.A., 12 m. W. of New York. It is a favourite residential centre, and manufs. hats, electrical supplies, etc. Pop. 35,700. 2. Tn. of Franklin co., Massachusetts, U.S.A., on Millers R., 35 m. W. of Fitchburg, with manufs. of machinery. Pop. 5600. 3. Co. seat of O. co., Texas, U.S.A., on Sabine R., 90 m. N.E. of Galveston. Pop. 7400. 4. Tn. of Vaudaise dept., France, on R. Aigues, 12 m. N. of Avignon. A synod held here in 529 (*Aransio*

of the Roms.) is of importance in the Pelagian controversy. O. contains some fine Rom. remains, and was the cap. of an independent principality from the eleventh to the sixteenth century; in 1531 it passed to the house of Nassau, distinguished members of which were William the Silent, Maurice of Nassau, and William III. of England. O. passed to France in 1713. Pop. 13,900. 5. Tn. of New S. Wales, Australia, on the E. slopes of Mt. Canobolas, 170 m. W.N.W. of Sydney. Farming is carried on, it is one of the best fruit-growing (cherries, apples, pears, plums, grapes, peaches, figs, etc.) dists. of Australia, and sheep (the dist. is noted for its fat lamb production) and cattle are reared. Gold, copper, and silver are mined. There are woollen mills, a small-arms factory, an electrical works, and fruit storage plants. Pop. 15,000.

**Orangeburg**, city of S. Carolina, and co. seat of O. co., 39 m. S.S.E. of Columbia. It has oil mills and cotton industries. Pop. 10,500.

**Orange Free State**, formerly a S. African Boer republic, now a prov. of the Union of S. Africa, bounded on the W. and S. by Cape Prov. (the Orange R. forms the S. boundary); on the N. by the Vaal R.; and on the E. by Basutoland and Natal. The high veld of the O. F. S., with the Transvaal, lies across the westward sloping surface of the plateau of S. Africa, the Vaal and Orange R. system carrying the waters of the E. through the Kalahari desert to the Atlantic Ocean. Its surface mainly consists of undulating, grassy plains and plateaux, sloping towards the N. from the Drakensberg Mts. in the S.E. to the E.; on the Basutoland border it is hilly. Generally speaking, the country lies at an altitude of 4000 to 5000 ft. above the sea. It is watered by the Vaal and Orange Rs., with their tribs. the Modder, Caledon, etc. The climate is temperate and healthy, with moderate rainfall. Typhus, however, is endemic, as indeed in half the Union. Stock farming, to which the country is admirably suited, forms the main industry, sheep, cattle, horses, and pigs being largely bred. An increasing amount of land, especially in the E., is being devoted to agriculture, which receives every encouragement from the gov. There are over 250,000 ac. under wheat. Maize, potatoes, oats, fruit, and tobacco are also grown. There is considerable mineral wealth. Diamonds are found near Jagersfontein and Koffyfontein, and the produce averages over £1,000,000 in value annually. (In Jan. 1919 the find of a stone of 388 carats was reported.) Coal is mined just S. of the Vaal, and to a lesser extent in Vierfontein. Iron ores, gold (see OENDALAARHURST), and salt are also found. Trade is mainly carried on with the United Kingdom. Cottons, wool, ostrich feathers, leather, and hides, diamonds, etc., are exported. During the Second World War diamonds, and particularly industrial diamonds, showed a decided boom, and the diamond mine at Jagersfontein is expected to reopen as soon as machinery is available. The cap. is Bloemfontein. Other im-

portant ins. are Harrismith, Smithfield, Ladybrand, and Jacobsdal.

The prov. has an administrator aided by a prov. council of twenty-five members (elected for five years). There is an executive committee of four members. It sends eight members to the Senate, and thirteen to the House of Assembly of the Union Gov. The O. F. S., like the Transvaal, has never extended the franchise to any but the white pop. Justice is administered under the Rom.-Dutch law. The prin. religious body is the Dutch Reformed Church. Education is free up to matriculation standard and compulsory up to the age of sixteen, but exemption may be granted in special cases or when a child has passed standard vi. and is in regular employment. Unless parents object, the two official languages, Eng. and Afrikaans, are taught to all pupils, the home language of the pupil being the chief medium of instruction and the second language being introduced gradually during the primary school course. Higher and technical education are under the control of the minister of education for the Union, while primary (including elementary) and secondary education are controlled by the administrator of the prov. There are about 151 European public schools and about eleven aided private schools, with a total enrolment of 10,600 pupils; and about 515 non-European public and aided schools, with total enrolment of 61,300, and four training institutions for native teachers. Area 49,647 sq. m. The census of 1946 gave a pop. of 875,000 (European 201,000; non-European 674,000).

**History.**—The earliest Boer settlement on the N. of the Orange R. was made about the year 1828, after which came the great trek of 1835–36, when 10,000 people, following the refusal of the Brit. Gov. to agree to the extension of the colonial boundary to the Kei R. as a move against predatory Kaffirs, and also in consequence of the abolition of slavery, crossed the Orange R. to escape altogether from Brit. rule. These settlers, however, soon quarrelled with the Griquas, who were under the protection of the Brit. Gov., with the result that Sir Henry Smith, in 1848, annexed the whole country S. of the Vaal, an event which led to the Boers taking up arms under their old leader, Pretorius, who was defeated at Boomplaats in 1848, and then retired with some of his adherents to the N. of the Vaal. The ter. was then known as the Orange R. Sovereignty. The Brit. Gov., however, in view of increasing difficulties with the Basutos, abandoned the country in 1854, and its independence as the O. F. S. was confirmed at Bloemfontein in that year, much against the will of many of the inhab., who preferred Brit. rule. In the main the subsequent hist. of the O. F. S. was peaceful, but there was some fighting with the Basutos and, eventually, the ter. of the Basutos was conquered and incorporated in 1869 by the treaty of Aliwal N. into the O. F. S. The discovery of diamonds at Kimberley at this time and the consequent influx of diggers led

to a dispute with the Brit. Gov. over the boundary of the O. F. S., which was settled in 1876 by a convention signed in London providing for a payment by Great Britain of £90,000 in commutation of the claim of the O. F. S. This convention was signed by Brand, whose moderation and statesmanlike qualities as president had won general recognition. In 1889, not long after his death, the O. F. S. entered into an alliance with the S. African Republic, which was renewed in 1897, and this alliance was appealed to as binding the O. F. S. to assist the S. African Republic in her quarrel with Great Britain in 1898. The republic took a prominent part in the S. African war of 1899-1902, and was made a Brit. crown colony (Orange R. Colony) in 1900. In 1907 responsible gov. was granted, and in 1910 the colony was merged in the Union of S. Africa as the prov. of the O. F. S.

**Native Administration.**—In the O. F. S. the native pop. in the reserves was never large and, despite immigration, it is still far lower in proportion to Europeans than in any other prov. of the Union. Formerly there was a Dept. of Native Affairs, but it was abolished in 1908, when native administration was entrusted to the colonial secretary's dept. From the outset it gave no general recognition to native law, though, by a special enactment, it acknowledged the legality of native marriages in the Thaba Nchu reserve and, by later enactment, a limited system of intestate succession derived from Rom.-Dutch law was introduced. Three chiefs have civil judicial powers, and two of these have criminal powers as well, in the native courts. The Native Administration Act, 1927, which gave these powers, also gave statutory recognition to native law in all provs. of the Union. This, though it obviated embarrassment arising from the previous limited recognition, was really in harmony with the political objective of segregation, and was directed less to the maintenance of native law for its own sake than to differentiating its field. There are four Native Reserve Boards, whose nominated members sit under the chairmanship of a magistrate, and derive their resources from the local tax imposed by the Natives Taxation and Development Act. There are to-day only three small reserves, one comprising lands assigned to Mopeli, a Basuto chief who submitted during the Basuto war of 1865-66; the others consisting of the remainder of the lands which the Basuto assigned in 1829 to a section of the Barolong which had been driven out of Bechuanaland and then left in undisturbed possession by the Voortrekkers in consideration of help rendered by them against the Basutos. As in other provs. of the Union there is a complicated system of pass laws. The regulations under the Native Administration Act, 1927, require the native to take out a pass to enter or travel within any 'pass area,' i.e. anywhere within the O. F. S. and Transvaal excepting native areas scheduled under the Native Land Act of 1913. The rigidity of the system is, however, mitigated by the issue of

travelling passes by officials and owners of farms, and by the grant of exemptions. There are also in Bloemfontein and other large tns. 'locations' for natives. The 28,000 natives who live in the Bloemfontein location are said to live under as good conditions as any in the Union. The natives here have cinema shows, concerts, and meetings; a Y.M.C.A., a native dispensary, and an undenominational high school. There are also sev. well-laid-out sports grounds. It has been found that by establishing an advisory board, elected by the natives and to which all matters concerning the location are first referred, the natives have been brought to take a pride in the progress and orderliness of their native tn. See A. H. Keane, *The Boer States*, 1900; J. H. Malan, *Die Opkoms van die Republiek van die Ooskaapland van die Orange 1795 tot die Jaar 1863*, 1929; H. J. Wikar, *Journals*, 1935; and E. A. Walker, *History of South Africa*, 1935.

**Orange, House of**, ruling family of a once independent principality now included in the dept. of Vaucluse, France, and to-day occupying the throne of the Netherlands (q.v.). The male line of Gerald Adhemar (fl. 1086) ended in 1174 when the heiress married Bertrand de Baux. Nine princes of his line followed one another until another heiress, Marie de Baux, married Jean de Châlons in 1393. His descendant, Philibert (1502-30), was an ablesoldier and for his part in the campaign of Charles V. was rewarded by the emperor with extensive possessions in the Netherlands. Philibert, dying without issue, was succeeded by his nephew, René of Nassau-Châlons, whose father, Henry, count of Nassau, had also enjoyed the emperor's confidence. René on his death in 1544 devised his titles and estates to his first cousin, William of O. Nassau, famous in hist. as William the Silent. The prince of this line rendered service to the cause of Dutch independence but still greater service to the Protestant cause. William the Silent was assassinated in 1584. His great-grandson became William III. of England; but on his death in 1702 the succession was disputed by the king of Prussia and John of Nassau-Dietz. The peace of Utrecht (1713) effected a compromise. The Prussian claim was abandoned, the ter. of O. was incorporated in France, and John was given the title prince of O. In 1815 his descendant, William VI., became king of the Netherlands. See Count A. de l'ontbriant, *Histoire de la principauté d'Orange*, 1891, and J. M. van de Venne, *Geslechts-register van vorstenhuis Nassau*, 1937.

**Orangemen**, members of the Orange Society, known also as 'Orange boys.' From the time of the Elizabethan settlements in Ireland there was bitter enmity between Catholics and Protestants. This feeling smouldered during the seventeenth century, but the events connected with the revolution of 1688 fanned it to a furious flame. During the whole of the eighteenth century Ulster in particular was kept in a continuous state of uproar by this semi-religious, semi-political feud

In 1795, when the Protestant party was in the ascendant, the Orange Society was formed, taking its name from William of Orange. The society was avowedly political, its aim being to secure Protestant ascendancy wherever possible. It was a secret society, arranged in lodges; and during the last century it spread widely, having lodges not only in Ireland but also in Great Britain and the dominions, especially Canada. The organisation has always had a tendency to bluster and riot, so much so that Parliament has several times been compelled to restrain it somewhat. From 1813 to 1828 it was entirely suspended in its native land. It keeps as high festivals the anniversaries of the battle of the Boyne (July 1) and the battle of Aughrim (July 12). See *Orangism Exposed* (anonymous, 1824, New York); Parl. Report on the Orange Association 1835; Lilburn, *Orangism*, 1866.

**Orange River**, or **Gariiep**, riv. of S. Africa, rising in the Mont aux Sources, Drakensberg, Basutoland, and flowing generally W. to enter the Atlantic in lat. 28° 38' S. It forms the N. boundary of Cape of Good Hope, separating it from the Orange Free State, Griqualand W., Brit. Bechuanaland, and Great Namaqualand. The chief tribes are the Vaal and Caledon on the r. b., and the Hartesbeest and the Zeekoe on the l. b. Its banks are well wooded, but much of the country through which it flows is desert. It is of little use for irrigation owing to the depth of its channel, and sand-bars, shallows, rapids, and falls make navigation impossible. Length 1100 m.

**Orango, Doroteo**, see VILLA, FRANCISCO.

ORANG-UTAN

A, Right hand. B, Foot.

**Orang-utan**, or **Orang-utan** (*Pongo pygmaeus*, or *Sinua satyrus*), member of the family Pongidae or Simiidae, which is found solely in Borneo and Sumatra. In colour it is tawny, and in height averages

about 4 ft. The brachycephalic condition of the head is very marked, the fore-limbs touch the ankles when the animal is erect, both hallux and pollex are short, and the former is usually devoid of a nail; the dorsolumbar vertebrae are sixteen in number. The O. is arboreal, and when on the ground it walks on the outside of its feet. During the night-time it sleeps in a nest which it builds in the trees. In habit it is solitary except during the pairing season, and in diet it is mainly frugivorous. See Winifred Felee, *Apes*, 1948.

**Oranienbaum**, in. in the Leningrad region of the R.S.F.S.R. on the S. coast of the gulf of Finland, 25 m. W. of Leningrad. It is a favourite summer resort, and contains a former imperial palace. Pop. 6000.

**Oratorio**, dramatic form of religious music consisting of solos and choruses, with instrumental accompaniment. The term, however, has been variously defined at different periods in different countries, and, in its beginnings, in the early seventeenth century, it had action, scenery, and costumes, while, sometimes, works not religious in character, have been called Os., evidently because they consisted of the solo, choral, and orchestral features of O. proper while yet not being operas, in that they were not intended for stage performance. Dr. Scholes points out that some quite modern Os., such as Berlioz's *Childhood of Christ* and Liszt's *St. Elizabeth* have been found capable of treatment in dress and action like operas and indeed of being staged as such.

The origin of both the name and the form is usually traced to the oratory of St. Philip Neri. About the middle of the sixteenth century this saint commenced a series of biblical lectures at the oratory. In order to make these more interesting, Annunziata, the master of the papal chapel, wrote settings for hymns, *Lauds spirituali*, to be interspersed throughout the lectures. It is probable, however, that the origin of the O., in Germany at least, is connected with the hymns and songs of the old miracle and mystery plays, and also with the usual method of singing the Passion gospel during Holy Week. The first O. was Emilio de' Cavalieri's *Rappresentazione di anima e di corpo* (1600), which shows the very close affinity between the O. and the opera. Both were founded on the monodic system of harmony, and to this system the It. school adhered. The name of Carissimi (d. 1674) is particularly important as a developer and exponent of the It. O. One of his Os., *Jephtha*, is founded partly on the scriptural story of Jephtha's sacrifice of his daughter, but it has also several rhymed passages for solo and chorus, and a narrator in the manner of a Bach Passion. In Germany the O. was from the beginning written round the Passion, the first example being Steffoni's *Passio secundum Mattheum* (1670). There is no successor, however, for over fifty years. Heinrich Schütz's (1585-1672) settings of the Passion prefigured Bach but they also have their own high value in addition (Scholes). The Ger. school did not follow

the It. in its monodic method, but worked almost invariably in the polyphonic style of composition. The form was raised to a great height by Bach (1685-1750), whose greatest composition of this kind appeared in 1729, the *Passion according to St. Matthew*. Only one O. is attributed to Wagner, an early, unimportant work, *The Love Feast of the Apostles* (1843), written for male choir. Dvořák's *Stabat Mater* is the only important Czech O. Beethoven's one O., *Christ on the Mount of Olives*, contains a famous 'Hallelujah' chorus. The most prolific composer of O. during the eighteenth century was Handel, who first wrote in Ger. and later in It. His best Os., however, belong to his Eng. period, the most famous being *The Messiah* (1741). Other well-known Os. are Bach's *St. John Passion* (1720); Haydn's *Creation* (1798), and *Seasons* (1801); Spohr's *Last Judgment* (1812); Mendelssohn's *St. Paul* (1838) and *lijah* (1838-46); Stainer's *Crucifixion* (1887); Elgar's *Dream of Gerontius* (1900); and Walton's *Belshazzar's Feast* (1931).

An historical list of Os., indicating importance and influence on development of form will be found at the end of the article on O. in P. Scholes's *Oxford Companion to Music*, 1941. See also Annie W. Patterson, *The Story of the Oratorio*, 1902.

Oratory, art of rousing the emotions and convincing the understanding of others by public speech according to the rules of rhetoric. It may be classified as political, forensic, and religious. The ancients experienced no strong religious passion, so that their O. was confined to the courts and the legislative assembly. Before Demosthenes the prin. orators of Athens were Lysias and Isocrates. The speeches alleged to have been delivered by Pericles and recorded by Thucydides are probably the composition of the historian; yet some of them remain among the most moving utterances of hist. Demosthenes stands apart from and above all others. An eclectic in style, he achieved a synthesis which makes him still the leader of human eloquence to whom alone of the Athenians Alcibiades yields the palm of O. At Rome the rugged eloquence of Cato, the Scipios, and the Gracchi gave way before the Attic influence. It has been said that a certain oriental strain marred the speeches of Hortensius; but the great forensic orations of his rival Cicero rank with, and, in the opinion of some, even surpass, the achievement of Demosthenes.

As at Athens, so at Rome, the end of freedom marks the decay of eloquence. After the extinction of imperial despotism two causes hindered the rebirth of O. There was a lack of political and legal institutions which have always been the nursery of eloquence, and language itself was undergoing a long and difficult transformation.

The Eng. language together with the parl. tradition and the hallowed dignity of the Eng. courts have fostered a high standard of O. The names of Lord Chatham, Pitt the younger, Charles Fox, Lord Brougham, Disraeli, and Gladstone adorn the eighteenth and nineteenth cen-

turies; and the splendour of their debates was enhanced by the speeches of their Irish colleagues Edmund Burke, Henry Grattan, Richard Shiel, and Daniel O'Connell. In France the voices of Mirabeau, Desmoulins, and Danton heralded and sustained the revolution. The twentieth century has experienced a decay of culture; and this decay has been marked by a lack of orators to interpret and control the portentous happenings of these fifty years. Two notable exceptions have been the impassioned demagogy of Adolf Hitler and, more important, the parl. and broadcast speeches of Winston Churchill during the Second World War. These swayed the destiny not of a single nation but of the world. Eng. forensic O. has enjoyed an equal splendour and suffers a similar eclipse. The eloquence of Henry Hawkins, Edward Carson, Rufus Isaacs, and F. E. Smith remains the glory of the Eng. Bar and Bench. Religious O. reached its perfect flower in France. St. Bernard of Clairvaux and Jean Gerson dominated the pulpit in the Middle Ages. The semi-political wranglings of the reformers were not fertile ground for the selfless passion which inspires the great pulpit orator; but from the seventeenth century onwards there arose a succession of preachers who, independently of the religious content of their discourses, rank with the finest speakers of the world. Bossuet, Bourdaloue, Fénelon, Massillon, and Lacordaire have no equals as exponents of the Christian faith and the duties of the Christian life. See J. Hardwick, *History of Oratory*, 1896.

Oratory of St. Philip Neri, Congregation of the, was founded in 1556 at the hospital of San Girolamo della Carità, Rome, by the saint whose name it bears. The society had at first no definite rule; but after the death of St. Philip a constitution conformable to his spirit and intention was drawn up by the historian Baronius, one of his earliest companions. The Oratorians are priests living in community under simple vows terminable at any hour. The Oratory was introduced into England by Newman in 1847, the first house being at Maryvale, near Birmingham, later transferred to Birmingham itself. The Brompton Oratory is an independent offshoot of this.

Another oratory was founded in 1611 by Cardinal de Bérulle, and called the Congregation of the Oratory of Our Lord Jesus Christ. The general intention was to strengthen eccles. discipline, and the rule was also adopted by the Oratory of the Immaculate Conception, founded in 1852 in Paris. See also ORATORIO. See J. E. Bowden, *Life of Frederick William Faber*, 1869.

Orbigny, Aléide Dessalines d' (1802-57). Fr. naturalist, b. at Couëron, Loire-Inférieure. He was appointed travelling naturalist to the Museum of Natural Hist., Paris; and in 1826-34 went on a scientific mission to S. America, embodying the results of his researches in zoology, paleontology, and ethnology in *Voyage dans l'Amérique méridionale* (1839-43). Among his other works were *Galerie ornithologique*

*des oiseaux d'Europe* (1836-38); the unfinished *Paléontologie française* (1840-54); and *Prodrome de paléontologie stratigraphique* (1850-52).

**Orbis Sensualium**, see COMENIUS.

**Orbit**, path traversed under the influence of gravitation by a heavenly body round its primary. In the solar system ellipses are traced by satellites round their planets, and by planets round the sun, the primary occupying one of the foci. The elements provided when an O. has been computed are the long. of perihelion, the long. of the ascending node, the inclination of the O., the eccentricity, the semi-axis major or mean distance, and the time of perihelion passage. The planetary Os. vary in eccentricity from 0.007 to 0.25, those of satellites from 0 to 0.21. Periodic comets move in elliptical Os. from about 0.46 to 0.9999 eccentricity; most comets move in nearly parabolic paths, while sev. trace a hyperbola. But all of those formerly moved in elliptic Os., and were thrown into hyperbolic Os. by the perturbations of the major planets. Spectroscopic binaries have less eccentric Os. than telescopic ones, the values ranging from about zero (implying nearly circular motion) to 0.67.

**Orbilius, Pupillus**, see PUPILLUS.

**Orcades**, Lat. for Orkney Is.

**Orcagna**, or **L'Arcagnuolo** (c. 1308-c. 1368), nickname (the archangel) of Andrea di Cione, Florentine painter, sculptor, and architect. His work is rich in colouring and ornamental in effect, though rather hard and conventional in execution. Among his masterpieces are the wall paintings in fresco and an altar-piece in the Strozzi Chapel, Santa Maria Novella, Florence; the frescoes in the Campo Santo at Pisa; the altar-pieces in tempera, 'The Coronation of the Virgin' (National Gallery, London); and in architecture, the church and tabernacle of Or San Michele, Florence. He left sev. unfinished works, completed by his brothers.

**Orcā, Orchā, or Urcāha**, state of the United State of Vindhya Pradesh, India. Iron and diamonds are produced. The cap. is Tehri. Pop. 363,000.

**Orchard**, large or small plantation of fruit trees. Modern Os. consist of 'straight' plantings of apples, pears, plums, and cherries. The plantation layout for mixed varieties, except for small garden Os., has been discarded. Best soils for fruit are of a loam character, with certain types of sands or clays for second choice; no fruits do well in soils subject to waterlogging or drying out. For apples, deep, sandy, gravelly, or clayey loams, with good draining subsoils, are best. For pears, medium to heavy loams. Plums do best on heavy to medium loams, and are more tolerant of wet soils than other fruits. Cherries like medium to light loams, and deep, well-drained soils. Soft fruits are less exacting and thrive on most soils, given adequate organic matter content. Land sloping to the S., W., or N. is preferable to that sloping to the E. Protection by windbreaks, natural or made, is needed on land fully exposed to the S.W. Maximum sunlight in summer

is essential. Elevation is important. High land is generally preferable to low, but the crucial factor is the movement of air currents. An O. should be sited and planted so that the heavy cold air can move through it easily to lower levels beyond. Frost pockets and narrow valleys should be avoided. A minimum rainfall of 20-25 in. per annum is needed for fruit crops. It is no longer good practice to plant Os. with 'filler' trees to be taken out some years later, and undercropping of tree fruits with bush fruits needs careful planning. A modern O. is planted for permanency from the start. Where circumstances dictate mixed plantings gooseberries may be planted with apples, black currants with plums, cherries with plums, but not apples with plums or cherries, since soil and manurial requirements must be similar. Plums or damsons may be planted on the windward side of Os. Raspberries, strawberries, and brambles are planted separately. Five systems of planting prevail: square, rectangular, diagonal, quincunial, and hexagonal. Spacing depends on type and habit of tree chosen. Gooseberries and currants may be planted at 6 ft. apart (1210 trees per ac.); bush apples and pears at 12 ft. apart (302 trees per ac.); half-standard apples, pears, and plums at 24 ft. apart (75 trees per ac.); and full standard tree fruits at 30 ft. apart (48 trees per ac.). Land for fruit should be deeply ploughed, and the subsoil broken up if hard and panned. No manure is necessary for tree-fruit planting, except potash on light or deficient soils. Soft fruits should have dung or compost ploughed or dug in before planting. If drainage is needed drains should be laid after the orchard has been laid out, but before trees are planted. Drains should run between the rows of trees into the main drain. Actual planting is done in dry open weather from about mid-Oct. onwards, but is best completed before Dec. Planting holes should be 9-12 in. deep, and 24-36 in. in diameter for tree fruits. Subsoil is broken up with a fork, then a little top soil put back so that the tree is planted in good top soil entirely. Firm planting is vital, but ramming of the soil, particularly clays, is undesirable. All trees need staking; bush trees can be staked with stakes driven slantwise, pointing into the prevailing wind, standards and half-standards are best given two stakes about 13-24 in. apart on each side of the tree, with a cross-pole fastened to the tree, 12 in. below the branching head. The O. floor should be cultivated and kept free from weeds and grass until tree growth is well developed.

**Grass orchards** are less popular. Although stock such as poultry and sheep can be run under half-standard or standard trees, manurial treatment tends to become unbalanced. Grass has a starving effect on tree growth, and Os. should not be planted direct in grass. When trees are well developed it is permissible to allow grass to grow over the roots, but it should be kept short by cutting or grazing with stock, and careful attention given to manuring and fertilising of trees.

Sheep suit fruit best, as their excrement has a high potash content; geese are excellent, then poultry; pigs and cows are less suitable, since their excrement is less evenly distributed. Overstocking should be avoided, and the land rested from stock and limed periodically. Temporary cover-cropping of O.s. with leguminous seed mixtures is helpful in building up organic content of soil. Intercropping of fruit with vegetables is apt to be handicapped as it interferes with spraying programmes. Good regular yields of fruit depend largely on manuring. Broadly, dessert apples, red currants, and gooseberries need potassium mainly, supplemented by nitrogen and phosphorus; cooking apples, pears, cane fruits, and strawberries require potassium, but heavier supplements of nitrogen; while stone fruits, black currants, and nuts need plentiful nitrogen and moderate amounts of potassium and phosphorus. In practice, manuring must be related to pruning, cultivating, soil, drainage, and type and variety of fruit and tree.

**Orchard House.**—A lean-to or span-roof glasshouse for the culture of fruit trees in pots should preferably be not less than 20 ft. wide, 12 ft. high at the ridge, and 6 ft. at the side. All sides should be made to open panel-wise for tree ventilation. Sufficient heating to nullify spring frosts in March–April is desirable. Pot trees can provide a greater variety of fruit from a given space than outdoor trees. Fruit ripens one to two weeks earlier. Success depends upon management and attention to watering, syringing, top dressing, and feeding to maintain health and fertility. Apricots, figs, nectarines, and peaches can be kept constantly in the house. Apples, pears, and plums can be placed out of doors in a favourable situation from early June to early Feb. Currants, gooseberries, and cherries are best cropped under glass, and then put outside until early Feb. Trees should have been grown in pots from the time they were grafted or budded, and should be three to four years old, well furnished with fruit buds. Size of pots are 12–16 in. Trees are grown in a compost of 1 part by bulk each of coarse sand, leaf mould, rotted manure, mortar rubble, and 5 parts medium loam, plus 12 oz. bone meal and 6 oz. of a balanced fruit fertiliser to every barrowful of compost. Repotting is done in mid Oct., but is not necessary every year. Healthy trees need only a little old soil removed from the surface and sides, and replaced with fresh compost. Trees are wintered out of doors after watering well, and plunging to the rims of the pots in ashes. Pots are then covered with organic litter to keep frost out. In Feb. trees can be moved into the house. Indoor trees usually need pollinating by hand, using a rabbit's sent or camel-hair brush when flowers are open. Fruits should be well-thinned, and all fruit trees in pots need careful pruning. Apples, pears, cherries, currants, and gooseberries are summer-pruned. In the case of nectarines, peaches, and plums, main shoots are cut back by one-half and laterals to two to three buds of their base.

**Orchardson, Sir William Quiller** (1835–1910), Brit. artist, b. in Edinburgh. He first exhibited at the Scottish Academy in 1848. In 1862 he settled in London, where for some time he worked in close association with John Pettie. He was elected A.R.A. in 1868, and in 1877 made R.A. In 1870 he visited Venice. He was made a D.C.L. of Oxford in 1890, and knighted in 1907. His work, usually dealing with incident, is dramatic, elegant, and harmonious in colouring. Among his best-known pictures are 'Challenged' (1865); 'Ophelia' (1874); 'A Venetian Fruit-seller' (1874); 'Plotsam and Jetsam' (1876); 'The Queen of the Swords' (1877); 'Hard Hit' (1879); 'Napoleon on board the *Bellerophon*' (1880); 'The Young Duke' (1889); and 'Her Mother's Voice' (1888). He was also a popular and successful portrait-painter.

**Orchestra**, body of instrumental players performing in a theatre or concert hall. The term originally meant the semi-circular space in front of the stage in the ancient theatre where the chorus danced and sang; it has been transferred from the place to its occupants. The modern O. did not begin to evolve till about 1600. At that period the same music was performed by voices and instruments; many books of madrigals are described as fit for viols or voices. The small instrumental groups were generally confined to the same family, e.g. the consort of viols or recorders, and they played what we should call chamber music. Wind bands existed, and trumpets and drums for military and ceremonial use. There were no public concerts before the eighteenth century; the O. developed in the theatre, the church and the court (Louis XIV. of France kept a band of twenty-four violins, initiated by Charles II. of England). Of these the theatre was the most important because it encouraged experiment. In his opera *Orfeo* (1607) Monteverdi used an O. of forty (seventeen strings, eight woodwind, nine brass, harp, two harpsichords, and three organs), and put orchestral colour deliberately at the service of dramatic effect. About the same time Giovanni Gabrieli at Venice extended the antiphonal principle from vocal to instrumental music, and wrote works for two groups of instruments (or Os.), contrasting the sonorities of strings and brass. But progress was not consistent. By 1700 the violin family had replaced the viols, and the centre of the O. became the string quartet (two violins, viola, and cello). It was always supported by a keyboard instrument (generally harpsichord or organ), which played the bass line and added any harmonic filling required. The keyboard player, who was often the composer, directed the performance (there was no conductor in the modern sense); next in importance were the leaders of the first violins and the basses, who took their position beside the keyboard. Oboes, bassoons, and flutes (more strictly recorders) won a place in the O. of Purcell (1659–95) and Lully (1632–87), and trumpets and drums were introduced for special effects; but the wind instruments

often had little to do except reinforce the strings, and flutes and oboes were generally played by the same players. The period of Bach and Handel saw the rise of the concerto, and the use of one or more solo instruments, either in contrast to the main orchestral body or to supply an *obligato* in a vocal work. The operas and oratorios of Handel not only introduced many additional instruments including trombones, transverse flutes, horns, and clarinets, besides several that failed to keep their place, but explored

the valve to horns and trumpets greatly extended their chromatic range and the power of the whole O. During the romantic period Os increased rapidly in size, and composers turned more and more to exploit the mounting possibilities of instrumental colour. This process reached its height in the works of Berlioz and Wagner who himself added a number of new instruments, and was carried to excessive lengths by Strauss and Mahler. In France special prominence was given to the cornet (taken from the military

BBC

Leader, Paul Beard, Conductor, Sir Adrian Boult.

fresh ground in orchestral sonorities. The modern O did not emerge till about 1800 when the keyboard player dropped out and the instruments became standardised in their three groups of strings, woodwind and brass supported by percussion. The first violinist was now the true leader of the O. In addition to pairs of flutes, oboes, clarinets and bassoons two (occasionally four) horns had been introduced from the hunting field and in Beethoven's Fifth Symphony the three trombones completed their transition from the church to the concert hall via the theatre. Big drum, cymbals and triangle were used for special effects (known as Turkish music), so was the piccolo and a little later the cor anglais while the harp returned from long exile. The wind bass was supplied by the serpent, ophicleide or double bassoon and from about 1860 by the tuba. In 1815 the application of

bind) and the instruments of the saxophone family. Perhaps the most laborious and nicest O is that used by Stravinsky in his *Sire du Temps* (1913). Since then there has been a movement led in part by Stravinsky himself in favour of smaller Os. Experiments have been made in the introduction of electric instruments such as the Ondes Martenot (q.v.).

To the growing complexity of the O is due the rise of the modern conductor a nineteenth century phenomenon developing out of the violinist leader. The first to conduct with a baton in London was Spohr in 1790. Weber in 1826 used a roll of paper, and others a violin bow. The interpreter conductor was largely the creation of Wagner. In earlier times a heavy baton had sometimes been used simply to beat time (I fully died as a result of injuring his foot with one). Early in

the nineteenth century control of orchestral music began to pass from the court to the middle classes, and public concert societies were founded. The Leipzig Gewandhaus already existed; the London Philharmonic Society was founded in 1813, the Paris Société des Concerts du Conservatoire and the Munich Odeon-Concerts in 1828. Many others followed. The number of permanent Os. increased rapidly after the middle of the century, especially on the continent and in the U.S.A. Until this century Britain was backward in this respect, but is now well supplied by the London Symphony, London Philharmonic, Royal Philharmonic, and the various Os. associated with the B.B.C., besides a number of prov. Os., of which the Halle in Manchester is the most distinguished. Promenade concerts began in Paris in 1833, and were transferred to London in 1838, where they flourished from c. 1840 to 1859 under Louis Jullien. Revived in 1895 at the new Queen's Hall by Henry J. Wood and Robert Newman, they have ever since been a strong influence in entertainment and education. An even greater influence has been the dissemination of orchestral music by gramophone and radio. The standard of instrumental performance expected (and achieved) in the last fifty years has shown a continuous rise. See A. Caroe, *The History of Orchestration*, 1925, C. Forsyth, *Orchestration*, 1936, *The Orchestra in the Eighteenth Century*, 1940; and *The Orchestra from Beethoven to Berlioz*, 1949.

Orchids (Orchidaceae), family of monocotyledonous plants of extensive distribution, though most abundant in damp equatorial regions. The known economic uses of its members are remarkably few and, indeed, are confined to the genus *Vanilla* (the dried pods of which yield the flavouring substance of that name), and to the genus *Orchis*, from the tubers of some species of which saleg, a nutritious drink, is or used to be derived. In Britain the family is represented by some fifteen genera, among which are *Aeolaea* (bird's-nest orchid); *Listera* (twayblade); *Spiranthes* (lady's tresses); *Epipactis* (helleborine); *Orchis*, represented by twelve species, some of which are common; *Aceras* (man orchid); *Ophrys* (insect orchid); *Hermidium* (musk orchid); *Habenaria* (butterfly orchid); and *Cypripedium* (lady's slipper). These are all terrestrial, and most of them, though small and not so brilliantly coloured as the tropical species, are pretty and interesting, and, with a few others from temperate climates, are grown in rock gardens and in shady borders or as pot plants in cold frames. Apart from these, a considerable number of O. can be grown with ease in a small greenhouse; and many choice, though of course not rare, varieties are procurable at small expense. For further particulars, see the various genera under their own names: Darwin's absorbing book, *The Fertilisation of Orchids*, 1862; J. Veitch, *Manual of Orchidaceous Plants cultivated under Glass in Great Britain*, 1887-94; W. Watson, *Orchids, their Culture and Man-*

*agement*, 1903; W. H. White, *The Book of Orchids*, 1902; J. O'Brien, *Orchids* (undated); J. Lindley, *Genera and Species of Orchidaceous Plants*; C. F. F. K., and L. L. Sander, *The Orchid Guide*, 1937; T. W. Hirscoe, *Orchids for Amateurs*, 1948; and J. Brooke, *The Military Orchid*, 1948.

Orchil, or Orchella, see ARCHIL.

Orehoenus, two cities of anc. Greece: (1) In Boeotia, on R. Cephissus. (2) In Arcadia, lying N. of Mantinea, W. of Stymphalia. Both were important till the fifth century B.C.

Oreus, Lat. mythology, one of the names of the nether world and its god, corresponding to Hades and Pluto respectively.

Orezy, Baroness, otherwise Emmuska Barstow (1865-1947), Brit. novelist, b. at Tarnaörs, Hungary, daughter of Baron Tarnaörs. She studied painting in London, and exhibited at the Royal Academy. In 1895 she pub. her novel, *The Scarlet Pimpernel*, first written as a play in collaboration with her husband, Montague Barstow, son of a Yorkshire clergyman, and followed this with more than forty novels of a similarly romantic character, chiefly of the period of the Fr. Revolution, including many 'Pimpernel' sequels, such as *The Elusive Pimpernel* (1908), most of which had a great vogue. Her writings included essays, historical novels, detective stories, and memoirs, *Links in the Chain of Life* (1947).

Ordainers, Lords. As part of the long-continued struggle between the Eng. barons and the Eng. kings, in 1310 a Parliament of the former set up a body of twenty-one peers, the Lords Ordainers, in an effort to control Edward II. After eighteen months' office they put forward proposals for future government, known as the 'ordinances' of 1311.

Ordeal (O.E. *ordǣl*, *ordǣl*, judgment; cf. Ger. *urteil*), or Judicium Dei, very common medieval method of deciding doubtful questions. It is not an isolated phenomenon, for in all parts of the world such appeals to magic are common, and many close analogies to the medieval methods may be found. It will be possible here to deal only with the medieval forms. Trials were generally made by boiling water, by red-hot iron, by cold water, by fire, or by blessed bread (the *corameli*). In the trial by boiling water the accused person was made to plunge his hand, and sometimes his arm, into boiling water, and perhaps take something from the bottom of the vessel. The hand was then soaked up, and his guilt or innocence was judged by its condition at the end of three days. The O. by red-hot iron was performed either by carrying a red-hot iron a certain number of paces or by walking barefoot over or between red-hot ploughshares. Well-known examples of this type of O. are those which vindicated Queen Emma (mother of Edward the Confessor) and St. Kunigunde. In the trial by fire the accused had to justify himself by walking between two fires of wood placed close together. Here, again, a certain number of days was allowed for recovery. In the O. by water the accused was bound and

thrown into cold water. If he sank he was innocent, but if the water refused to receive him he was guilty. This long remained a favourite test of witchcraft. the O. by blessed bread depended upon the belief that a perjurer could not swallow such food. Henry III. abolished legal Os in England, except trial by battle, which theoretically remained in force until 1818, when it was brought to an end on the occasion of its claim by a man indicted for murder.

Orden, El, *see* New DOVGOLA.

Order, in taxonomy (classification of plants and animals) refers to a group below class and higher than family. It is therefore formed of a number of families which are a div. of a class, e.g. the O. Carnivora belongs to the class Mammalia and includes such families as Canidae (dogs) and Felidae (tigers and cats). *See* BOTANY, ZOOLOGY, etc. O. is also a term in architecture (*q.v.*).

Ordericus Vitalis (1075-c. 1142), monk and historian, b. at Atoham, Shropshire. St. Evroul, a Norman monastery, was his home for most of his life. His *Historia Ecclesiastica* (1123-41), dealing with England and Normandy, contains some important contemporary hist. It was ed. by L. Duchesne in 1819, and by A. le Prévost for the Société Historique de France in 1838-55, and trans. into Eng. by T. Forester in 1853-56.

Order in Council, order issued by the sovereign by and with the advice of the Privy Council. The O. in C. is the chief constitutional instrument through which the Crown can increase the residue of its prerogative authority (*see* CROWN), and is perhaps the sole remaining mode by which the Privy Council can exercise such legislative powers as still subsist in it. But apart from the royal regulations for the army and navy, and legislation for Crown colonies (*q.v.*) and protectorates (*q.v.*), Os in C. are, in practice, only made subject to the assent of Parliament, or in pursuance of express statutory powers conferred on the Crown. Legislation by Os in C. is, nevertheless, authorised by a host of statutes. The provisions of the Extradition Act are applied by Os in C. to the states with which Great Britain has concluded treaties, and the O. in C. is the orthodox mode of creating courts for the trial of Brit. subjects in barbarous countries in pursuance of powers conferred on the Crown by the Foreign Jurisdiction Act, 1890 (*q.v.*). As most of the business formerly transacted by the Privy Council has now been assigned to the various gov. depts., Os in C. so far as they do not relate to the Crown's discretionary authority (prerogative), are drafted by the different ministries or depts. concerned, while the Cabinet itself determines the general policy of such Os in C. (Halsbury, *Laws of England*.) In cases of emergency constitutional limits have been disregarded, and Parliament has been subsequently asked to ratify the action by granting an indemnity to those issuing the O. in C.

Orders, Army. The king's regulations and O. for the Brit. Army which were

formerly notified in army circulars, have, since 1888, been promulgated together with General O. under the title of A. O. The Crown has always issued regulations and O. for the government and general economy of the military forces, in execution of statutory provisions relative thereto; but such O. would not be enforced by the law if in any way *ultra vires*, e.g. if they purported to affect persons not subject to military law (*see* as to this under MARTIAL LAW). A. O. are issued to the Army Council nominally by the command of the sovereign as expressed under the sign manual. Details relating to appointments and promotions, pay, uniforms, etc., or other special matters, are dealt with by royal warrants issued through the War Office.

Orders, Holy. The Church of England, in the preface to her ordinal, insists on the necessity of the apostolical succession and the threefold ministry. These three O. are bishops, priests, and deacons, who are set apart for their office by the laying on of the bishop's hands and the invocation of the Holy Ghost. The Church of England is therefore unable to recognise any but episcopal ordination. The Rom. Church, however, while holding to the same principle of apostolical succession, refuses, for technical reasons, to accept the validity of Anglican ordination. In the Rom. Catholic Church there are also certain minor O. of little practical importance, those of acolyte, exorcist, reader, and doorkeeper. Among Presbyterians ordination is performed by the presbyters, while many other Protestant bodies have no form of H. O. whatever. *See* ORDINATION.

Orders, Monastic, *see* under MONASTICISM.

Orders of Knighthood. Origin and hist. of knighthood generally has been treated in the article KNIGHTHOOD. This article relates principally to the different O. of K. of the various nations of Europe.

GREAT BRITAIN AND IRELAND: (1) *The Order of the Garter*.—Selden, corroborated by Froissart, fixed the date of the foundation of this anct. order as 1345; but, in the absence of all authentic records, both the date and the cause of foundation rest upon mere tradition. The register known by the name of the Black Book, which is usually referred to as treating of the order from its very foundation, was only drawn up in its present form towards the middle of the fifteenth century. Burke, commenting on Froissart's statements, says that the old chronicler vividly conjures up the whole scene of the origin of the order with his naïve and vivid account of how Edward III. resolved to re-erect Windsor Castle, the scene of dramas of King Arthur and the Round Table, and to make an order of knights of himself and his children, to be called the Knights of the Blue Garter, and that an ann. feast of the order should be solemnised at Windsor on the day of St. George. Popular tradition has the different version, derived from the romantic episode narrated by Polydore Vergil, of the countess of Salisbury's garter dropped at a court festival and

picked up by the king himself, who, observing the general significant smile of the onlookers, tied it round his own knee and uttered the celebrated words: 'Honi soit qui mal y pense.' Burke is not disposed to discountenance this story, characteristic as it is of an age steeped in the romance of gallantry. A third theory is that of Camden, the antiquary, who says that the order originated at the battle of Crécy, when Edward ordered his garter to be displayed as a signal for the onset. In any case, there is no more ant. or illustrious order in Europe. It had undergone many changes before the Act of 1805, when its constitution was fixed as comprising the sovereign and twenty-five knights companions, together with such lineal descendants of George III. as might be elected. Its statutes have at different times provided for the admission of

THE STAR OF THE GARTER

sovereigns and extra knights, the latter of whom have always become part of the twenty-five companions on the occurrence of vacancies. Since 1917 membership of the order is again at the sole discretion of the sovereign without reference to the Prime Minister. The habit and uniform are the garter of dark blue ribbon, edged with gold, bearing in golden letters the motto above-mentioned: with chased gold pendant and buckle, blue velvet mantle lined with white taffeta, and a star on the left breast; crimson velvet hood and surcoat, black velvet hat with plume of white ostrich feathers and a tuft of black heron's feathers fastened in by a band of diamonds; gold collar with twenty-six pieces, each in the form of a garter, and the figure of St. George slaying the dragon attached to it.

(2) *The Order of the Thistle.*—Burke, ignoring the fabulous antiquity ascribed to this order by tradition, traces its organisation as a knightly confraternity to the reign of James II., but mentions the fact that the royal warrant issued prior to the promulgation of the statutes relating to the order refers to the alleged institution of the order by Achaian, king of the Scots, to commemorate a victory obtained by him over Athelstan, king of the Saxons,

'in the time of which there appeared in the heavens a white cross in the form of that upon which the apostle Saint Andrew suffered martyrdom.' The order is under the especial tutelage of St. Andrew. It fell into desuetude after the abdication of James II., but was revived in 1703 by Queen Anne. The insignia are the star worn on the left side of the coat, consisting of a St. Andrew's cross of silver embroidery, in the centre of which is a thistle of green in a field of gold, surrounded by a circle of green bearing the motto 'Nemo me impune lacessit' ('No one provokes me with impunity,' the motto of all the Scottish regiments, and generally rendered in the vernacular, 'Wha daur meddle wi' me?'), the collar of thistles intermingled with sprays of rue, and the badge worn pendant-wise and tied under the arm, consisting of a figure of St. Andrew, in gold enamel, with green gown, bearing before him the cross, enamelled white, the whole environed with rays of gold in the form of a glory. By a statute of 1827 the order is to consist of the sovereign and sixteen knights.

(3) *The Order of St. Patrick.*—The national order of Ireland, founded by George III. in 1788. It was formed on the model of the Garter, and named after the Irish patron saint. The motto 'Quis separabit?' was assigned to it by the king in order to cement the harmony which the king is said to have been anxious to foster throughout the dominion. The insignia are the star of the cross of St. Patrick on a field argent, charged with three imperial crowns within a circle of azure, containing the motto above noticed. The order now consists only of the sovereign and about a dozen knights, including princes of the royal blood.

(4) *The Order of the Bath.*—Founded traditionally in 1399 by Henry IV., revived by George I. in 1725. It differed from the *Knighthood of the Bath*, that more ant. order, admission to which was characterised by various ceremonies, the chief being that of bathing, and which form seems to have died out at the coronation of Charles II., but to have been revived and combined with the newer order into a regular military order. There were to be originally, in addition to the sovereign and a prince of the royal blood, only thirty-five knights; but eventually, to commemorate the termination of the Napoleonic wars, the numbers were increased and divided into three classes; and again, in 1847, it was further extended by the addition of civil knights commanders and companions. The first class is comprised of knights grand cross (67 military, 29 civil, excluding distinguished foreigners honoured by the king); and the second, knights commanders (161 military, 112 civil, exclusive of foreigners); the third, companions of the order (702 military and 368 civil). The principal insignia of the military classes are a gold Maltese cross with the inscription 'Ich dien,' gold collar of nine imperial crowns and eight roses, thistles, and shamrocks issuing from a sceptre; of the civil classes, a silver star of eight rays, charged with

three imperial crowns, surrounded with a red circle in which is the same motto; a badge of gold with the same emblematic rose, thistle, and shamrock.

(5) *The Order of St. Michael and St. George*.—Founded in 1818, not long after the cession of Malta to Great Britain and the submission of the Ionian Isles to Eng. protection, for the purpose of honouring the most meritorious of the Maltese and Ionians, and also such Brit. subjects as had distinguished themselves in the Ionian Is. or Mediterranean. William IV. ordained that it should consist of knights grand cross, knights commanders, and cavalieri or companions, to the number of fifteen, twenty, and twenty-five respectively. The members of the order enjoy rank and precedence immediately after the corresponding classes of the Order of the Bath. The insignia of the knights grand cross are a seven-rayed silver star, in the centre of which is a representation of the Archangel St. Michael encountering Satan, and the motto 'Auspiciis mellioris sevi' (Augury of a better era); a collar of lions and Maltese crosses, a gold cross badge surmounted by the imperial crown, a Saxon-blue satin mantle lined with scarlet silk, and a blue satin chapeau; of the knights commanders and companions, a four-rayed star and smaller cross.

(6) *The Star of India*, instituted in 1861, now comprises knights grand commanders, knights commanders, and companions. The collar of the star consists of alternate links of lotus flowers and red and white roses and palm branches. The motto is 'Heaven's Light our Guide.'

(7) *The Order of the Indian Empire*, under the grandmastership of the Indian viceroy, was estab. to commemorate Queen Victoria's assumption of the title Empress of India.

(8) *The Royal Victorian Order* was founded by Queen Victoria in 1896 'as a reward for personal services to the queen and her successors.'

(9) *The Most Excellent Order of the British Empire*, instituted in 1917, having both civil and military divs. awarded to both men and women for services rendered to the Brit. Empire. It has five classes: Knights or Dames Grand Cross (G.B.E.); Knights or Dames Commanders (K.B.E. or D.B.E.); Commanders (C.B.E.); Officers (O.B.E.); Members (M.B.E.).

(10) *The Knights Bachelor* do not constitute a royal order, but comprise the surviving representation of the anc. State O. of K. The Register of Knights Bachelor, instituted by James I. in the seventeenth century, lapsed, and in 1905 a voluntary association, now known as 'The Imperial Society of Knights Bachelor' by royal command, was formed with the primary objects of continuing the various registers dating from 1257, and obtaining the uniform registration of every created knight. In 1926 a design for a badge to be worn by Knights Bachelor was approved and adopted.

AUSTRIA: The following orders of imperial Austria have been officially discontinued, although the orders are still worn. (1) *The Order of the Golden Fleece*,

founded by Philip le Bon (duke of Burgundy and the Netherlands) in 1430, on the occasion of his marriage with Isabella of Portugal. Its archives were taken by Charles VI. to Vienna, and there received with vast splendour, but the possession of the order was for a long time a bone of contention between Spain and Austria, and it must be distinguished from the Sp. order of the same name. The motto is 'Je l'ay empris' (I have accepted it (the order)). The characteristic emblem of the order is the golden fleece, hanging on a golden blue-enamelled flint stone, emitting flames of fire, and the motto 'Pretium laborum non vile.' (2) The purely military *Order of Maria Theresa*, founded by that queen in 1757. (3) *The Order of Leopold* (founded as a set-off to the apostolic *Order of St. Stephen*, which was confined to the nobility), estab. in 1808 by Francis I. for the purpose of honouring all meritorious subjects, civil or military, regardless of rank. (4) *The Order of Elizabeth Theresa*, founded in 1750; the second military order of Austria. (5) *The Order of the Iron Crown*, founded in 1809 by Napoleon Bonaparte in commemoration of his coronation as the first hereditary king of Italy, the reigning kings of the various It. states to be grand masters of the order. After the fall of Napoleon the order was forgotten until Francis I. of Austria, in 1816, during his visits to the new It. provs., reintroduced it in a modified form, when it received the name of the *Austrian Order of the Iron Crown*. The name is derived from the anc. Lombardian crown (which was used to crown Napoleon) of gold and precious stones, behind which is attached an iron ring forged, according to tradition, from the nails of Christ's cross. Other orders of Austria were the *Order of the Star Cross* and the *Teutonic Order* (which originated like the Hospitallers of St. John in the time of the crusades), and the *Civil Cross of Merit*, founded in 1809.

BELGIUM: (1) *Order of Leopold* (civil and military), founded in 1832; motto 'Union is strength.' The administration of the order is vested in the foreign minister. The characteristic emblem is the crossed swords and crowned lion. (2) *Iron Cross and Medal*, founded 1835. Like the Order of Leopold, conferred upon the revolutionary defenders of the fatherland; hence the inscription 'Independance de la Belgique.'

BULGARIA: *The Order of St. Alexander* was instituted in 1881, and the senior *Order of SS. Cyril and Methodius* in 1909, both were abolished by decree in 1918. In the same year the following orders were created or maintained: *People's Republic of Bulgaria*; *People's Liberty 1941-1944*; *8th September 1941: For Bravery* (military); *People's Order of Labour*; *For People's Service*; and *For Science and Arts*.

DENMARK: (1) *The Order of the Elephant*.—Officially dated as of the first half of the fifteenth century, is rarely bestowed and commands high respect. Originally of a religious character, and formerly requiring papal consent on grant, since 1803 it has entirely lost its religious element.

**Distinctive emblem,** a white elephant and mahout; motto 'Magnanimi Pretium.' (2) *Order of the Dannebrog*.—Second of the Dan. O. of K., founded by Waldemar II., 1319, in honour of the banner of Denmark, which was supposed to have fallen from heaven to inspire the army at the siege of Reval. In 1500 the order was suppressed, but revived by Christian V. in 1671. In 1808 Frederick VI. made it an order of merit for all the Dan. people, whether for military or civil services. It has four degrees, and in addition a class of Dannebrogsmænd, who are not strictly members of the order. In 1842 a special class (grand commanders) was created for persons of royal blood. The decoration is a white enamelled gold cross, suspended by a white ribbon with a red border. The inscription reads 'God and the King,' and it carries the figures 1219, 1671, and 1808.

**FRANCE:** *The Legion of Honour* (the only existing order in France).—After the coronation of Napoleon (1804), this order, which was estab. in 1802, as early as the year 1814 counted about 37,000 members. Its organisation has been modified at various times, and the order is now divided into five ranks, viz. knights of the grand cross, grand officers, commanders, officers, and knights. There is no more numerous order of knighthood at present in existence anywhere. The highest grades, however, rank with the most exalted European orders, and the celebrated cross is a much coveted distinction. The president of the Fr. Republic is the grand master of the order, but the administration is vested in a grand chancellor. Military and naval members receive salaries when on the active list. Women are eligible, e.g. Rosa Bonheur and Madame Curie were both members. There is a considerable number of foreign members, whilst the number of Fr. members of the four higher classes is limited. The decoration consists of a white enamelled star with double rays under a royal crown, in the centre of which is the effigy of Henry IV., and on the reverse the motto 'Honneur et Patrie.' The star for the knights is silver, and for the other classes gold.

**GERMANY:** The following are the orders which were in existence under the old Ger. Empire: *The Order of Albert the Bear* (Anhalt); the orders of *Fidelity*, of *Charles Frederick*, of the *Zähringen Lion*, and of *Berthold I.* (Baden); *The Order of St. Hubert* and the military *Order of Maximilian Joseph* (Bavaria); *The Order of Henry the Lion* (Brunswick); the orders of *Louis*, of the *Golden Lion*, and of *Philip the Magnanimous* (Hesse); the orders of the *Wendish Crown*, and of the *Griffin* (Mecklenburg-Schwerin); *The Order of Duke Peter Frederick Louis* (Oldenburg); orders of *The Black Eagle*, of *The Red Eagle*, *Order for Merit*, orders of *The Crown*, of *William*, of *The House of Hohenzollern*, and for ladies, of *Servius* (Prussia); *Order of the Rauten Krone*, or *Crown of Rue*, the military *Order of St. Henry*, and *The Order of Albert* (Saxony); *The Order of Ernest* (duchies of Saxe-Coburg-Gotha and Saxe-Meiningen); *Order of Vigilance* (Saxe-Weimar); orders of *The Crown of*

*Württemberg*, of *Frederick*, and of *Olga* (Württemberg); *Iron Cross*, originally instituted in 1813 by Frederick William III. for service in the war of Liberation, and granted to civil as well as military personnel. The decoration consists of a Maltese cross of iron edged with silver, and, hitherto, the initial of the sovereign granting the award has been in the centre; above, on the upper arm, is a crown, and below, on the lower arm, the date of the campaign. The Grand Cross of double the size is presented to the victor of a decisive battle. The Cross is worn round the neck. The two remaining classes, called first and second, granted for bravery in action, are worn on the left breast. The order was revived by William I. on July 19, 1870, just before the outbreak of the Franco-Prussian war, and again in the First and Second World Wars, when large numbers were awarded.

The Prussian orders of *The Black Eagle*, and *For Merit*, were among the most distinguished in the world. The former was founded by the elector of Brandenburg on the day of his accession to the throne of Prussia in 1701. The emblem was a blue enamelled octagon, consisting of a cross with 'F.R.' (Fredericus Rex) in the middle of the obverse, and a black eagle with expanded wings in each of the four spaces between the arms of the cross. Candidates must already have been knights of the Red Eagle. *The Order for Merit*, called *Pour le Mérite* in Germany, was divided into two classes: military, and science and art. It was originally founded as the 'Ordre de la Générosité,' by Prince Charles Emil in 1665, but in 1740 converted by Frederick II. to its later appellation and restricted to military persons. A century later it was extended to persons of civil merit, when, among others, the following celebrated Gers. were honoured in the new div.: Savigny, Lessing, Mendelssohn, Schelling, Schlegel, Tieck, Meyerbeer, Grimm, Humboldt, and Schwanthaler; and the following foreigners: Count Borghese, Chateaubriand, Faraday, Herschel, Daguerre, F. List, and Rossini. Later recipients include Carlyle and von Moltke.

**GREECE:** *The Order of the Redeemer*, founded in 1833 by King Otho to commemorate the deliverance of Greece after the war of Independence. Badge: white enamelled cross, the wings of which are connected with oak and laurel leaves. *The Order of George I.* was instituted in 1912.

**HOLLAND:** (1) *The Military Order of William*, founded in 1815. Emblem: a cross with the motto 'For valour, devotion, loyalty.' (2) *The Order of Orange Nassau*, founded by Queen Wilhelmina in 1892. (3) *The Order of the Netherlands Lion*, founded (1818) for civil merit.

**ITALY:** (1) *The Order of the Annunziata*, founded in 1362 by Amadeus VI., count of Savoy, under the style of *The Order of the Collar*. It is the highest order in Italy, and its members take precedence over all other state officials. Emblem: a collar consisting of love-knots and roses, with a pendant and medallion representing the

**Annunciation.** (2) The order of *SS. Maurice and Lazarus* (St. Maurice and St. Lazarus), being a combination of the anct. *Military Order of St. Maurice*, founded in 1434, and the religious *Order of St. Lazarus*, founded in 1512. Its great merit lies in the fact that it is not only pre-eminently conferred on persons notable for their charitable works, but that its income is devoted to charitable purposes. (3) *The Order of the Crown of Italy*, founded in 1868 to commemorate the estab. of the kingdom of Italy. Titles of nobility are no longer recognised, but those existing before Oct. 28, 1922, are incorporated as part of the name.

**LUXEMBOURG:** *The Order of Adolphus of Nassau* (1858); *The Order of the Oak Crown* (1858, revived); and *The Order of the Golden Lion* (1890), which is the hereditary order of the grand duke.

**MONACO:** *The Order of St. Charles* (1853, revived).

**NORWAY:** (1) *The Order of St. Olaf*, founded in honour of the introducer of Christianity into Norway. (2) *The Order of the Norwegian Lion*, founded by Oscar II. in 1904.

**POLAND:** *The Order of the White Eagle* and *The Order of Polonia Restituta*.

**PORTUGAL:** The orders of *Christ*, *St. James*, and *Avis*, all three being originally spiritual orders, but secularised in 1789. The first-named was a revival of the Templars after their abolition in France by Philip le Bel, King Louis of Portugal giving an asylum to that famous order in consideration of their support against the Sp. Moors in Algarve. The distinctive emblem is a white cross within a red.

**RUMANIA:** *The Order of the Star of Rumania* (1877) and *The Order of the Crown of Rumania* (1881). The latter has both civil and military divs. Both were abolished in 1917.

**RUSSIA:** Under the Soviet Gov. there are no titles. In former imperial Russia the tsar used to be Grand Master of all the Russian orders, with the exception of that of *St. Catherine*, which was an order for ladies. The grand dukes became, at baptism, knights of the order of *St. Andrew*, founded in 1698 by Peter the Great to initiate his court into the refinement of the civilised courts of Europe and to encourage his nobility in the pending war with Turkey; *Alexander Nevsky*, founded in 1725 by Catherine I.; *The White Eagle*, founded in 1713 by Augustus II. of Poland, and after the revolution of 1831 united, together with other Polish orders, with those of Russia; and *St. Anne*, founded in 1735 by Duke Charles Frederick in memory of the Empress Anne and in honour of the Duchess Anna Petrovna. The prin. emblems of the above orders were for that of *St. Andrew*, a blue enamelled figure of St. Andrew on the cross, resting on the eagle of the empire with three crowns; of *Alexander Nevsky*, an octagonal red enamelled cross with the imperial eagle in its corners, and in the middle the figure of St. Alexander on horseback; of *The White Eagle*, a cross containing on its face the white eagle with expanded wings, and gold flames in the

corners; of *St. Anne*, a Maltese cross with the initials of St. Anne and the inscription 'Amant: just: piet: fidem.' The decoration of the order of *St. Catherine* was, for Class I., a grand cross adorned with diamonds, the figure of St. Catherine, was, for Class I., a grand cross adorned with diamonds, the figure of St. Catherine, and the inscription 'For love and fatherland'; for Class II., a similar star smaller in size and with fewer diamonds. *The Military Order of St. George* was founded in 1769 for military service on land or sea, and the decoration was a white cross with gold borders, containing in its central medallion the figure of St. George slaying the dragon. But while there are no titles or O. of K., as such there are many related to war service or labour. The highest Soviet distinctions are those of *Hero of the Soviet Union* and *Hero of Socialist Labour* and both include the *Order of Lenin* (instituted in 1930), the *Hammer and Sickle Gold Medal*, and a certificate of honour. Other orders, instituted between 1918 and 1933, are those of the *Red Banner* (1918), the *Red Banner of Labour* (1920), the *Red Star* (1930), and the *Badge of Honour* (1935). Five more orders, issued during the Second World War, are of the *Patriotic War*, *Victory*, *Kutuzov*, *Alexander Nevsky*, *Boydan Khmelinsky*, and *Victory and Glory*.

**SPAIN:** All orders were abolished after the declaration of a republic. The chief orders which existed under the monarchy were those of (1) *St. James of Compostella* (patron saint of Spain after the victory of Clavijo), founded by certain nobles in the twelfth century by analogy to the Templars in pursuance of their united intention to protect Christian pilgrims against the Moors. It degenerated into a mere decoration of military merit. The badge is a representation of the cross of red cloth shaped like a sword, with red carved lilies on the hilt, which used to be worn by the old knights. (2) *St. James of Calatrava*, founded with a view to protect Castile against the Moors. The representative cross of this order was a red cross cut out in the form of lilies. (3) *St. James of Alcantara*, formed to protect Spain against the Moorish inroads when the above orders had been compelled to migrate by Ferdinand, king of León and Galicia. The cross in this case, which was substituted for the previous black collar and scapulary, is green. *The Order of the Golden Fleece* has been dealt with under Austrian orders, there having been both a Sp. and an Austrian branch of that order.

**SWEDEN:** *The Order of the Seraphim*, or the *Blue Ribbon*, founded according to general opinion in 1280 by Magnus I., is the most anct. and illustrious existing Swedish order. Its objects, which were very exalted, consisted in carrying out the candidate's promise made to God and the king to defend the laws of the order, to shed his blood for the evangelical religion and his country, and to sustain the anct. glory of the Swedish name. The badge is a star with the initials J. h. s. (Jesus hominum salvator). Other orders are those of the *Pole Star*, *Charles XIII.*

(granted to freemasons of high degree), *Vasa* or *Green Ribbon*, and the *Sword* or *Yellow Ribbon*.

**TURKEY:** *The Order of Glory* (1831) and *The Order of Privilege* (1879). Also two other orders with civil and military awards, the *Mejidieh* (1851) and the *Osmanieh* (1862). Titles were abolished in 1934.

**YUGOSLAVIA:** The following are the old Serbian, and other orders, the traditions of which were continued under the kingdom of Yugoslavia: *The Order of the White Eagle* (1882); *The Order of St. Sava* (1883); *The Order of Attila the Great* (1898); *The Order of the Star of Karageorgević* (1904). *The Order of St. Lazarus* belongs only to the king. They were abolished after the declaration of a republic.

Other and non-European countries also have their O. of K. Japan's prin. order is that of the *Chrysanthemum*, founded in 1877, and practically conferred only on members of the royal house or foreign princes. The only Chinese order is that of the Imperial *Double Dragon*, which is conferred only on foreigners, the Chinese native analogy to a knight being the mandarin (q.v.). Siam has *The Order of the White Elephant* (1861), also the *Sacred Order for royalty*; Persia, *The Order of the Sun and Lion* (1808). Egypt has sev. orders of recent creation: *Order of Mohammed Ali* (1915); *Order of the Nile* (1915); *Order of Al Kamal* for ladies (1915); the *Military Star of King Fuad* (1919); and the *Order of Ismail* (1922). See also **HOSPITALITERS, KNIGHTS OF**.

See G. A. Cibrario, *Descrizione storica degli Ordini Cavallereschi*, 1846; J. B. Burke, *The Book of Orders of Knighthood and Decorations of Honour*, 1858; and the *Almanach de Gotha* (to 1944).

**Ordinaries**, see **HERALDRY**.

**Ordinary**, in canon law, designates an ecclesiastic of superior standing, who exercises his jurisdiction according to the normal discipline of the Church. In the Church of England it usually designates the bishop or his chancellor.

**Ordinate**, see **GEOMETRY, ANALYTICAL**.

**Ordination**, ceremony at which Holy orders are conferred in the Christian Church. Early forms are to be found in the Prayer-book of Serapion, Justin Martyr, the *Didache*, and the *Canons of Hippolytus*. In the Rom., Gk., and Anglican churches O. can be conferred only by a bishop. Among Presbyterians, O. is performed by the body of presbyters, acting by one of their number previously appointed. Here also the imposition of hands is used. The ceremony by which a bishop is made is called **Consecration**.

**Ordnance**, heavy weapons of warfare, see **ARTILLERY**.

**Ordnance Board**. From Coke's reports we learn that the Board of Ordnance took its name from an ordinance or law (not extant) made to regulate the bore and size of artillery, and was the state dept. charged with the care of crown fortresses and their armaments, garrisons, and stores. Apparently, the board existed long before the reign of Charles II., but it was not till 1683 that it was reorganised as a civil dept. of the state for the custody and

supply of both naval and ordnance stores, and the master-general of the board placed under the orders of both the Lord Treasurer and the Lord High Admiral. The navy was formerly more associated with the ordnance than the army, but the development of the standing army has resulted in the army subsequently acquiring possession of the Ordnance Dept., and, through the secretary for war, providing all armaments and warlike stores, munitions, and equipments for both services. After the revolution of 1689 the O. B. was divided into two branches: the 'military,' which subsequently became the Ordnance Corps (Royal Artillery and Royal Engineers) under the master-general, and the 'civil,' which had to do with making contracts with manufacturers or contractors to supply warlike munitions and equipments, and acted as custodians of the store dept. The master-general, who was independent of the secretary for war, was president of the O. B. and the chief adviser to the Crown in military matters. This position he held throughout the eighteenth century, and down to 1828 he was generally a member of the Cabinet. The board presented its own estimates to Parliament, and was therefore separately responsible to Parliament for the expenditure of the money voted to it. Use down to its abolition it appears to have done an immense amount of work, though there seems not unnaturally to have been an inveterate antagonism between the Ordnance Dept. and the secretary for war, especially as, in spite of the distinction into a civil and a military branch, the former had soon become more or less merged in the latter. The duties of the board were in the highest degree comprehensive, comprising as they did the construction and upkeep of forts, the acquisition of land for that purpose, the purchasing, warehousing, and forwarding of stores, the manuf. of munitions and equipment for army and navy, and the execution of the ordnance survey (q.v.) and geological survey. It seems clear that all these duties, being essentially ancillary to those of the War Dept., could hardly be economically and efficiently carried out except by that dept., and it is not surprising that they were, in 1855, transferred to the War Dept. by the Ordnance Board Transfer Act, from which year the O. B. ceased to exist. See C. M. Clode, *Military Forces of the Crown*, 1869, and W. R. Anson, *Law of the Constitution*, 1886.

**Ordnance Factory**, Royal, Brit. Gov. organisation for the production of military and naval war materials. Aircraft factories were controlled during the Second World War by the Ministry of Aircraft Production. There was great expansion of the O. Fs. during the war years, some being both built and worked by the gov. others built by the gov. and worked by private firms under contract. See T. Hay, *R.O.F.: the Story of the Royal Ordnance Factories*, 1940.

**Ordnance Survey**, body formed in 1791 to make a map of Great Britain at the scale of 1 in. to 1 m., chiefly for defence

purposes. Almost simultaneously Parliament ordered the undertaking of a trigonometrical survey of England and Wales, and, the task being a military one, entrusted it to the Board of Ordnance, whence the title O. S.

By 1840 only Scotland and the six N. Eng. cos. remained unmapped at the 1-in. scale, and in that year the Treasury, after survey experience in Ireland, decided that these areas should be surveyed at the 6 in. to 1 m. scale. A long controversy ensued as to the most suitable scale. A departmental committee in 1853 recommended the survey of all cultivated areas at a scale of 1:2500, a scheme approved by the Treasury, but limited to areas where the 6-in. survey was being carried out. An adverse vote by the House of Commons in 1857 aroused such criticism that a royal commission on the subject was estab., which in 1858 approved the 1:2500 scale. Four years later the House of Commons ordered the extension of a survey at this scale to the S. cos. still mapped only at the 1-in. scale. To meet an agitation for the cheapening of the system of land transfer the estab. of the O. S. was doubled, in 1880, and from 1890 a complete series of the large-scale plans was available.

The civil work of the O. S. had long preponderated over the military, so that in 1870 control passed from the War Office to the Ministry of Works, passing to the Board of Agriculture later and remaining under the control of the equivalent ministry.

The First World War interrupted severely the periodical revision of the large-scale survey, and afterwards financial retrenchment put heavy limitations on the dept.'s work. Thus the inter-war development of new housing estates and roads outstripped the recording of them by the O. S. Administrative efficiency became so impaired that, in 1935, a departmental committee, under Viscount Davidson, was estab. to report on the matter. The Second World War almost immediately interrupted the implementation of the committee's recommendations, and not until 1947 was real progress possible. See also MAPS.

**Ordovician**, name given by Prof. Lapworth to certain Welsh rocks, the Cambro-Silurian of Murchison and Sedgwick. The system consists of greywackes, grits, and shales, with black mudstones, conglomerates and limestones, and is arranged into three chronological divs.: Arenig, Llandello, and Bala. The rocks are typically developed in N. Wales, where the Arenig series, which is characterised by huge masses of contemporaneous lavas and ashes, builds up the ranges of Cader Idris and the Arenigs, etc. Dark shales represent the Llandello in this dist., and the Bala series is made up of flagstones, shales, and thin limestones. Both the Arenig and Bala subdivisions were periods of volcanic activity. Volcanic rocks of Bala age build up the ranges of Snowdon and Penmaenmawr. In Shropshire, the Arenig, Llandello, and Bala beds are represented by the Shelve series, the Middleton series,

and the Chirbury series and Caradoc beds respectively. The Borrowdale series of the Lake District is underlain by the Skiddaw slates with Arenig graptolites, and overlain by the Conistone limestones with Bala brachiopods. The O. of Scotland (Girvan and Moffat) indicate deep water conditions, and are famous for their radiolarian cherts and the pillow-lavas of Ballantrae. O. rocks are known in Ireland, Scandinavia, Belgium, W. France, Bohemia, N. America, Australia, and New Zealand. The most important fauna of O. time are the graptolites, which are used as zone fossils, Dichograptidae and Phyllograptidae marking the lower half of the system, and Dicranograptidae and Leptograptidae the upper half. The chief genera of Trilobites are *Ogygia* and *Asaphus*. Brachiopods, cephalopods, and radiolaria were abundant, and some fishes have been found in the strata of the Rockies in W. America. The Brit. O. strata are of economic value, being mined for lead and silver, while roofing slates are obtained from the Borrowdale series.

Ordu, vilayet of Turkey on the N. coast of Asia Minor, between Samsun and Kerasund. Pop. 333,900.

**Ordzhonikidze**, Grigori (1886-1937), Russian statesman, b. at Gorechka. A Georgian, and a Bolshevik Socialist, he estab. the Soviet system in Georgia and Armenia in 1920-21. He was a member of the central executive committee of the Soviet Union, and chief of the main economic council. The tn. of O. (g.v.) was named after him.

**Ordzhonikidze** (formerly Vladikavkaz), cap. of the N. Ossetian A.S.S.R., on the Terck R. There is a research institute, and metal foundries. To the W. the Sadon mines produce zinc, lead, silver, and copper. O. was founded in 1784 as a fortress. Pop. 127,200.

**Ordzhonikidzgrad**, tn. of the Bryansk Region of the R.S.F.S.R., 5 m. N.W. of Bryansk. There are railway workshops. Pop. 82,300.

**Ore**, and **Ore Dressing**, see METALLURGY (EXTRACTION METALLURGY).

**Orebro**, or **Oarebro**: 1. Prov. of central Sweden. Area 3560 sq. m. Pop. 240,900. 2. Cap. of above prov., near the W. end of Lake Hjelmarn. 53 m. S.W. of Vesterås. It was long a place of assembly of the diet, which, in 1529, here decreed the estab. of Lutheranism. It was largely rebuilt after a fire in 1854, and is now a centre of the iron trade; copper and silver are also mined near by. Manufs. include machinery, chemicals, footwear, and matches, and the chief state railway workshop is here. O. is an inland port and a railway junction. There is a state technical college. Pop. 56,300.

**Oregon**, the 'Beaver State', one of the United States of America, bounded on the N. by Washington, E. by Idaho (from which states it is separated by the Columbia R. and the Snake R. respectively), S. by California and Nevada, and W. by the Pacific Ocean. Gross area 96,980 sq. m., including 630 sq. m. of water. The prin. rvs. are the Columbia, and its branches, i.e. the Willamette, Fall R., Snake R.,

and the Owyhee. The Columbia, which is 14 m. wide at its mouth, carries abundant steamship traffic 400 m. from the Pacific to the Idaho state lines. The Dalles and Celilo Canal, completed in 1915, opens the Columbia and Snake Rrs. to navigation to a distance of nearly 600 m. from the ocean. Large oceangoing vessels can reach Portland, 103 m. inland. The Cascade Mts., which have extinct volcanic peaks of 4000 to 10,000 ft. high, run N. and S., dividing the state into two unequal regions. The W. third of the state, bordering the Pacific, has a mild, equable, and moist climate, with valleys of great fertility, where pines grow from 250 to 300 ft. high, and firs from 4 to 10 ft. in diameter. Almost every variety of temperate-zone crop is produced. The prin. industries are lumbering, flour and grist milling, fish canning, paper and pulp making, printing and publishing. There are planing mills, meat-packing factories, foundries, copper-smelting works and refineries. Minerals include gold, copper, lead, and mercury. Value of mineral products in 1947 was over \$16,000,000. The timber of O. is the most extensive in the U.S.A. The standing timber equals about 400,000,000 board feet. The ann. cut of timber is the greatest in the U.S.A. The total forest area in 1948 was nearly 30,000,000 ac., of which 17,500,000 ac. were publicly owned, and 11,660,000 ac. were privately owned. The fruit industry is an enormous one. O. apples being sold all over the world. Salmon fisheries, especially at the mouth of the Columbia R., are among the world's finest. Halibut, sturgeon, and oyster fisheries are also abundant.

O. sends to Congress two Senators and four representatives. The Legislative Assembly has a Senate of thirty members, elected for four years, and a House of sixty representatives, elected for two years. The chief religious bodies are Catholic (70,000 members); Methodist (30,000); Disciples of Christ (20,000); and Presbyterian (20,000). School attendance is compulsory from eight to twelve years of age, but if the twelfth year of school has not been completed, attendance is compulsory for a further four years; those between sixteen and eighteen must attend part-time or evening schools if deficient in basic education. Prin. tns.: Portland City (\$05,400); Salem, the state cap. (\$0,900); Eugene (20,800); Klamath Falls (16,500); Medford (11,300); and Astoria (10,400). O. was the name formerly given to the whole ter. W. of the Rocky Mts., claimed by the U.S.A. as far as lat. 54° 46' N. This claim was resisted by the Brit. Gov., which asserted a right to the entire ter. The boundary dispute was, however, settled on the forty-ninth parallel. The N. portion is now Washington. The territorial gov. was organised in 1843, and in 1859 it was admitted as a state. Pop. 1,517,000. O. instituted the national movement for direct primaries, initiative, referendum, and recall. It voted for prohibition before the U.S.A. It has a celebrated agric. college at Corvallis with 8000 students. See hist. of the state by N. H. Bancroft, 1886-88;

H. S. Lyman, 1903; C. H. Caroy, 1922; and H. W. Scott, 1924; also J. H. Horner, *Oregon: her History, Great Men, and Literature*, 1921; P. H. Parrish, *Historic Oregon*, 1937; Federal Writers' Project, *Oregon: End of the Trail*, 1940; and P. Parkman, *The Oregon Trail* (Oxford), 1944.

Oregon Pine, see DOUGLAS FIR.

Oregon River, see COLUMBIA RIVER.

O'Reilly, John Boyle (1844-90), Irish revolutionist and author, b. near Drogheda. Convicted of Fenianism in 1866, he was sentenced to death by court martial, but his sentence was commuted. In 1869 he escaped from W. Australia in an Amer. whaler, and settled in Boston, Massachusetts, as a journalist. In 1870 he took part in O'Neill's invasion of Canada. He was well known in America as a writer. His work included four vols. of poems between 1873 and 1886, and *Moondyne*, a novel of convict life (1889). See J. J. Roche, *Life of John Boyle O'Reilly* (includes complete poems and speeches ed. by Mrs. O'R.), 1891.

Orskhovo-Zuyevo, tn. of the Moscow region of the R.S.F.S.R., 60 m. E.N.E. of Moscow. There is a large peat electric-power station, and in the dist. are manufs. of cotton fabrics, silk, linen, woollen, and knitted goods. Pop. 99,300.

Orel: 1. Region of the R.S.F.S.R. The surface is hilly. The prov. is drained by the Desna on the W., the Oka on the N., and the Sosna on the E. The soil is fertile and the climate mild. Agriculture and the rearing of pigs and cattle are the chief employments of the people. Corn and hemp are grown. There are also manufs. of chemicals, iron, and leather. Area 18,042 sq. m. Pop. 3,482,000. 2. Or Oryol, cap. of the above region, on the Oka at its confluence with the Orlík, 228 m. S.S.W. of Moscow, and a railway junction. It was founded in 1566, as a stronghold against the inroads of the Tartar tribes of the Crimea. It has a univ., founded in 1919. The chief manufacturing establs. in the tn. are yarn, shoe, rope, and linen thread factories, and metal, glass, and brick works. The prin. articles of export are cereals and hemp. It was nearly destroyed by fire in 1848. O. was of the greatest strategic importance in the Second World War. Pop. 110,500. See further under EASTERN FRONT OR RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

Orenburg, see CHKALOV.

Orense: 1. Inland prov. of Spain, bounded S. and W. by Portugal, on the E. by León and N. by Pontevedra. Generally it is mountainous; the prin. rvs. are the Miño and Sil. It once formed part of the old prov. of Galicia. Area 2694 sq. m. Pop. 485,900. 2. Cap. of the above, stands on the l. b. of the Miño on Montenegro. The riv. is crossed here by a seven-arched bridge over 1300 ft. long and, at its highest point, 135 ft. above the riv.-bed. It was built by Bishop Lorenzo in the thirteenth century, and repaired two centuries later. O. has a Gothic cathedral, also dating from Lorenzo's time. There are thermal springs in the

vicinity. Hams, chocolate, leather, textiles, and iron goods are produced. Pop. 25,000.

**Oreodaphne**, see OCOTEA.

**Oreodontidae**, family of primitive mammals, belongs to the order Ungulata, and all the species are peculiar to N. America, where they occur from the upper Eocene to the lower Pliocene. The dentition is complete, the feet are tetradactyle, the manus either tetra- or pentadactyle. The chief genus is *Oreodon*, of which several species have been found.

**Oreodoxa**, genus of tropical palms, which are easily grown in the stove-house. *O. oleracea* is the cabbage palm of the W. Indies, its young leaf buds being considered a great delicacy. The leaf-stalks of *O. samsonia* are reddish-bronze when young, and it is often grown for its decorative value. *O. regia*, with long pinnate leaves, is one of the most graceful palms.

**Oreopanax**, genus of tropical shrubs and trees (family Araliaceae), easily grown in the stove-house if given plenty of water during the summer. *O. andreaeanum* bears tall erect racemes of green flowers and elliptic leaves. *O. petatum* has roundish heart-shaped leaves, and greenish white flowers.

**Oresme, Nicole (Nicolas)** (c. 1310-82), Fr. prelate of Normandy, b. near Caen. He became grand master of the college of Navarre (1355), dean of Rouen, and finally bishop of Lisieux (1377), after having been tutor to the dauphin (later Charles V.). He trans. Aristotle's *Ethics*, *Politics*, and other treatises, and wrote the *Tractatus Montanorum* (editor L. Wolsowski, 1864), at the request of Charles V.

**Orestes**, son of Agamemnon and Clytemnestra. On the murder of his father by his mother and Ægisthus, he was taken by his sister, Electra, to his uncle, Strophilus, king of Phocis. He became friendly with Pylades, the king's son, and together they journeyed to Argos, and killed Clytemnestra and Ægisthus. Pursued by the Furies he became mad. According to one story he regained his senses on being tried and acquitted by the court of the Areopagus. According to another story he had to bring the statue of Artemis from the Tauric Chersonesus. Apollo was his adviser in each story.

**Oresund**, see SOUND, THE.

**Orfila, Mathieu Joseph Bonaventura** (1787-1853), Franco-sp. chemist, b. at Mahon in Minorca. In 1823 O. became prof. of chem. at Paris, and dean of the Faculty of Medicine (1830-48). His celebrated work on poisons, *Toxicologie Générale*, appeared in 1813-14. Other works are *Léçons de médecine légale* (1823) and *Traité des exhumations judiciaires* (1830, with O. Lesueur). See C. Suchaut, *Les Médecins de Paris*, 1845, and P. Ménérier, *Nécrologies*, 1853.

**Orford, Earl of**, see WALPOLE, HORACE and ROBERT.

**Orford, Edward Russell**, first Earl of (1653-1727). Eng. admiral, b. at Chiswick. He fought against the Dutch in the North Sea (1672-73), and against the Barbary pirates in the Mediterranean (1676-82). A prominent Whig leader in the revolution

of 1688, he signed the paper inviting William of Orange to England. He defeated the Fr. off La Hogue or Barleur (1692), became first lord of the Admiralty (1691-99) and again 1709-10 and 1714-17, and was created earl of Orford and Viscount Barleur (1697). The title died with him, but was renewed for the Walpole family (1742). See J. Campbell, *Lives of the Admirals*, ii., 1779, and J. Charnock, *Biographia Navalis*, 1794-98.

**Organ**. The O. is probably the most ancient musical instrument, in some shape or form. It was derived, like smaller instruments of the flute family, from the pan-pipe. Although this form of stopped pipe was the first known, it is certain that open and reed pipes, too, were known at an early date. The earliest type of O. was presumably of Chaldean origin; the pipes were ranged on top of a wind-box, air being admitted to each pipe by drawing out a slotted lever, so that the slot, corresponding with the foot of the pipe, allowed a current of air to pass into the pipe, and so produce sound. The wind pressure was at first derived either from blowing with the mouth, or from the *hydraulus*, a hydraulic apparatus which gave a more balanced and regular supply of air. Later, crude bellows were introduced, but not until the fourteenth century was the *hydraulus* finally discarded. This method of producing sound was, with slight modifications, employed until the eleventh century. Meanwhile, by the end of the fourth century, the O. was well established as a church instrument, and in the seventh century its introduction was encouraged by Pope Vitalian. In A.-S. England, and in France, O. playing and also O. making were well known by the eighth century; and in the next century Germany also became the home of those arts. Up to this time, Arabia, Constantinople, and Venice had been leaders, but they were now superseded by France and Germany, and during the tenth century England was enriched by many notable specimens (e.g. the celebrated and very large Winchester instrument). For long after the tenth century there were few O.'s that could not easily be moved about the church; the term positive O.s. was used for those of fixed position, while those that were carried in procession by a player who played the keys with one hand and with the other manipulated the bellows were portable O.s. The introduction in the eleventh century of a crude lever-key system, to replace the old draw-slides, was a very important development, the sixteen-note instrument of Magdeburg Cathedral being the first recorded keyboard O. The keys, however, at this time, were of considerable size, and had to be punched down. In the twelfth century, pipes sounding thirds, fifths, and eights were added, but so far no method of playing save with the full O. had been invented. The first instance of an attempt in that direction was made in the Halberstadt O. (fourteenth century), which had three separate keyboards, two of which sounded only part of

the full group of pipes for a particular note. By this means, a descent was made possible and the introduction of the notes F $\sharp$ , C $\sharp$ , E $\flat$ , and G $\sharp$  made further advances possible. In the fifteenth century keys more convenient in size, and a system of pedals, were invented; and the first step in the direction of 'registration' was made by the introduction of the spring-box, by which various sets of pipes, singly or in optional groups, could be manipulated through the medium of one manual. So far, only open metal pipes, resulting in one quality of tone, had been used. Tone-colour was next obtained by the addition of stopped wood pipes for soft tones, e.g. flute, bourdon, etc.; and

ORGAN PIPES

Left to right: Open diapason (flute) pipe—pure organ tone; oboe (metal) pipe—imitative reed tone; 'stopped' wood pipe—flute tone; 'open' wood pipe—flute tone.

reed stops, such as the posanne and trumpet, were also added. String-tones, too, were obtained by the use of cylindrical pipes of small bore; and experiments were carried out in the use of tapering pipes. Although not introduced into England until nearly 300 years later, the Ger. O. builders of this period used a separate set of pipes for the pedal, thus originating the 'pedal bass.' More modern inventions may be said to begin with the composition pedal (1809). In 1832 Barker invented a pneumatic lever, which overcame the excessive exertion that had formerly been entailed in playing with a full or heavy registration. Two years later Elliot and Hill introduced the radiating pedal-board into the York Minster O., this idea was later combined with Willis's concave and radiating pedal-board.

The ordinary modern O. embodies these principles. It consists of bellows, wind-trunk, and chests and keys and pedals; the keys and pedals are in contact by

means of a system of trackers or of electric cables with the pipes and reeds, which are grouped at discretion by means of stops, composition-pedals, and couplers. The electric-contact ideas were first brought forward by Dr. Gauntlett at the 1851 Crystal Palace Exhibition. At the Paris Exhibition in 1867 the tubular pneumatic system was advanced. All modern touch-systems are variants of these two methods. The keys are arranged in three, four, or five rows, or manuals, the order of the manuals being (1) 'great,' (2) 'swell,' (3) 'choir,' (4) 'solo,' and (5) 'cello.' In a three-manual O. the 'solo' is occasionally found instead of the 'choir.' The principle of the swell was invented by Jordan in 1712; the pipes are ranged in a box, of which the front resembles a Venetian blind, which opens or closes as the swell-pedal is manipulated. The Hope-Jones electro-pneumatic Os. have a double touch, i.e. two levels of depression for the same key, the lower being more emphatic and suitable for picking out a theme, the higher being adapted to accompaniment. Similar effects are obtainable by means of ingenious inventions by Casson and others. The compass of keys on a modern O. is five octaves (sixty-one notes), and of pedals, thirty-two notes; and many improvements and new ideas in the matter of swell- and composition-pedals and combination couplers continue to be presented. With the advance in the mechanical perfection of the instrument has come a corresponding advance in ease of control which has made possible the construction of gigantic instruments of which the most notable example is that in the Convention Hall, Atlantic City, U.S.A. This instrument possesses seven manuals, 1249 stop keys, and over 33,000 pipes, whilst its blowing apparatus necessitates engines of over 100 h.p. Its tonal range is remarkable and is spread over four gallery Os. in addition to its main divs. While nothing approaching the size of this monster is found in this country there are many magnificent examples of the O.-builder's art in cathedrals, churches, and concert halls. Notable examples are those at Liverpool Cathedral, St. Paul's, and Canterbury Cathedral. Size alone is not a criterion, many notable Os. with a smaller tonal range depending chiefly on the refinement and balance of their tone colours rather than on great power.

Although now passing into disuse, the cinema O. contributed something new both in tonal values and constructional technique. Making free use of the extension principle whereby various tones are 'borrowed' at varying pitches, its main tone is based on the tibia, a large-scale flute, instead of the diapason. String, brass, and wood-wind stops give an orchestral effect and ingenious mechanical devices make possible a variety of percussion effects. A trumulant is generally used over the whole tonal range to overcome the dead acoustics of the average cinema. Instruments vary in size from small instruments with only five main ranks to large concert Os. of three or four

manuals capable of reproducing the full range of orchestral tone colour.

In 1935 a new type of instrument made its appearance—the electronic O. Instead of pipes, this new development made use of the thermionic valve. The depression of a key caused a valve to oscillate at a fixed frequency corresponding to the note. The electrical wave so produced was fed into an amplifying unit similar to that of a radio set and thence into loudspeakers whence it emerged as sound. Various modulations of tone colour were brought about by the addition of the necessary harmonics to the fundamental tone. Since that date there have been many developments both in the system whereby the initial tone is produced and in tonal variety. The chief advantage of the electronic O. is that it does not require tuning, having no pipes; it takes up a minimum space and is considerably cheaper than the pipe O. Nevertheless it is still only in the development stage. A full understanding of its working requires a certain technical knowledge in electrical science, but the subject is fully covered in *The Electronic Musical Instrument Manual* by Alan Douglas.

The case of the electronic instrument has brought about a great advance in playing technique. It would be invidious to mention by name any of the recitalists of to-day, especially since many of them are so well known through the medium of broadcast recitals.

The standard of professional competence in O. playing is safeguarded by the Royal College of Organists. This body holds examinations every year not only in playing but in general musicianship, and its diploma—of A.R.C.O. and F.R.C.O. indicate a high level of musical education.

Burns' *Dictionary of Organ and Organists* (1921) list over 700 books in the bibliography of the instrument, many of which are now only to be found in technical reference libraries. The standard work on the subject is E. J. Hopkins, *The Organ: its History and Construction*, 1877, now out of print but available in many libraries. For a list of some seventy other books the reader is referred to L. Scholes's *List of Books about Music*, 1939, a copy of which should be available in any public library. Many articles of interest have appeared in the monthly journals, the *Musical Times* and *Musical Opinion*, and the quarterly journal, *The Organ* is devoted to full descriptions of outstanding instruments with illustrations.

**Organ, Organic, Organism, see under Biology.**

**Organic Chemistry.** term formerly applied to the study of compounds obtained directly or indirectly from living organisms or their products or remains, but now used to denote the chem. of the compounds of carbon. The name was first definitely employed in the modern sense by Gmelin in 1818. Organic compounds are extraordinarily numerous, and include such important and diverse substances as hydrocyanic acid, strychnine, brucine, and oxalic acid among poisonous; aspirin, antifebrin, salvarsan, chloral,

Bayer 205, morphia, penicillin, mepacrin, and di-amine among drugs; chloroform, ether, cocaine and novocaine among anaesthetics; lyddite, trinitrotoluene (T.N.T.), dynamite, nitroglycerine, cordite, and gun-cotton among explosives; camphor, vanillin, musk, geraniol, citral, ionone, and benzaldehyde among perfumes; coal, petrol, paraffin, coal-gas, and most other fuels; starch, sugar, fats, vegetable and animal oils, proteins, and vitamins among foodstuffs; phenol, cresol, iodoform, and formalin among antiseptics; and cotton, silver, alcohol, vinegar, turpentine, soap, dyes, paper, calcium carbide, and photographic developers among common commodities. Protoplasm itself, the actual living matter of animals and plants is a congeries of carbon compounds.

**Historical.**—Although many organic compounds, such as starch and sugar, have been known from very early times, little progress was made in the elucidation of their properties and composition until the late eighteenth century, when the Swedish Pomeranian chemist, C. W. Scheele (1712-86) first prepared, and examined the properties of, chemically pure specimens of many important carbon compounds, e.g. glycerine, uric acid, milk-sugar, and hydrocyanic acid. A. L. Lavoisier (1743-91) began the systematic analysis of organic compounds and showed that, in addition to carbon, the elements most frequently present in them are hydrogen and oxygen, and, less often nitrogen, chlorine, sulphur, phosphorus, and other elements. Further advances in methods of analysis were made by J. von Liebig (1803-73), and with the simultaneous progress in general chemical theory it became at length possible to arrive at definite conclusions as to the structure of numerous carbon compounds.

In the early days of the science it was believed that organic compounds could be originally formed only under the influence of an occult *vitalis* or vital force, but this belief was gradually abandoned when such typical products of living organisms as alcohol, urea, and oxalic acid were prepared artificially in the laboratory. A striking discovery, made by Liebig in 1823, that the molecules of silver cyanate and silver fulminate consist of the same numbers of the same atoms, followed by the further discovery (F. Wohler, 1828) of the same peculiar relationship between urea and ammonium cyanate, led to the recognition of the phenomenon of isomerism (*q.v.*) To define the constitution of an organic compound it is, in fact, insufficient to state merely the numbers of the atoms of the various elements in its molecule, since many different compounds of the same molecular formula (isomers) may exist. Thus the formula  $C_2H_6O$  applies to two compounds, viz. alcohol and dimethyl ether, while the formula  $C_{12}H_{22}O_{11}$  applies to at least 120 different compounds. The frequency with which isomerism occurs emphasised the need to investigate the constitution of carbon compounds much more closely, with the aim of discovering the way in which the

atoms are arranged within the molecule. The results of such investigation are expressed in structural formulae, whereby the difference between isomers is clearly indicated. Thus dimethyl ether exhibits properties best indicated by the formula  $\text{CH}_3\text{OCH}_3$ , whereas the properties of alcohol are represented by the formula  $\text{CH}_3\text{CH}_2\text{OH}$ . Both formulae it will be observed, contain the same number of the same atoms viz two of carbon six of hydrogen and one of oxygen but the structure of one molecule is entirely different from that of the other.

Prominent in this research into the molecular architecture of organic compounds were Liebig and Wohler who

alone. Further progress was made by J. B. A. Dumas (1800-81), who showed that many properties of organic compounds were conditioned by the general structure of the molecule as a whole, and that as long as this structure was broadly maintained an electropositive element such as hydrogen might be partly or wholly replaced by such a typically electronegative element as chlorine without alteration of the fundamental nature of the compound so treated. While at first this theory of types appeared to be diametrically opposed to the radical theory, A. Laurent (1807-83) and C. F. Gerhardt (1816-86) showed that the two might easily be reconciled since substitution of

A GENERAL VIEW OF A MODERN ORGANIC RESEARCH LABORATORY

showed that certain groups of atoms radicals, could maintain their identity throughout a series of chemical changes and were present in numerous related compounds. Thus the radical benzoyl  $\text{C}_6\text{H}_5\text{CO}$  whilst incapable of independent existence is contained in the following (and in many other) substances: benzoic acid  $\text{C}_6\text{H}_5\text{COOH}$ , benzoyl chloride  $\text{C}_6\text{H}_5\text{COCl}$ , benzoyl iodide  $\text{C}_6\text{H}_5\text{COI}$ , benzyl cyanide  $\text{C}_6\text{H}_5\text{CH}_2\text{CN}$ , benzamide  $\text{C}_6\text{H}_5\text{CONH}_2$ , and benzaldehyde,  $\text{C}_6\text{H}_5\text{CHO}$ . While the number of radicals is theoretically infinite it is found in practice that only a comparatively small number occurs with any marked frequency, and by a study of the properties that these common radicals (e.g. methyl  $\text{CH}_3$ -, ethyl  $\text{C}_2\text{H}_5$ -, carbonyl  $-\text{COOH}$ , carbonyl  $>\text{CO}$ , aldehyde  $-\text{CHO}$ , phenyl  $\text{C}_6\text{H}_5$ -) confer on compounds containing them, it is possible to deduce their presence or absence in newly discovered compounds and to predict with some confidence the properties of a compound from its structural formula.

chlorine for hydrogen and other similar places. It might well leave the general shape and position of the radicals unchanged, the derived radicals being roughly similar in chemical character to the originals.

In 1828 Sir Edward Frankland (1818-1898) introduced the idea of valency (1828) or definite combining power of atoms, observing for example that one atom of phosphorus showed a tendency to combine with either three or five atoms of other elements, but no other number, the valency of phosphorus was therefore said to be three or five. Hydrogen on the other hand has only one combining bond per atom while oxygen has two, so that to satisfy the combining power of one oxygen atom two hydrogen atoms are needed. The theory of valency, as applied to organic compounds, was greatly improved and extended by A. Kekulé (1829-96) who in 1858 showed that carbon uniformly has a valency of four and that carbon atoms have the remark-

able and almost unique power of linking up together to form chains, rings, etc., which constitute the framework of the compound molecules. Thus butane,  $(CH_3CH_2CH_2CH_3)$ , has a straight chain of four carbon atoms:  $C-C-C-C$ ; isobutane,  $(CH_3)_2CHCH_3$ , a branched chain:

$C$   
 $\begin{array}{c} C \\ | \\ C-C-C \end{array}$ ; and benzene,  $C_6H_6$ , a closed

chain or ring of six carbon atoms:

$\begin{array}{c} C \\ / \quad \backslash \\ C-C-C \\ \backslash \quad / \\ C \end{array}$  In 1865 Thoms Brown (d.

1922) introduced the system of denoting each valency bond, or unit of combining power, by a line, a neat device that at once rendered possible the clear and precise formulation of the supposed arrangement of atoms within a molecule. For example, the graphic formulae of (d.) alcohol, and (e.) dimethyl ether are written as follows:

Similarly, the more complicated molecule of acyl acetate is graphically represented as:

While such formulae undoubtedly indicate to some extent the actual spatial arrangements of the atoms in a molecule, they are more rightly to be regarded as an epitome of the chemical properties of the substances they represent, and their value is consequently in no wise diminished by modern theories and discoveries relating to the structure of the atom.

Remarkable evidence on this point is to be found in the facts of stereoisomerism (*q.v.*), a branch of O. C. founded by L. Pasteur (1822-95), J. H. van't Hoff (1852-1911), and J. A. Le Bel (1847-1930). They

showed that the ordinary plane formulae were insufficient to account for certain cases of isomerism, *e.g.* that of the lactic acids, where three distinct compounds exist, all of which must be represented by the single plane formula,  $CH_3CH(OH)CO_2H$ , and van't Hoff and Le Bel independently and almost simultaneously in 1874 suggested that in such cases it is necessary to take into account the three-dimensional structure of the molecules. It has indeed been found that wherever the molecules of a compound are asymmetric, the observed isomerism can be explained only by space formulae, and, conversely, it has been possible to predict previously undiscovered isomers by a recognition of asymmetry in the molecules of a substance. Such isomerism (stereoisomerism) is not always accompanied by asymmetry, but when asymmetry is present the stereoisomers

are distinguished by their optical effects on polarised light.

The rapid growth of O. C. in the last hundred years has been extraordinarily fruitful on the practical side, since the structure of many valuable natural products has been ascertained, and their manuf. by artificial methods from cheap sources rendered possible. Thus indigo, acetic acid, alizarin, and methyl alcohol, to name only a few, can now be prepared synthetically at a much lower cost than formerly; while the range of dyes, drugs, explosives, etc., has been extended enormously by applications of the knowledge won by organic chemists. In the sphere of biochemistry (*q.v.*) O. C. is throwing light on the physiological basis of life whilst in medicine it is now possible deliberately to build up new remedial and preventive substances of practically any desired character. In agriculture, horticulture, paper-making, brewing, tanning, and numerous other industries the organic chemist is playing an ever-increasing part while the former art of perfumery is rapidly becoming a more specialised branch of the science of O. C.

*General.*—Organic compounds are classed in sev. divs., of which the two principal are the fatty or aliphatic (*q.v.*) and the aromatic (*q.v.*). Aliphatic compounds, so called on account of the fact that the fats are among the most typical members of this div. (*Gk. αλφαι, fat*), may theoretically be regarded as ultimately derived from methane or marsh gas,  $CH_4$ , while benzene and its derivatives are classed as aromatic. The main distinction in structure between the two groups is that the aromatic substances contain a closed chain nucleus of carbon

atoms, *e.g.* benzene,  $\begin{array}{c} \text{H} & \text{H} \\ \diagdown & / \\ \text{C} & -\text{C} \\ / & \diagdown \\ \text{H} & \text{H} \end{array}$ , and

the aliphatic compounds have open chains of carbon atoms, *e.g.* pentane  $CH_3CH_2CH_2CH_2CH_3$ . Heterocyclic compounds contain a closed ring consisting partly of carbon atoms and partly of other multivalent atoms, *e.g.* pyridine

the compounds fall into well-defined homologous series. Any particular homologous series can be represented by an algebraic formula, *e.g.*  $C_nH_{2n+2}$  for the paraffins or  $C_nH_{2n}$ , and any two consecutive members of a series differ in molecular constitution by one carbon atom and two hydrogen atoms. Thus methane,  $CH_4$ , ethane,  $C_2H_6$ , and propane,  $C_3H_8$ , are the first three members of the paraffins. All

the members of a given series can be prepared by similar methods and show a general similarity of properties, two facts that do much to lighten the labour of the student of O. C. Some of the prin. classes of organic compounds are given below, with general formulae:

#### Aliphatic.

1. Paraffins,  $C_nH_{2n+2}$ .
2. Olefines,  $C_nH_{2n}$ .
3. Acetylenes,  $C_nH_{2n-2}$ .
4. Alcohols, e.g.  $C_nH_{2n+1}OH$ .
5. Aldehydes, e.g.  $C_nH_{2n+1}CHO$ .
6. Fatty Acids,  $C_nH_{2n+1}CO_2H$ .
7. Ketones, e.g.  $C_nH_{2n+1}CO \cdot C_{n-1}H_{2m+1}$ .
8. Ethers,  $C_nH_{2n+1}OC_mH_{2m+1}$ .
9. Amines, e.g.  $C_nH_{2n+1}NH_2$ .
10. Amides, e.g.  $C_nH_{2n+1}CONH_2$ .
11. Carbohydrates, e.g.  $C_6H_{12}O_6$ , glucose,  $C_{12}H_{22}O_{11}$ , cane-sugar, and  $(C_6H_{10}O_5)_n$ , starch.

#### Aromatic.

1. Benzene hydrocarbons,  $C_6H_6$ .
2. Nitro-compounds, e.g.  $C_6H_5NO_2$ .
3. Amino-compounds, e.g.  $C_6H_5NH_2$ .
4. Phenols, e.g.  $C_6H_5OH$ .
5. Sulphonic acids, e.g.  $C_6H_5SO_3H$ .
6. Diazo-compounds, e.g.  $C_6H_5N_2Cl$ , and aromatic alcohols, aldehydes, acids, ketones, ethers, amides, amines, etc.).

#### Heterocyclic.

1. Derivatives of pyridine,  $C_5H_5N$ .

2. Derivatives of pyrone.

3. Derivatives of pyrrole,

4. Derivatives of furane,

5. Derivatives of thiophen,

6. Derivatives of quinoline,

7. Derivatives of isoquinoline,

See J. B. Cohen, *Organic Chemistry for Advanced Students*, 1907, 1928; F. Beilstein, *Handbuch der organischen Verbindungen*, 1918-28; A. F. Hollemann, *Textbook of Organic Chemistry*, 1920; E. J. Holmyard, *Outlines of Organic Chemistry*, 1924, 1936; H. Gilman, *Organic Chemistry*, 1938; and P. Karrer, *Lehrbuch der organischen Chemie*, 1913.

**Organic Husbandry**, practice of agriculture and horticulture in all their phases based upon the use of organic materials and natural methods, to the exclusion of chemical fertilisers, dusts, and sprays, and artificial forcing of stock for their produce. The keynote is the law of return, whereby it is held that the residues of organic life, plant remains, animal and human excreta, etc., must be returned to the earth, and in decomposition stimulate the natural processes that restore and build soil fertility. A naturally fertile soil means healthy plants; healthy plant food means healthy animals and humans. The cycle is thereby complete, and high disease-resistance means no need for insecticides, fungicides, or medicine. O. H. also embraces mixed, not specialised, farming, mixed crops rather than monoculture, and the use of soil-building plants and trees to prevent erosion. Theoretically it is held that chemical fertilisers disrupt the natural processes of nutrition, destroy an essential link between certain soil-fungi (mycorrhiza) and plants, and so adversely affect plant and animal nutrition and health. In practice, O. H. is founded on the conservation of all plant and organic debris on farms and gardens, and their conversion into humus and plant foods via the compost heap. Composting methods vary in detail, but in principle consist of the stacking of mixed organic materials in layers, sandwich-fashion. The thickest layers are of plant debris topped by thinner layers of animal matter (manure, etc.) which serve to accelerate decomposition. A dusting of lime may be added as an alkalinising base, and a sprinkling of soil. The sequence is repeated to form moist, aerated, flat-topped heaps with tapering sides, not less than 5 ft. square and 4 ft. high. Heaps may be turned once or more times to restimulate rotting. Compost heaps can be made smaller than the dimensions stated above if given protection in a compost bin. In scarcity of animal manure, organic fertilisers (bone meal, hoof, and horn, dried blood, etc.) may be used. Finished compost is applied at any season. High handling and labour costs are the chief disadvantages. Shrot composting is practised on farms and consists of dressing green manure crops on spent pastures with farmyard manure and ploughing in by Aug.-Sept. Consistent stocking of the soil with organic matter improves it biologically and chemically, and the accretion of humus and plant nutrients gives sound fertility. See Sir A. Howard, *An Agricultural Testament*, 1940; F. H. Billington, *Compost*, 1942; Lady Eve Balfour, *The Living Soil*, 1913, 1917; Friend Sykes, *Humus and the Farmer*, 1946; and E. Pfeiffer, *Soil Fertility, Renewal, and Preservation*, 1947.

**Organisation for European Economic Co-operation**, formed after the Foreign Aid Act authorising the Marshall Plan for European Recovery was signed by President Truman on April 3, 1948; the sixteen European nations which had accepted the Marshall offer met in Paris to set up a joint organisation (i.e. the O.E.E.C.) which was intended to outlive the European Recovery Programme. The understanding was that European countries should come to an agreement upon the economic assistance required from the U.S.A., and upon measures of self-help. A preliminary conference between Britain, France, and Russia, in 1947, broke down when the Soviet Union expressed its dislike of a European economic programme on the grounds that current arrangements would be disturbed and national sovereignty impaired. The other two countries, however, issued invitations to all European states save Spain, to take part in measures of economic co-operation. Fourteen accepted the invitation, namely Austria, Belgium, Denmark, Elro, Greece, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Sweden, Switzerland, and Turkey. Czechoslovakia's initial acceptance was later reversed, and other countries in the Russian sphere of influence refused, namely, Bulgaria, Finland, Hungary, Poland, Rumania, and Yugoslavia. A conference of the sixteen participants was held in Paris, and ultimately outlined a plan for the restoration of European economy by the end of 1951. This was held to require four measures: the solving of the problem of Europe's trade deficit with America, estimated at \$22,440,000,000 for 1948-51; maximum mutual co-operation by the sixteen nations; the establishment of internal financial stability; and maximum production by each participant. A convention in 1948 was signed by the sixteen countries, the Anglo-Amer. and Fr. occupation zones of Germany, and the Anglo-Amer. zone of the Trieste free ter. The first part thereof laid down the general obligations undertaken in the field of economic co-operation; the second set out the constitution of the permanent O.E.E.C., namely, a council, an executive committee of seven, a secretariat, and sev. *ad hoc* committees. In the U.S.A. the Economic Co-operation Act of 1948 became law in April, authorising the expenditure of \$5,300,000,000 for the European recovery programme over the succeeding twelve months. Congress ultimately appropriated \$5,055,000,000 for this purpose. An Economic Co-operation Administration was estab. (E.C.A.) under an administrator, represented by a special representative in Europe, and missions in each participating country. Assistance was to be contingent upon intra-European co-operation, and also each participant was required to conclude an agreement with the U.S.A. for the supply of information, stabilisation of currency, promotion of production, etc. Specific projects substantially undertaken with assistance under the Act were to be approved by the

administrator. O.E.E.C. shared out to the participants the Amer. aid, which was voted in a block allocation, in proportion to their own contributions to self-help under the intra-European payments scheme. It also undertook to study individual programmes, and reported thereon to the Amer. authorities in Dec. 1948. Hoffman, the Marshall Aid administrator, urged the economic integration of W. union—the creation of a permanent, freely trading area comprising 270,000,000 consumers. He called on the O.E.E.C. (Oct. 31, 1949) to have ready early in 1950 a record of accomplishment and a programme which would take Europe well along the road towards this goal. He also advocated direct incentives to private exporters to help close the dollar gap—gov. targets and exhortations being insufficient. See also *Europe, History—Marshall Plan* and subsequent sections. See F. Perroux, *Le Plan Marshall, ou l'Europe nécessaire au monde*, 1948, and the O.E.E.C. reports as pub. by H.M.S.O.

**Organists**, Royal College of, see ROYAL.  
**Organo-Metallic Compounds**. Compounds of metals with alkyl (e.g.  $C_2H_5$ ) or aryl (e.g.  $C_6H_5$ ) groups. They are colourless liquids with low boiling points. Many of them are decomposed by water with liberation of much heat, and burn in air often with explosive violence. Some compounds, e.g.  $Mg < Br$ , contain halogen as well. These are known as Grignard's reagents. Thus to make magnesium ethyl bromide, dry magnesium (1 atom) is covered in a flask with dry ether and 1 molecule of ethyl bromide is added. A vigorous action sets in, and finally a solution of the Grignard reagent in ether is obtained. These reagents are very valuable in organic chemistry. Thus with water and alcohol they yield hydrocarbons; with oxygen they give alcohols; they react with halides of metals (and some non-metals); they absorb carbon dioxide and can be made to yield acids (carboxylic) by treating the product with a dilute mineral acid. Aldehydes can be converted into secondary alcohols, and so on.

O.-M. C. of the type  $Mg(C_2H_5)_2$  can be made either by the action of an alkyl halide with the metal, or by the action of zinc alkyl and the metallic chloride in question. Thus  $Su(C_2H_5)_2$  can be made from stannic chloride and zinc ethyl.  $Zn(C_2H_5)_2$ . Zinc ethyl itself is a liquid which boils at  $118^\circ C$ . Aluminium methyl,  $Al(CH_3)_3$ , boils at  $130^\circ C$ . and reacts violently with water. Mercury, tin, lead, etc., yield compounds like  $Hg(C_2H_5)_2$ , whilst lead tetraethyl (g.e.) has found commercial application as an anti-knock reagent. Merc. ethyl is obtained from zinc ethyl and mercuric chloride, and also by the action of ethyl iodide on sodium amalgam. It boils at  $159^\circ C$ , i.e. very poisonous, but does not oxidise easily in air.

**Organon**, see PHILOSOPHY, Logic.  
**Orgeiev**, or **Orgoev**, tn. of the Moldavian S.S.R., on the Runt R., 25 m. N. of Kishinev. There are limestone quarries, and

various manufs., including tanning and dyeing. Pop. 18,000.

**Orgies** (Gk. ὄργια), name in anct. Greece for ceremonies, especially applied to secret religious rites and customs connected with the worship of various pagan divinities (Dionysus or Bacchus, Demeter or Cybele, Orpheus), to which only the initiated were admitted. The modern sense of debauchery and unbridled revelry is derived from the acts of mystic symbolism and unrestrained licence which were characteristic of such feasts as the Dionysia and Eleusinian mysteries (*q.v.*).

**Oriani, Alfredo** (1852-1907), It. novelist and essayist, scarcely known outside Italy, is celebrated in his own land as the precursor of Fascism, and the Fascists undertook a national ed. of his works. He was born at Casola Valcenio, a small vil. in Romagna, and here in his villa he passed most of his life. During his life he was practically ignored by the mass, but was later honoured not only by the Fascists, but also by the critic Benedetto Croce, and by the literary group of the journal *Voce*. He preached that Italy needed real unity, and that there was too much regionalism. Italy must affirm its place in Africa, alongside the other great European colonising powers. To the tendency prevailing in his time he opposed the martial spirit. These things were especially set forth in *The Political Battle in Italy* (1892) and *The Ideal Revolt* (1907). Also for a time he tried his hand at novels, which were marked by a pitiless realism, the fruit of his observation of the villagers around him. Among these were *Jealousy* (1894); *Defect* (1890); and *Holocaust* (1902).

**Oribasius** (c. A.D. 326-403), Gk. physician, native of Sardis or Pergamum, friend and physician of the Emperor Julian, accompanying him to Gaul (355) and to Persia (363). He became quarrelsome at Constantinople (361). O. was banished temporarily by Valentinian and Valens, but recalled in 370. Half of his *Medicinal Collection* (Συναγωγή Τριπλή) is extant. It is largely compiled from Galen and others (*see* ed. of 1852-76).

**Orid**, *see* ORIDA.

**Oriel College, Oxford**, founded in 1326 by Edward II., prompted thereto by Adam de Brome, clerk in chancery. The name comes from a message in Oxford called *La Oriele*, which was denied to the college at its foundation, but the origin of this name is unknown. The number of fellows was at first ten, with a provost, but additional endowments brought the number up to eighteen. Famous members of the college include Sir Walter Raleigh, Gilbert White, Thomas Hughes, and Cecil Rhodes. *See* D. W. Rannie, *Oriel College*, 1900; G. C. Richards and H. E. Salter, *The Dean's Register of Oriel, 1116-1661*, 1926; and G. L. Shadwell and H. E. Salter, *Oriel College Records*, 1926.

**Oriel Window**, projecting window differentiated from a bay window by the fact that it is not on the ground floor. Among old writers, however, the term is frequently applied to an ordinary bay

window. The oriel projects from an upper storey, and is supported by some ornamental feature such as a bracket, corbel, or engaged column. Oriels were commonly used in late Gothic civil architecture, more especially in France and England.

**Oriental and African Studies, School of** was formally opened by King George V. on Feb. 23, 1917, its original charter of incorporation being issued on June 5, 1916. In the amending charter of 1938 (which added the words 'and African' to the title and restated the purposes of the school) it is provided that the purposes are 'to further research in, and to extend the study and knowledge of the languages of Eastern and African peoples, ancient and modern, and the literature, history, religion, law, customs, and art of those peoples. The school is affiliated to the univ. of London. The courses are designed for the needs of persons about to proceed to the East or to Africa for study and research, for the public service or commerce, or for the pursuit of a profession or calling.' The governing body comprises, besides *ex officio* members, representatives of the foreign secretary, the secretaries of state for war and the colonies, the corporation of the city of London, the L.C.C., Brit. Academy, London Chamber of Commerce, and Council of the Royal Asiatic Society. The scope of the teaching covers culture and hist., phonetics, linguistics, courses for colonial service probationers, and commercial courses. Instruction in culture and hist. embraces the hist. of oriental and African countries, with Intermediate and B.A. honours courses in the hist. of the near and middle E., of India, and of the Far E.; Arabic epigraphy; Heb. epigraphy and palaeography; Persian epigraphy; Indian palaeography; Burmese and Mon epigraphy; oriental laws and their hist., in particular, Islamic law throughout the world, Hindu law; Burmese Buddhist law; Chinese law; the literatures, religions, philosophies, and customs of oriental and African countries; oriental art and archaeology, and social anthropology. *See Bulletin of the School of Oriental Studies, London Institution*, vol. 1, 1917-20, and *The Calendar of the School of Oriental and African Studies for Thirty-Third Session, 1945-49*.

**Oriental Languages, *see* under LINGUISTIC FAMILIES, The Tibeto-Chinese Linguistic Family.**

**Oriental Plague, *see* under PLAGUE.**

**Orientalion**, determination of the points of the compass with special regard to the E.; in eccles. architecture the arrangement of a sacred building so that its main axis may point towards the E. In the Gk. temples the main door was at the E. end, and some such custom was followed in the early Church. The altar was near the W. end, and the officiant faced the people standing still further W. Later the custom became estab. of placing the altar at or near the E. end, the priest officiating usually with his back to the congregation.

**Oriente**: 1. The most easterly of the Cuban provs. (formerly Santiazo de Cuba),

covering an area of 14,128 sq. in. The prov. is mountainous in parts, but is drained by numerous streams and has some fertile valleys and plains. The highest int. peak is Turquino (8320 ft.). The chief products are iron, copper, manganese, mercury, slate, marble, sugar, tobacco, fruit, cereals, coffee, honey, wax, petroleum, etc. Cap. Santiago. Pop. 1,356,500. 2. Region of Ecuador, St. America, on the E. side of the Andes. It is divided (since 1925) into the provs. of Napo-Pastaza and Santiago-Zamora. It comprises a large tract of country in the Amazon valley, and is crossed by many rivers. An area rich in timber, rubber, and probably gold, its possession has been disputed by Ecuador, Peru, and Colombia. Area 219,095 sq. m., of which only 110,000 are inhabited. Pop. 295,200.

**Orient Line**, line of steamships between London and Australia, which succeeded the old O. L. of sailing ships which used to ply between London and Adelaide. Its steamship service to Australia was started in 1878. At that time it sailed some of the Pacific Steam Navigation Company's ships, but this arrangement ended in 1901 and, later, the O. L. built a new fleet of 12,000-ton steamers to replace them. The Orient steamers call at Gibraltar, Marseilles, Toulon, Port Said, Suez, Colombo, etc., on their way to Australia. The O. L. is a subsidiary of the P. & O. Line. The *Orcades* (31,000 tons gross), largest passenger liner yet built in the Vickers-Armstrong Barrow yard, was launched in Oct. 1917. She was named after a new ship lost during the Second World War, and can accommodate 750 passengers in first class, and the same number in the tourist class, and carries a crew of 608, with a speed of 22½ knots; she can make the passage between England and Melbourne in twenty-eight days. A second ship for the Orient company, with similar characteristics, was laid down on the berth vacated by the *Orcades*.

**Oriflamme** (Med. Lat. *auriflamma*), red flag of the abbey of St. Denis, which the kings of France received from the abbot on their consecration. It was at first used only against infidels, but later was in general use, appearing for the last time at Agincourt. In the fifteenth century the O. was superseded by the blue standard powdered with fleurs-de-lis, and the last mention of the original O. is in the inventory of the abbey of St. Denis dated 1531.

**Origanum**, genus of aromatic herbs and sub-shrubs (family Labiatae). *O. Marjorana* is the sweet marjoram of gardeners. *O. vulgare*, the common marjoram with purple or white flowers, is also aromatic. *O. dictamnus*, dittany of Crete, is a handsome pink-flowered plant often grown in hanging baskets.

**Origen** (186-c. 254), given by Eusebius the title of Adamantius, was b. at Alexandria of Christian parents, and later became the most famous and influential Christian writer of his century. Under the persecution of Septimius Severus (202) his father, Leonidas, achieved martyrdom, and herein he would gladly have been

followed by his son, had Origen not been prevented by his mother. The boy was brought up at the feet of Pantænus and Clement of Alexandria, and so great was his progress that Demetrius, bishop of Alexandria, and later one of his most determined opponents, permitted him to give catechetical instruction at the age of eighteen. Not only was O. learned in the Scriptures, but was also thoroughly conversant with Gk. philosophy. The persecution of Caracalla (216) was specially directed against the learned, and therefore O. was forced to leave his native city. He travelled through Palestine, and here he gave public instructions in the Scriptures at the invitation of the bishops of Jerusalem and Caesarea. Demetrius objected to this as being out of order, for O. was not a presbyter, and he returned to Alexandria. About 231 he paid another visit to Palestine on his way to Greece, and on this journey the two bishops ordained him presbyter. Demetrius again objected on technical grounds, and a synod deposed O. and forbade him to teach in Alexandria. Palestine and certain other dioceses refused to accept this decision and O. settled at Caesarea. His fame soon raised the school to a position almost equal to that of Alexandria.

O. was a most voluminous writer. His influence was vast, though even in his own day he was suspected of heresy. His great work was the adaptation of Gk. philosophy (especially the Logos doctrine) to the needs of Christian thought. An outstanding biblical scholar, O. represented all that was best in the scholarship and exegesis of the first three centuries of the Christian era and, like Erasmus, he stood for breadth in Christian thought and tolerance in controversy. If in some essentials Erasmus and O. are alike, they differed in that Erasmus was more a man of the world, and O. more ascetic and more devout. In theology Erasmus learnt from O. and, broadly speaking, O. liberated Erasmus from subservience to Augustine and Aristotle. O. drew men's attention from Aristotle to Plato, from St. Paul to St. John, from the atonement to the incarnation. O. and Augustine are among the most famous theologians of the Catholic Church, and they supplement and correct one another, for each is weak where the other is strong. Among his works, extant in some form or other, are *Hexapla* (q.v.), commentaries on Matthew, John, and Romans, his work on *Fundamental Doctrines* (*Ἱερα γωνία*), and his great apologetic *Against the Gentes*. The best ed. of his works is that of the Berlin Academy (commenced 1899). See also G. Thomasius, *Origenes*, 1837; J. Denon, *La Philosophie d'Origène*, 1881; S. von Harnak, *History of Dogma*, vol. n. 1894-99; W. Fairweather, *Origen and Greek Patristic Theology*, 1901; E. de Faye, *Origène*, 1903-1928; and A. Lieske, *Theologie der Logik-mystik bei Origenes*, 1935.

**Original Sin**, doctrine of the corruption of human nature inherited from Adam's fall, and the consequent necessity of baptism for remission of sins and of divine grace for recovering God's good pleasure.

The doctrine, though developed by St. Augustine in the fifth century, was not formulated by him. The foundation in the O.T. is the story of Adam and Eve in Genesis; the *locus classicus* in the N.T. is St. Paul, Rom. v. 12-21. Early witnesses to it among the fathers are Irenæus (*Adv. Hæc.* iii. 22, v. 14), Tertullian (*De Test. Animæ* iii.) and Origen (*Hom. in Jer. viii.* 1). In the fourth century it was denied by Pelagius, and hence underwent a considerable development by St. Augustine, especially in his *De gratia Christi et de peccato originali* (418) and his works against Pelagius. He showed that the practice of baptising infants implicitly assumed that they were in a 'state of O. S.' The doctrine was reaffirmed by the Council of Trent (1545-1563) in its fifth session. Calvin taught that through Adam's fall depravity and corruption attached to all men in such a way that the redemption covered without eradicating their guilt. For testimonies from the fathers see R. de Jouanel, *Euchiridion Patristicum*, 1928.

**Orihuela**, city of Spain in the prov. of Alicante, on both sides of the Segura, 13 m. N.E. of Murcia. Called Oreolis by the Goths, it is an auct. bishopric. There is a trade in fruit, wine, oil, cereals, and manufs. of linen, silk, and woollen goods. etc. Pop. 38,000.

**Orillia**, summer resort of Ontario, Canada on Lake Couchiching in Simcoe co., 60 m. N. of Toronto. There are iron foundries and saw- and grist-mills, and factories for making motor cars and agric. implements. Pop. 8,100.

**Orinoco**, third largest riv. of S. America, being next in importance to the Amazon and Plata. Its source is in the Sierra Parima, Venezuela, at an altitude of nearly 5000 ft., below Ferdinand de Lesseps Peak, 3° 40' N. lat. and 61° 30' W. long. Up to its junction with the Guaviare, which joins it on the l. b., W. of 68° W. long., it holds a generally E.N.E. course for 360 m. After flowing W.S.W. 20 m. past Esmeraldas, it is joined on the l. b., at 3° 10' N. lat. and 66° 17' W. long., by the Casiquiare, which links up at its S. extremity with the Rio Negro, a trib. of the Amazon, while, on the r. b., it is joined by the Ventuari. From its confluence with the Guaviare it flows almost due N. for 350 m., being joined on the l. b. by the Vichada and Meta, both in Colombia, and the Apure and its many trib. in Venezuela, and descending from the highlands by the cataracts of Maipures (which are nearly 2 m. wide and some 660 yds. long) and Atures (5 m. wide and 6 m. long). Between the mouths of the Guaviare and Meta it separates Venezuela from Colombia, but otherwise its entire course runs through Venezuelan ter. From the junction with the Apure the main stream flows almost due E., across the llanos or grassy plains to the Atlantic at 8° 20' to 10° 0' N. lat. In this part of its course the prin. trib. are the Caura, Caroni, and Paragua, all in Venezuela, and all flowing from the S. The delta begins at 62° 30' W. long., 130 m. from its mouth by throwing off a branch which flows N. into

the Atlantic, and covers an area of 8500 sq. m. The Boca de Navios, between Brit. Guiana and Nulma Isle, is the mouth mostly used, but six others are also navigable. The Boca de Navios is divided by a line of ls. into two channels, each 2 m. in width. The water of the riv. is of a milky-white colour, and may be easily distinguished at a great distance from the land. The O., with its source in S.E. Venezuela on the Brazilian border, thus describes a great semicircle, the estuary being no more than 500 m. from its source in the Sierra Parima, whilst its entire course is 1960 m., of which 900 m. below the Atures cataracts and 600 m. above them at the Maipures cataracts are navigable. The head of uninterrupted navigation is at the confluence of the O. with the Apure, 777 m. from the mouth of the riv. During its upper course the O. flows between the mts. and dense forests of Venezuelan Guiana on the E., and the wide llanos of Colombia on the W.; but after it reaches the lowlands, below its junction with the Apure, it has mts. on its l. b. or N. side and the plains on its r. b. At a distance of 150 m. from its source the riv. is only 90 yds. wide; above its junction with the Casiquiare, at an altitude of 1000 ft., it is 650 yds. wide; below its junction with the Apure, at an altitude of 200 ft., it is from 4 to 5 m. wide. In the flood season (April-Sept.), following the rains, the lower course becomes an immense lake, covering the llanos for some miles to the E. of the Apure. The area of the basin is about 370,000 sq. m.

**Orioles** are passeriform birds found only in the old world, and constitute the family Oriolidae; the Amer. O., or Baltimore birds (*g.r.*) belong to a separate family, the Icteridae. The birds are insectivorous and frugivorous, and hence are to be seen usually on forest trees. The plumage is generally very brilliant, and the male bird utters a flute-like note. *Oriolus galbula* (*orolus*), the golden oriole, which is occasionally seen in Britain, is orange-yellow in colour with black markings; *O. kundoo* is the Indian mango-bird.

**Orion**, in Gk. mythology, was the son of Hyrieus, of Boeotia, a hunter of great beauty. He loved Merope, the daughter of Oenopion of Chios, and for offering violence to her was blinded by Dionysus. He opened his eyes to the rising sun, and his sight was restored. He afterwards lived in Crete, and haunted in company with Artemis, and, according to one version of the legend, he was slain by the bite of a scorpion.

**Orion**, most brilliant and interesting of the constellations, contains three splendid stars, Rigel (magnitude 0.3), Betelgeuse (0.9), Bellatrix (1.9), and forty-four stars between magnitudes 4 to 5.2. The Great Nebula in O., which is just visible to the naked eye, is one of sev. nebulae in the constellation, but none of the others approaches it in size. It surrounds  $\theta$  Orionis, the middle star of the giant's sword (see NEBULÆ). Betelgeuse is one of the largest stars visible, its diameter being about 270,000,000 m. It is a cool star, the surface temp. being only 2500° C. The

stars in O are not all at the same distance from the earth, Rigel being about three times as far away as Betelgeuse and the others are situated at various distances.

**Orion's Dog, see CANIS MAJOR**

**Orissa**, prov. of India, recently separated from Bihar, but enlarged by some dists. which were transferred from Madras and the Central Provs. The cultivation of rice is the main activity of over two thirds of the people. Some jute is produced, and sugar cane and cereals are grown for domestic consumption. Turmeric is grown in the Ganjam dist. for export. Cuttack (cap.) (pop. 63,000) is

the old O. div. It now comprises the six dists. of Balasore, Cuttack, Ganjam, Koraput, Puri and Sambalpur. It is administered by a governor, assisted by a council of ministers and a single chamber legislature. Area 59,835 sq. m. Pop. 12,143,000. See C. B. M. under *Orissa in the Morning* 1925.

**Oristano**, city of Sardinia, Italy, on the Gulf of O. on the W. coast. There are potteries. Pop. 16,800.

**Oriza Language, see under INDO-EUROPEAN LANGUAGES**

**Orizaba**, city of Mexico, in the state of Vera Cruz, 28 m. N. E. of Mexico city.

ORISSA, INDIA. THE JAGANNATH (JAGANNAH) TEMPLE

known for fluted work. Puri (39,000) is famous for the temple and procession of Jagannath. O. is under the jurisdiction of the high court of Calcutta. The prov. has six colleges, the Ravenshaw College at Cuttack is maintained by the gov. and affiliated to the Univ. of Calcutta. There are also over 120 special schools for boys and girls, including training schools. There are 500 m. of railway in the prov. and 1,000 m. of roads. O. is ceded to the Marathas in 1751, was conquered by the Brit. in 1803. The various dists. formed in outlying portion of the Bengal Presidency up to 1912, when they were transferred to Bihar, but in 1936 it was constituted a separate prov. some portions of the Central Provs. and Madras (which latter provs. had long contained what, in effect, were parts of O. considered in its cultural unity) being transferred to

It is reached from the cap. via the B. by the Mex. m. S. branch of the National Railway. There is a good cable tram in sugar and tobacco estates are many, and there are railway workshops. The weaving of table linens is a new and thriving industry and there is also noted for its wool textile. There are many silver and gold mines in the neighborhood. Cattle raising and agriculture are also carried on. The chief crop is coffee. The Mita (mt.) runs are 20 m. S.W. of the town. In the vicinity of the slumbering volcano of O. or Citlaltépetl, which rises to a height of 18,300 ft. Its last serious eruption was in 1566. Pop. 29,300.

**Orizonte** (Jan Frans van Bloemen) (1662 c. 1740) Dutch painter, b. at Antwerp. He left his native town for Italy early in life, and passed the remainder of

his life in that country. His finest pictures are in the pontifical palace at Monte Cavallo. He was particularly noted for his landscape paintings, and was nicknamed 'Orizonte' by the Society of Flemings at Rome by reason of the beauty and delicacy shown in his portrayal of distances. He had two brothers, also painters, viz. *Pieter van Bloemen*, called 'Standaert' (1657-1719), and *Norbert van Bloemen*, called 'Cephalus' (1670-1746).

**Orjonikidze**, see **ORDZHONIKIDZE**.

**Orjonikidzeograd**, see **ORDZHONIKIDZEGRAD**.

**Orkhon Inscriptions** (also known as **Siberian, Early Turki, Pre-Islamic Turki** or **Kök Turki Runes**) are the earliest epigraphical monuments written in Turki; and the earliest alphabetic inscriptions discovered in N. central Asia. They belong to the seventh and eighth centuries A.D. Some of them are long funerary inscriptions, describing the war-glories of the T'u-küe or Türküt (plural of Turk; Turke), the earliest known Turki people, who ruled over Mongolia from the mid sixth century A.D. to the mid eighth century. These inscriptions were found on the Upper Ob, the Upper Yenisei, and particularly on the R. Orkhon, to the S. of Lake Balkal. The inscriptions are written either in horizontal lines running, like the Semitic alphabets, from right to left, or vertically (perhaps under Chinese influence) in columns following each other from right to left. This script was deciphered in 1893 by the Dan. scholar W. Thomsen. The language of the inscriptions is early Turki, the oldest form known of the Turkish tongue, which differs very widely from Osmanli Turkish. The script, which must have already been in use in the sixth century A.D., consists of thirty-eight letters, of which four are vowels (*a, y, u, ö* or *ü*); curiously enough, many consonants vary in form according to the following vowel-sound, e.g. *k* has as many as five forms (for writing (1) *ka*, (2) *ky*, (3) *ko* or *ku*, (4) *ka*, *ke*, *ki*, and (5) *kö* or *kü*). The origin of this script is uncertain; it may have derived from a local Pahlavik script (see under **PAHLAVI**) or from the Sogdian alphabet (see under **ALPHABET**).

There are two forms of the Orkhon script, the monumental, of which a few varieties are known, and which externally resembles the Teutonic runes, and the cursive form, the script of various fragments at Turfan (E. or Chinese Turkistan).

**Orkney Islands**, separated from Caithness by the Pentland Firth (q.v.), lie between 58° 41' 24" and 59° 23' 2" N. lat. and between 2° 22' 2" and 3° 25' 10" W. long.; and are seventy-three in number at low water, of which twenty-eight, besides Pomona, or Mainland, are inhabited. The area of the O. I. is 376 sq. m. The surface is very irregular, and the land is indented by numerous arms of the sea. Next to Pomona, the most important of the is. are N. and S. Ronaldshay, Hoy, Rousay, Stronsay, Flotta, Shapinsay, Eday, and Sanday. The highest peak

is Ward Hill in Hoy, which has an elevation of 1560 ft. The temp. of the O. I. is comparatively mild, considering their N. lat. This is due chiefly to the proximity of the Gulf Stream. There is little difference in temp. between day and night; and frost and snow are rare. The rainfall averages 36½ in. At the season of the 'longest day' there is no darkness for about six weeks and during the summer solstice snapshots can be taken at midnight. The exports are chiefly fish, agricultural produce, and cattle. The chief tns. are Kirkwall, the cap., and Stromness. The Orkney and Shetland (q.v.) Is. return one member to Parliament.

Many brochs, chambered cairns, and burial mounds remain as evidence of prehistoric and Norse settlements. The Neolithic dwellings of Skara Brae are important examples. The Orkneys, under the name Orkades, are mentioned by the anc. geographers, Pliny, Ptolemy, and others. In 876 Harald Haarfager conquered both them and the Hebrides. During the greater part of the tenth century they were ruled by independent Scandinavian jarls (earls), but in 1098 they became formally subject to the Norwegian crown. Thus they remained Scandinavian till 1468, when they were given to James III. of Scotland as a security for the dowry of his wife, Margaret of Denmark. The is. were never redeemed from this pledge; and in 1590, on the marriage of James VI. with the Dan. Princess Anne, Denmark formally resigned all pretensions to the sovereignty of the Orkneys. During their long connection, however, with Norway and Denmark, all traces of the primitive Celtic pop. disappeared, and the present inhab. are of the pure Scandinavian stock. Pop. 21,900. See J. Gunn (ed.), *The Orkney Book*, 1909; A. W. Brøgger, *Ancient Emigrants, Norse Settlements*, 1929; V. G. Childe, *Skara Brae*, 1931; and J. S. Clouston, *A History of the Orkneys*, 1932.

**Orkney and Shetland, Duke of**, see **BOTHWELL, EARL OF**.

**Orlando, Vittorio Emanuele** (b. 1860), It. jurist and statesman, b. in Sicily, was a prof. of constitutional law at Palermo. He became minister of the Interior in Boselli's Cabinet (1916). He succeeded Boselli as premier in 1917, and proved a tower of strength at the time of Gen. Cadorna's (q.v.) disastrous defeat at Caporetto (q.v.) by stiffening the national resistance. In the Inter-Allied Peace Conference in Paris, 1919, he was one of the 'Big Four' (see **PEACE CONFERENCE**). He succeeded from the council in May 1919 on the Fiume question. Retiring from politics after the advent of Fascism, with which he had no sympathy, he returned to the Constituent Assembly to fight against the peace treaty after the Second World War, but, on the Chamber's approval of the treaty, he resigned his seat.

**Orlando**, tn. in Florida, U.S.A., co. seat of Orange co., 125 m. S. of Jacksonville. Citrus fruits are cultivated here, and it is a favourite centre for tourists. Pop. 36,700.

**Orléanais**, former prov. of France, Pagus Aurelianensis of the Romans. It

corresponds to the present depts. of Loiret, Loir-et-Cher, Eure-et-Loir, and parts of Seine-et-Oise, Nièvre, etc. Orleans was the cap.

**Orleans, Dukes of.** The title, of duke of O., was created by Philip VI., and conferred on his son Philip. When the third duke ascended the throne of France as Louis XII. in 1498, the duchy lapsed. Louis XIII. in 1626 bestowed the title of duke of O. on Jean Baptiste Gaston; but the title was not revived after his death until, in 1660, Louis XIV. revived it in favour of his brother Philip. Descendants of this line are living at the present time; a brief account of the persons who have held the title follows:

**Louis (1372-1407),** the younger son of Charles V., was previously count of Valois and of Beaumont-sur-Oise and duke of Touraine, being created duke of O. in 1392. He married Valentina, daughter of the duke of Milan. His quarrel with Philip II., duke of Burgundy, on the question of his wife's claims to Milan culminated after the death of Philip in his being murdered by one of the partisans of John, Philip's successor.

**Charles (1391-1465),** commonly called Charles d'Orléans, was the eldest son of the above duke. He married Isabella, the widow of Richard II. of England, in 1406; in 1415 he was captured at Agincourt, and kept a prisoner in England until Nov. 1440. Released then, he spent most of the rest of his life at Blois, where he held a literary court. He is a graceful poet, representing the art of the last period of the Middle Ages, and some of his romances are surpassed by none in their class.

**Jean Baptiste Gaston (1608-60),** was the third son of Henri IV. and Marie de Medici. He married, first Marie de Bourbon, and secondly, Marguerite, a sister of the duke of Lorraine. His nature was weak and his part in the intrigues of the period did him but little credit. He died at Blois.

**Philip I (1640-1701),** the son of Louis XIII. of France, was created duke of Orleans in 1661, and married Henrietta, sister of Charles II. of England, the same year. After her death (supposed to have been by poison at the duke's instigation) he married Charlotte Elizabeth, daughter of Charles Louis, elector-palatine of the Rhine.

**Philip II. (1671-1723),** regent of France, the son of the above duke, bore the title of duke of Chartres until the death of his father. On the death of Louis XIV., he became sole regent in spite of the king's testament, which he induced Parliament to set aside. On the king attaining his majority in 1723 Philip continued in power as his prime minister. It was during his regency that the schemes of John Law (*q.v.*), the Scottish financier, which Philip countenanced, brought the country to the verge of bankruptcy. The talents of the duke were great, but were counterbalanced by his debauchery and vice.

**Louis (1703-52),** the only son of the above duke, who succeeded to the duke-

dom in 1723, was pious, cultured, and peaceable; after holding the post of colonel-general of infantry for eight years he retired into private life in 1730. He married Augusta, the daughter of Louis William, margrave of Baden.

**Louis Philippe Joseph (Egalité) (1747-1793),** b. at St. Cloud, was principally notable for his complete change of views during the revolution, when he took the name of Philippe Egalité, and voted for the death of Louis XVI., but he was guillotined in spite of his views. He married the daughter of the duke of Penthièvre.

**Ferdinand Philip Louis Charles Henri (1810-42),** was b. at Palermo. He served with distinction in sev. campaigns, and organised the battalion of light infantry known as the Chasseurs d'Orléans.

**Henri (Prince of Orleans) (1867-1901),** was b. at Ham, near Richmond. He was chiefly noted as a traveller and explorer, discovering the source of the Irrawaddy, for which he received the medal of the Geographical Society of Paris.

**Louis Philippe Robert (1869-1926),** was b. at Twickenham and educated in France till 1886; he returned thither in 1890 and expressed a wish to serve as a conscript, but was imprisoned for a short period. He served with the Brit. Army in India, and in 1900 caused adverse comment by his commencement of insolent caricatures of Queen Victoria. On his death, without issue, Jean, duke of Guise, became pretender to the Fr. kingship, being succeeded in 1940 by his son Henri, comte de Paris. See M. Coryn, *House of Orleans*, 1936.

**Orleans,** important commercial tn. of France, (cap. of the dept. of Loiret, and formerly cap. of the old prov. of Orléanais, is situated on the r. b. of the Loire, 754 m. S.S.W. of Paris by railway. O. stands on the verge of a magnificent plain sloping toward the Loire, and watered by the Loire and Loiret. Among its prin. buildings are the cathedral, with two lofty and elegant towers, one of the finest gothic edifices in the country; the tower; bishop's residence; the houses of Joan of Arc, of Agnes Sorel, of Diane de Poitiers, of Francis I., and of Pothier. The tn. contains three statues of Joan of Arc. Manufs. include hosiery, cotton, and linens, goods, blankets, refined sugar, vinegar, leather, tobacco, machinery, etc. There is some trade in wine, brandy, corn, and sugar. In 1128 O. was besieged by the Eng. under the duke of Bedford, but was delivered by the inspiring exertions of Joan of Arc (*q.v.*), who on this account is also named the Maid of Orleans. Pop. 71,606.

**Orleans, Isle of,** is. of Quebec, just below Quebec City, on the R. St. Lawrence. It is a fertile spot, 21 m. long, with an area of 69 sq. m., and is noted as a summer resort. It possesses, beside mackerel, cod, and halibut fisheries, large deposits of gypsum.

**Orleans, Maid of,** *see* JOAN OF ARC.

**Orleans,** *new, see* NEW ORLEANS.

**Orley, Bernart van (c. 1190-c. 1542),** Flem. painter. b. at Brussels. He studied under Raphael at Rome, and later was appointed painter to Margaret of Austria. He made a number of designs for tapestry.

the most celebrated being 'The Life of Abraham' at Hampton Court, and 'Maximilian's Hunts' in the Louvre, and among his numerous pictures are 'The Last Judgment,' 'The Holy Family,' 'The Magdalen Reading' (in the National Gallery, London), 'The Descent from the Cross,' 'Christ on the Cross,' etc.

**Orloff Diamond**, see **DIAMOND**.

**Orlov**, or **Orloff**, noted Russian family: **Alexis**, Count O. (c. 1736-1808), Russian admiral, was an accomplice in the conspiracy of 1762, which made Catherine autocrat of Russia in place of Peter III., whom O. killed. Made an admiral, he commanded a naval expedition against the Turks, whom he defeated at Chesme.

**Theodore (Fedor) O.** (1741-96), Russian officer, brother of above, fought against the Turks and took Navarino in 1770.

**Gregory O.** (1734-83), Russian courtier and general, brother of two preceding, saw service in the Seven Years war.

**Gregory O.**, Count (1777-1826), nephew of Alexis. He lived principally in Paris and Italy, and pub. *Travels in Paris of France*, etc.

**Michael O.** (1785-1841), son of Theodore, served in campaigns against Bonaparte. He took part in secret associations of the Russian Army in the reign of Alexander, and was disgraced in 1825.

**Orm**, or **Ormin**, see under **ORMULUM**.

**Ormazd** (or **Ahura Mazda**), in the Zoroastrian system, was the principle of light and good and creator of all things. He is in perpetual conflict with Ahriman (q.v.), but will prevail ultimately. The Lat. form is **Ormazdes**.

**Orme, Robert** (1728-1801), historian of India, b. at Anjengo on the Malabar coast, went to Calcutta in 1742, and entered the E. India Company's service. In 1752 he pub. *A General Idea of the Government and People of Indostan*. He was appointed a member of the council at Madras two years later. Returning to England in 1760, he began his *History of the Military Transactions of the British Nation in Indostan from the year 1745* (1763-78). He also wrote other books and essays on India.

**Ormesby**, par. and vil. of N. Riding, Yorkshire, England, 4 m. S.E. of Middlesbrough.

**Orme's Head**, Great, bold promontory in the extreme N. of Carnarvonshire, N. Wales. It projects into the Irish Sea, 5 m. N.W. by N. of Conway, and has a lighthouse visible at a distance of 24 m. The Little O. H., a smaller headland, lies to the E.

**Ormoe**, pueblo of Leyte, Philippine Is., on the W. coast, 34 m. W. of Tacloban. Hemp is largely produced. Pop. 40,000.

**Ormolu** (Fr. or *moulu*, ground gold), species of brass, made up of equal parts of copper, zinc, and tin, and of a golden-yellow colour. The prin. use of O. is for the mountings of furniture. Small articles are made from O., and it is also a basis for cloisonné work, produced in China for a long period.

**Ormond**, health resort of Florida, U.S.A., in Volusia co., on the Halifax, 68

m. S. of St. Augustine. Between it and Daytona, to the S., stretches the Daytona Beach, used for automobile racing and speed trials. Pop. 1600.

**Ormonde, James Butler**, first Duke of (1610-88), succeeded as twelfth earl of O. in 1633, and in 1661 was created duke in the Irish, and in 1682 duke in the Eng., peerage. He acted for Charles I. against the Irish rebels in 1643, and in the following year was appointed lord-lieutenant of Ireland. In 1648 he was royalist commander in Ireland, where, after the execution of the king, he proclaimed Charles II. He was defeated by Cromwell in 1649, and fled abroad to join the king. On the restoration he was made lord steward of the household, and was again lord-lieutenant of Ireland in 1661-69, and 1677-82, and once more in 1681. After James II. came to the throne he retired into private life, but in 1687-88 he opposed sev. of the more arbitrary acts of the king, and especially those directed against Protestantism.

**Ormonde, James Butler**, second Duke of (1665-1745), eldest surviving son of Thomas, earl of Ossory, succeeded to the dukedom in 1688. He was a supporter of William and Mary and at their coronation acted as lord high constable. He commanded the Life Guards at the battle of the Boyne, and was present at the battle of Steinkerk. He was taken prisoner at the battle of Landen, but was exchanged for the duke of Berwick. Under Anne he held the offices of lord-lieutenant of Ireland and captain-general of the forces. From the latter office he was removed on the accession of George I., and in 1715, as a leader of the Eng. Jacobites, was impeached, but escaped to France. He now threw in his lot with the pretender, and took part in the rising of 1715, and four years later accepted the command of the abortive expedition of the Sp. fleet to England.

**Ormonde**, old name for the dist., comprising Tipperary, Ireland, which afterwards became E. Munster.

**Ormskirk**, anc. mkt. tn. of Lancashire, England, 11 m. N.E. of Liverpool. There is a seventeenth-century grammar school, and a church with both a spire and a tower. There are brass foundries, an ordnance depot, breweries, and cake and biscuit factories. It is celebrated for gingerbread. Pop. 20,700.

**Ormulum**, early Eng. metrical trans. of the gospel hist., consisting of a series of Eng. homilies in iambic verse written by Orm, canon of St. Augustine in the vicinity of Lincoln, about 1200. See also under **ENGLISH LANGUAGE**. See ed. of R. M. White, 1852 (revised by R. Holt, 1878), and P. Lambertz, *Die Sprache des Ormulum nach der lätlichen Seite untersucht*, 1901.

**Ormuz**, see **ORMUS**.

**Ornaments**, term for accessories of a church or the worship in it, e.g. vestments, organ, bells, plate, paten, chalice, font, pulpit, pastoral staff, etc. The question as to what is allowed according to the ornaments rubric in the Book of Common Prayer has involved considerable con-

troversey and litigation, but, broadly, most of the *O.* used in 1549 are regarded as legal.

**Ornaments, Musical**, notes which are not a part of the melody or harmony, but merely embellishments thereof. Some are now obsolete, either because the fashion of highly ornamented playing and singing is dead or because great elaboration is not suited to modern instruments. Some of the embellishments that were indispensable to the harpsichord, for example, because of its inability to give prominence to certain notes by accentuation, sound merely fussy on the pianoforte. *O.* include acciaccatura, mordent, shake, turn, roulade, etc.

**Oro**: 1. Dept. of N.W. France, formed from part of anc. Normandy, and divided into the arrons. of Alençon, Argentan, and Mortagne; cap. Alençon. It comprises two distinct physical regions, viz. the W., consisting of rugged hills and extensive forests, with patches of pastureland occasionally interspersed, and the E. with fertile valleys and rich pasture lands. Iron, copper, lead, and granite are the prin. minerals. Cereals are cultivated to a certain extent, but more care and attention are given to the apple and pear orchards, for the raising of cider and perry. The dept. is famous for its horses, and cattle are reared and dairy produce exported. Iron wares, linens, cotton, lace, glass, and leather goods are the prin. manufs. The dept. was the scene of heavy fighting in 1944. Area 2371 sq. m. Pop. 273,200. 2. Riv. of France rising in the *O.* dept., and flowing generally N.W. for half its course, and N.E. for the remainder, reaches the Eng. Channel in the bay of the Seine. Length 80 m. The prin. tns. on its banks are Caen, near the mouth, Thury, Harcourt, and Argentan, all of which places were involved in the battle of Normandy of 1914. See further under WESTERN FRONT IN SECOND WORLD WAR.

**Ornithosephalus**, small genus of epiphytal orchids, natives of tropical America. *O. grandiflorus* bears racemes of white and green flowers, and the suggestion of the bird's beak, which gives the genus its name, is found in the long slender rostellum to which the pollen masses are attached. The plant is usually grown in peat and sphagnum in a small pan suspended near the roof of a greenhouse.

**Ornithogalum**, or Star of Bethlehem, genus of bulbous plants (family Liliaceae), bearing racemes of white, greenish-white, or yellow flowers. They are never blue as in the closely allied genus *Scilla*. The only true Brit. species is *O. pyrenaicum*, the spiked star of Bethlehem. A number of varieties are grown in warm borders or as pot plants.

**Ornithoglossum**, genus of bulbous plants (family Liliaceae), occasionally grown in the greenhouse. *O. glaucum*, with greenish-brown flowers, and *O. undulatum*, with purple-green flowers, both natives of S. Africa, are the prin. species.

**Ornithology**, branch of zoology which teaches the hist. of birds. See BIRD.

**Ornithopter**, form of flying machine

operated by flapping wings; none has ever proved successful in practice.

**Ornithorhynchus Anatinus**, Duck Mole, or Duck-billed Platypus, Australian mammal which, with the two spiny ant-eaters, forms the primitive group, Monotremata. Prototheria is Huxley's name for those primary mammals from which, it was conceived, the Monotremata were evolved. This latter is a class added by Lamarck for *O.* and echidnas. They are also regarded as a sub-class of mammals, Ornithodelphia. Except for the fact that the young are produced from eggs, and for the flat beak-like mouth, *O. A.* bears no resemblance to a bird. It lives in long burrows on the banks of rvs. The eggs are laid two at a time in a small chamber at the end of the burrows. These eggs have a non-calcareous shell, but like those of birds and other egg-laying vertebrates, have a yolk. The young are believed to hatch very soon after the eggs are laid, and are at first naked and blind. In an early stage, the short fleshy bills are provided with teeth, and these are lost as the animal matures, and hard horny patches developing in each jaw take their place. The oval, flattened body becomes clothed with fur, which is well adapted to an aquatic existence, and the feet are webbed. The fore-limbs are provided with five powerful claws with which the animal burrows. The broad, flat tail is short, and the total length of the body is about 20 in. A horny spur on the hind foot, which is able to inflict a poisonous wound, occurs only in the male.

**Oro**, or El Oro, S.W. prov. of Ecuador. Cacao is the prin. product, and gold is found. The cap. is Machala. Area 2338 sq. m. Pop. 77,530.

**Orobanchaceae**, family of leafless, scaly, succulent plants, which are parasitical on the roots of other plants or which live upon decaying organic matter. Among the genera are *Orobanche* and *Lathraea*, both of which are represented by Brit. species.

**Orobanche**, or Broomrape, genus of parasitic plants, with many-sided spikes of flowers, usually of a brownish colour. *O. purpurea*, a rare parasite on milfoil, has, however, pale blue flowers with purple veins. *O. major* and *O. minor*, the commonest species, are both parasitic on leguminous plants, and sometimes cause considerable loss to crops.

**Orobis**, or Bitter Vetch, genus of leguminous plants, usually classified with the genus *Lathyrus*, but without the tendrils which characterise its members. The roots of *O. tuberosus* (*Lathyrus macrorrhizas*), which bears variegated purple axillary flowers, are sometimes eaten in the Scottish highlands. *O. lathyroides* is a handsome garden plant.

**Oronsay**, see COLONSAY AND ORONSAY.

**Orontes**, or Nahr-el-Asi (The Rebel-lous), riv. of N. Syria, which rises in the Anti-Libanus, and flows first N., through Lake Kadz., to Antioch, and then turns W.S.W., and enters the Mediterranean Sea, 40 m. N. of Latakia. Length 250 m.

**Oroomlah**, see URMUMAH.

**Oropesa Float**, mine-sweeping device comprising a pear-shaped float on the end

of a wire and moving at an angle to the ship. The wire is held to a set depth by a kite, and cuts the mooring cable of mines by being serrated.

**Oropus**, anc. tn. and seaport of Greece in Attica, 23 m. N. of Athens. Its possession was the source of continual strife between the Athenians and Boeotians from the sixth century B.C. to 338 A.C., when it came into undisputed possession of the Athenians.

**Oroya**, tn. of Peru, 137 m. from Callao, at the junction of the Central Railways and the Cerro de Pasco Railways. The tn., which stands at an altitude of 12,180 ft., is situated at the confluence of the Mantaro and Yauli Rs. The chief activity is the smelting of copper ore. Pop. 15,000.

**Orpen**, Sir William Newenham Montague (1878-1931), Brit. painter, son of Arthur Herbert O. of Stillorgan, co. Dublin. At the age of eleven he went to the Metropolitan School of Arts, Dublin, and, later, to the Slade School. O. was one of the artists chosen by the gov. to paint pictures of the First World War, being given the rank of major. He was knighted in 1918, and in 1921 he became president of the International Society of Painters and Gravers. His war pictures, many of which he presented to the nation, show scenes tragic, comic, and grotesque, according as the subject struck his fancy; they are forceful and to the point, but artistically remain acrid and dramatisations of his emotions rather than generalisations. Among the best known of these are 'Changing Bibles' and 'Bombing at Night.' His best pictures are genre subjects and interiors with figures such as 'The Fracture,' 'Homage to Manet,' 'A Bloomsbury Family' (that of Mr. Wm. Nicholson). He painted many portraits, including 'The Hon. Percy Wyndham' (1907), a notable early example of his powers, 'Dame Madge Kendal,' and 'Sir Ray Lankester,' all of a rather mechanical brilliance. A portrait of himself holding a 'Dead Ptarmigan,' and another of 'Alfred W. Rich, Esq.,' are examples of excellent sketching. Among his pictures of Irish life, 'The Irish Wedding' and 'Sowing the Seed in the West' are greatly admired. Undoubtedly a great draughtsman, as a painter he was rather the brilliant executant than the great craftsman. See memoir by P. G. Konody and S. Dark, 1932.

**Orpheus**: 1. In Gk. legend, the son of Oeagrus by the muse Calliope, and the most illustrious poet of the pre-Homeric period. He lived in Thrace, and accompanied the Argonauts on their expedition. O. was presented by Apollo with a lyre, on which he played so exquisitely that not only every living thing but rivers and rocks were moved by his sweet harmony and obeyed his will. He married the nymph Eurydice, who died from a serpent's sting. Resolved to recover her, O. dared to descend into Hades. The music from his lyre gained him entrance, and so far captivated Pluto that he consented to his prayer on condition that he should not look back at his wife until they reached the upper world. But when he had almost

reached this earth O. turned to see if she were following him, whereupon Eurydice vanished before his eyes. He then retreated in his grief to the mt. caves and scorned the amorous advances of the Thracian women, who, in revenge, tore him limb from limb in Bacchic frenzy and threw his head into the Hebrus. The muses collected his remains and buried them at the foot of Olympus, while Zeus placed his lyre among the stars. 2. Mythical founder of a school of mystic theology which flourished at Athens during the sixth century B.C. Orphism resembled the Thracian worship of Dionysus. See E. W. Maass, *Orphicus*, 1895;

THE DEATH OF ORPHEUS  
A vase in the British Museum.

Jane E. Harrison, *Prolegomena to the Study of Greek Religion*, 1908; and W. K. C. Guthrie, *Orpheus and Greek Religion*, 1935.

**Orphica**, number of early Gk. poems on mystic subjects. They were once ascribed to Orpheus, but many of them were written during the fourth century A.D. The chief poems of the Orphic cycle are the *Argonautica* an epic poem on the voyage of the Argonauts; *Lithica*, a poem on the properties of stones; *Physica*, and *Musica*. See A. Dieterich, *De Hymnis Orphicis*, 1891; eds. of the *Orphica* by Hermann, 1805, and Abel, 1885; and an Eng. trans. of the *Hymns* by T. Taylor, new ed., 1896.

**Orpiment**, native triarsulphide of arsenic which occurs in lemon-coloured crystals in Czechoslovakia, Rumania, the U.S.A., Kurdistan, and elsewhere. Formerly it was used as a dye.

**Orpington**, urb. dist. of Kent, England, mainly residential and agric. There was a printing press here in 1873 for printing Ruskin's own works, superintended by George Allen, who was also his publisher.

The parl. constituency of O. includes part of the Darford rural dist. Pop. (estimated) 59,000.

**Orr, John Boyd, first Baron Boyd-Orr** (b. 1880). Scottish physiologist and nutritional expert, b. at Kilmaurs, Ayrshire; he was educated at Glasgow Univ., where he took his M.A., M.D., and D.Sc. degrees. He entered the medical profession but gave up his practice to study animal nutrition at the Rowlett Institute of Animal Nutrition, Aberdeen, of which he was director until his retirement in 1945. During the First World War he served with the Royal Army Medical Corps. His work on *Minerals in Pasture and their Relation to Animal Nutrition* appeared in 1928, and four years later he became a member of the Reorganisation Committee for the Fat Stock Industry. He also served on other gov. organisations concerned with animal nutrition and milk supply. His researches, embodied in *The National Food Supply* (1931) and *Food, Health, and Income* (1936), were the basis of the rationing system in the Second World War. He was professor of agriculture at Aberdeen Univ. from 1912 to 1945. In the latter year he was elected M.P. for the Scottish Unions, but resigned in 1946 on account of his work with the United Nations Food and Agric. Organisation, of which he was director-general. It was a period of acute world food shortage, and his proposals were successful in averting a famine situation. On his retirement from the Food and Agric. Organisation he became chancellor of Glasgow Univ. (1947). He was knighted in 1935 and created a baron in 1949. He was awarded the Nobel Peace prize for 1949.

**Orrell**, tn. of Lancs linc, England, 4 m. W.S.W. of Wigan. There is a cotton mill, sand and gravel quarry, and farming in the neighbourhood. Pop. 7000.

**Ortery, Earls of**, see **BOYLE**.

**Ortery**, instrument deriving its name from the one constructed for Charles Boyle, earl of Orrery, by Rowley, 1715. It was an improved form of the sixteenth-century planetarium (a machine for exhibiting the relative motions of the planets and their positions in respect to the sun and one another) invented, or at least constructed, by George Graham (1672-1750), and showed the motions of the members of the solar system, with relative sizes and distances, but circular orbits, by means of arms and uprights moved by geared wheels. A good example is to be seen in the Kelvin Grove Museum, Glasgow, and Thomas Tompion, the famous London clockmaker, also constructed an O.

**Orrievsk**, see **PERDICHEV**.

**Orris Root**, rhizome of *Iris florentina*, a violet-scented plant occurring in S. Europe. A starch or flour is prepared from the rhizome for use in the manu. of toilet powders, especially dentifrices. The plant is cultivated for the purpose in the N. of Italy, and is sometimes grown in Brit. gardens.

**Orr, Eugenio D'** (b. 1882), art critic, was b. in Catalonia. He became director of

public instruction in Barcelona. Under the *nom de plume* of Xenius he was regarded as the champion of catalanism. About 1920, however, he began to separate himself from his Catalan friends, and to write in Castilian. As art critic he has been one of those who battled for fuller recognition of what Portugal contributed to art. One of his finest books is his *Life of Goya*.

**Orsav**, see **D'ORSAY**.

**Orsborn, Albert William Thomas** (b. 1886), see under **SALVATION ARMY**.

**Orsha**, and, tn. in the Mogilev Region of the Byelo-Russian S.S.R., 74 m. W.S.W. of Smolensk, and a railway junction. There is a trade in grain, seeds, and timber, and before the Second World War there were also tanneries and lime-kilns. New factories had been constructed, or were under construction before the Ger. invasion, and the lime factories were among the most important in Russia. The dam which is projected at O. will raise the level of the Dnieper and enable large riv. vessels to sail into smolensk. O. was lost to the Russians in the Ger. invasion of 1941, but at the end of Sept. 1943 the Russians were pouring through the Smolensk gateway and preparing to attack the fatherland line, a line between Vitebsk in the N. and the Pripet marshes in the S., marked by a series of strongholds among which O. was one. Vitebsk held out tenaciously under its Ger. garrison until summer 1944, and a new Russian drive was launched on June 23, with that place as its focal point. Gen. Chernyakovsk broke the defences N.E. of O., and on June 27 the Gers. were driven out of that tn. Pop. 30,000. See further under **EASTERN FRONT IN SECOND WORLD WAR**.

**Orsini, Giovanni Gaetano**, see **NAPOLIS** (popes), **Napoles III**.

**Orsk**, tn. of the Chkalov Region of the R.S.F.S.R., 155 m. S.E. of Orenburg (now Chkalov), near the confluence of the Ural and Or Rs., originally a fortress on the Orenburg line against the Kazan. There is oil-refining, a pipe-line connecting with the R. Emba wells, chrome and nickel deposits, tallow, soap, and brick works, railway workshops, and an electric power station. Pop. 65,800.

**Orsova**, name of two tns. of Rumania, on opposite banks of the Danube, at the Iron Gates. Old O. on the W. bank of the R. Corina, is a trading and shipping centre. Pop. 6000. New O., on the opposite bank, was repeatedly taken and retaken in the wars of the eighteenth century. Pop. 3000.

**Ortega, Cape**, promontory, and the most N.-westerly point of Spain on the bay of Biscay, 3.5 m. N.E. of Corunna. A battle was fought off it in 1805 between Sir Richard John Strachan and a small fr. fleet, survivors of Trafalgar, all the ships of which were captured or sunk.

**Ortega y Gasset, José** (b. 1883). Sp. essayist and philosopher, b. at Madrid, educated at the Jesuit school of Miraflores and the univ. of Madrid, where he graduated in philosophy and literature in 1904.

In 1908 the univ. conferred upon him the chair of metaphysics. During the following years O. founded and wrote for the philosophical journals *Faro* (1908) and *Europa* (1911). Always of a retiring disposition, O. became famous in 1911 through his speech on 'Old and New Politics,' in which he denounced the restoration of the monarchy and Alfonso XIII. personally, and as a result of which the League of Political Education was estab. Among O.'s prin. works are *The Revolt of the Masses* (1932); *Invertebrate Spain* (1937); and a *Philosophy of History* (1941).

**Ortelius Wortels** (Ortel, or Ortell) Abraham (1527-98), Flemish geographer and mathematician, b. at Antwerp, of Ger. parents. His *Theatrum orbis Terrarum* (1570) was the first great atlas, and he also wrote *Synonymia Geographica* (1578). In 1575 he was appointed geographer to Philip II. of Spain, and two years later he came to England and helped to induce Camden to produce his *Britannia*.

**Orthez**, tn. of France in the dept. of Basses-Pyrénées on the Pau, here crossed by a fourteenth-century bridge, 25 m. N.W. by W. of Pau. The viscounts of Béarn had their cap. here in the thirteenth century. O. was a Calvinist centre. It was the scene of a battle in 1814, one of the last actions of the Peninsular war, in which Wellington defeated Marshal Soult. Pop. about 6200.

**Ortho-acids**, name applied to substances containing one or more —C(OH), groups. They are known in the form of their derivatives, the free acids being unstable, rapidly losing water with the formation of ordinary acids containing the —CO OH group:

**Orthoceras**, large genus of fossil cephalopods in the order Tetrabranchiata and family Nautilidae. The species have a simple aperture, and the shell is quite straight. The genus is closely allied to the living one, *Nautilus*, but itself occurs only in the fossil form; it is found from the lower Silurian to the Lias. *O. titan* is the term applied to a huge species.

**Orthochromatic Photography**, see under PHOTOGRAPHY.

**Orthoclase Porphyry**, hypabyssal rock which may be regarded as intermediate between plutonic syenite and volcanic trachyte. It occurs in dykes and veins, and is composed of a micro-granitic groundmass with little or no free quartz, and containing relatively large phenocrysts of orthoclase feldspar. Micaceous varieties are sometimes called mica-trap, which term includes the orthoclastic type of lamprophyre, viz. minette.

**Orthodox Eastern Church**, see GREEK CHURCH.

**Orthodoxy** (literally, right opinion), correct belief, especially in religious doctrine, but also in philosophical, social, or political principles. Belief not orthodox, but not too inimical, is *heterodoxy*; while denial or holding incompatible opinions is *heresy*. Each religion or sect naturally

has its own O., which may vary in different periods of its hist. The term may be applied in general to beliefs consistent with the Scriptures, but each religion or sect usually formulates its own dogma in creeds or by reference to the ideas of founders or prominent teachers. Formal acceptance of the Thirty-nine Articles constitutes O. in the Anglican Church. The Gk. or E. Church is often referred to as the Orthodox Church, claiming to be the most faithful conservator of the primitive faith.

**Orthography** (Gk. *orthographia*, correct writing), art of accurate spelling. Such accurate spelling should properly be a reliable guide to the pronunciation of the word spelt, but since the number of symbols used for the representation of speech seems always to have been less than the number of sounds used, it is probable that O. has never perfectly served its purpose. It, and Sp. are still mainly phonetic, Ger. is less so, while Eng. and Fr. are far from the ideal. Before the Conquest Eng. was more or less phonetic. During the period from the Conquest to the introduction of printing, roughly, that is to say, during the Middle Eng. period (see ENGLISH LANGUAGE), the same state continued. Even at this time, however, the need of reform was felt, as is shown by Orm or Ormin's attempt at phonetic spelling, the O. of the *Ormulum* (q.v.) being the most valuable extant source of information on the development of sound in Middle Eng. During the Middle Eng. period pronunciation and dialect varied in the sev. parts of the country. The spelling often differed. There were conventional representations of the various sounds, but there were not conventional representations of whole words. Even the introduction of printing did not finally fix the O., and the attempt was still made to make the spelling of the word represent the pronunciation. But there was now less freedom of change in the spelling, which became almost fixed by the end of the seventeenth century. Pronunciation, however, went on changing, and now the spelling has not only ceased to be a guide to pronunciation, but in many cases it has become a positive hindrance. It seems hardly necessary to cite examples to prove the inadequacy of our present symbols. Whereas we have but twenty-three symbols (c, x, and g are supernumerary), there are from thirty-eight to forty-four sounds to be represented. Even in the use of our few symbols there is much inconsistency. Especially is this true with regard to the vowels. Taking an example at random, we see, for instance, the short e sound represented not only by e as in *set*, *fed*, *nettle*, but by a as in *rany*; by ea as in *feather*, *leather*; by ai as in *said* and *against*; by ei as in *heifer*; by eo as in *jeopardy* and *leopard*; by ei as in *leisure*, by ay as in *says*. In the present century, however, a movement has arisen for a reform in this direction, although with little headway even in America. See also SIMPLIFIED SPELLING.

**Orthopædic Surgery** (Gk. *orthós*, straight; *paîs*, child), branch of surgery concerned

with bones, joints, muscles, nerves, and any tissues so injured or diseased that deformity or impairment of function may result; its applications are by no means confined to children. The main types of affections treated in O. S. are: (1) Affections of joints. These affections may be due to bacterial infection or to injuries such as fractures, bad sprains, or repeated minor injuries. (2) Affections of bone may similarly be due to infection or to injury. The growth of bone may also be affected by certain disturbances of the endocrine secretions, by deficiency of antirachitic vitamins, and by tumours. (3) Diseases or contraction of the soft tissues such as skin, muscle, and tendons near joints may cause deformity. Contraction due to injury may sometimes be prevented by sterilisation of the wound, and, if necessary, subsequent appropriate skin- or tissue-grafting. Gradual stretching will correct some forms of contraction. Infected or injured bursae, the lubricating sacs over the joints, are other frequent causes of deformities such as bunions and housemaid's knee. (4) Affections of the nervous system include obstetric injury to this system, degeneration of nerve tracts, cerebral lesions, and infantile paralysis. The latter is a highly infectious epidemic disease, in which the muscles supplied by the affected nerves become paralysed and atrophied. Various workers claim to have prepared a curative serum, but this has not yet been tested sufficiently. The treatment in general use consists in the application of suitable apparatus to prevent deformity, and, later, of massage and electricity to restore muscular activity. (5) Most deformities are 'static,' and mainly due to bad postures. Flatfoot, round shoulder, and hollow back are some of the commonest static deformities. (6) Congenital affections result from abnormal embryological development, and their causes are not fully known. Congenital clubfoot, flatfoot, dislocation of hip, affections of the vertebral column, are amongst other congenital faults treated by O. S. See Sir R. Jones and R. Lovett, *Orthopaedic Surgery*, 1923; R. Whitman, *Treatise on Orthopaedic Surgery*, 1927; E. A. Crook, *Kids to Orthopaedic Surgery*, 1929; and W. C. Campbell, *Textbook of Orthopaedic Surgery*, 1930.

**Orthophosphoric Acid**, see PHOSPHORUS.

**Orthoptera** (Gk. *orthos*, straight; *pteron*, wing), large order of insects containing over 13,000 species, among which are such well-known creatures as grasshoppers, crickets, cockroaches, leaf- and stick-insects. They are characterised by their conspicuous and biting mouth-parts, stiff tegmina, and membranous metathoracic wings, which close like a fan when in repose; the wings are frequently either reduced or absent, and there is no abrupt metamorphosis.

**Orthoptics**, see REFRACTION, ERRORS OF. *Night-testing*, and *under SQUINT*.

**Ortho-Sulphobenzimide**, see SACCHARIN.

**Orduñeira**, health resort of Spain, in the prov. of Coruña, on the Santa Marta estuary, 23 m. N.E. by E. of Ferrol. Pop. 21,600.

**Ortler Group**, group of the E. Alps, forming the watershed of the Adige, Adda, and Oglio R. basins. The Ortler, or Ortler Spitze (12,810 ft.), the highest summit in the group, is in the Trentino, Italy. It was once regarded as the loftiest mt. in Europe and quite inaccessible, but in 1804 it was ascended by Josef Pichler and other Tyrolean mountaineers. Gebhard climbed it in 1805, and the discovery of easier routes in 1865 caused the ascent to become popular with tourists.

**Ortolan** (*Emberiza hortulana*), member of the bunting family, common in Europe and W. Asia, but a rare visitor to Britain. It spends the winter in Africa, and is netted in great numbers while migrating. It rapidly fattens after being fed for a short time on oats, millet, and other grain, and is then killed for the table, being highly valued by epicures. The O. somewhat resembles another bunting, the yellowhammer, but its head is grey. The upper surface is reddish brown with black streaks, the throat yellow, and the under parts greenish-olive. The nest is made on the ground or on banks, and in it are laid about five eggs.

**Orton, Arthur**, see *under* TUBEROSE CASE.

**Ortona a Mare**, com. and episcopal seat of Italy, in the prov. of Chieti, 12 m. E. of the tn. of Chieti. It is situated on a cape in the Adriatic Sea, and possesses a small harbour, used chiefly for coasting trade. It contains a cathedral and a ruined castle. The cathedral was badly damaged by bombardment in the Second World War, half the building, together with the campanile and sculptured portal, and the portico being demolished. The Aragonese Castle and the Farnese Palace were also badly damaged, and the Pazzi Palace completely destroyed. Pop. 19,895.

**Ortygia**, see SYRACUSE.

**Ortyx**, see QUAIL; VIRGINIAN QUAIL.

**Oruro**, city of Bolivia, cap. of the dept. of the same name. The dept. has an area of 20,380 sq. m. and an estimated pop. of 203,500. The tn. is the seat of a bishop and the headquarters of a military dist. It is the hub of the Bolivian railway system and the centre of its great tin-mining area. Silver, copper, and wolfram are also worked in the dist. The city stands at an altitude of 12,100 ft. and the nights are very cold. There is a large power station. The pop. is 18,000 largely Indians, and there are a number of Eng.-speaking mining officials.

**Orvieto**, walled city of Italy in the prov. of Perugia, on the r. b. of the Paglia, 60 m. N.N.W. of Rome. It has been the seat of a bishop since A.D. 509. One of the caps. of the Etruscan League, there are tombs of the fifth century B.C. The cathedral, a beautiful specimen of the It. Gothic, built of black-and-white marbles, dates from the thirteenth century. There is trade in corn, silk, and a delicate white wine. Pop. 19,000.

**Orwell**, first known as the Gipping, riv. of England, in Suffolk. It has its source a few miles W. of Stowmarket, through which it passes, flowing also through

Needham Market. Below Ipswich it forms the estuary known as the O. The riv. is navigable to Stowmarket.

THE ORWELL RIVER AT PARKSTON  
CLAY, HAWTHORN

**Oryol**, see ORILL

**Oryx**, important genus of antelopes, belongs to the sub-family Hippotraginae, and contains six species, natives of Africa, Arabia, and Syria. Both sexes have long, annulated horns, and the female possesses four mammae. *O. leucorhynchus* (the leucorhynch), *O. beatrix* (the Beatrix antelope), *O. gazella* (the gazelle), and *O. baysa* (the baysa) are the four best-known species.

**Orzesko**, Elise, née Pawlowska (1842-1910), Polish writer, b. near Grodno, Lithuania. She deals mainly with two themes, the misery of the peasants and the desolation of the Jews in their ghettos. In *Meir Kzifowicz* (1878), her best novel, she symbolises the two currents that exist in all these ghettos, assimilation, and complete religious, cultural, and social separation. Other books, *Eli Makower* (1875), on the relations between the Polish nobility and the Jews; *On the Niemen* (1886), on the Polish aristocracy (of which she was a member); *On Lost Souls* (1886), on country life in White Russia; and *Gloria Victis* (1910).

**Osage**, riv. of U.S.A., rises in S.E. of Kansas as the Marais des Cygnes. Entering the state of Missouri, on the S.W., it flows E.N.E., and bearing N.E. it enters the Missouri R., joining it on the r. b., 10 m. from Jefferson City. Length 494 m.

**Osage Orange** (*Machonia aurantiaca*), hardy deciduous tree, native of N. America. It is usually spiny, and bears either or serrated shiny leaves and small yellow or green flowers, which are followed

by large golden fruits, filled with a foetid slime.

**Osaka**, largest city of Japan, 30 m. from its seaport of Hiogo, is situated on a large riv. on the S.E. coast of the is. of Honshu, in the most central and populous part of the empire, and surrounded by the great tea dists. Before the Second World War it was the great emporium of trade and luxury. It had over 7000 flourishing factories, producing textiles, glass, metal goods, leather goods, ships, etc., and exported chiefly to Korea and China, large quantities of sugar, straw goods, and textiles. There is a fine castle. It suffered from a disastrous earthquake in 1891, and from fire in 1909. By the treaty of 1858 Brit. subjects were to be allowed to reside in O. for the purpose of trade from Jan. 1, 1868. O. was much damaged by Amer. bombers in June-July 1945. Following a raid by super-fortresses, June 1, some 400 super-fortresses bombed O. again on June 7; again bombed June 8, 14, and 19, the raid of June 11 being especially severe. Industrial targets S. of O. were hit on July 3, and an oil refinery N. of it on July 9. Then on July 24 some 700 super-fortresses bombed the town together with others. Pop. (1940), 3,252,300. See further under PACIFIC CAMPAIGNS IN SECOND WORLD WAR.

**Oswatimie**, tn. of Miami co., Kansas, U.S.A., 45 m. S.W. of Kansas City, on the Missouri Pacific railroad. It is in an agric. dist., and has railroad shops. Pop. 4100.

**Osbeckia**, genus of deciduous or evergreen herbs or shrubs (family Melastomaceae), bearing racemes of red, purple, violet, or yellow flowers.

**Osborn, Henry Fairfield** (1857-1935), Amer. palaeontologist; b. at Fairfield, Connecticut. In 1890 he became Dr Costa prof. of zoology, Columbia Univ., and dean of faculty of pure science there 1892-95. Curator of vertebrate palaeontology in Amer. Museum of Natural Hist., 1891-1910, he was later research prof. of zoology, Columbia Univ.; palaeontologist to the Canadian Geological Survey, 1900-1904, and to the U.S.A. Geological Survey after 1900. Celebrated for reconstruction of prehistoric mammals, his works include *From the Greeks to Darwin* (1894); *Evolution of Mammalian Molar Teeth* (1907); *The Age of Mammals* (1910); *Men of the Old Stone Age* (1915); *Origin and Evolution of Life* (1917); *Impressions of Great Naturalists* (1921); *Evolution and Religion in Education* (1926); and *Man Rises to Parnassus* (1927).

**Osborne, Dorothy** (1627-95), daughter of Sir Peter O., who held Ghernacy for the king in the Civil war, and wife of Sir Wm Temple, Eng. diplomat and essay writer, whom she married in 1655. Her letters to him during their long separation before marriage have a very great charm. See Macaulay's brilliant essay on her husband, and E. A. Parry (ed.) *Letters from Dorothy Osborne to Sir William Temple*, 1888, ed. by G. C. Moore-Smith, 1928; also Lord D. Cecil, *Two Quiet Lives*, 1947.

**Osborne, Francis**, see LEBEN, DUKE OF.

**Osborne House**, formerly one of the favourite residences of Queen Victoria, in the Isle of Wight, 1 m. S.E. of Cowes. Queen Victoria died there in 1901, and the estate was willed to the Prince of Wales, who, on his coronation as Edward VII. in 1902, made a gift of the building and grounds to the nation, to be used as a convalescent home for officers of the army and navy.

**Osborne Judgment**, trade union action brought in the king's bench div., taken to the court of appeal and, finally, to the House of Lords (1909). The decision declared null and void a trade union rule which provided for an enforced levy on members towards the payment of the salaries of M.P.s, and thereby checked the growing political power of the unions.

**Osbourne, Lloyd** (1868-1947), Amer. novelist and collaborator with R. L. Stevenson in some of the latter's stories; b. at San Francisco, son of Samuel O. and Fanny van de Grift, his wife, whom Stevenson married in 1880. It was at Braemar, in 1881, that, to please his stepson, Stevenson wrote *Treasure Island*. O. was educated at private schools in Paris and Jægersværd, and at Edinburgh Univ., where he studied engineering. Thereafter he was nearly always with the Stevensons. Stevenson encouraged O. to write, and O. collaborated with his stepfather in writing *The Wrong Box* (1889); *The Wrecker* (1892); and *The Hob-Tide* (1894). Collaboration with so famous an author has tended to obscure O.'s individual merits and indeed O. was only twenty-six when Stevenson died. O. alone invented and wrote *The Wrong Box*, which Stevenson only touched up after its completion. The earlier part of *The Wrecker* was entirely O.'s work, but Stevenson invented the character, James Pinkerton, and wrote the last four chapters, besides more than four others (including the Paris scene), or about one-third of the book. *The Hob-Tide* was jointly planned and written throughout in intimate collaboration, but Stevenson completed the story, and largely rewrote most of it. O., however, was himself a first-rate story-teller, apart from the inspiration and guidance he received from Stevenson, and he knew well the S. Seas which are the background of much of his work. With his sister, Mrs. Strong, he wrote *Memoirs of Tahiti* (1903) on life in Samoa; in collaboration with his nephew, Austin Strong, he wrote two plays entitled *The Little Father of the Wilderness* (0000) and *The Exile* (0000), which latter was produced by Sir John Martin-Harvey. In 1887 he was U.S.A. vice-consul for Samoa, where he resided with Stevenson till the latter's death in 1894. After Stevenson's death he left Samoa in 1897, with his mother, and eventually made his home in the U.S.A. His separate pubs. include *Love the Fiddler* (1903); *The Motor-maniacs* (1906); *Three Speeds Forward* (1907); *The Adventurer* (1907); *Harm's Way* (1909); *The Kingdoms of the World* (1911); *Wild Justice* (1922); *An Intimate Portrait of R. L. S.* (1924); *The Grierson Mystery*

(1928); *Peril* (1929); and contributions to many magazines.

**Osea**, see **HUESCA**.

**Oscans** (*Oscra lingua* was the Lat. term for their speech), or **Osci**, in Gk. "Ὀσκι", or "Ὀσκιος", from *Opaci* or *Opici* (terms connected with the Indigenous word *opus* or *opsum*, in Lat. *opus*, meaning work, to work), were Italic tribes who inhabited S. Italy in the first millennium B.C. About 200 Oscan inscriptions are extant; 150 of them have been found in Campania. They belong mainly to the third and second centuries B.C., but some inscriptions may be dated in the fifth century B.C., others down to the Christian era. The most carefully engraved of them is the *Cippus Abellanus* of the first half of the second century B.C., containing a treaty for the joint use of a temple by the inhab. of Nola and Abella. The longest is the *Tabula Bantina* of the second half of the second century B.C., containing the local laws. The most important is the *Tabula Agnonensis*, of the mid third century B.C., containing a list of local divinites. There is an inscription from Messina (in Sicily), and a variety of short inscriptions come from Pouébo. Oscan coins have been found dating from the fifth to the first century B.C. The Oscan script was an offshoot of the Etruscan alphabet. The careful spelling and engraving of the inscriptions, the precise differentiation of sounds, the invention of the letter-sign *u* for *u*, which did not exist in Etruscan, and of *i* for an open *i*, indicate the development of script and language.

The O., till their ruin in the Hannibalic war, had a higher civilisation than the contemporary Romans, and very probably possessed a literature. Their language was one of the most important of the Italic dialects, belonging to the same linguistic branch as Lat. This branch can be subdivided into two groups, Italic proper (Oscan, Umbrian, Sabelian and some minor dialects, such as Pelignian, Volturnian, Marrucinian, Sabine) and Latian (Lat. and Faliscan) (see under **INDO-EUROPEAN LANGUAGES**). These two groups can be distinguished as P-group (Italic proper) and Q-group (Latian), one of the most remarkable characteristics of their divergence being the fact that in the former group the Indo-European guttural-velar sound *q* and *q'* are represented by *p* and *b*, while in Latian they are represented by *p* and *u* or *pu*, following *m*; e.g., Lat. *quis*, Oscan *pus*; *venit*, *benust*, S. *puhlu* under **LATIN LANGUAGES AND LITERATURE**.

**Oscar I.** (1798-1859), king of Sweden and Norway. Son of Bernadotte. Although proposals to reform the constitution proved abortive in his reign, much was done to promote the national welfare, especially in freedom for industry and trade, efficiency of communications, and reform of the criminal law. The Malmo armistice between Denmark and Germany (1848) in the war over Schleswig-Holstein was brought about by Swedish influence. In 1857, owing to O.'s ill-health, his son (afterwards Charles XV.) became regent.

**Oscar II.** (1829-1907), king of Sweden and Norway (of the latter until 1905), son of Oscar I., b. in Stockholm. In 1856 he married Princess Sophia, daughter of Duke Wilhelm of Nassau, and in 1873 succeeded his brother, Charles XV., as king of Norway and Sweden, being crowned in the cathedral of Drontheim (Norway). When Norway separated herself from Sweden (1905) it is attributed to King Oscar's broad mind and insight that there were no serious popular uprisings (see NORWAY, SWEDEN, HAAKON VII.). During his reign great strides were made in national development, scientific research, geographical discovery, and industrial enterprise. He wrote *Memorials of the Swedish Fleet* (poems); *Military History of Sweden, 1711-13* (1861-67); a trans. of Herder's *Cid*; a poetical version of Goethe's *Torquato Tasso* (1861), and *Memoirs of Charles XII.* (Eng. trans., 1879). See A. de Maricourt, *Oscar II. in time*, 1906.

**Osoeola** (Seminole, As-se-ho-lar), chief of the tribe of Seminole Indians in Florida, U.S.A. In 1835 the Indians rose in rebellion against being transferred to reservations W. of the Mississippi R. Amer. troops were sent against them. In Dec. Maj. Dade and 100 soldiers were massacred in a Florida swamp, and on the same day O. killed and scalped Gen. Wiley Thompson, commander of the Amer. forces. For a long time O. and his men held out, and hundreds of Amer. soldiers perished of fever in the swamp. He was taken prisoner at last while holding a conference under a flag of truce, an act of inexcusable treachery, though represented as one of retaliation, and confined in Fort Moultrie until his death. Gen. Jess-up, who captured O., was severely censured for his act, but he contended that it was the only way to stop the career of the treacherous chief. However, the war went on for about seven years, costing the U.S.A. \$30,000,000.

OSCILLATION

**Osoersleben**, tn. of Saxony-Anhalt, Germany, on the Hode, 12½ m. N.N.E. of Halberstadt. Textiles, foods, and engineering goods are produced. O. was heavily raided by Amer. bombers on Feb. 20, 1944. Pop. 14,100.

**Osci**, see OSCANS.

**Oscillation.** A body is said to oscillate when it moves backwards and forwards like a pendulum. The verb to oscillate means to swing to and fro or to vibrate. The body need not vibrate by virtue of its own elasticity merely. The motion of a pendulum is the typical oscillatory motion. Suppose the bob is displaced from D to B, and then released. It swings along the arc BC and then back along CB, and so on. It oscillates along BC. BD is the amplitude of O. Suppose the bob is moving through D in the direction BC. The time taken before the bob moves again through D in this same direction is called the period of O. For any given pendulum of constant length this period is always the same if the pendulum is not restrained. This period is termed the natural period of O., and is defined as the period of a body which is set oscillating and left to itself. But a body may execute forced O. If it is acted on by an alternating force of definite period, it ultimately oscillates in a period coincident with that of the force and not with its own natural period. The centre of O. is the point of an oscillating body such that if the whole mass of the body were concentrated there, the time of O. would be unchanged. It coincides with the centre of percussion of the body. See also under CENTRE.

**Oscillograph**, electronic measuring instrument used for the study of wave-form of rapidly recurring voltages over a wide range of frequencies. The phenomena to be examined are presented to the viewer as a graph of voltage plotted against time on the fluorescent screen of a cathode ray tube (see VALVES; TELEVISION). The tube used invariably employs electrostatic deflection of the beam in either the horizontal or vertical direction. The heart of an O. is the time base on whose accuracy and linearity much of the instrument's usefulness depends. The time base circuit is concerned entirely with the horizontal deflection of the beam. It is essential that the fluorescent spot on the screen shall move at a constant speed during its forward or operative stroke, returning, on completion, to its starting-point in the shortest possible time. To this end, the time base generates a voltage of the form illustrated in the accompanying diagram. It will be seen that during the time of the forward stroke  $t_1$  the build-up of voltage is linear, while, during the flyback or return stroke

GENERATION OF VOLTAGE IN TIME BASE

( $t_2$ , the voltage collapses and the spot returns to the beginning of its trajectory in a fraction of the time taken for its initial excursion. An O. time base is

provided with controls which enable the cycle just described to be varied in frequency from a few cycles per second up to sev. kilocycles. These controls are often calibrated in frequency so that the composition of any wave-form being examined may be directly measured with respect to time.

Vertical deflection of the spot is carried out by applying the voltage to be examined to the vertical deflecting plates of the cathode ray tube, either directly or through amplifiers built into the instrument. These amplifiers must possess a flat and uniform response up to the frequencies of a few megacycles if they are to handle all types of wave-form without distortion, and their design must be carried out with considerable care. Provision is invariably made in the O. to enable the wave-form under examination itself to 'trigger' the time base independent of the frequency controls of the latter. This synchronising control injects a fraction of the incoming voltage into the time base controlling circuit so that a wave-form whose repetition frequency is not constant can be held steadily on the screen for viewing.

The O. is to-day one of the most useful tools developed for the use of the electronic engineer. With its aid complicated wave-forms can be examined easily and in detail which is essential in such applications as radar (*q.v.*) and television (*q.v.*). More recently it has been called to the aid of the mechanical engineer for the measurement of vibrations in engines and other structures such as airframes, etc.

**Osh**, tn. of the Kirghiz S.S.R., in the region of the same name, on the R. Ak-Bura, 55 m. N.E. of Marzhilan. There are silk-mills. New roads have been built to Khoror, Frunze, and Stal'nabad. Pop. (1933) 44, 800 (1935) 29,000.

**O'Shaughnessy, Arthur William Edgar** (1844-81), Eng. poet, b. in London. He was for a time, from 1863, assistant in the zoological dept. of the Brit. Museum. In 1870 he pub. *An Epic of Women, and Other Poems*. This vol. met with great applause, but he was not so successful in his next venture, *Lays of France* (1872), nor in his third vol., *Musica and Moonlight* (1874). His *Songs of a Worker*, ed. by A. W. N. Deacon, were pub. posthumously (1881). See life by Louise C. Moulton, 1894.

**Oshawa**, industrial city of Ontario, Canada, on Lake Ontario, 30 m. E. of Toronto. It has a good harbour, and is on the main lines of both the Canadian National and Canadian Pacific railways from Toronto to Montreal. It is the centre of a good agric. dist. The city has a fine collegiate-vocational institute, a modern hospital, a good public library, thirty-one churches, and four parks. Its hydro-electric power is provincially owned and municipally operated. The most important industry is motor-car and truck manufacture; other industries include motor accessories, castings, brass and copper fittings, plastics, pharmaceuticals, builders' supplies, sheet-metal materials, woollens, pottery, and glass bottles. Pop. 30,000.

**Oshima**, group of three small is. belonging to Japan, lying S. of Kushin, in 30° 50' N. lat. and 130° E. long. Their names are Kuroshima, Iwoshima, and Takashima.

**Oshkosh**, city and co. seat of Winnebago co., Wisconsin, U.S.A., stands on both banks of the Fox R., near its mouth, 78 m. N.N.W. of Milwaukee, originally called Athens. Its prin. trade is in lumber and the various industries connected therewith; it also has engineering works for the manuf. of motors, boilers, etc. The city has a handsome frontage along the shores of Lake Winnebago, where many fine public edifices have been erected. Pop. 39,000.

**Osiander, Andreas** (1498-1552), Ger. Protestant divine, b. at Gunzenhausen. was son of a blacksmith whose name was Hoseman. He took an active part in the Reformation, and attended conferences at Marburg, Augsburg, and Schmalkald. While pastor in Nuremberg he pub. his famous *Harmony of the Gospels* (1537). In 1548 he was appointed lecturer at the newly founded univ. of Konigsberg, but his religious opinions were unpopular, and he was attacked by Melancthon and other Lutheran divines. O. became the founder of a famous family; his son Lukas (1534-1601), a court preacher; Andreas (1562-1617), son of Lukas, chancellor at Tubingen; Johann Adam (1626-97), preacher and prof. and chancellor at Tubingen; and his sons, O. and John, famous physician and philologist respectively. See life by W. Moller, 1870.

**Osiers**, trees or shrubs of the willow genus (*Salix*), cultivated for conversion into basket-making and other wicker-work. They are grown in plantations known as holls, and the produce is commercially called rods. O. are usually grown on deep rich alluvial soil, which is subject to flooding. Sets of two years' growth, about 18 in. long, are planted in Feb. or March at the rate of about 20,000 per ac. The land needs careful clearing for the first two years, and the holls must be replanted three years, lasting, if properly managed, fifteen years. *S. viminalis* is the common osier, with forty varieties or hybrids. This is the species chiefly used in basket-making. Brit. osier-beds also contain *S. triandra*, the Fr. willow, much hybridised; *S. purpurea*—which does not attain the tree form, its slender twigs being grown as O. by pollarding the trunk; and the golden osier, a variety of white willow.

**Osimo** (anct. Auximum), tn. in the Marche, central Italy, 9 m. S. of Ancona. It contains a cathedral, and ruins of the anct. walls, being a Rom. colony from 157 B.C. It has trade in grain and silk. Pop. 22,900.

**Osiris**, one of the chief gods of the anct. Egyptians. He was the son of Sob, the Earth, and Nut, the Heaven, and the husband of his sister Isis. After enduring much tribulation he was slain by Seth, but rose again, and finally became judge of the dead in the lower regions. The myth has been interpreted to signify the setting and rising of the sun as well as the ebb and flow of the Nile. The worship of O. spread to

Greece and Rome, and the Egyptian deity was identified with Dionysus. See J. E. Harrison, *Prolegomena to the Study of Greek Religion*, 1908; A. Wiedemann, *Die Religion der Alten Ägypten*, 1890; and H. Keel, *Der Götterglaube im alten Ägypten*, 1941.

**Osjek**, see ЕЗЖЕК.

**Oskaloosa**, tn. and co. seat of Mahaska co., Iowa, U.S.A., 62 m. S.E. of Des Moines, between the Skunk and Des Moines Rs. It has coal mines and foundries, and manufs. clothing, tiles, boilers, and wagons. Pop. 10,000.

**Osler**, Sir William (1849-1919), Eng. physician and humanist scholar, b. at Bond Head, Ontario, Canada. A wanderer by nature, he held his first chair of medicine at McGill Univ. 1874-81; he then became prof. of clinical medicine at the univ. of Pennsylvania, 1884-89; and at the age of forty he accepted the chair of medicine at Johns Hopkins Univ. in Baltimore, 1889-1904. Appointed Gulstonian lecturer at the Royal College of Physicians, London, in 1889, at the age of fifty-six he became regius prof. of medicine at Oxford. A versatile man, O. left the impress of an original mind on pathology, clinical and scientific medicine, and epidemiology. His famous *Principles and Practice of Medicine* (10th ed., 1917), was the most popular text-book in the Eng. language with sev. generations of medical students and practitioners. In his teaching O. inaugurated what has since been accepted as the Oslerian method, which characterises the Brit. school to-day, that the student should concentrate on the patient, using books and lectures merely as tools. Among O.'s most original and lasting contributions to scientific medicine must be included his investigations of the blood-platelets, his researches on the malarial parasite, his studies in malignant endocarditis, and his writings on angina pectoris and allied disorders. Tuberculosis was also one of his special subjects and he was one of the first to give tuberculin a thorough clinical trial. Under his guidance Oxford became the pioneer of the tuberculosis dispensary system in rural areas, and O. spent much of his time and talents in arousing public consciousness to the menace of this disease. He was one of the first seriously to question the establishment of alcohol in medical practice, and to point out that its regular use increased the danger of tuberculosis. O. was more than a great physician and scientist; he was a humanist and classical scholar, being the first member of his profession to be elected president of the Classical Association, and he was also made president of the Bibliographical Society in 1913. He was an enthusiastic collector of all Sir Thomas Browne's writings, which are included in the Bibliotheca Osleriana, or library, which he bequeathed to McGill Univ. O. was an apostle of international medicine and personified the truth of the saying that the art of healing knows no frontiers. Elected F.R.S. in 1898, he was created a baronet in 1911. Among his works are *Cerebral Palsies of Children* (1889); *Chorea and*

*Choreiform Affections* (1894); *The Principles and Practice of Medicine* (8th ed. 1912); *Lectures on Abdominal Tumours* (1895); *On Angina Pectoris and Allied States* (1897); *Monograph on Cancer of the Stomach* (1900); *Science and Immortality* (1904); *Aquamitias and other Addresses* (1904); *Counsels and Ideals* (1905); *An Alabama Student and other Biographical Essays* (1908); and *The Evolution of Modern Medicine* (1913). He also ed. *A System of Medicine*, in 7 vols. (1905-10). See F. G. Reid, *The Great Physician*, 1931.

**Oslo** (formerly Christiania), cap. city, and (with Aker) co. (*fylke*) of Norway, on the S.E. coast, at the head of the O. Fjord, on the Akershus peninsula, and on the bays on either side of the peninsula. The tn. extends W. to the R. Frognar E. to the R. Løelv, and northwards up the valley of the Akerselv, and is very beautifully situated among pine woods and hills. The sheltered harbour is excellent, and has ample facilities to accommodate the largest ships. There is good anchorage throughout the harbour, the depths being 11 to 26 fathoms. During severe winters the fjord may be frozen, but is always kept open by ice-breakers. There are two railway stations with a good service of trains to all parts of Norway and into Sweden. Electric trains connect the city and the suburbs; the roads are good and the easy travelling has made O. a centre of extensive tourist traffic. The tn. has been well planned, full advantage being taken of the natural beauties of the site. A broad garden runs from E. to W. from the Storting to the foot of the hill on which stands the royal palace. The chief roads lead from either side of the central gardens. The tn. is nearly all modern, two of the oldest buildings being the Akershus fortress, now partly a prison, formerly a royal palace, and the Akers church, built in the eleventh century, but restored in 1860. Among the prin. public buildings are the Storting (Parliament) (1866), where the archives of the nation are kept; the univ., founded in 1811 by Frederick VI. of Denmark, which has 6000 students, a fine library containing 85 000 vols., a numismatic collection, and a splendid collection of Scandinavian antiquities; botanical gardens, and an observatory. The royal palace is a modern building completed in 1918. Our Saviour's church is in Stortorget off Karl Johansgate boulevard, close to Parliament House. N. of the univ. is the museum of art, containing a fine collection of auct. and modern painting and sculpture. The historical museum near to the art museum contains a good collection of Norwegian antiquities; at another museum are the remains of two Viking ships excavated in the neighbourhood from burial-places of Viking chiefs. One is the Gokstad ship on Bygdø Is. (ninth century) in good preservation and actually seaworthy. Frognerparken, one of sev. beautiful parks, contains the vast collection of works by the sculptor, Gustav Vigeland. Statues of Ibsen and Bjørnson stand in front of the National Theatre, close to Parliament House.

Formerly timber was the tn.'s prin.

was cousin-german of Abu Soflan. One of the early converts to Islam, he was one of its most zealous supporters, and linked himself still more strongly to Mohammed by becoming his son-in-law and private secretary. He was elected to succeed Omar in the caliphate in Dec. 634, and a most unworthy successor he proved to be. The Moslem Empire, however, continued to extend itself on all sides till the insane nepotism of O. gave its progress a sudden check. O. averted the crisis of a general revolt by unconditional submission; but having soon after attempted to put to death Mohammed, the son of the Caliph Abu-bekr, the latter made his appearance at Medina at the head of a troop of malcontents, and forcing his way to the presence of O., stabbed him to the heart.

**Osman I.**, or **Othman**, **Othoman** (1259-1326), surnamed **Al-ghazi** (the conqueror), the founder of the Ottoman or Turkish Empire, was b. in Bithynia. His father, Orthogrul, the chief of a small tribe of Oghizian Turks, had entered the service of Ala-ed-din Kaikobad, the Seljuk sultan of Iconium, and had rendered important services to that monarch and his successors in their wars with the Byzantines and Mongols. Orthogrul dying in 1289, after a rule of more than half a century, his tribe chose his son O. (i.e. the 'young husband'), as his successor. O. trod in his father's footsteps; and on the destruction of the sultanate of Iconium in 1299 by the Mongols, succeeded in obtaining possession of a portion of Bithynia. He had previously subjugated many of the neighbouring Oghizian chiefs, and this new accession of ter. rendered him powerful enough to attack the Byzantines with success. In July 1299 he forced the passes of Olympus, and took possession of the whole ter. of Nicaea, with the sole exception of the tn. of that name, which resisted his efforts for five years longer. In 1301 he defeated the Emperor Andronicus II. at Baphrion; in 1307 he incorporated the prov. of Marmara in his dominions; and continued till his death steadily to pursue his plans of conquest. He is worthily accounted the first founder of the Turks' great kingdom and empire. O. assumed the title of sultan on the extinction of the Iconian sultanate in 1299. From his name is derived the name **Osmanlis**, under which was comprehended all the Turkish subjects of the former sultans.

**Osman II.** (1605-22), sixteenth sultan of Turkey, son of Ahmed I. He succeeded to the throne in 1615 on his brother, Mustafa I., being declared incompetent, but he reigned for only four years. War with Persia having been brought to a close by a treaty in 1618, by which all the conquests of Murad III. and Mohammed III. were relinquished, the Janissaries, now unoccupied, began to plot against the sultan. O., finding a pretext in the revolt of the Moldavians who had joined the Poles, declared war against the king of Poland, and marched on Khotin. The Janissaries proved entirely untrustworthy, with the result that the expedition was unsuccessful. O. then planned to collect an army in

Arabia, but the Janissaries, being warned of his project, revolted, and O. was dethroned and put to death in 1622.

**Osman III.** (1696-1757), succeeded his brother Mahmud I. as sultan of Turkey in 1754, his reign of three years was not marked by any political event of importance.

**Osmanli**, see **OSMAN I.** or **OTHMAN**.

**Osmanthus**, genus of evergreen shrubs and trees (family Oleaceae). The flowers of *O. fragrans*, sometimes grown in green-houses, are used in China to scent tea. *O. ilicifolius* and *O. Delavayi* are very handsome hedge plants.

**Osmiridium**, or **Iridosmine**, alloy of osmium and iridium. It commonly occurs associated with platinum, palladium, copper, gold, and iron in the so-called platinum ores, found usually in outcrops of detritus deposits. The chief supplies of platinum ore are obtained from Russia, New Granada, Brazil, California, and Australia. Of these, the Australian deposits are richer in O. in proportion to the platinum, and deposits have been found in Tasmania, where the O. is associated with iron. O. is used as a source of the two metals osmium (q.v.) and iridium (q.v.).

**Osmium**, metallic chemical element, symbol Os, atomic number 76, atomic weight 190.8. It occurs associated with iridium in the alloy osmiridium, which is found in platinum ores in the following proportions: Russian ores, 4.1 per cent; Australian ores, 27.1 per cent; Californian ores, 9.6 per cent. The platinum ore is first treated with aqua regia, the osmiridium being left as an insoluble residue. This alloy is then fused with common salt in a current of chlorine, the iridium being converted into  $OsO_4$ , O. tetroxide. Metallic O. is obtained by the addition of an alkaline formate. O. is a grey metal of sp. gr. 22.5; it fuses at about 2500° C. It forms a protoxide  $OsO$ , a sesquioxide  $Os_2O_3$ , a dioxide  $OsO_2$ , a tetroxide  $OsO_4$ , etc. It forms well-defined alkaline salts called osmates, red or green in colour. When heated in a current of chlorine, the metal forms O. dichloride,  $OsCl_2$ . O. is used as a catalyst, and the tetroxide is largely used in the preparation of specimens for microscopic examination.

**Osmosis**, percolation and intermixture of fluids separated by a porous membrane, first studied by the Abbé Nollet, 1748. He found that if a solution of cane-sugar contained in a vessel the bottom end of which was closed with an animal membrane (e.g. parchment) and placed in pure water, the latter entered into the cane-sugar solution, thus raising the level in the inside vessel until the hydrostatic pressure resulting was equal to the force tending to make the water enter. This force is known as osmotic pressure. A membrane which will allow simple water molecules to pass but which does not allow solute molecules to go through is known as a semi-permeable membrane. Quantitative work was done by Pfeffer using special semi-permeable membranes such as copper ferrocyanide precipitated inside

the walls of a clay vessel. Valuable work has also been done by the earl of Berkeley, Hartley, and many others. The actual selective flow of material through a membrane is called *O*. It was shown by van't Hoff that the laws of osmotic pressure are similar to those relating to gas pressure. The osmotic pressure of a solution varies directly with the concentration, temp. being constant, and also, for a definite concentration, is proportional to the absolute temp., if the volume is constant. This corresponds with the laws of Boyle and Charles for gaseous pressures. Then, again, equimolecular quantities of substances when dissolved in the same volume of solvent exert equal pressures at the same temp., i.e. they are said to be isotonic. It may be said that ideally the molecular weight in grammes of a non-electrolyte when contained in 22.4 litres of water-solution at 0° C. exerts an osmotic pressure of one atmosphere. In actual practice such solutions would often be too concentrated to obey the laws exactly. This law is true only of non-electrolytes and corresponds with Avogadro's hypothesis applied to gases, which states that equimolecular quantities of gases at the same temp. exert equal pressures. The measurement of osmotic pressure furnishes a method of determining the molecular weights of non-volatile substances and of substances which decompose when vaporised. The method is rarely employed in practice, as the direct measurement of the osmotic pressure is difficult. In the case of electrolytes valuable information as to the degree of ionisation can be obtained by comparing the observed osmotic pressure with the theoretical value,

$$m = \frac{n}{i}$$

where *m* is the 'degree of ionisation,' *n* is the number of ions given by 1 molecule of the electrolyte (e.g. for NaCl, *n* = 2, Na<sup>+</sup> and Cl<sup>-</sup>) and *i* is the ratio of observed to calculated osmotic pressure. The phenomenon of *O*. is constantly taking place in living bodies, both animal and vegetable. Sap is caused to rise against the action of gravity in trees and plants, and the action of drugs in causing a flow of water through a membrane is probably due to *O*.

**Osmund**, St. (*d.* 1099). Eng. saint. As a chaplain he accompanied his uncle, William the Conqueror, to England, and in 1072 became chancellor. In 1077 he was made bishop of Salisbury (Old Sarum), where he completed the cathedral and estab. a chapter of secular canons. He is particularly remembered as the compiler of the liturgical services for his diocese, now known as the Sarum Use (*q.v.*). He engaged in the preparation of Domesday Book, and, as a hobby, practised bookbinding. He was canonised in 1457.

**Osmunda**, or **Flowering Ferns**, genus of very handsome ferns, so called because the brown sporangia are borne in branched masses at the tips of the huge fronds where the leafy portion disappears. The fronds are twice or thrice divided into pinnae, and sometimes attain a length of 6 ft. or more. There are a number of species; the only

Brit. one, *O. regalis*, the royal fern, is one of the most handsome. *O.* root fibre, which is now largely used in the cultivation of orchids, is mainly obtained from *O. claytoniana*, a native of N. America.

**Osnabrück**, city of lower Saxony, Germany, lies in the fruitful valley of the Hase, 80 m. W.S.W. of Hanover by railway. *O.* has iron and steel works and manufs. of cigars and tobacco, musical instruments, textiles, machinery, and many other industries. *O.* was raised to a bi-hopric in 783 by Charlemagne. The peace of Westphalia was signed here in 1648. The cathedral is a fine specimen of the Byzantine style of architecture of the twelfth century. The church of St. Mary, a noble Gothic building, was erected by the bishops of *O.* in the fourteenth century; it was completely burnt out by air raids in the Second World War, when the city suffered heavily, the cathedral losing its roof and the tops of its towers.

*O.* was first bombed by the R.A.F. in July 1941, and frequently thereafter. It was important to hasten the capture of *O.* in the Allies' 1915 campaign because it was by the railway from that tn. that the Gers. were able to carry V2 weapons into Holland, and it was the only railway by which they could do so. On April 2, following the crossing of the Rhine by the Twenty-first Army Group, a Brit. airborne force crossed the Dortmund-Ems Canal, and approached *O.*, while the Canadians pushed 15 m. into Holland; on April 4 Brit. armoured spear-heads crossed the Weser N.R. of *O.*, and next day *O.* was taken by the Brit. first commando brigade. Pop. 98,700.

**Osoño**, tn. of Chile, cap. of the dept. of *O.*, on the State Railways 590 m. S. of Santiago. The city, which is a distributing centre of an important agr. region, was founded in 1558 and soon developed into one of the chief tns. of the country. Some of its streets still preserve much of their colonial character, but modernism is the dominant note to-day. The Instituto Aleman, indicative of the Ger. character of the city, is an instance of the prevailing concrete construction. Pop. 62,000.

**Osprey**, **Fish Hawk**, **Fishing Eagle**, or **Bald Buzzard** (*Pandion haliaetus*), cosmopolitan bird of prey which feeds on fish, and is the only member of its genus. Its length is about 2 ft. and its wing expands nearly 6 ft. The plumage is dark brown on the upper surface and white on the under parts. The head and throat are white with streaks of light and dark brown. *O.*s are somewhat gregarious in habit, and the nest is often made in trees near the seashore or lakes, &c. In it are laid two or three white eggs, blotched with crimson. The *O.* is practically extinct in Britain.

**Ossa**, or **Kissavos**, mt. in N. Thessaly, Greece, E. of the P. Peneus. Mt. Olympus is opposite, and between them is the vale of Tempe, famous in old traditions as the haunt of the Centaurs and Titans. It is 6405 ft. high. See also PELION.

'Osservatore Romano' (It. for 'Roman

Observer'), daily evening paper issued from the Vatican state. It was founded in 1860 by a group of Its. who had no official connection with the Vatican, but was acquired by the Church during the pontificate of Leo XIII. It is a semi-official organ (unlike the *Acta Apostolicae Sedis*), but one column of it is supplied from official sources. It is generally held to reflect the policy of the Vatican, and at times the popes have referred to its columns. Its circulation suffered heavily when engaged in dispute with the Fascists, who rendered its sale practically impossible, but since then it has returned to normal.

**Ossetia**, areas of Russia, in the mid-Caucasus. They are inhabited principally by the Aryan race known as Ossetes, descendants of the Alans, with an Iranian speech. N. O. lies N. of the Caucasus Mts., and is an autonomous S.S.R. S. O. lies immediately S. of it across the range, and is an autonomous region of the Georgian S.S.R.

**Ossett**, tn. in W. Riding of York-shire, 2½ m. W. of Wakefield. It has coal-mines, engineering works, and cloth mills, and is the centre of an area engaged in the preparation of artificial wool, mungo, merino, etc. At S. O. there are mineral springs. Pop. 14,400.

**Ossewa Brandwag**, or Ox-wagon Sentinel, organisation formed by certain elements of the Afrikaans-speaking people of S. Africa, with the avowed purpose of maintaining Afrikaners as a language and Afrikaans culture. It derived some influence from the inspiration that impelled the Voortrekkers northward when the Brit. Parliament of that day decreed freedom for slaves in Cape Colony. Many of its original founders and members genuinely believed that Afrikaans culture might disappear unless kept alive among the Afrikaans-speaking people, but, like many analogous organisations, they soon assumed a political character and developed into republican extremists. Thus the old Broederbond became an association aiming at an anti-Eng. despotism and, later, identified themselves with the Nationalist political opposition led by Dr. Malan against the Hertzog Gov. After 1935 the Broederbond sank into obscurity and the O. B. emerged to take its place as a body running a secret coterie, whose real purpose was to establish a dictatorship on the Nazi model. It adopted the Nazi technique and the Nazi uniform, and its badge was the Ger. eagle combined with the swastika. It accumulated Bren guns, rifles, and ammunition and made no secret of its intention to attempt a *coup d'état* if the opportunity came. It received the open support of Dr. Malan and, by 1941, claimed to have a membership of 250,000 among the 2,000,000 white inhab. of S. Africa. Other similar organisations were the Handlaversbond or Maintainers' League, and the Boerevolk, neither of any great influence. Its influence, however, declined sharply during the Second World War.

**Ossian** (Pawu), latinised form of the Gaelic Oisín, the name of a semi-mythical

Gaelic bard who is claimed by both Scotland and Ireland, and the presumed author of a number of narrative poems of high excellence, dealing with the deeds of Fionn MacCumbhal and Cuchulain. About the middle of the eighteenth century James Macpherson (q.v.), a Scottish tutor, claimed to have discovered and transcribed these poems, which had existed in the Highlands from time immemorial in oral tradition. He embellished them somewhat in the process of trans., but the fact that they were afterwards taken down from the recital of many aged persons in the Highlands thoroughly disposed of the adverse criticism of Dr. Johnson, who saw in Macpherson's performance nothing but a pure invention. See T. W. Rolleston, *Myths and Legends of the Celtic Race*, 1911, and G. F. Black, *Macpherson's Ossian and the Ossianic Controversy*, 1926.

**Ossietsky**, Carl von (1889-1938), Ger. pacifist and journalist b. in Hamburg. He served in the regular army in the First World War and afterwards went to Berlin in the hope of founding a popular front against war. He was on the staff of the Berlin *Volkzeitung* and later (1928) editor of *Die Weltbühne*, a vehicle of advanced pacifist opinion. In 1929 one of his contributors accused the Reichswehr of secretly rearming in defiance of the Versailles Treaty and O. with his contributor, was sentenced to eighteen months' imprisonment. Meanwhile another article, by an anonymous contributor, developed the familiar thesis that all soldiers were murderers; O. was charged with insulting the army but was acquitted. In 1931-32 he was imprisoned on an alleged charge that he had revealed military secrets, and of being an enemy to the state (1933-36). While in prison in a concentration camp he was awarded the Nobel prize for peace for 1935 and should have received the sum of 100,000 marks, but it was never accurately learned how much he actually received, his lawyer being convicted of embezzling 83,500 marks of the prize money entrusted to him by O.'s wife. He died in a sanatorium for tuberculosis, which he had contracted through his maltreatment in the concentration camp at the hands of the Nazis.

**Ossification**, formation of bone. As a normal process it occurs in the development of the human body, and is particularly characteristic of the fetal and childhood periods. In general the structure is at first represented by cartilage, which is gradually transformed to the harder tissue known as bone. O. sometimes occurs as a morbid process, but more usually the term is incorrectly applied to calcareous deposits having the outward properties, but not the minute structure, of bone.

**Ossining**, tn. in Westchester co., New York, U.S.A., on the E. bank of the Hudson R., 31 m. N. of New York. It was known as Sing Sing till 1901. The chief manufactures are chemicals and machinery, and there are iron foundries. It contains the state prison of Sing Sing. Pop. 16,000.

**Ossoli**, see PETER, SARAH MARGARET.  
**Ossory**, anc. kingdom of Ireland in the

**Ostland**, see **POLAND**, *History*.

**Ostmark**, name given to Austria by the Ger. Gov., after its incorporation into Germany in 1938.

**Ostracism** (Gk. *ostrakon*, a potsherd), democratic expedient exercised by the people of Athens, decreeing the banishment for ten, later five, years of any person who in any way whatever endangered the political equality of citizens. The Prytanes each year gave the opportunity in public assembly for the exercise of the right, each citizen writing the name of the person concerned on a potsherd or an earthen tablet, 6000 votes being necessary for sentence to be pronounced. It was introduced by Cleisthenes about 600 B.C. and abolished by Alcibiades, Miltiades, Themistocles, Cimon, Alcibiades, and other great citizens were ostracised. Civil rights and property were not thereby forfeited.

**Ostracoda**, order of minute crustacea belonging to the sub-class Entomo-tracea and being itself divided into four sub-orders, Podocopa, Mydocopoda, Cladocopa, and Platycopoda. An ostracod usually leaves the egg as a nauplius, is of low and simple form, and uses only three or fewer appendages in locomotion. The *Cypris*, belonging to the family Cypridae, is a common type of ostracod, having a bivalve enveloping shell resembling a mollusc, a body without segments, and seven pairs of appendages.

**Ostrava**: 1. Moravská O. (Moravian O.; in Austrian, Mährisch-Ostrau, tn. on the Ostrawitz, 19 m. E.S.E. of Troppau, in Czechoslovakia, formerly in Austria. It has a mining academy, and owing to its position on an important coalfield has iron works, coke ovens, blast furnaces, and boiler, brick, soap, and petroleum factories. Soviet troops stormed O. on April 30, 1945. For its great strategic importance as the classic military gateway from Vienna to Poland see under **EASTERN FRONT IN SECOND WORLD WAR** in the account of the Russian invasion of Austria in 1945. Pop. 180,000. 2. Ślązská O. (Silesian O.), tn. in Silesia near Moravská O. Pop. 22,000.

**Ostrich** (*Struthio*), largest living bird, a native of Africa; but the name is sometimes given to the rheo, a native of America. It has long been valued for its plumes, and the production of O. feathers is still a fairly important farming activity in S. Africa. For many yea. the birds were hunted and shot before their plumes were removed, and it is only comparatively recently that Os. have been domesticated. Young birds were first enclosed in S. Africa in 1857; yet in 1865 only eighty were in captivity. After 1870 greater attention was given to their domestication, and the possibility of their extinction, which was then threatening, is now more or less remote. A flock under modern systems of O. farming is given the free run of about 1000 ac. of veldt, where the birds pick up a good deal of rough food. In addition, lucerne or some other similar crop is grown at the rate of about 1 ac. for three birds. The birds usually pair in May or June, and a pair of birds

breeds as often as three times a year: the hen lays an egg every other day, a sitting numbering from twelve to twenty eggs; and if they are removed, as many as 120 may be laid in the course of a year, whereas only half that number could be expected if the eggs were left to be hatched naturally. Other advantages of artificial incubation are that the eggs can be tested at the end of ten days, and, if found to be infertile, can be used, whilst still fresh, in the kitchen or sold to manufacturers of sweetmeats. The chickens hatch out at the end of six weeks, and for the first 50 or 60 hrs. are given no food, but allowed to bask in the sun. Afterwards they are put in charge of a native child, under whom they become very tame. In the first six months their growth is very rapid. At six months the chick feathers are removed by clipping, and two months later the dead quills are pulled out. At eighteen months they are full-grown, though not fit to breed till twice that age. Usually it is the three rows of feathers at the tips of the wings and the tail feathers that are taken, the quill being cut about 2 in. from the socket. The quill stumps are removed two months later to allow a new crop of feathers to appear. An exceptionally good bird should yield from 20 to 26 oz. of feathers, and should give about sixty long whites and from sixty to seventy long blacks, in addition to the body feathers. Birds may be plucked thrice in two years, but once a year is a fair average. The cock should yield one-third more than the hen. The S. African industry has shown great fluctuations. The price of feathers was highest just before the First World War, but later fell so low that O. breeding for profit was threatened with extinction. Since 1882 Os. have been bred in S. Africa from carefully selected strains, but for many years no increase in the number of plumes has resulted. The boom in Os. began in 1880, when £200 for a pair of birds was a common price. Particularly fine birds would fetch as much as £1000. Six years later the prices fell, and many farmers were ruined. The result was that output was reduced, and prices then recovered. In 1912 prices were good, but 1913 saw another heavy fall in the price of feathers. Probably no S. African industry suffered more from the outbreak of hostilities, the export trade being large. Drought and the change of fashion have reduced the number of birds in the union to a tenth of their former number. In 1913 there were 776,113 Os. on European-owned O. farms, but the latest census (1937) shows only 40,261. Immediately after the First World War prices rose rapidly, but the volume of trade was not maintained, and to-day the industry appears to have fallen to lower depths than ever. In 1939 the value of O. feathers exported was recorded as £32,976 (in 1914 it was £1,342,717), and in 1940 it fell to £16,945. There is a fine of £100 for exporting Os. and of £5 for exporting eggs for incubating from S. Africa. It may be noted that the Chartered Company at one time enclosed some 10,000 ac. on the Shangani R. for O. camps, but the

experiment was discontinued. Experiments in the tanning of O. skins have met with such success that the O. is disappearing from many dists. in the union.

**Ostrich, South American, see ITIKA.**

**Ostroda** (Ger. *Osterode*), tn. of Poland in the former E. Prussia, on Lake Dzwenz, 39 m. S.E. of Elblag (Elbing). There is a castle of the Teutonic knights dating from 1270, and iron-works. Pop. (1939) 19,300.

**Ostrog**, tn. in the Volhynia region of the Ukrainian S.S.R., 120 m. N.E. of Lvov, on the R. Goryn. There are oil-works and potteries, tanning, and manufs. of tobacco, candles, and soap. In 1581 was issued here the first complete trans. of the Bible in old Slavonic. Pop. about 13,000.

**Ostrogoths, see under GOTHs.**

**Ostrowskia magnifica**, hardy perennial plant (family Campanulaceae), a native of the Bokhara Mts. It sometimes exceeds 7 ft. in height and bears huge campanulate blooms, lilac, blue, or pure white. It needs protection in winter.

**Ostuni**, tn. in the prov. of Lecce, Italy, 19 m. W.N.W. of Brindisi. It is the seat of a bishop, and contains a cathedral. Pop. 30,600.

**Oswald**, *Wm. H.* (1853-1932), Ger. chemist, b. at Riga in Latvia. In 1887 he was appointed to the chair of chem. at Leipzig Univ., but retired from this position in 1906. He also held the position of director of the Electro-chemical Institute of Leipzig in 1898, and was the first exchange prof. at Harvard Univ. in 1905. In 1909 he was awarded the Nobel prize for chem. His process of forming nitrogen oxides by the oxidation of ammonia enabled Ger. munifs. of explosives in the First World War to be maintained despite the loss of Chilean nitrate imports. His numerous works embrace general chem., principles of natural science, energy, electro-chem., and monism; and works on Comte, Schopenhauer, etc. His autobiography, *Lebenslinien, eine Selbstbiographie*, was pub. 1926-27.

His son, Wolfgang, was b. 1883 in Riga, and from 1922 held the first chair of colloidal chem. at Leipzig, and became a leading authority on this subject.

**Ostyaks, Ostiaks, or Ket.** people of Finnish stock of N.W. Siberia. They are scattered in isolated groups along the Ob basin northwards to the estuary, and eastwards to the Yenisei between Yeniseisk and Turukhansk. They are gradually dying out, and though they are spread over an area of 400,000 sq. m. number only about 18,000. Their national organization is completely broken up, and they have almost ceased to dwell in settled abodes since the destruction of their vils, and strongholds by the early Russian invaders of W. Siberia. They are a very primitive people, and are still in great part heathens, living on raw flesh in dirty huts, and using weapons of bone and stone. They also employ bows and arrows, and subsist by fishing and hunting fur-bearing animals. In religion they are Shamanists, and nowhere else does the wizard or medicine-man enjoy more influence than

among the O. Their language belongs to the Finnish div.

**Osuna** (anct. *Urso*), tn. of Seville prov., S. Spain, 50 m. E.S.E. of Seville. Corn, esparto grass, oil, olives, wine, and fruit are produced. Pop. 18,000.

**Oswald, Saint** (c. 605-642), king of Northumbria (634-642), and son of Ethelfrith of Bernicia. He defeated the Welsh king, Cadwalla, at Heavenfield (identified with St. Oswald's Crock, near Chollerford, Northumberland) and thus fought his way to the throne. He had previously become a convert to the Christian faith at Iona, and by the help of St. Aidan, on becoming king of Northumbria, estab. Christianity throughout the kingdom, founding the Lindisfarne bishopric. His festival is celebrated on Aug. 5. To commemorate his victory over Cadwalla, O. raised the first cross over the Christian altar in Bernicia. He was defeated in battle and slain by Penda, at a place then called Maserfield (probably Oswestry).

**Oswald, Saint** (d. 992), Eng. ecclesiastic and archbishop of York, said to be of Dan. parentage. He was brought up under the care of his uncle, St. Odo of Canterbury, who, at his request, sent him to the monastery of Fleury on the Loire to learn the rule of St. Benedict, which, on his return to England, he taught to his fellow countrymen. He was associated with St. Dunstan and St. Ethelwold in the revival of eccles. discipline and monastic life in England, himself founding the abbey of Ramsey, and the monastery at Worcester, which later became the cathedral priory. He was made bishop of Worcester in 961, and archbishop of York in 972.

**Oswaldtwistle**, urb. dist. and tn. of E. Lancashire, England, 3 m. E.S.E. of Blackburn. It has cotton mills, collieries, stone quarries, and chemical works. Paper and pottery are manufactured. Sir R. Peel was born (1750) at Peelford in the township. Pop. 12,800.

**Oswego**, city and cap. of O. co., New York, U.S.A., on the S.E. shore of Lake Ontario and 35 m. N.W. of Syracuse. It has a good harbour and large shipments of grain, lumber, and coal. There are sev. iron foundries, machine shops, and oil works, and the manufs. include matches, engines, hosiery, starch, flour, textiles, etc. It is of historic interest because of its importance in Fr. and Indian wars. Pop. 22,000.

**Oswego Tea**, name applied to sev. species of *Monarda* plants, natives of N. America, by reason of the infused dried leaves being occasionally used as a beverage, given as a stomachic or in intermittent fevers. They are of the family Labiate, similar to mint in appearance. The particular species are the *M. purpurea*, *M. didyma*, and *M. Kalmiana*.

**Oswell, William Cotton** (1818-93) Eng. explorer, b. at Leytonstone. He obtained an appointment in the East India Company, and in India became an enthusiastic hunter of big game. Sent to S. Africa to recover his health, at Kuruman he was the guest of the famous missionary, Moffat, and his wife. In 1810, together with two

Indian officers he explored the Limpopo. Here he met with the *kuibaboa* or straight horned rhinoceros, which he believed to be a separate species of the white rhinoceros. After another year in India O returned to the Cape (1818) and joined the Livingstones at Kolobeng (1819). With Livingstone and Mungo Murray he took part in the discovery of Lake Ngami and in the exploration of the Kalihail desert. His notable expedition by traversing routes previously impassable to Europeans succeeded in connecting the

indeed the earliest story of the expedition was learned through letters from Livingstone. See also by his son W. Edward O., 1900.

Oswestry, tn. of Shropshire, England 20 m. N.W. of Shrewsbury. The trade is chiefly zinc, tinning, insulated equipments and printing. In there are railway workshops. There is a market weekly in markets. There is an infant grammar school founded in 1407 and the church originally belonged to a monastery founded in memory of Oswald, said to have been slain

High Commissioner for New Zealand

ONIA LAO LAKE WAIAHI

The great LAO LAKE WAIAHI with its islands

pastoral lands from which great numbers of the quadruped were taken. If he found the sand in some places and sun fire hot, he described the scenery along the Zouga the first of New Zealand. He was infected with cholera 75 ft in circumference. For his efforts in the expedition O received a medal from the Paris Geographical Society and the *kuibaboa* rhinoceros was named after him. He also took part in the discovery of the Zouga, which the party first came upon in Schuurman's country where it was called the *Sesheke* (discovered Aug. 4, 1814). But notwithstanding O's merit services to geography and the loyal attitude of Livingstone towards him. His work soon passed into oblivion the cause of this being his invincible laziness as a writer,

here 1812. O was the original seat of the family of Fitz Alan from whom descended the earls of Arundel and the Stuart kings. (Sep. 11, 90). See W. Carter *History of Oswestry* 1811.

Oswestry, tn. of Polish Silesia 33 m. W. by S. of Cracow. See OSCHWITZ CONCENTRATION CAMP.

Oxymandias, see PAMISIA II. Oxyris, genus of heathen shrubs (family Santalaceae). *O. alba* the principal species. Leaves numerous of small white flowers, full web by red berries. It is a native of S. Europe and is half hardy in Britain.

Otago, prov. dist. of New Zealand S. is situated to the S. of the prov. dists. Canterbury and Westland. It was one of the six original dists. of the colony which since 1876 have been abolished and the co-

system adopted. It is divided into two areas: O. Portion and Southland Portion. The mts. run from N.W. to S.E., the chief ranges being the Barrier Mts., the Kakanui Range, the Crown Mts., the Hector Mts., Richardson Mts., Kyre Mts., Aika Mts., Livingstone Mts., and Takitimu Mts. The chief rivs. occur on the E. coast, those on the W. being short torrential streams, and of the former the Clutha, which discharges the drainage from lakes Hawea, Wanaka, and Wakatipu, has the largest volume of any riv. in New Zealand. The Mataura drains the country to the S. of Lake Waikare, and the Waiau R. discharges the waters of lakes Te Anau and Manapouri. The fjord-like lakes lie in long narrow valleys, and are famous for their fine scenery, and of these the chief are Wakatipu, with a depth of 1239 ft., and Lake Manapouri, 1462 ft. deep. Among industries may be mentioned the rearing of live-stock, arable agriculture, and mining, the prin. crops being wheat, oats, and barley, as well as all sorts of vegetables and fruits. In 1911 there were sixty-seven cheese factories and eight butter factories. In 1940-41 13,738 tons of cheese and 27 tons of butter were forwarded for export. O. has an important woollen-milling industry. Gold occurs in large quantities, and also coal, brown stone, and slates. The cap. is Dunedin, which is picturesquely situated on the S.W. side of O. harbour. It was founded in 1848 by members of the Free Church of Scotland, and owes its prosperity to the gold mining of O. It is the most important commercial centre in New Zealand and is the seat of one of the chief colleges in New Zealand Univ., and the prin. school of mines. Area (O. Portion) 14,050 sq. m.; (Southland) 11,170 sq. m. Pop. (O. Portion) 152,200; (Southland) 71,400; and about 400 Maoris in each.

**Otaheite**, see TAHITI.

**Otaridja**, see FUR SEAL.

**Otaru**, seaport on the W. coast of Japan, off the is. of Yezo on Ishikari Bay, 90 m. N. of Hakodate. It has the most important fisheries of the is., and is especially a herring fishing centre. It manufs. agric. implements, vegetable oils, spirits, etc. Pop. 154,000.

**Otavallo**, bn. of Ecuador, S. America, on the railway between Quito and Ibarra, 90 m. from Quito and 16 m. from Ibarra. It is the centre of an agric. dist. Its industries include wool, carpets, and ponchos. Pop. 15,000.

**Otavi**, mining centre of S.W. Africa, in Namaqualand. Deposits of lead and copper are worked at five centres in the dist.

**Otea**, see GREAT BARRIER ISLAND.

**Oxford**, vil. of Kent, England, 2½ m. N. of Sevenoaks. It has traces of a Rom. villa, and was the scene of battles fought by Offa of Mercia and Canute. There are extensive ruins of the palace built by Archbishop Warham in the early sixteenth century, and sev. Tudor houses in good preservation. Pop. 2000.

**Otfried** (c. 800-70), religious poet, b. in Alsace. Having studied in the abbeys of St. Gall and Fulda, where he had Rabanus

Maurus for his master, he joined the Benedictine monks and entered the monastery at Weissenburg. He wrote *Liber Evangeliorum*, a poetical harmony of the gospels in Old High Ger., printed at Basle in 1571. See study by D. A. McKenzie, 1946.

**Othere, Onthere, or Ottar**, 'the old sea-captain who came from Helleland,' Norse navigator and explorer of King Alfred the Great's reign. He made two voyages between 880 and 900, in one of which he sailed round the N. Cape into the White Sea. See King Alfred's trans. of Orosius (Sweet's ed., 1883).

**Othmar, St. (Otmár, Audemar) (d. 759)**, was of Teutonic origin. In 720 he became abbot of the dilapidated monastery of St. Gall. There he introduced the Benedictine rule, and made St. Gall the most important abbey of Switzerland. He died in prison after an unjust condemnation, by an eccles. tribunal, after persecution by two neighbouring counts.

**Otho I., or Otto the Great (912-73)**, Holy Rom. Emperor, son of Henry the Fowler, at whose death in 936 he was crowned king of the Gers. at Aix-la-Chapelle. He stopped the progress westward of the Huns and Wends, made Bohemia and Bavaria his tribes, and estab. a feudal system, subject to himself, throughout central Europe. In 961 he attempted to release Louis of France, who had previously assisted his rebellious barons, from the captivity in which he was held by Count Hugh, and in 961 defeated Boleslas of Bohemia. Adelaide of Italy was besieged in Canosa by Berenger II., and after crossing the Alps and releasing her, O. married her at Pavia. In 961 he again invaded Italy, and was crowned emperor of the W. by Pope John XII., whom he later deposed in favour of Leo VIII. See K. Hampe, *Otto der Grosse*, 1923; J. Haller, *Das alt-deutsches Kaiserium* (6th ed.), 1924; R. Holtzman, *Kaiser Otto*, 1936; and M. Lintzel, *Die Kaiserpolitik Ottos*, 1943.

**Otho II., or Rufus (955-83)**, Holy Rom. Emperor, son of Otho I. and Anelaide of Italy. On the death of his father in 973 he was forced to contest the crown with his cousin, Henry of Bavaria, whom he defeated and sent into exile. He then went into France on an expedition against Lothair, and succeeded in laying waste Champagne, but was defeated at the Aine. He was next called to Rome by a rising of the citizens, whom he treated with great cruelty. In 982 he was defeated in an engagement with the Gks. and Saracens at Basentello, in Apulia, by the treachery of the Beneventans.

**Otho III., or Otto (980-1002)**, Holy Rom. Emperor, son of Otho II. and Theophanu, daughter of the Gk. emperor. He succeeded to the throne as a child, and during his minority great power was obtained by the Rom. consul, Crescentius. In 996 O. non. ated Gregory V., a relative of his own, as pope, but the nomination was rejected by the consul. In return for this O. marched to Rome and succeeded in dragging Crescentius from the castle of Sant' Angelo and bringing about his

execution. There is a story that the widow of Crescentius gained an influence over O., and then, in revenge for the murder of her husband, poisoned the young emperor by means of either a poisoned glove or a potion. See O. E. Schramm, *Kaiser, Rom und Renovatio*, 1929.

**Otho IV.** (c. 1174-1218), Holy Rom. Emperor, son of Henry the Lion, duke of Bavaria, and Matilda of England. He spent some time at the court of Richard I. of England, and assisted him in his wars with Philip Augustus. In 1197, on the death of the Emperor Henry VI., O. became the Guelph candidate for the throne in opposition to Philip of Swabia, supported by the Ghibellines. After a long struggle it appeared that Philip was victorious, but he was assassinated in 1208 and O. was crowned emperor in 1209. He at once became involved in a conflict with Pope Innocent III., and after invading Naples in 1210 was called back to Germany by insurrection there. In 1214 he was utterly defeated at Bouvines by the pope's ally, Philip Augustus. See E. Winkelmann, *Philipp von Schwaben und Otto IV.*, 1872-78.

**Otho, Marcus Salvius** (c. A.D. 31-69), emperor of Rome. In 58 he was sent by Nero to govern Lusitania, in order to separate him from his wife, Lopprea Sabina, whom Nero afterwards married. In 68 he supported Galba's rebellion against Nero, and when Galba became emperor accompanied him to Rome. He expected to be nominated as Galba's successor, but Galba designated Piso for this, and O. stirred up a rebellion. Galba and Piso were killed, and O. was proclaimed emperor in 69 everywhere except in Germany. Here Vitellius had been proclaimed emperor, and he marched on Italy and defeated O., who then killed himself.

**Otho, or Otto, of Freising** (c. 1111-58), historian, son of Leopold, margrave of Austria. He was made bishop of Freising by his half-brother, Conrad III. His great work is a world hist., *Chronicon seu historia de duabus civitatibus*. In seven books, coming down to 1146, which was continued by Blasius to 1210. He also wrote a hist. of the Emperor Frederick I., and a treatise on the end of the world. See C. Mierow, *The Two Cities* (Eng. trans. of Hofmeister's ed. of the *Chronicon*), 1928.

**Othonna**, genus of trailing shrubs or herbaceous plants (family Compositae) with tuberous roots and yellow flowers. *O. crassifolia*, African ragwort, is a useful plant for hanging baskets or pots.

**Othonnopsis**, genus of shrubs (family Compositae), with decorative grey glaucous leaves and showy yellow flowers borne in late spring. *O. cheirifolia*, a native of N. Africa, is easily grown on a dry rocky or hot border, but needs protection in winter.

**Othrys** (*Ossa*), or Heliovo, lofty mt. range in S. Thessaly, Greece, now called Gura, shutting in the Thessalian plain on the S. It extends from Mt. Tymphrestus, a summit of the Pindus Range (S.), E. through Pithiotis to the coast, separating

the Peneus and the Spercheus. The summit Gerakovouni is about 5670 ft. See Strabo, ix.; Herod., vii. 129.

**Otiorrhynchus**, genus of weevils or plant-eating beetles. Many cause great damage to cultivated crops, both in the larval and beetle states. They can be destroyed by spreading pieces of sacking near infested plants and collecting them during the daytime while they seek shelter.

**Otis, James** (1725-83), Amer. statesman, b. at Barnstable, Massachusetts. He was a prominent member of the Massachusetts House of Representatives, and is especially famous for his speech of 1761 in support of the liberty of the colonies with regard to taxation. He was one of the organisers of delegates to the Stamp Act Congress of 1765. He pub. in 1762 *Indication of the Conduct of the House of Representatives of the Province of Massachusetts Bay*, in which he defended the Assembly for its rebuke of the governor for calling upon it to pay for protection against Fr. privateers which it had not sought, and *Rights of the British Colonies Asserted and Proved* (1761), etc. See lives by W. Tudor, 1823; P. Bowen, 1847; and F. W. Sprague, *Birthplace of the Patriot James Otis*, 1917.

**Ottis Media**, see E.M.

**Otley**, tn. in the W. Riding of Yorkshire, England, 9½ m. N.W. of Leeds, on the R. Wharfe. Near by is Farley Hall, where Turner painted many of his pictures, and where there is a fine private collection of his works. There is a seventeenth-century grammar school, and the seat of the Fairfax family is at Denton Park near by. O. has an agric. trade and manufs. of leather goods and machinery, and in the vicinity are woollen and worsted mills. Pop. 11,020.

**Otocyon**, see *Yoa*, *African Wild Dogs*. **Oteliths**, or **Ear Stones**, are concretions, usually stony, which occur in the cranial cavity of fishes, and which are in contact with the ends of the acoustic nerves. Their function is as an organ of balance, and they vary greatly in size, but are commonly minute. In the cod they are as big as the thumb-nail, and resemble porcelain in colour and texture. Frequently they are the only parts of a fish's anatomy which survive decay, and their variation affords a clue in many cases to species. Corresponding concretions occur in many invertebrates.

**Otomi**, Indian tribe of the Mexican plateau. They are probably a people of immense antiquity, dating from before the Toltec invasion, and were driven S. and partially subdued by the Aztecs or Nahuas. At the time of the conquest of Mexico they inhabited the mountainous dist. W. of the Mexican lakes. They number about 280,000, and are scattered through Guanajuato, Hidalgo, Queretaro, and Mexico states.

**Otranto** (anc. *Hydruntum*), seaport and archiepiscopal see of Lecce prov., Italy, on the strait of O., 45 m. S.E. of Brindisi. It has an anc. cathedral and ruins of an old castle (see *Horace Walpole's Castle of Otranto*). In the Middle Ages the chief port of Italy whence passengers took ship for Greece, O. was taken by the Turks

(1180) O is a fishing centre and a scenic resort. Building material and cereals are exported. Pop. 300.

**Otsego**, title in co. O, New York U.S.A. 60 m N.W. of Albany. It is 9 m long, and 1 to 2 m wide, and is the source of the Susquehanna R.

**Otsu**, tn in the prov. of Ōmi, Honshū Japan on Lake Biwa 9 m S.E. of Yotsu. It is the ancient capital of Ōmi province and is famous for its annual festival of the (q.v.). Pop. 6,000.

**Ottajano**, tn in the prov. of Lazio, Italy at the foot of Vesuvius. It has a castle built on a hill outside the tn. Pop. 13,900.

**Ottava Rima**, the eight-line stanza of (hendecasyllabic lines used for chivalric romance and in medieval poetry. There are other decasyllabic octaves and

that used by Chaucer in *The Monk's Tale* and later by Spenser with or without that adoption of the Alexandrian which converts it into the Spenserian stanza. The O.R. stanza with a chivalric lines rhythm alternately followed by a couplet on a new rhyme (*catamb*) was introduced into England by Sir Thomas Wyatt who adopts the Italian chivalric rhyming scheme *abba cdcd* in the sestet

to generally rhyme *duccia* to rhyme the first line to accommodate *per amica* (q.v.). The O.R. was used by him. It was later for sonnet purposes with a rhymic base and it was especially effective in mock heroic verse (*q.v.*). See also the third of Luigi Pulci (*q.v.*) and Francesco

Barbi (*q.v.*) and others. It was occasionally used by Elizabethan poets (*q.v.*) but never became popular. *Mathematica* on the front of Edward II. reign in rhyme with *tuus* was afterwards modelled on O.R. in *Il Capitano* (War

1600) but more often in a form such as Edward Fairfax at his 'clinging of' (1630) and in Sir John Harington's translation of Ariosto. It was also revived by that poet in the nineteenth century as *q.v.* by Wm. Lisle Russell who in 1811 wrote *Amor's Love* a heroic poem in

O.R. full of fine and famous Wm. Lisle Russell's translation of *Orlando* (1820-1) and John Keats's *Hyperion* (1818) in *The Mount and the Meadows* and *Arthur and the Knight of the Round Table* (1819) partly

to be by Wm. and John Keats's *Hyperion* but it is not finding application to modern uses as by Byron's *Hyperion* partly in Keats's and partly in Keats's and others. It is especially exemplified by *Hyperion* (1819) and *Hyperion* (1819).

It was also used for purely romantic poetry by Shelley (*q.v.*) in *The Witch of Atlas* and Keats's *Hyperion* the latter showing the possibility of expressing tenderness and pathos in O.R. despite the inherently unsuitable structure of O.R. for that purpose while Shelley overcame such difficulties by his unique gift of flowing melody. See J. G. K. Smith, *The Principles of English Metre* 1923.

**Ottawa** 1) Episcopal city, port of entry and cap. of the Dominion of Canada in Ontario on the R. O. at its confluence with the Rideau 101 m W. of Montreal

O. is on both the Canadian National and Canadian Pacific main railway lines and lies 220 m N.E. of Toronto and 110 m W. of Montreal. It is a handsome city, picturesquely situated on a cluster of hills overlooking the O. R., it is regularly laid out in rectangular blocks between the Chaudière and Rideau Falls and is divided into two parts by the Rideau Canal. Much money has been spent in recent years improving its parks, drive ways, and general appearance. The chief buildings are the Parliament Buildings (1859-65) on Parliament Hill the Roman Catholic

NEAR THE CHAUDIÈRE FALLS, OTTAWA, ONTARIO. THE CHAUDIÈRE FALLS, OTTAWA, ONTARIO.

at the head of Notre-Dame (Christ Church) Cathedral. Parliament Hill the residence of the governor general in the suburb of New Edinburgh is in the city. The Catholic group of the Parliament Buildings dominates the city. There are also lower has a splendid caisson and a noble memorial lumber to the soldiers of the First World War. O. is also a Catholic city (1810) now it is a primary teachers' training college, technical school, college, and a minor high school (1911) public school, free library, and a public library. Besides its two churches there are over twenty churches, and the central Canada exhibition. The chief industry of the city is lumbering. The woods of the city are winter in cutting down the timber which is floated down to O. by the spring floods.

The output of the O. lumber-mills is enormous. There are also manufs. of flour, iron goods, leather, and matches. The Chaudière Falls (200 ft. wide and 50 ft. high), on the O. R., between O. and Hull, supply splendid water power to drive the factories situated along the banks of the riv. Within 50 m. of O. are installed hydro-electric plants, to a capacity of 1,023,500 h.p. The city is the social and educational centre of Canada and contains many museums, galleries, and educational institutions. The site of O. was discovered in 1613 by Champlain, who named the riv. that joins the O. here the Rideau. The city's origins date back to 1826, when a tn. grew up around the headquarters of the Brit. army engineers who were building the Rideau Canal, which, with the chain of Rideau Lakes further S., affords navigation for small craft to Lake Ontario at Kingston, 90 m. S. The commanding officer of the engineers was Col. By, and the settlement was first called Bytown. The tn. was incorporated in 1854 and the name changed to Ottawa, after the great riv. on its N. side. In 1858 Queen Victoria chose it to be the cap. of Canada, at that time comprising only what are now the provs. of Quebec and Ontario. In 1867, on confederation, it was made the cap. of the dominion. It returns two members to the dominion House of Commons and three to the Ontario Legislature. Pop. 155,000, O. being the sixth city for size in Canada, following after Montreal, Toronto, Vancouver, Winnipeg, and Hamilton. 2. Co. seat of Franklin co., Kansas, U.S.A., on Osage R., 35 m. S.E. of Topeka. It has railroad machine works, and contains the O. Baptist Univ. Pop. 12,000. 3. Co. seat of La Salle co., Illinois, U.S.A., on Illinois R., 83 m. S.W. of Chicago. The Fox R., joining the Illinois just above O., provides water power for extensive and varied manufs. Coal is found in the neighbourhood, and there are valuable mineral springs. Pop. 15,000. 4. One of the largest rivs. of Canada, rises in lat. 48° 30' N., long. 76° W., on the watershed on the opposite side of which rise the St. Maurice and Saguenay. After a course of over 700 m. it falls into the St. Lawrence by two mouths, which form the Is. of Montreal, and its drainage area measures about 80,000 sq. m. During its course it widens into numerous lakes of considerable size, and is fed by many important tribs. The O. is connected with Lake Ontario at Kingston by the Rideau Canal. An immense lumber trade is done on the riv.

**Ottawa**, tribe of N. Amer. Indians, whose original home was on the upper O. R. In 1466 they were driven to the W. by the Iroquois, and early in the eighteenth century settled about the lower end of Lake Michigan. They now number under 5000, and are found mainly at the Mackinac Agency in Michigan, and on Monticulin Is., and Cockburn Is., Ontario. They belong to the Algonquin stock.

**Ottawa Conference**, imperial economic conference of the Brit. Commonwealth of Nations, held at Ottawa in July 1932. A series of trade agreements were concluded

between the United Kingdom Gov. and the govts. of the dominions, the general principle being to grant free entry for dominion imports into the United Kingdom market in consideration of preferences for United Kingdom exports into dominion markets. These agreements were for a period of five years ending July 1937, but were to continue unless either party gave six months' notice of termination. Discussions arose in 1933-1935 over the expanding Australian and New Zealand imports of frozen or/and chilled meat, but it was eventually arranged to regulate the supplies of frozen and chilled beef on a given basis, the actual allocation to be left to an Empire Meat Council. Difficulties also arose over the principle, incorporated in all the Ottawa agreements, of adjusting tariffs on Brit. secondary goods according to the relative cost of production as compared with similar manufs. in the dominions; in some cases the dominion govts. were really protecting secondary industries which economically were unsound, and it was found that appeals by United Kingdom groups to dominion tariff boards, even where successful, were ignored through doubts as to the official status of these boards, and as to whether their decisions were binding on the dominion gov. concerned or were merely advisory. In Feb. 1937 the United Kingdom and Canadian Govts. concluded a new trade agreement continuing for four years the principles of the agreement of 1932. The decisions which Brit. statesmen took at Ottawa influenced the economic prospects of most peoples, whether within the Brit. Empire or not. The O. C. tried to dovetail the new protectionist policy of Great Britain into the long-standing protectionist policies of the dominions. Great Britain and the dominions assumed reciprocal obligations, both of a general and a detailed character, to give preferential treatment to each other's commerce. Foreign critics suggested that the Ottawa treaties were a violation of Great Britain's international obligations and an unprovoked attack on the livelihood of innocent neighbours. The treaties were neither, and the conference was designed for mutual protection against the intolerable aggression of most other nations and was in fact demanded by the dominions; and, though some of the colonies, especially the rubber- and tea-producing colonies like Ceylon and Malaya, would have preferred the continuance of the free trade system, others, like the W. Indies and Mauritius, wanted a sheltered market for their basic products. Certainly the legal right of the Brit. Empire to co-ordinate its separate tariffs in a general structure of reciprocal preferences is incontestable, and criticism, generally, came ill from the politicians who framed the outrageous Hawley-Smoot tariff in the U.S.A. In fact the Ottawa experiment is already past history: in the course of the immediately succeeding years agreements were made which considerably modified the treaties or agreements made as a result of the conference. It soon became evident that the

St. Mary is one of the finest in England. Its hist. may be traced back to 1061 and a Norman font has been discovered. In the fourteenth century Bishop Grandisson rebuilt much of the thirteenth-century structure, transforming it into a collegiate church, which status it held until the Reformation. The building bears striking similarities to Exeter cathedral, on which Grandisson also worked. The dist. contains good examples of Elizabethan architecture at Cadhay and Knightstone. Escot Grange was the 'Fair Oaks' of Thackeray's *Pendennis*. Coleridge was b. in O. St. M. The ann. carnival said to have originated in 1688, is held Oct. Nov. 5. Pop. 4000.

Otto, see OTTHO.

Otto, Nicholas, see under GAS ENGINES.

Otto the Great, see OTTHO I.

Ottokar, see OGHIER.

**Ottoman Bank**, prin. foreign bank in Turkey. It was estab. in 1863 as the Imperial O. B. (an Anglo-Fr. institution) by imperial firman under a concession from the Turkish Gov. The original title was altered to O. B. in 1925. It has a branch in every important tn. of Turkey. The concession of the O. B., extended in Aug. 1925, by the Turkish Gov. for a further period of ten years, was prolonged (June 5, 1933) until March 1952. The chief offices are in Istanbul, London and Paris.

**Ottoman Empire**, see TURKEY.

**Otto of Roses**, see ATTAR OF ROSES.

**Ottrelite**, blackish- or greenish-grey mineral, occurring in shining oblong plates more or less hexagonal, in argillaceous schist. It resembles chloritoid and phyllite, and is probably monoclinal.

**Ottumwa**, coal-mining city of Iowa, U.S.A., cap. of Winnebago co., is built on both banks of the Des Moines R., 25 m. S.E. of Oskaloosa. It has a large pork-packing industry. Pop. (1930) 23,000.

Otus, see ATODIN.

**Otway, Thomas** (1652-5) Eng. dramatist, b. at Trotton, Sussex, was educated at Winchester and Christ Church, Oxford, and afterwards went on the stage. He was unsuccessful as an actor, but utilised his theatrical experience in writing plays. His tragedy, *Albion*, was produced in 1675, with Mrs. Betterton and Mr. Barry in the cast. In quick succession appeared *Don Carlos* (1676); *Edith and Laurence* (a tragedy adapted from Racine, 1677); *The Cheats of Scapin* (a farce adapted from Molière, 1677) (these last two were acted on the same night and sub. soon afterwards in one vol.); and *Friendship in Fashion* (1678). He became famous with *The Orphan* (1680) and added to his reputation with *Love Preserved* (1682). His plays brought him but little money, and at the height of his fame he was almost destitute. It is not certain how he met his death, but the story goes that he died of starvation in an inn. His two best plays have considerable merit. See life and works ed. by T. Thornton, 1813.

**Ötztal**, valley, in the Austrian Tyrol, drained by the Ötz, which flows N. till it joins the Inn. It is very beautiful, sur-

rounded by the O. Alps, on which are the finest glaciers in Austria.

**Ouachita**, or **Washita**, riv. rising in W. Arkansas, U.S.A., connected with the Mississippi by the Tensas series of bayous. It flows E., S.E., and S. through Louisiana into the Red R., 15 m. N.W. of the latter's confluence with the Mississippi. Length about 550 m., navigable for steamers to Camden, Arkansas.

**Oudenarde**, **Oudenaerden**, see ADEL-NAARDE.

**Oudh**, or **Oude** (native **Ajodhya**), region and prov. of India extending from the Himalayas (Nepal frontier) to the Ganges (N. to S.), drained by its tribs, the Gomra and the Gumti. Area about 24,158 sq. m. From 1902 it formed part of the United Provs. (O. and Agra) under a lieutenant-governor. From 1921 it was under a governor. The United Provs., from 1937, had an autonomous system of government; but after the resignation of the Congress ministry in 1939 the governor, by proclamation under the Government of India Act, 1935, declared that all the statutory functions would be exercised by him, and vested in himself all the powers of the legislature. In 1947 it was assigned to the new dominion of India. The chief court at O. constituted 1925, sits at Lucknow. Rice, cereals, sugar, opium, tobacco, indigo and cotton are produced. Lucknow is the cap. It was under the Mogul emperors in the sixteenth century, but had an independent Mohammedan dynasty in the eighteenth century, and was annexed by the Brit. in 1806. It played an important part in the Sepoy Mutiny (1857-58). The great ann. fair of Ramnagar is held there. Pop. (1911) 11,111,000. See also AJODHYA.

**Oudtshoorn**, tn. of S. Africa, in Cape Prov., on the R. Grobelaars, 277 m. W. of Port Elizabeth. It is an agric. centre, and had an air-training school during the Second World War. The Camero stactute caves are near by. Pop. 17,000.

Ouessant, see USHANT.

**Oughtred, William** (1575-1660), Eng. mathematician, b. at Eton, Buckinghamshire, and educated at Eton and King's College, Cambridge. He invented an 'Easy Method of Geometrical Dialectic', which was translated in MS. for some years until Christopher Wren's trans. into Lat., made in 1647, was pub. in 1648. About 1603 O. was ordained priest, and in 1604 presented to the rectory at Allbury, Surrey. O. was one of the first among Eng. mathematicians of his day. In his *Clavis Mathematicæ* (1631) he introduced the signs  $\times$  for multiplication and  $:$  for proportion.

**Ouzröö**, tn. in Belgium, and suburb of Liège, 2 m. to the S.W. on the R. Meuse. It has coal-mines and blast furnaces. Chief industries are iron, steel, machinery, caoutchouc, and chemicals. Pop. 19,200.

**Ouida**, pseudonym of **Marie Louise de la Ramée** (1839-1908), Eng. novelist, b. at Bury St. Edmunds. began her literary career by contributing to the *New Monthly Magazine* when she was twenty. Her first novel was *Granville de Vieux* (1863), subsequently known as *Held in*

**Tondage**, *Strathmore* (1867) had the distinction of being produced by Burnand in *French*. She pub more than threescore books among the best being *Under Two Flags* (1867), *Poor* (1870), *Told a Tale* (1871), *The Little Wooden Shoes* (1874) and *Mobs* (1874). She wrote with exaggeration of fashionable life but she had many admirable qualities and an enthusiasm for her characters that for the moment made the most impossible creations seem real. See *Elizabeth Lee Ouida a Memoir*, 1911, M. Elwin; *Literary Wallflowers*, 1931, and Ros. M. Milly; *Elizabeth Ouida* 1937.

OUIDA (SNOW LEOPARD)

**Ooustitis**, cf. *MAIYOSSE*.

**Oulachan** see *CANDID* 111.

**Ould**, *Hermon* (b. 1870) Eng. play-wright, poet, and critic. Lived in London His first play, *The Secret and the Day*, appeared in 1915, and he has since written a number of plays. In original others trans. fr. in the text or adaptations from the Chinese and other sources. His poems have been pub. in *Candid* 1245 (1921), *The One who was* (1942) and *Times* 9, 10, 11 (1941). Other works include *The Girl of the Year* (1938) and a musical play, *Shuttle* (1943). He is general ed. of the *International P. N. Club* and ed. of its pub. in 1911. Awarded the Order of Chevalier of the Legion of Honor (1938).

**Oultor**, vil. of 1000 in Lind 2 m W of Lowestoft on the E. Waveney. O. road, near by, a popular bathing, and fishing resort. Pop. 400.

**Oulu** (Swedish *Uleaborg*) 1. North in most lat. or prov. of Finland. It consists of the pl. (1000-1200 ft) of Lapponia the fertile lowlands of Osterbotten on the gulf of Bothnia, and the plateau (1500-1600 ft) of Siomansky and Kaimi. Land area 21,887 sq. m. Pop. 377,400. 2. City 11 m. above a seaport at the mouth of the R. Uleä in the gulf of Bothnia with trade in wood, tar, and pitch. Pop. 36,400.

**Ounce** (fr. *once*, Sp. *onza* It. *oncia* from *uncia* a twelfth) In Troy

weight an O. is the twelfth part of a pound, or 20 pennyweights, each of 24 grains, in all 480 grains. In apothecaries fluid measure 20 fluid O's equal 1 pint. The O. in avoirdupois weight is the sixteenth part of a pound, 437½ grains or 16 drams.

**Ounce** (fr. *once* O. *lonce* (taken for *lonce*) fr. *lat. uncial* from *uncia*) In zoology 1. *Uncia* the snow leopard. Its habitat is in the Himalayas at an elevation ranging from 10,000 to 15,000 ft. The little size of a leopard its ground color is pale yellowish grey and dingy white beneath. Its fur is thick and it has a well marked rosette. It has never been known to attack man.

**Oundle**, picture of stone built mkt. town of Northampton in England on the R. Nene 11 m. W. of Peterborough. It has one of the most prominent churches in the county and a number of interesting buildings among which is a hall of 14th cent. built in 1626, and the town hall. O. school can trace its origin to the Guild of Our Lady of O. refounded by J. A. Wyatt in 1499. It was a free school. Sir Wm. Lockhart 1668, a free school. The school was under the patronage of the W. hospital of St. Mary. It was taken over by the buildings in 1791. When they were to be eight children in the 18th century it fell into disrepair but was reformed in 1791. In the course of the last hundred years it has increased greatly in size and scope and many new buildings were erected. A new school building was dedicated in 1911. A memorial to 611 boys killed in the First World War. There are now twelve schools accommodating 6,500 boys. Pop. 2100.

**Oourisa**, genus of perennial plants (family Scrophulariaceae) often grown or moist rocks. *O. coccinea* the best known species has reddish hairy stems and leaves and dark scurfy flowers borne on daisy raceme.

**Ouro Preto**, tn. of Brazil in the state of Minas Geraes, 130 m. from Rio de Janeiro on the Minas R. It is served by a branch of the Central Brazil Railway. Gold workings and iron are mined in the dist. which is also an agr. and fruit growing area. There are textile mills and 100 factories. The tn. built on a rocky ground 300 ft. above sea level is a remarkable stone house of colonial and baroque architecture and painting and in that account has been declared national monument (1933). Its fine paved streets, the scene of it is well preserved, cross steep hills or wind with splendid churches. Pop. 1000.

**Ouro Preto** black gold formerly *Villa Rica* city of Brazil 100 m. about 1699 formerly cap. of Minas Geraes state (the government being transferred to Ouro Preto 1898) 180 m. from Rio de Janeiro connected with it by rail. The rich gold mines of P. began in 1691. The P. is of the double worked the column. Iron, aluminum and manganese are produced. There is a national mining academy, a library, a botanical garden and an old theatre. Pop. 60,000. See R. T. Burton, *Highlands of Brazil* 1869.

of scouts. Behind this screen the outpost commander chooses his line, and decides on the positions for the various portions of his force. Patrols are also sent out to observe special points and ground not in view from but near enough to the outpost to be of value to the enemy. All persons passing through the outpost line are challenged, and the outpost commander is given definite orders as to the disposal of the various kinds of individual, who may endeavour to pass.

**Outram, Sir James** (1803-63), Eng. soldier, *b.* in Derbyshire. He entered the Indian Army in 1819, and soon acquired an excellent reputation not only as a soldier, but also as a political agent. In 1842 he was described by Sir Charles Napier as 'the Bayard of India.' He rendered valuable service in the first Sikh war, and from 1847 to 1851 was resident at Baroda, and from 1855 in Oudh. He went with Havelock to the relief of Lucknow, and commanded the garrison there during the second siege. He was created baronet in 1858, and appointed military member of Lord Canning's council. He pub. sev. books on India. See lives by Sir F. J. Goldsmid, 1880, and L. J. Trotter, 1903.

**Outward Bound Schools.** An organisation based on the idea that short-term character-training schools for boys (and perhaps later for girls) should form an integral part of youth education, acting as a power-unit for all social services in collaboration with youth movements. These schools must be founded on the following principles: (1) They must be residential and the courses must last for a minimum of four weeks; (2) they must be open to all, based on a spiritual foundation, and must contain a diversity of occupations and nationalities, without political or sectional bias; (3) they must present each boy with a set of conditions necessary to give him, possibly for the first time, the opportunity to discover himself (these conditions - self-discipline, team-work, adventure, physical fitness, hardship, and some risk - are rarely met with except in time of war); and (4) they must endeavour to develop character through training with a vocational interest.

The Sea School was founded in 1911, and was shaped by two men of forceful mind and Christian purpose—Lawrence Holt, the founder, whose interest gave the venture a nautical bent, and Kurt Hahn, who introduced the concept that the training of adolescents should be devised to produce a 'whole man,' meaning one whose spiritual entity is preserved in its full stature and dignity, clothed in a body developed to the full limit of its natural capabilities. The training at the Sea School, as it will be at all O. B. S., includes self-discipline, team spirit, rescue work to develop 'the Samaritan spirit,' physical fitness, and a useful and an adventurous project. The address of the Outward Bound Trust (limited by guarantee) is, 40 Broadway, London, S.W.1.

**Ouverture, Pierre Dominique Toussaint L.,** see TOUSSAINT.

**Ouvirandra, Lattice, or Lace-leaf Plant,** genus of tropical aquatic perennials (family Naiadaceae) with broad, oblong, and lattice- or lace-like leaves. They are grown in the stove-house in a well-shaded tank, and the lacework of the leaves is shown up by introducing a sheet of white-enamelled iron as a false bottom.

**Ouzel, or Ousel, see BLACKBIRD; DIPPER; KING OUSEL.**

**Ovalherero, see HERERO.**

**Ovalle,** *to.* of Chile, 60 m. S. of Coquimbo. It is the centre of a fruit-growing and mining dist., and wool is also grown. There are thermal springs in the vicinity. Pop. 32,700.

**Ovals.** *Cartesian O.,* elaborated by Descartes; the locus of a point so moving that the sum or difference of given multiples of its distances from two fixed points remains constant. The ellipse is one of

CASSINI'S OVAL

the family. *Cassini's O.,* the locus of a point so moving that the product of its distances from two fixed points (H and S,  $HC = SC = a$ ) is equal to a constant  $C^2$ . The special case when  $a = C$  is called a *lemniscate* (see diagram).

**Ovambanderu, see under HERERO.**

**Ovambo,** one of the prin. native races of S.W. Africa. They are a Bantu race, and follow agriculture. They still have an unimpaired tribal organisation. They came into S.W. Africa at a later date than the Hottentots (twelfth century), but before the Hereros, and made their home in the N. of Hereroland. Every O. tribe has its special organisation and particular customs. In physical appearance and growth of hair the Os. resemble the Hereros, but a thicker build predominates, whereas the Hereros are often tall. Many Os. like the Hereros, in older times bore a tribal token on their eye-teeth, and their pleasures were raiment and protracted expeditions in the uninhabited parts of the tribal ter. Their chief food is a porridge of Kaffir-corn and millet, milk, meat, beans, melons, and ground-nuts. They make plates, bowls, and baskets, both ornamental and useful. Their numbers approximate to 120,000. Ovamboland, even under Ger. rule, was left to the operation of its own tribal organisation, and it represents to-day the one area in S.W. Africa in which this organisation can be utilised by the administration as an organ of government. Its area is about 16,000 sq. m. See H. Vedder, *South-*

*West Africa in Early Times* (trans. by C. G. Hull), 1938.

**Ovar**, tn. of Douro prov., Portugal, on the lagoon of Aveiro, 20 m. S. of Oporto, 5 m. from the coast. It is a fishing centre, produces wine, wheat, millet, and onions, and trades in timber. Pop. 12,700.

**Ovariectomy**, in surgery the removal of the uterine appendages, e.g. the ovaries and the Fallopian tubes. It was first performed by McDowell of Kentucky in 1809, and by Charles Clay of Manchester in England in 1842. In 400 cases which the latter dealt with, the mortality was over 25 per cent; but this major operation, once regarded as one of the gravest in the sphere of surgery, is now associated with a lower mortality than any other. The ovaries may be the seat of inflammation caused by injury during labour, or by gonorrhoeal infection, and of new growths known as ovarian cysts, or dermoid tumours, and of cancerous growths. In addition O. is now practised when through disease the tubes owing to inflammation become distended. An incision is made in the walls of the abdomen, and all adhesions are separated. The contents of the tumour are removed, the collapsed sac is drawn outside the abdomen; and the neck being secured by ligature or otherwise, the mass is cut away and the stump of the pedicle stitched over or buried in a bare portion of the broad ligament. Antiseptic sprays and sponges are generally used, hence the very low mortality now obtained; in some cases this is as low as 4 per cent. *See also* GYNECOLOGY. *See* C. Berkeley, J. S. Fairbairn, and C. White, *Diseases of Women*, 1931.

**Ovary** forms, together with the tubular appendages, the female reproductive system. There is one on each side of the uterus, which is placed in the centre of the pelvic cavity. Each is contained in a fold of peritoneum known as the broad ligament, and connected to the uterus by the Fallopian (uterine) tube. Each O. contains groups of germinal cells, known as Graafian follicles, and in the centre of each of these is a primitive ovum. It has been estimated that there are 30,000 such ova in the O., and these follicles are all connected by and embedded in tissue known as the stroma of the O. The Graafian follicles are contained in the superficial or cortical portion, while the deep or medullary portion is highly vascular, and is reddish in colour. The O. is oval and is about 1½ in. long and 1 in. thick. Ovulation, or rupture of the wall of the Graafian follicle, occurs midway between two menstrual periods, and so an ovum is liberated and passes by way of the Fallopian tubes into the uterus. If it has been fertilised, it then further develops, as explained under BIOLOGY and EMBRYOLOGY, while if not it is thence extruded. The O. produces the female sex hormone; another hormone, progesterone, is formed in the corpora lutea which develop from the ruptured Graafian follicles. In plants the O. is that part of the pistil which contains the ovule, and from which the fruit will later be formed.

*See* ANATOMY; BIOLOGY; BOTANY; EMBRYOLOGY; FLOWER; FRUIT; SKIN.

**Ovary** (in botany), *see* FLOWER; FRUIT; FERTILISATION.

**Ovation**, lesser triumph (*q.v.*) awarded to a Rom. *imperator* who had achieved minor success or success in a minor war. The Senate did not head the procession; the general entered on foot or horseback instead of in a chariot; he was clad in the *toga praetexta*, or ordinary magistrate's robe, instead of the *tunica palmata* and *toga picta*, and was crowned with myrtle instead of laurel. A sheep was sacrificed instead of an ox, hence the term (*ovis*, sheep).

**Oven**. The oldest types of O. are arched in shape, and built of stone or brick, and are heated by burning a wood fire within them. When the walls are thoroughly hot, the fire is raked out and the material to be baked inserted on a long narrow wooden shovel called a peel. The baker's O. commonly in use is an improvement upon this type. Thus the fire is confined to a separate fire-place, either opening into the O., fixed within it, or so arranged that it can be moved about it, thus ensuring equable heating. The or stone is mostly used for the bottom, or sole, of the O., and a draw-plate, or movable false bottom, is substituted for the peel. Coke or anthracite is often used as fuel. Os. for more general use are best made of iron, and are usually heated externally by flues, regulated by dampers, which convey the heat from a fire. For domestic use Os. are heated by superheated steam, by gas, or by electricity, and contain iron shelves which may be moved up or down to regulate the amount of heat which reaches the article to be cooked. Special O. are made for biscuits and confectionery, containing revolving bands on which the material is baked. The temp. may be gauged by a pyrometer.

**Oven-bird**, popular name for a genus (*Iunarius*) of S. Amer. psittine birds. It is so called on account of its wonderful oven-like nest, which is a massive structure, weighing often about 8 lb., and placed on the bough of a tree. It is composed of mud and pieces of sticks and straw and animal hair. The white eggs are laid upon a bed of soft dry grass in a large chamber which is reached through an ante-chamber. The birds are monogamous, and share the duties of incubation. Darwin, in his *Naturalist's Voyage* (1845), gives an interesting description of two species, both of a reddish tint of plumage. One, *F. cucullatus*, builds its nest at the bottom of a narrow cylindrical hole.

**Over**, anct. bor. of Cheshire, England, now a ward of the urb. dist. of Winford (*q.v.*). St. Chad's church, restored in 1531 and in 1870, dates back to the twelfth century, and is probably built on the site of an even earlier church. The right of holding a cattle-fair was granted by Edward I.

**Overbeck, Johann Friedrich** (1789-1869), Ger. painter, b. at Lübeck. At Rome, with others, he formed in 1810 the 'Pro-Raphaelite' brotherhood known as the

duties formerly performed by the Foreign Office in connection with commercial intelligence and with the commercial diplomatic and consular services. The Board of Trade has taken over its work.

**Overseer**, parochial official charged with the supervision of the poor in England and Wales. The office was estab. in 1601 and abolished in 1927. The O formulated and levied poor rates, and prepared valuation, jurv, and voters' lists.

**Overstone, Samuel Jones Loyd, Baron** (1796-1883), Eng. banker, b. in London, educated at Eton and Trinity College, Cambridge. He was M.P. for Hythe during 1819-26, and contested Manchester in 1832. He succeeded his father as head of Jones Loyd & Company bankers (merged in London and Westminster Bank in 1841) in 1841. He was a great authority on banking and finance, and the Bank Act of 1844 was based on his principles. He wrote sev. treatises on currency etc.

**Overtones**, see HARMONICS.

**Overtown**, tn. in N. Lanarkshire 13 m S.E. of W. W. It has extensive iron works, and is situated on the verge of the Clyde valley fruit-growing area. Pop. 2400.

**Overture**, work intended to serve as an opening to a larger composition, usually in oper. but often a symphony or suite. The early classical no. Os as such, but were generally prefaced as a prologue often sung. The instrumental piece became popular in Italy in the 18th c., and was known as a *sinfonia* or *concerto*. The form of the It. dramatic O. assumed a more permanent character with Scarlatti who divided it into three sections. In France, and foundations for the classical symphony by also divided the O. into three parts, a slow introduction, a lively allegro in fugue form, and a dance form, generally a minuet. This type called the It. O. became popular in England, and was used by Purcell and Handel. At this stage of its development the O. bore little or no reference to the work it prefaced, so that it was not unusual for the O. to one opera to be played before the performance of another. Nor was the O. confined to the oper. field but was used also as an opening to plays, oratorios, suite, or ballet. The reformers instituted in the field of the O. by Gluck and Mozart are of the utmost importance. The former closely identified the O. with the opera it prefaced, making it something analogous to the work itself, and often (as for example in *Alceste*) joining it without a break to the first scene. Mozart further solidified the relationship between O. and opera by introducing into the former themes from the later as in *Don Giovanni*. With both composers the O. developed into a single movement, usually in sonata form, but without the repetition of the exposition. Meanwhile the O. branched off in another direction, becoming virtually a symphony, as late as the end of the eighteenth century the symphonies of Haydn, belonging to the symphony set, were called Os. In the mid-

eighteenth century the It. O. became increasingly important. The early Os. of Cherubini foreshadowed those of Rossini, with their use of the cumulative crescendo, now known as the 'Rossini crescendo'. Beethoven, continuing the forms of Gluck and Mozart, raised the O. to greater expressive and dramatic heights. The first *Leonore* O. No. 319, to all intents and purposes, a distillation of the oper. *Idello* in symphonic form. The *Egmont* and *Coniolan* Os. were part of the musical music written for these plays and were in the nature of independent compositions suitable for concert use. The Os. of Weber also adhere to the classical form and are closely allied with the oper. using themes appearing in them. In the early nineteenth century interest arose in the concert O. which although it was usually written with a dramatic subject in mind, bore no relation to any opera. An example is 'Lukavsky's *Pomona and Juliet*' which is in sonata form but resembles the symphonic point more than the oper. O. Wagner employed the O. in various ways, and not to his credit, and to be like. With the exception of the O. to *The Flying Dutchman* which in classical form, his most important Os. may be divided into two main groups according to their functions, as a prelude to the rest of the work as in *Tannhäuser*, *Tristan*, and the *Meistersinger* and primarily intended to set the proper mood as with *Die Walküre* and *Parsifal*. Yet another type of O. is chiefly a potpourri of themes from the play intended with an eye for the concert hall. Among modern composers the trend of the O. is toward the shorter form intended to prepare the mood of the play.

**Overysel**, see OS, 111, 112.

**Ovid** (Publius Ovidius Nason) (43 B.C. - A.D. 17) Lat. poet of the Augustan age. At Sulmo (Abruzzo) of an ancient and distinguished family in easy circumstances. He was well educated and trained for the Bar, studying for some time at Athens and Athens at Rome. He had considerable literary ability, played a leading part in the literary circle and was made one of the *tresviri capitales*, but on coming into his father's estate left the law to his wife and pleasure. He had many friends and lived a gay and licentious life in Rome and in his country seat. He was three times married, but only his third marriage was successful. In A.D. 8 he was suddenly banished by Augustus to Tomi now Constantza, on the Danube. No reason for this is certainly known, but the cause is obviously hinted at in ex. places in his works. He appears by an indication to have been in some secret, possibly, as has been suggested, about the emperor's grand daughter, Julia, of which Augustus wished to remove all evidence. But the ostensible cause of his exile was the immoral tendency of his *Amores* (cf. *Tristia*, II, 207-III, 19). O. suffered much from the climate and the lack of company. He was never allowed to return to Rome and died in exile. His work is distinguished by its spontaneity and ease, its graceful elegance, and play.

of fancy its descriptions of passionate  
tender, and pathetic scenes, its insight  
into human nature, and, previous to his  
exile its air of gaiety and joyousness. His  
frequent uses of much that he wrote may  
be partly condoned by the manner of his  
age. The *Amores*, addressed to a certain  
probably imaginary Cornelia appeared  
in 16 B.C. His work, *Mela's* tragedy,  
praised by Ovidium and Lucius is  
now lost. The *Epistole ad Herodes* are a  
series of love letters written by famous  
heroes and heroines and among the most  
refined and successful examples of Latin  
elegiac poetry. Among his best Latin  
works are the *Ars Amatoria* (three books)  
and the *Troica Imitatio*, dealing suc-  
cessfully with the method of conducting  
and getting over love affairs. His  
*Metamorphoses* (eleven books) on which  
he based his hopes of immortality never  
received his final correction. It is  
brilliant and interesting and contains  
passages of great beauty. The *Pastorals*  
are tender and graceful, of which only  
six are extant; is a poetical commentary  
on the daily duties of a shepherd, written  
with festivity and rhythm. The period  
of his exile produced one comparatively  
unimportant work, the *Tristia*.  
*Epistole per Pontum* and *Alia et cetera*.

**Oviparous**, in zoology, is applied to birds, reptiles, fishes, and insects whose mode of reproduction is the exclusion of eggs from the female condition of an egg, the hatching of which takes place outside the body of the female parent. The lowest mammals (platypus and the spiny anteaters), all birds, and reptiles and fishes, and most insect orders are *Oviparae*. See also OVOVIVIPAROUS.

**Ovoviviparous**, a zoology term applied to animals whose method of reproduction is by the retention of the egg in the mother's body until it has developed into a young one, and which has been hatched within the body of the parent as an embryo without any placental attachment to the womb, so that the offspring have not been developed from a direct connection with the mother.

the blood-vessels of the mother, as in truly viviparous animals. Examples are the marsupials, the viper, the aphids (green flies), and various other invertebrates.

**Ovule** (Lat. diminutive of *ovum*, an egg), minute body of a circular or oval shape which occurs in the ovary of the carpel of a flowering plant. Os. may be solitary or numerous, and after fertilisation by the action of pollen become seeds. They consist principally of the nucellus, a central mass of tissue covered by one or more coats or integuments, and in most cases they are attached by a short stalk or funicle to the placenta, a ridge of tissue in the ovary. At the anterior end, the micropyle, a narrow canal or opening leads to the nucellus. Down this the pollen tube passes in fertilisation. The form of the O., its arrangement on the funicle, and the relative position of the micropyle vary in different families. In Ranunculaceae, for example, the O. is always inverted, so that the micropyle and funicle adjoin. The Os. are grouped in the placenta in various ways, the chief being axile, free central, and marginal.

**Owain ab Gruffydd**, see GLENDOWER, OWEN.

**Owari**, or Bishiu, prov. of Japan, in Honshu; largely a fertile plain, rice, wheat, barley, and horse-radish are extensively produced, and poultry rearing is important. The local clay is used in ceramics, an industry begun in 1297. Chief tn., Nagoya.

**Owatonna**, tn. in Steele co., Minnesota, U.S.A., on the Straight R., 56 m. S.W. of St. Paul. It is a health resort with mineral springs. Pop. 8700.

**Owego**, summer resort, cap. of Tioga co., New York, U.S.A., on the Susquehanna. It has trade in agric. products, manuf. leather, woollen goods, and iron, and has flour and timber mills. Pop. 3000.

**Owen Glendower**, see GLENDOWER, OWEN.

**Owen, John** (1560-1622), Brit. epigrammatist, b. at Plas Ddu, Carmarvonshire, educated at Winchester and Oxford; he became headmaster of King Henry VIII. School at Warwick. His Lat. epigrams, which have both sense and wit in a high degree, gained him much applause, and were trans. into Eng., Fr., Ger., and Sp.

**Owen, John** (1616-83), Eng. Puritan divine, b. at Stadhampton, Oxfordshire, and educated at Oxford, from which he was driven by Laud's statutes. Originally a Presbyterian, he passed over to Independency. In 1649 he accompanied Cromwell to Ireland, and in 1650 to Edinburgh. He was dean of Christ Church, Oxford (1658), and one of the 'triers' of ministers appointed by Cromwell. After the Restoration he was ejected from his deanery, but was favoured by Charendon who endeavoured to induce him to conform to the Anglican Church by offers of high preferment. Strange to say, Charles II. also held him in regard, and gave him money for the Nonconformists; and he was allowed to preach to a congregation of Independents in London. His great

learning and ability rendered him a formidable controversialist, especially against Arminianism and Romanism. His works fill 28 vols.; among the best known being *The Divine Original, etc., of the Scriptures*, (1659); *Indwelling Sin* (1668); *Christologia*, or . . . *The Person of Christ* (1670); and a commentary on Hebrews.

**Owen, Sir Richard** (1804-92), Eng. naturalist, b. at Lancaster. He studied anatomy at Edinburgh under John Barclay, and, coming to London, held various posts in the Hunterian Museum at the College of Surgeons. He made his name with the pub., in 1832, of a memoir on the pearly nautilus. In 1836 he was appointed the first Hunterian prof. of comparative anatomy and physiology. His prin. works at this time were a *Catalogue of the Physiological Series of Comparative Anatomy* (1833-40); *Odontography* (1840-45); and *British Fossil Mammals and Birds* (1844-1846). In 1856 the queen placed at his disposal for life Sheen Lodge in Richmond Park, and he became director of the Natural Hist. Museum at S. Kensington, for the estab. of which he was largely responsible. His *Anatomy and Physiology of the Vertebrates* appeared in 1868. He was undoubtedly the first anatomist of his day, and one of the greatest that ever lived. See life by his grandson, Rev. R. Owen, 1891.

**Owen, Robert** (1771-1858), Welsh Socialist, b. at Newtown, Montgomeryshire, was a precocious lad who came to London, worked as a shopman in London and Manchester, and eventually became the owner of successful cotton mills at Chorlton. There, eventually, he instituted a system of co-partnership, and started schools for infants. His scheme, then an entire novelty, attracted much attention, and drew many famous persons to visit and consult him. He wished to improve the conditions of labour, and especially of child labour, and he was the prime mover of the Factory Act of 1819. His open declaration of religious scepticism outraged largely against his schemes. His communist settlements in England and America proved to be failures. His *Idolotrophy* appeared in 1857-58. See lives by L. Jones, 1890; F. Podmore, 1906; and G. D. H. Col., 1930.

**Owen, Robert Dale** (1801-77), Scottish-Amer. social reformer and author, son of the preceding. Born and educated in Glasgow, he accompanied his father to New Harmony, Indiana, 1825. In 1835 he was elected to Indiana Legislature, and was a member of Congress, 1841-7. O. took a leading part in founding the Smithsonian Institution, and was U.S.A. minister at Naples, 1853-58. Some of his publs. are *Footfalls on the Boundary of another World* (1860); *Policy of Emancipation* (1863); *The Wrong of Slavery* (1864); *Debatable Land between this World and the Next* (1872); and an autobiography, *Threading my Way* (1874).

**Owen, Sir Stanley**, see BUCKMASTER, BARON.

**Owen, Wilfrid** (1893-1918), Eng. poet, b. at Oswestry, educated at the Birkenhead Institute and at London Univ. He

served on the W. front in the First World War, and was killed at the Sambre Canal. His work shatters the illusion of the glory of war, and, by a rare mastery of the association of words, he brings home to us both the hollowness and wreckage of war and the tender loveliness it has ruined. In technique his work shows one remarkable feature, a then peculiar type of rhyme used to enhance the expression of feeling. In these experiments in assonance and dissonance, well exemplified in his *Strange Meeting*, he substitutes for vowel identity a consonantal identity which is really an adaptation of means to an end. There is a deep humanity of self-revelation in such poems as *Greater Love* and *Apologia pro Poemata Meis*. See S. Sassoon (ed.), *The Poems of Wilfrid Owen*, 1921, and *The Poems of Wilfrid Owen* (ed. with memoir by Edmund Blunden), 1931.

**Owen Falls**, rapids of the Victoria Nile, in Uganda, situated 3 m. below the Ripon Falls (q.v.). In 1919 an agreement between the Brit. and Egyptian Govts. was concluded for the construction of a dam here, for the production of hydro-electric power and the control of the Nile waters. Plans for this work were prepared by and approved by the Egyptian Ministry of Public Works and the Uganda authorities. The construction of the dam is the responsibility of the Uganda Electricity Board, and when constructed will be administered by that body, which will regulate the discharges to be passed through the dam on the instructions of the Egyptian resident engineer. See also NILE.

**Owensboro**, co. seat of Davies co., Kentucky, U.S.A., on the Ohio R. The city has tobacco, furniture, and cellulose factories, and also coal and iron mines. The oil found near by has made O. the centre of a large oil producing field. Cattle are raised. Pop. 30,200.

**Owens, John** (1790-1846), Eng. cotton merchant, and founder of O. College, b. at Manchester. He entered his father's business, and soon making a large fortune he was able to bequeath £100,000 for the erection of a college, the instruction in which he implicitly wished to be secular. The Univ. of Manchester may be said to owe its foundation to O. College.

**Owen Sound**, co. tn. of Grey co., Ontario, Canada. It lies at the head of the large bay of the same name on the S.W. shore of Georgian Bay (Lake Huron), and owes its name to the great impression made by the fine natural harbour on Capt. Owen, who conducted the first hydrographic survey of the great lakes shortly after the war of 1812-14 with the U.S. Owing to his glowing description the Brit. officials gave his name to the bay. The original name of the settlement was Sydenham, changed to O. S. in 1851. Incorporated as a tn. in 1856, it became a city in 1920. It lies 110 m. N.W. of Toronto, on both the Canadian Pacific and Canadian National railways. It is an important livestock shipping centre, and its chief industries include furniture; marine, mining, and heavy castings;

woodenware; refrigerators; knitting; steel boats; stoves and furnaces; bolts, screws, and wire; tanning; lumber; paint and varnishes. Pop. 14,000.

**Owen Stanley Mountains**, mt. chain in the E. of Australian New Guinea. The highest peak is Mt. Victoria (13,200 ft.), but there are sev. peaks over 10,000 ft. high. In the Pacific campaigns of the Second World War the Jap. in 1912 made persistent efforts to penetrate to the S.E. of the is. in order to secure the mastery of the immediate approaches to Australia, but the O. S. M., which divide the is., proved a formidable barrier to any advance from the direction of Lae and Salamaua (q.v.) (July). But having gained a foothold in the Buna-Gona area and at Milne Bay (whence they were soon driven out again) the Jap. on Sept. 9 succeeded in crossing the range and a fortnight later they were within 32 m. of Port Moresby. The ill-fated attempt by the Jap. to drive the Amer. out of Guadalcanal, however, led to their abandonment of the initiative in New Guinea. The halting of their advance toward Port Moresby threw them back on the defensive, while their attempts to check the counter-attacking Australians S. of the O. S. M. were abortive, largely because of the growing air superiority of the Allies. After the capture of Forthwaite ridge at the end of Sept., the Australians were faced with little opposition until they had pushed through a gap and made contact with the Jap. on the N. slopes of the O. S. M. On Nov. 3 the Allies took Kokoda and on the 23rd entered Gona. By Jan. 22 the last Jap. forces in the is. were overcome (see PACIFIC CAMPAIGNS IN SECOND WORLD WAR).

**Owl** (*Strix*), distinguished from all other birds of prey, except the osprey, by the tarsus (of the leg bones) being half the length of the tibia, while the outer toe is able to be turned backwards or forwards at will. Another distinction is in the absence of the aftershaft present in the feathers of all hawks; this is a small accessory plume which springs from the under side of the main feather. Os. are mostly nocturnal in habit, but some hunt for food in full daylight. The head is always large, the neck short and contracted, the eyes are directed forwards and are surrounded by a characteristic ruff of feathers. The short beak is hooked. Os. have long been the subject of much superstition, being universally regarded as birds of ill omen. This has undoubtedly had much to do with their ruthless persecution, and only in recent years has it been realised that they are the most important check upon the excessive multiplication of rodents. In addition to these, reptiles, fish, and insects are eaten, and some species have been observed to feed on carrion. Indigestible remains of the food are cast up in the form of pellets.

Of the 15 species, the barn, white, screech, or church O. is the most widely distributed throughout Britain. The colour of the plumage varies, but the upper parts are commonly tawny buff mottled with grey, white, and brown, and

the under surface is whitish or sometimes yellowish with grey spots. The face is white and the bill yellow and a broad, fan-shaped pattern of feathers is formed round the eye and back of the head. The legs are long and covered with downy feathers. The eggs, which in all *O.* are white and laid in a stork-nest tower, in other buildings as well as in hollow trees. The faintly tawny or wood *O.* is more local in its distribution and hides during the day in woods, commonly nesting in holes in trees. The ground color is dark tawny or brown, approaching grey in some specimens. The short-tailed or woodcock *O.* frequents open places and flies in the day time as well as at night. Its distribution is more northerly than the others. The head, tail and wings are a rich brown with darker brown patches on the under

**Ox-bird**, see DUNLIN.

**Ox-bow**, type of lake. By meandering courses, rivers may form great loops: the neck of such a loop being eventually severed, a horse-shoe-shaped backwater is formed. The deposition of silt blocks up the ends, thus forming an O. lake. They are found, for example, in the lower Mississippi valley.

**Oxenford, John** (1812-77), Eng. author, b. at Camberwell, London. An accomplished linguist, he trans. Calderón's *La Vida es Sueño* and Goethe's *Dichtung und Wahrheit*. The knowledge of Schopenhauer's philosophy in England dates from the appearance of his essay on 'Iconoclasm in Philosophy' in the *Westminster Review* (Dec. 1876). From about 1850 O. was dramatic critic to *The Times*, his appreciations being rendered useless through their excessive and indiscriminate amiability. Two of his best known plays are *My Fellow Clerk* (1835), and *Twice Killed*, a farce (1835).

**Oxenham, John**, assumed name of William Arthur Dunkerley (d. 1911). Eng. author, educated at Old Trafford School and Victoria Univ., Manchester. He spent his early years in commerce, travelling in Eng. and U.S.A. He later took up the business side of journalism and was associated with Jerome K. Jerome in the periodicals *The Idler* and *To-day*. Turning to writing, he pub. his first novel, *God's Prisoner*, in 1898. This and succeeding romantic novels gave him a vogue, to which in 1913 he added the popularity of *Bess in Amber*, a book of verse. In 1911 his *Hymn for the Men at the Front* became very widely known. This was followed by other vols. of poetry, and after the war he wrote a number of books on the life of Christ, including *The Cedar Tree* (1921) and *The Hidden Years* (1925). He was over eighty at his death.

**Oxenstjerna, Axel, Count** (1583-1651), Swedish statesman, b. at Fono in Upland, and educated at the univs. of Rostock, Jena, and Wittenberg, became imperial chancellor to Gustavus Adolphus (1612). During the king's absence in Livonia and Finland (1611-16) O. looked after affairs at home. As a diplomatist he arranged the marriage between his youthful sovereign and Mary Eleonora of Brandenburg, drew up an agreement with Denmark jointly to occupy Stralsund (1629), and negotiated the favourable truce of Altmärk with Poland (1630). After Gustavus's fall at Lützen (1632) it was his courage and resourcefulness which kept the Protestant League together, and led, in 1633, to the formation at Heilbrunn of the Evangelical Union. In the Dan. war of 1643-45 his tactical skill again proved invaluable. During the brief rule of Queen Christina, O. was handicapped by the jealousy of his young mistress, but he nevertheless emphatically opposed her abdication.

**Oxenstjerna, Bengt Gabrielsson, Count** (1623-1702), Swedish statesman, was appointed governor of Masovia, Great Poland, Kulm, and Kulavia (the Polish provs. which his country had conquered) in 1655. His spirited and prolonged

defence of Thorn against the Poles ended at length in a capitulation so dignified that its terms were afterwards included in the Peace of Oliva (1660). For four years (1662-66) he was governor-general of Livonia. As minister of foreign affairs (1680-97) he supported Great Britain, Holland, and the emperor against France and Denmark.

**Oxenstjerna, Johan Gabriel** (1750-1818), Swedish poet, b. at Fono, was a nephew of Count Gyllenborg. He wrote a trans. of *Paradise Lost*, besides a number of original poems and odes and an eulogy of Gustavus III., at whose letter-loving court his academic elusions and graceful idylls were much admired. O. undertook many political and diplomatic missions for his king and patron, who in return created him marshal in 1792.

**Ox-eye Daisy**, or Dog Daisy (*Chrysanthemum leucanthemum*), perennial herb of the order Compositae. It has daisy-like flower-heads with white rays and yellow disk florets.

**Oxford, Earl of**, see VERN, ROBERT DE.

**Oxford, Robert Harley, Earl of**, see HARLEY, ROBERT, EARL OF OXFORD AND MORUMBER (1661-1721).

**Oxford**, city, municipal co., and parli. bor., episcopal see and co. tn. of Oxfordshire, is situated at the confluence of the Thames and the Cherwell, 52 m. W.N.W. from London (63½ m. by rail). Though the tn. is famous chiefly for its univ., it owed its initial rise to other influences. It was situated between Merca and Wessex, on one of the best of the fords across the Thames. Its importance in early times is shown by the first mention of it in hist., which occurs in the *Anglo-Saxon Chronicle* for 912. Here we read that in this year Edward, son of Ethelred, took possession 'of London and Oxford and all the lands obedient to these cities.' The tn. probably made a stubborn resistance to the Norman invaders, and Domesday Book shows the troubles which followed. To prevent further revolt the Norman governor, Robert D'Oilly, built huge works to keep the tn. in submission. The remains of these are to be seen in the castle tower and parts of the churches of St. Michael, St. Peter in the E., and St. Cross. The city again figures prominently in the troubles of Stephen's reign, and in 1142 the Empress Matilda was besieged there, escaping over the riv. on the ice. But, with unimportant exceptions, the fortifications were not again seriously attacked till the seventeenth century, after which it ceased to rank as a place of strength, and rapidly fell into decay, though D'Oilly's tower has successfully weathered the storms of eight centuries, and even now is practically intact. In 1258 the Provisions of O. were drawn up there for the guidance of Henry III., and the Montfort rebellion thus took its rise. Again, in the civil war of Charles I.'s reign, O. figures as the chief cavalier centre, enthusiastic in support of the king. Fable has naturally been busy with the origin of O. Univ. (q.v.), which has been traced back to the time of Alfred. Univ. College, a venerable looking building, was

for many years reputed to have been founded in 872 by Alfred; the assignation, however, was based on a forged charter concocted in the early hist. of the college, and the college really owes its existence to a small benefaction made by William of Durham in the thirteenth century, but of its original building not a stone remains. By many authorities Merton College (1261) is regarded as the earliest of O.'s foundations, and to Walter de Merton is justly due the conception of academic institutions on which the existing colleges are based. Historically, however, we must date the rise of O. Univ. from the beginning of the twelfth century, at which

John H. Stone

OXFORD: MAGDALEN TOWER AND BRIDGE.  
On the left, the Botanical Garden.

time we read that such teachers as Theobald of Ely taught there. There was at first little if any discipline, teachers and scholars gathering quite promiscuously. Organisation began in the thirteenth century, by the end of which O.'s scholars were to be numbered by hundreds. The fame of the univ. grew steadily, until by the fourteenth century it was the equal of any in Europe. But as the univ. grew, there was increased opposition between it and the tn. This opposition often became so acute as to lead to terrific struggles, and the feud survived until modern times in the 'town and gown' conflicts. A very interesting period in the hist. of O. is that which deals with the coming of the friars in the thirteenth century.

The old tn. of O. is built almost entirely in the angle formed by the Cherwell and the Thames, here called the Isis. The four main roads of the tn. meet at the place known as Carfax (derived from

Lat. *quadrifurcus*, 'four-forked'). Carfax Tower, said to have been built in the reign of Edward III., shows indications of a much earlier date. It was renovated in 1894, and the curious 'Quarter Boys' relic of bygone days, restored to use. N. from Carfax runs Cornmarket Street, continued further N. as Magdalen Street. Where Cornmarket Street runs into Magdalen Street it is crossed by a thoroughfare known under the successive names (E. to W.) of George Street, Broad Street, Holywell Street, and Long Wall Street. It sweeps round in a large curve, and roughly marks the boundaries of the ancient city in that direction. Some fragments of the old wall still remain, notably as part of the wall of Merton Gardens. W. from Carfax runs Queen Street, continued as New Street. In Cornmarket Street is St. Michael's Church, the tower is late eleventh-century work. Not far from it is the church of St. Mary Magdalene, an interesting building of various dates. Near by is the Martyrs' Memorial, a monument commemorating the martyrdom of Ridley, Latimer, and Crammer, designed by Sir Gilbert Scott. S. runs St. Aldate's as far as Tolly Bridge, near which are moored the barges of the college boat clubs. Until near the end of the eighteenth century, an ancient water-tower, known as Friar Bacon's Study, rose over the old bridge. Eastwards from Carfax runs the High Street, off which is the univ. church of St. Mary the Virgin, built between the thirteenth and fifteenth centuries, except for the baroque porch, erected by Laud. It was in St. Mary's that Crammer was degraded previous to his martyrdom; to St. Mary's were brought from Cumnor the mangled remains of Amy Robsart; and here its pulpit Keble preached his famous sermon on national apostasy. A fire on the night of Nov. 17, 1916, destroyed the seventeenth century Jacob Schmidt organ and the roof of the chancel, besides devastating an area roughly 80 ft. by 40 ft. This street passes out of O. over Magdalen Bridge. Magdalen Bridge commands fine views N. and S., the former the wooden heights of Headington Hill, with St. Clement's Church in the middle distance, the latter Magdalen College school playing fields and a section of the botanic gardens. In High Street are the examination schools, used in the World Wars as a military hospital, designed by Sir Thomas Graham Jackson, who also designed O.'s 'Bridge of Sighs', connecting the two sections of Hertford College. Opposite to Hertford is the Bodleian Library, most of which was designed by Holt of York. Near it is the Clarendon Building, which for many years was the home of the O. Univ. Press. Designed by Vanbrugh, both of its main elevations are stately; that on the S. contains a figure of Lord Clarendon, from the proceeds of whose book, the *History of the Rebellion*, the building was erected. The New Bodleian, designed by Sir Giles Gilbert Scott, was opened in 1947. Christ Church, one of the smallest, but certainly one of the most beautiful, of Eng. cathedrals, is a splendid example of Eng.

church architecture. The pier-arches are early twelfth-century work, as are the transepts and choir-aisles. 'Tom Tower' of Christ Church contains the famous bell from which the tower gets its name. The statue is that of Wolsey, who planned Tom Quad, and to whose genius the conception of the cathedral was really due, though the honour has been assigned to Henry VIII. O. has now expanded to take up many suburbs, Osney and Botley on the W., Grandpont in the S., St. Clement's on the E., and St. Giles's and Summertown, the popular residential dist., on the N. There are sev. well-known schools in O. Magdalen College school was founded in 1180 by William of Waynflete for instruction in grammar; the college choristers, not originally members of the school, have since 1819 been boarded in the master's house at the expense of the college. St. Edward's School, founded in 1863, was originally in New Inn Hall Street, being removed to Summertown in 1873. Others include Headington School, Milham Ford School, and O. High School, for girls.

Before 1914 O. was regarded solely as a univ. city and mkt. twn., printing being then its only c.a. bleable industry. Between the two wars the O. motor industry expanded rapidly, and the city's pop. rose from 67,000 in 1921 to 91,000 in 1938. By 1945 O. itself contained a pop. of 100,000. Extensive development had also taken place immediately outside its limits, so that the total pop. is really much larger. Many of the workers travel daily to Cowley, either from neighbouring vills. and small twns., or by train from Reading, Swindon, and other places further out. O., however, possesses a few natural advantages for the location of heavy industry, and the success of the motor industry must be attributed to the initiative and ability of its founder, Lord Nuffield. Unfortunately, the only effective controls on building were those exercised by the physical geography of the site, and the built-up areas now resemble the spokes of a wheel radiating from Carfax, and separated by the valleys of the Cherwell and the Thames. The old walled city was planned on its cramped site at the S. end of the gravel terrace between the two rivers, and is in striking contrast to the unplanned development of recent years. But in 1945 the city council appointed Mr. Thomas Sharp, president of the Tn. Planning Institute, to prepare a master-plan for the future development of O. Since 1885 the city has returned only one member to Parliament: before that date it sent two. The univ. returned two members. See J. Ingram, *Memorials of Oxford*, 1837; C. W. Boase, *Oxford* (in *Historic Tns. series*), 1887; G. Smith, *Oxford and the Colleges*, 1895; P. Dearmer, *The Cathedral Church of Oxford*, 1899; C. Headlam, *Oxford* (Medieval Tns. series), 1907, and *Oxford and its Story*, 1914; A. Lang, *Oxford*, 1916; J. Wells, *The Charm of Oxford*, 1920; J. Betjeman, *An Oxford University Chest*, 1938; C. Hobhouse, *Oxford*, 1938; T. Sharp, *Oxford Replanned*, 1948; and W. J. Arkell, *Oxford Stone*, 1948.

Oxford, vil., 57 m. W. of Pictou, in Cumberland co., Nova Scotia, Canada. Pop. 1400.

**Oxford and Asquith** (Emma Alice Margaret Tennant), Countess of (1864-1945), sixth daughter of Sir Charles Tennant, wealthy ironmaster of Peeblesshire, and a descendant of Robert Burns, b. in Peeblesshire. Her autobiography, pub. in 1920, recording her vivid impressions of leading men and women, portrays her in her uninhibited youth as an exceedingly versatile and unconventional young woman, a gay talker, a dashing rider to hounds, a student of Plato, and an inveterate flirt. Later she became a conspicuous member of the brilliant Victorian group known as 'The Souls,' of whom Arthur James Balfour was the moving spirit. 'The Souls' were moved by an interest in things of the mind, as opposed to the ordinary frivolous interests of the hour. The romance of her life was her meeting with the rising politician, Herbert Asquith, and her marriage to him in 1894. Asquith put service to his country before other considerations, sacrificing a financially successful career at the Bar to devote himself to politics. There were doubts on the part of many as to the possibility of Margot (her pen-name) being able to subordinate herself to her husband's interests, but the marriage, involving what seemed a difficult adjustment for the bride, in assuming the care of her widower husband's spirited children, was in every way successful. Money conditions were not easy in such a social position for the family. These were the circumstances which led her to take up writing, with the result that a valuable series of pen-sketches of notabilities of her time was made available to the world. In 1920 a publisher offered her £10,000 for her diary. This pub. led to a lecturing tour in America in 1922, when interviewers in scores besieged her. As a writer hers was a personal success rather than a noteworthy literary achievement. The secret of her brilliant reputation lay partly in her good fortune, but still more in her vivid and vital personality. Her pub., in addition to the famous *Autobiography of Margaret Asquith* (1922), include *Plays and Persons* (1923); *Law Sermons* (1927); *Ocellaria* (1928); and *More Memories* (1933). She had two children, the Honourable Anthony Asquith, film producer, and a daughter, Elizabeth (d. 1915), who married Prince Antoine Bibesco. See Barry Pain, *Marge Asquith*, 1920.

**Oxford and Asquith, Herbert Henry**, first Earl of (1852-1928), son of Joseph Dixon Asquith, of Morley, Yorkshire, was b. on Sept. 12, 1852. He was educated at the City of London School, and went later as a scholar to Balliol College, Oxford. He distinguished himself at Oxford in classics, taking the Craven scholarship and becoming a fellow of his college. He was also president of the Union. He was called to the Bar after leaving Oxford, and quickly distinguished himself; he defended John Burns in 1887 in the case arising out of the riots in Trafalgar Square, and in 1889 he

was junior counsel for the Irish Nationalist members in the Parnell case. In 1886 he became a member of the House of Commons for E. Fife, a seat which he retained up to the year 1918. In 1892 he moved the vote of want of confidence which led to the fall of the Salisbury gov., and was rewarded by the office of home secretary in the Liberal Cabinet which was then formed. He was bitterly attacked during his period of office when the Featherstone riots took place. Between 1895 and 1906 he divided his time between law and politics, and probably did much to weaken his position in the party by his rigid adherence to imperial ideas during the Boer

*Topical Press*

LORD OXFORD AND ASQUITH

war. But on the announcement of the fiscal policy of Mr. Chamberlain, he led the movement which was to unite the Liberal party on economic grounds, and to sweep the country in 1906. In 1905, on the resignation of Mr. Balfour, he became chancellor of the Exchequer in the Campbell-Bannerman gov., and soon became the most prominent man of the party. In April 1908, on the resignation of Campbell-Bannerman, he became Premier. In 1909, when the rejection of the budget by the Lords forced an election, he returned to attack, with the help of the Irish and the Labour members, the veto of the Lords. Following a general election, Nov. 1910, a Veto Bill was introduced and passed, after a threat of creation of peers had led to the withdrawal of the official opposition. In 1911, Asquith being Premier for the third time, was passed an Insurance Act, and in 1912 Bills for the Better Government of Ireland and Welsh Disestablishment were introduced.

The dominating issue in politics in the

years immediately preceding the First World War, while he was as yet Premier, was Irish Home Rule. He would allow nothing to compromise Liberal policy in this issue. Female suffrage, rightly or wrongly, was supposed to be prejudicial to the Home Rule champions. Hence on the suffrage issue the whole Nationalist party under Redmond rallied to the Asquith banner, and the Plural Voting Bill, in spite of his negative pledge to the suffragettes 'not to use his personal influence against them,' was, fortunately for the Home Rule Bill, lost. Then came the historic Curragh Incident (*see CURRAGH INCIDENT*). Col. Seely, then war minister, resigned, and Asquith abruptly announced that he proposed to act as war minister himself. He handled the situation with tact and skill. Negotiations were now continued for finding some *via media* which would give S. Ireland Home Rule, and at the same time meet the objections of such parts of Ulster as were affected. In March 1914 he announced his readiness to give to each Ulster co. the option of excluding itself from the Irish Parliament. While this Bill made progress towards the statute book, treason was being fomented in Ulster, especially by the importation of arms and the formation of the Irish national volunteers. In this conjuncture the king on the advice of Asquith summoned a conference of party leaders to meet at Buckingham Palace. But no settlement was reached. None could say what might happen, when this and every other question of internal politics became submerged in the cataclysm of the First World War. Asquith resigned the war ministry to Lord Kitchener, and devoted his energies to securing the solidarity of the country against the common enemy. There still remained some difficulty about the Home Rule Bill, which, under the Parliament Act, was now ready for the royal signature. To the statute book the Nationalists demanded that the Bill should go, but the Ulster members asserted that this would be to violate the political truce agreed upon. A similar conflict raged on the fate of the Welsh Disestablishment Bill. Asquith, however, brought in a Bill the purpose of which was, while securing the placing of the Bill on the book, to postpone their operation for at least a year until the war was over.

As a peace Prime Minister he had revealed great qualities as a debater, and much dexterity as a party leader. But to the test of war he showed, at all events in the earlier months, none of the incisiveness which seemed at a later stage to characterise his policy towards the questions of conscription and the shell shortage. His speeches were admirable expositions of the purposes for which the country was fighting. On the munitions question which was destined to prove his downfall there was believed to be a marked and indeed bitter, difference of opinion between Lord Kitchener and Sir John French (later earl of Ypres) on the kind of ammunition that was suitable. The assumption was without any foundation

whatever. The outcome of the matter, however, was Asquith's suggestion that the interests of the nation were probably better served by the substitution of a non-party gov., and the consequence was a Coalition Gov. drawn from all parts of the House. The Irish Nationalist leader was even offered a post in the Cabinet but he refused. Then came the Irish Rebellion of 1916. After the execution of the ring-leaders, Asquith visited Ireland in the hope of laying the foundations for an honourable settlement. Negotiations were set on foot between the leaders of the opposed Irish factions, Lloyd George being the gov. intermediary. A compromise was reached but soon afterwards wrecked through the influence of the Unionist wing of the Coalition ministry. Among the Unionists at this time conviction was growing that if the war was to be won Asquith should be superseded. The first blow was dealt by Lloyd George by his proposal of a War Council from which the Prime Minister should be excluded, an exclusion which he defended on the ground that the independence of opinion from party influence would thereby be secured. Asquith concurred, but yielding to the pressure of his friends afterwards withdrew his consent. Lloyd George retained it by sending in his resignation. Then Bonar Law and the other Unionist members of the Cabinet gave notice to the Premier that they were no longer willing to co-operate with him, and he was thus forced into a resignation and Lloyd George displaced him as Prime Minister (1916). This was really the end of Asquith's long and distinguished record as a minister of the Crown. Apart altogether from the Home Office imbroglio the true cause of his downfall was his real or fancied inability to handle the shell shortage problem. Col. Edmondson, *The Times* military correspondent, had made in spite of the press campaign a public revelation of the seriousness of this shortage. Where Asquith failed Lloyd George succeeded. The minutes were forth coming and at a huge price to the nation and the war was won. But the transfer of power from the leader to his lieutenant naturally brought with it the bitterest acrimony between the respective adherents and the cleavage was never mended.

In the 1918 Khaki election Asquith was defeated for 1916 and found himself in the anomalous position of being leader of the Liberal party and custodian of its funds, yet apparently without the possibility of being returned to the Commons. Ultimately he was 'outraged' for Paisley, Buck in the House, and disavowed by all his old friends to underwrite the position of Lloyd George. That availed nothing, and when at last the Coalition fell the common disaster induced the two warring sections of the Liberal party to reach a compromise whereby Asquith was accepted as leader with Lloyd George as his chief lieutenant but hardly *fiduciarius*. The former's popularity and authority had now a fresh lease of life and when Baldwin in 1922 committed the blunder of joining battle

over the free trade and tariff issue Asquith exploited the situation with his accustomed powers of strategy and argument. But unfortunately for Liberalism, when he was again returned for Paisley he found that the political battlefield had changed. There was a third contestant in the field, the Labour party. In combination with the Labour party the Liberals could turn Baldwin out of office. In the result Asquith announced that he considered it to be his duty to help the Labour party into power but that he would withdraw his support if it should commit what the Liberals held to be extravagances. The Conservatives never forgave him for this apparent playing into the hands of the Labour party and the brief and glorious eight months reign of Ramsey MacDonald's first gov. was followed by the return of a Coalition gov., with a tremendous majority. Asquith though still Liberal leader once again found himself without a seat. But an impossible situation was created in Feb. 1923, when he was raised to the Upper House, with the title of Earl of Oxford and a few weeks later he was made Knight of the Garter. This left Lloyd George as leader of the Liberal party but the assumption that differences between him and Lloyd had been made it was difficult during the general strike of 1926 when the collapse of the strike, Lloyd charged Lloyd George with pursuing a policy of his own towards the strike and was denounced by his colleagues. The Liberal press however supported Lloyd George. The quarrel had little effect on Lloyd's life and stroke of misadventure which, though slight beside the earlier slight to energy, and he died at Sutton Court on Feb. 1, 1928. His *Memories of a Reflection* published a few months after his death contain well-chosen comments on some of the great events in his long political experience and characteristically returned observations on the action of his party.

**Oxford and Cambridge Cup**, the play contested for annually by Aristocratic universities. It was first played in 1833 by old blues at Oxford and Cambridge.

**Oxford Broad**, see *under* *see* *see*.

**Oxford Clay** sub group of the Oxford in div. of the Middle Jurassic system, consists of layers of stiff fine-grained clay. It stretches from Dorchester where it attains a thickness of about 800 ft. through Oxford to York where it is about 100 ft. thick. The beds are very fossiliferous yielding a Monocle (*Taxon*), *Cordetes*, *Dumetia*, *Ornatia*, *Belemnites* (*Hastata*) and abundant *Lucinellina* (*Myophoria* *dilatata* (*Oscia*) etc.). *Ammonoites* (*Cordatis* and *Taxon* occur in local fossils. Gastropods and Brachiopods are found, but are not plentiful. Fishes (*Hypobius*, *Leptodus*, etc.) and some reptilian genera (*Ichthyosaurus*, *Platanosaurus*) have been found. In France the rocks are represented by the 'Oxfordien,' and they are found in Germany at the base of the 'White Jura.'

**Oxford Group**, or **Buchmanian**, form of

John H. Stone

OXFORD: THE UNIVERSITY CHURCH OF ST. MARY

On the right is Brasenose College.

religious revivalism founded at Oxford Univ. in 1821 by Frank N. B. Buchman (b. 1878), a wealthy Lutheran evangelist. The O. G. disclaims any intention of establishing a new sect; it aims to serve and to leaven the churches from within by the integrity of its members' lives; and it professes to reproduce the religion of the Apostles without their poverty and self-abnegation. The O. G.'s work of personal evangelism is conducted informally and fatigamately in groups which gather together in educational institutions, in church congregations, and, more popularly, in private houses. At these 'house parties' there are discussions, personal confessions, known as 'sharings,' and the giving of counsel by the evangelists or 'life-changers.' Groups have been established by Buchman in all parts of the world, and the members have been remarkable for their zeal and sincerity. Four main objections are raised against the system by orthodox churchmen. (1) It ignores the intellectual and institutional side of Christianity; enthusiasm is no alternative for sound reasoning and sacramental grace; (2) the practice of 'sharing' and of reliance upon divine guidance without the discipline of authority in dogma and morals is open to dangerous abuse; (3) the movement is too exclusively bound up with the moods and claims of adolescents; (4) its conception of Christianity is too meagre and limited.

Oxford Movement, known also as the Tractarian Movement, and by its supporters as the Catholic Revival, was an attempt to revive primitive and Catholic religion in the Church of England. Its

proximate cause was the gov.'s abolition of ten Irish bishoprics in 1833, which caused many to ask on what the church could rest if attacked by the gov. The reply came from Oxford in the insistence on the divine mission of the church as the extension of the Incarnation. Newman dates the commencement of the movement from Keble's sermon at St. Mary's, Oxford, on July 11, 1833. In the same year began the pub. of the *Tracts for the Times*. In 1831 Pusey gave the movement the weight of his learning and influence. Other names prominent in the origination of the movement were those of Newman, Keble, and Froude. The *Tracts* evoked a storm of opposition, and in the chaos that followed many of the original leaders seceded to the Church of Rome. The events of this period may be studied in Newman's *Apologia* and Liddon's *Life of Pusey*. But the movement continued with increased vigour, and by the beginning of the twentieth century had transformed the face of the whole Anglican communion. It has promoted home and foreign missions, frequent services, a high standard of clerical life, and reverent ceremonial. There are many books on the subject. See R. W. Church, *The Oxford Movement*, 1891, and W. Walsh, *Secret History of the Oxford Movement*, 5th ed., 1899.

Oxford Sheep, see under SHEEP.

Oxfordshire, or Oxon, midland co. of England, bounded on the S. by the Thames. The surface is varied; the greater part of the co. lies in the Thames-basin, but in the N. there are stretches of downs, while the S. is hilly, the greatest elevations being reached in the Chiltern Hills. Part of Wyckwood Forest, disafforested in 1862, is found in the W. The chief riv. is the Thames, with its tributaries, the Windrush, Evenlode, Cherwell, and Thame, none of which rises in the co. The scenery in the Thames valley is extremely beautiful, and includes many favourite resorts, Henley, Goring, etc. The soil is good, and agriculture flourishes; the main crops are barley, oats, and wheat, while beans and turnips are also grown. Farming in all its branches is carried on, and cattle, sheep, and pigs are reared. Some iron ore is raised, and brickmaking is an important industry. The chief manufactures are motor vehicles at Cowley, blankets at Witney, gloves at Woodstock, agric. implements and engines at Banbury (which is also famous for a certain kind of cake), with tweed, lace, and paper mills. The co. is served by the W. Region railway, and also by a branch of the Midland Region from Bleicester to Oxford. The co. includes fourteen hundreds, and two parishes, each returning one member. The Rollright Stones and the Devil's Quoit at Stanton Harcourt are well-known prehistoric monuments. Oxford was the chief stronghold of the Royalists throughout the Civil war (1642-46), and was the scene of many engagements. Few of the old castles remain, the most notable being those of Oxford, Shilburn, and Hampton, while there are remains of such celebrated mansions as Minster Lovell, Greys Court, and Ryeford. Of all the

monastic buildings that were the natural outcome of the close proximity of the univ. but few remain, the abbey church at Dorchester being the most important. There are a number of beautiful churches, besides those in Oxford (*q.v.*) itself, including those of Iffley, Adderbury, and Minster Lovell. Area 768 sq. m. Pop. 244,000. See A. Moe, *Oxfordshire*, 1942, and R. Turner, *Oxfordshire*, 1949.

**Oxford University.** The beginnings of teaching at Oxford cannot be carried further back than the beginning of the twelfth century, when we read that it was the seat at which Theobald of Ely gave instruction (c. 1120). As a corporate body the univ. probably took its rise towards the end of this century or the beginning of the thirteenth. Under the Oxford and Cambridge Act, 1534, a Statutory Commission was set up for Oxford, and many new statutes were made for the O. U. and colleges. The univ. is a corporation consisting of masters and scholars united under the chancellor. The undergraduates and bachelors of arts, being in *statu pupillari*, have no voice in the government of the univ., which rests with the senior graduates. Final control over all acts and business of the univ. rests with the House of Convocation, which consists of all M.A.s and doctors of the higher faculties who have kept their names on the univ. books. Convocation cannot now, as formerly, override the Congregation, but this change is of no real importance inasmuch as the only matter on which it had resisted the Congregation was in the granting of theological degrees to members of all denominations, which matter was resolved by agreement in 1820. Before a proposition is submitted to Convocation it comes before the Congregation of the univ., constituted in 1834, consisting of (1) the chancellor; (2) the officers of the univ.; (3) a body of graduates qualified by residence. This body, besides approving and amending legislation submitted by the Hebdomadal Council to Convocation, has considerable powers in the election of the administrative boards of the univ. The auct. House of Congregation, consisting of college deans, examiners, and certain masters of arts, was once concerned with education and discipline, but now has practically no other function than that of granting degrees. Its former functions were lost under the Act of 1834, which created the Congregation of the univ. The Hebdomadal Council, instituted in 1631, consists of the chancellor, vice-chancellor, and proctors (official members), and a number of other members, heads of houses and profs. elected for six years by the Congregation. It carries on the ordinary business of the univ., including, especially, the initiation in promulgating, considering, and submitting to Convocation all univ. legislation and the control of policy. Ceremonial functions of the univ., which till 1609 were observed in St. Mary's Church, are held in the Sheldonian theatre (built by Wren, 1669). O. U. possesses faculties in theology, law, medicine, *literæ humaniores*, modern hist., Eng. language and literature, medieval and

modern languages, oriental languages, physics, sciences (including mathematics), and biological science, and has boards of studies for music, philosophy, politics, and economics, while there is also a univ. extension board. O. U. awards the usual degrees and diplomas and admits both men and women after preliminary examination (matriculation). Among the scholarships offered, the Rhodes scholarships are some of the most important. These scholarships were founded in 1902 by Cecil John Rhodes, awarded to students from the colonies, America, and Germany. The Bodleian library, founded in 1602, is also the general library of O. U., and contains 1,250,000 vols. and 49,000 MSS. There are also a number of departmental and college libraries. The relations between the univ. and colleges are intimate, all members of the colleges being members of the univ., but the college corporate bodies are distinct from the univ., and manage their own property. For articles on the sev. colleges see under their respective titles: ALL SOULS, BALLIOL, BRASENORSE, CHRIST CHURCH, CORPUS CHRISTI, EXETER, HERTFORD, JESUS, KEELE, LINCOLN, MAGDALEN, MERTON, NEW, ORIEL, PEMBROKE, QUEEN'S, ST. EDMUND'S HALL, ST. JOHN'S, TRINITY, UNIVERSITY, WADHAM, and WOODSTOCK COLLEGE, which are men's colleges, and LADY MARGARET HALL, ST. ANNE'S, ST. HILDA'S COLLEGE, ST. HUGH'S COLLEGE, and SOMERLEVILLE, which are women's colleges; also NEWMAN and RUSKIN COLLEGES. St. Peter's Hall for men was founded in 1929. In 1918 a donation was accepted for the

John H. Stone.

CHRIST CHURCH, OXFORD: FRONT QUAD KNOWN AS TOM QUAD

estab. of an Anglo-Fr. graduate college, to be called St. Anthony's. In 1948 there were about 8000 undergraduates. See A. Vallance, *The Old Colleges at Oxford*, 1912; C. Headlam, *Oxford and its Story*, 1911; Sir C. Mallet, *History of the University of Oxford*, 1924; J. A. R. Marriott, *Oxford: its Place in National History*, 1933; A. M. Rogers, *Doc. by Degrees*, 1938; C. Hobhouse, *Oxford*, 1939; and *Oxford University Handbook* (ann.).

**Oxford University Press**, dept. of the univ. wholly owned by 'the Chancellor, Masters, and Scholars,' and by far the

largest institution of its kind in the world. It receives no grant from the univ., nor from any other source, but is self-supporting, the profits being employed both as a source for working capital and to finance the pub. of learned works. It is governed by a univ. committee, the Delegates of the Press. Its prin. depts are (1) the publishing office at Oxford, responsible for the learned and educational books bearing the imprint 'At the Clarendon Press' (a name derived from the first earl of Clarendon, part of the profits from whose *History of the Rebellion* contributed to the cost of a building which housed the press for more than a century); (2) the printing works, also at Oxford; (3) the publishing dept. in London, whose functions have for long included, in addition to the distribution of Clarendon Press books and Oxford Bibles and prayer books, the production of certain classes of books of a less strictly academic character (e.g. the World's Classics series, *q.v.*), and conveniently differentiated by the more general imprint 'Oxford University Press.'

The first Oxford book is believed to have been printed in 1478 (though the date on the title-page is 1468), but the continuous hist. of the press does not begin until 1585. Many notable works of learning were issued during the next 300 years, and a period of great expansion began towards the close of the nineteenth century, coinciding with the growth of public education. The most widely known Oxford books are no doubt the Bibles and prayer books, and the dictionaries and reference books, notably the great *Oxford English Dictionary*, begun in 1884 and completed in 1928, and the *Dictionary of National Biography*, handed over to the delegates by its original publisher, Messrs. Smith, Elder, in 1917.

**Oxgang**, see BOVATE.

**Oxidation**, chemical process whereby substances take up or combine with oxygen, as, for example, when magnesium burns in air  $2\text{Mg} + \text{O}_2 = 2\text{MgO}$ . A substance containing hydrogen can sometimes lose some or all of it in the form of water when oxidised. Thus alcohol,  $\text{C}_2\text{H}_5\text{O}$ , is oxidised to acetaldehyde,  $\text{CH}_3\text{CHO}$ , by the oxygen-giving mixture of potassium dichromate and sulphuric acid. Further  $\text{O}$ , by the addition of oxygen, produces acetic acid,  $\text{CH}_3\text{COOH}$ . Thus the result of  $\text{O}$  may be either an increase of oxygen or a decrease of hydrogen. Extending the term, we may say that the addition of a negative element or radical is a process of  $\text{O}$ , whereby a compound corresponding to a higher degree of  $\text{O}$  is obtained, e.g.  $2\text{FeCl}_2 + \text{Cl}_2 = 2\text{FeCl}_3$  (see OXYGEN). Ferrous chloride is derived from ferrous oxide,  $\text{FeO}$ , and ferric chloride from ferric oxide,  $\text{Fe}_2\text{O}_3$ . Thus  $\text{O}$  sometimes involves valency increase.

**Oxide Paint**, paint in which the colour of the pigment is due entirely to inorganic iron compounds. The pigments mix well, are inert and permanent, and vary in colour from dark red to black through purple. They are chiefly used in external painting, in an oil medium.

**Oxides** are binary compounds formed by the union of the elements or compound radicals with oxygen. They may be divided into three classes: (1) Basic  $\text{O}$ ; (2) acid-forming  $\text{O}$ ; (3) other  $\text{O}$ , including suboxides and peroxides. Basic  $\text{O}$  are the  $\text{O}$  of metallic elements which unite with acids to form salts with the elimination of water. Thus  $\text{CaO} + 2\text{HCl} = (\text{aCl})_2 + \text{H}_2\text{O}$ . Acid-forming  $\text{O}$ , or acid anhydrides are the  $\text{O}$  of non-metallic elements or negative groups, which unite with water to form acids, e.g.  $\text{SO}_2 + \text{H}_2\text{O} = \text{H}_2\text{SO}_3$ . Some of the higher  $\text{O}$  of the metals are acid-forming, e.g.  $\text{CrO}_3$ , chromic anhydride, unites with water to form chromic acid,  $\text{H}_2\text{CrO}_4$ . In the remaining class of  $\text{O}$ , we have the neutral  $\text{O}$ , such as water ( $\text{H}_2\text{O}$ ), which have neither acid nor basic properties; suboxides which are generally reducing agents (see REDUCING AGENTS), e.g. lead suboxide,  $\text{Pb}_2\text{O}$ ; peroxides, which act as oxidising agents, e.g. lead peroxide,  $\text{PbO}_2$ . (Sometimes an arbitrary distinction is made between peroxides like  $\text{BaO}_2$ , which give hydrogen peroxides with dilute acids, and dioxide-like  $\text{MnO}_2$ , which do not.) The above classification is not a hard and fast one, as some  $\text{O}$  may be both acid and basic, e.g. the oxide of tin,  $\text{SnO}$ , and the oxide of antimony,  $\text{Sb}_2\text{O}_3$ . See OXYGEN.

**Oxides, Alkyl**, see ETHERS.

**Oximes** are compounds derived from the aldehydes (*q.v.*) and ketones (*q.v.*) by replacing the oxygen atom of the  $>\text{C}=\text{O}$  or  $>\text{C}=\text{O}$  group by the radical  $>\text{N.OH}$ . This replacement is usually effected by acting on an alkaline aqueous solution or suspension of the aldehyde or ketone with hydroxylamine hydrochloride,  $\text{NH}_2\text{OH} \cdot \text{HCl}$ , the alkali serving to liberate free hydroxylamine from the hydrochloride:

The  $\text{O}$  are usually beautifully crystalline compounds, and are used in the separation and purification of the aldehydes and ketones. They are also of considerable interest from the point of view of stereo-isomerism (*q.v.*).

**Oxlip** (*Primula elatior*), handsome plant with a very limited distribution in the E. cos. of England. It is intermediate in character between the primrose and the cowslip, but may be distinguished from the rather common hybrid between these two plants by the absence of folds in the throat.

**Oxon**, see OXFORDSHIRE.

**Ox-pecker**, or *Buphagus africana*, is a species of Starling, the starling family, found in Africa. In colour it is a dingy brown, with tawny under surface and tail. It is a strong flier, of great swiftness, and in habit is insectivorous. Its various names, of which rhinoceros-bird is one, are

four flat labial palps or lips assisting the food to the large dilatable mouth. On each side are a pair of simple gills placed between the folds of the mantle. All produce vast numbers of eggs, the common *O.* is computed to produce more than 1 000 000 during the summer; they are

I

discharged into the gills, where they remain until hatched, when they escape in a cloud. In the free-swimming period numbers are decimated by slight variations of temp. and by enemies. Only those that survive ultimately attach themselves to a rock or other substance. If they escape their number increases, they grow in the course of five or six years into a shell fish sufficiently large for the table. Although they do not know the art of *O. culture* in Britain, but to a limited extent it is only within the last year that it has been revived. The number of localities suitable for *O. culture* in the U.S. cannot be decided, for the water is cold in summer, and cannot exist where there is sand, it works its way into the lungs of the shell, it prevents it from opening and closing, and soon kills the animal. Sewage pollution is not harmful to the *O.* themselves, but there is serious risk of infecting them with typhoid and other diseases fatal to the beds must therefore be free from any possibility of impurity. The technique of *O. culture* is an important industry, and usually the fattening or fattening is done on elevated where it being (less) in that initial breeding grounds, a small also suitable fattening places. The fattening beds at Whitstable Kent are probably an unimpaired the well-known one of the most important breeding ground is very old. It is the transplanted and is artificially fattened *O.* that are called natives. *O.* fishing in the open sea is carried on in a few places by diving, but usually by means of a dredger which is hauled up along the bottom, tears up *O.* of all size. *O. culture* has become an important industry in France, the chief beds are at La Rochelle, Marennes, Rochefort, the Isle of Ré and Oléron the Bay of St. Pierre Caudale and Granville. The art of artificial breeding

is distinct from *O. culture* was developed in France at St. Brieuc by Prof. P. Coste in the middle of 18th century. There are important beds in many other European countries. *O. fishing* is a very important activity in the U.S.A. those from certain beds in Chesapeake Bay and points on the New England coast being specially favoured. The 'Blue Points' are a famous brand. Not only are enormous quantities sent fresh to the big cities but thousands are tinned and shipped to many parts. The States mainly get their *O.* from the Gulf of Mexico. As the beds are free from the diseases and parasites that have attacked the Brit. beds the Amer. *O.* is very much cheaper. The *Pinna* are a family with genus *Pinna* (fan shell) and *P. ca* nearly related to the *O.* They are found chiefly in the Mediterranean, where they sometimes attain a length of over 1 ft. Fresh water *O.* (*Unio*) found in river in America are cultivated for the shells used in button making.

**Oyster Bay**, harb. to the summer resort of Nassau, New York U.S.A., on the coast of Long I., is connected with New York a distance of about 2 m. by a steamboat service and is in addition a favourite seaside resort and summer resort. *O. culture* is well known in the harbor of the city of New York.

**Oyster-catcher**, **Mussel picker** or **Sea Plover** (*Haematopus ostragus*) bird of the plover family, fairly common on British shores though it often goes up as many miles inland to breed, it nests in mud at a height of over 100 ft. It is usually a rich, strong, red-brown in the adult, but there are a few of the pale or stone colour. It has a long, dark brown or black bill, the sides of the

OY-111 (C. M. B. 16)

show the duties of incubation. The young are reared by the downy, able to run at a few hours old and in five or six weeks are able to fly. The adult only the birds congregate in large flocks on the coast. The long bill is perfectly adapted for forcing open the shells of molluscs, but both marine and

terrestrial worms and insects are also consumed. The birds are about 16 in. long; the head, neck, and upper parts are black, and the under parts white, but pure white specimens occasionally occur in large flocks.

**Oystermouth, see MUMBLE.**

**Oyster Plant, see SALSFY.**

**Ozanam, Antoine Frédéric** (1813-53), Fr. scholar, b. at Milan, and educated at Lyons. Whilst studying law in Paris he associated with Chateaubriand and Montalembert, and became, with them, a champion of the Catholic revival. From 1840 onward he was prof. of foreign literature at the Sorbonne. His chief writings are *Dante et la philosophie catholique au XIII<sup>ème</sup> siècle* (1839) and *Etudes germaniques* (1847-49). See study by H. Auer, 1933.

**Ozark Mountains**, range of highlands, rarely rising above 2000 ft., which, beginning from the Missouri R., extend in a S.W. direction almost to the Arkansas R. They traverse chiefly the States of Missouri and Oklahoma, but also cross the S.E. corner of Kansas and the N.W. of Arkansas.

**Ozokerite**, part of native paraffin, which appears in consistency like wax or spermaceti. The colour varies from the white of the pure substance to green and yellowish-brown, and often shows a greenish opalescence. It melts at about 63° C. and is lighter than water. The impure solid found in Galicia and Rumania is purified by treatment with concentrated sulphuric acid and distillation. Original O. from Moldavia is soluble in ether, giving a yellow solution. The wax is used for making candles, sealing wax, and insulating material.

**Ozone**, allotropic form of oxygen found in very small quantities in the lower atmosphere but in considerable quantities at a height of 30 m. above sea level. O. is formed out of the oxygen of the air by an electrical machine in operation, and when lightning discharges occur; it is also found in the oxygen prepared from the electrolysis of water. Varying quantities of the gas are obtained during many processes of slow oxidation at ordinary temps., e.g. oxidation of phosphorus in air. During the combustion of ether on red-hot platinum, a considerable amount of O. is formed. The gas is best obtained by exposing pure dry oxygen to the influence of the silent electric discharge. A simple apparatus for this purpose consists of a straight piece of narrow glass tube, con-

taining a straight platinum wire inside which passes through the walls of the tube at one end and is there sealed into the glass. A second wire is wound round the outside of the tube. On connecting the end of the outer wire and the free end of the platinum wire to the terminals of an induction coil and passing a slow stream of oxygen through the tube, the issuing gas is found to be highly charged with O. O., as prepared above, is always mixed with excess of oxygen (80 per cent or more), and even in this diluted state it has a strong unpleasant smell which induces headache, and it has an irritating effect on the mucous membrane. The gas is slightly soluble in water, 1.5 c.c. dissolving in 1000 c.c. of water. It condenses to an intensely deep blue liquid which boils at -112° C., and is a very explosive substance. O. is a powerful oxidiser; it attacks and destroys organic matter, indiarubber being quickly rotted through by its action. It bleaches vegetable colours, and acts at once upon most metals, silver and mercury being converted into oxides. Sulphides are converted into sulphates, and the gas also liberates iodine from potassium iodide. This latter constitutes a rough test for the presence of the gas, the liberated iodine forming a blue compound with starch solution. From the observation that two volumes of O. when heated to 250° C. are transformed to three volumes of oxygen, the difference between this latter gas and its allotrope is explained by giving O. the formula O<sub>3</sub>, i.e. it contains three atoms to the molecule, whereas the oxygen molecule only contains two atoms. If this be the case then, since the molar weight of oxygen 16, that of O. will be 24. This is confirmed by the rate of its diffusion, which is proportionately slower according to Graham's law. The O. present in sea air is supposed to explain its bracing effects. The gas is employed for purifying drinking water, for bleaching purposes, and for thickening oil. It has also been used for freshening the atmosphere in underground railways (e.g. in London). On the large scale it is prepared by suitable modifications of the electrical process described above.

**Ozothamnus**, genus of evergreen flowering shrubs (family Compositae), natives of Australia. *O. rosemarinifolius* bears small heads of white flowers and fragrant leaves. It is hardy in sunny sheltered borders or against sunny walls in the S. of England. It attains a height of from 6 to 10 ft.

**P**, sixteenth letter of the Eng. and other W. European alphabets, descended, through the medium of the Gk., Etruscan, and Lat. alphabets, from the N. Semitic *pe*, meaning 'mouth,' but it is unlikely (although many eminent scholars still hold such an opinion) that it represented in its original form a mouth. Indeed the original name seems to have been chosen independently of the form of the letter, which was  $\phi$  or  $\psi$  (the script being from right to left). *P* is the thin letter of the labial series (*p, b, f, v*) and is interchangeable with the other letters of the series. *P* in Sanskrit, Gk., and Lat., is replaced by *f* in the Germanic tongues (see *F*). Words beginning with *p* in Eng., and its kindred Germanic tongues, are almost all of foreign origin (Slavic, Celtic, Lat.), as *pain* (Fr. *peine*, Lat. *pœna*), *plough* (Polish *plug*), *pit* (Lat. *puteus*, a well). The Gk. preposition *apo* (Sansk. *upa*) became in Lat. *ab*; Gk. *hupo*, Lat. *sub*; Sanskrit *upa*. Lat. *ob*; but before sharp letters, as *t* and *s*, the original *p* was retained in pronunciation, as is shown by inscriptions (*capstulit, optinuit*). There are remarkable interchanges of *p* with the sharp guttural *k* or *q* (see under *INDO-EUROPEAN LANGUAGES*, where the subdivisions into *P*-group and *Q*-group are mentioned). Thus for Lat. *quis, quod, quam*, the Oscan dialect had *pis, pod, pum*; Lat. *equus, canis*, corresponded to Gk. *hippos* (Eolian *hikkos*), *pepos*; similarly Gaelic *mac* (son), *ceathair* (Lat. *quatuor*, four), *coig* (Lat. *quinque*, five), correspond to Welsh *map, pedwar* (Gk. *pelltores*), *pump* (Gk. *pent*, or *pempē*). In Gk. *p* is sometimes replaced by *t*, as *tis, tessares*, for *pis, pelltores*. In such words as *consumption, consumption*, *p* has been introduced as an intermediary between the incompatible sounds *m* and *t*. The initial *p* of Lat. words has for the most part passed into Fr. unaltered; in other positions *p* has become *r*; thus Fr. *écrique, cheveu, décevoir, pauvre*, from Lat. *episcopus, capillus, decipere, pauper*. In chem. *P* is the symbol for phosphorus, *Pd* for palladium, *Po* for polonium, and *Pt* for platinum.

**Paardeberg**, mt. of the Orange Free State, on the Modder R., S. Africa. It was here in 1900 that Gen. Cronje (*q.v.*) and his army surrendered from starvation, a Brit. attack on the Boer entrenchments having failed.

**Paarl, or The Paarl**: 1. Dist. of Cape Prov., S. Africa, noted particularly for its vineyards. 2. Cap. of the above dist., 36 m. N.E. of Cape Town, on the Berg R. Large quantities of fruit and tobacco are produced in the vicinity, and there is wine-growing, fruit-canning, jam-making, a baking-powder factory, textile mfrs., etc. Pop. (tn.) (white) 10,900, (other races) 15,600.

**Pabianice**, tn. in the prov. of Lodz,

Poland, 10 m. to the S.W. of Lodz. Its chief occupation is the manuf. of textile fabrics. Pop. (1939) 40,000.

**Pabna**, cap. of the dist. of the same name in E. Bengal, Pakistan, 76 m. W.N.W. of Dacca. Area of dist. 1936 sq. m. Pop. 1,705,000 (tn. 23,500).

**Pana**, see *TOLENGYS*.

**Pacaraima Sierra**, range of mts. in S. America, in L.A. N., and extending from W. to E. for over 200 m. They form a boundary line between the basins of the Orinoco and Rio Branco Rrs., and also between Venezuela and Brazil. Highest peak, Mt. Borama (8600 ft.).

**Pacasmayo**, tn. in the prov. of Peru, in the dept. of La Libertad, 60 m. N. of Salaverry. Connected by rail with Guadalupe and Chiloto, it exports rice, silver and copper, cotton, and hides. Pop. 1,500.

**Pacchiarotto, Jacopo** (1661 c. 1510), lt. painter, b. at Siena. From 1530 to 1535 he was concerned in conspiracies against the gov., and was compelled to flee into hiding in France. In 1539 he was exiled, but was allowed to return to Italy in 1540, the supposed year of his death. Many works attributed to him are authentic, but among those which are in 'Ascension' in the Siena Academy.

**Pace**, measure of length, derived from the Lat. *passus*. The latter, however, was measured from the heel-mark of one foot to the mark where it next touched the ground, thus equalling in the modern sense of the word two paces. The Lat. *passus* was a little less than 5 ft., a thousand of them went to a Roman mile. As a unit of measure paces are only reliable when taken by trained persons, such as a troop of soldiers.

**Pacelli, Eugenio**, see *PAS* (popes), *PAS XVII*.

**Pacha**, see *PASHA*.

**Pachacamac**, anc. city of Peru, on the coast, 20 m. from Lima, the site of which has been excavated by Peruvian and U.S. The Incas adopted the earlier god *P.* as a god of earthquakes. To the Yuncas *P.* was a creature, and the tn. was built and had a great temple; it remained a sacred city under the Incas.

**Pacheco, Francisco** (1571-1651), Sp. painter, b. at Seville. In 1611 he visited Madrid, and eventually opened a school of painting in Seville. Among his pupils here was Velázquez, who married his daughter. The latter part of his life was spent in literary work, chiefly on the subject of painting. Some of his best paintings are in Madrid and Seville.

**Pachm., Vladimir de** (1848-1933), Russian pianist, b. at Odessa. His musical education was obtained in Vienna, and on returning to Russia in 1869 he continued his studies, beginning public performances in 1882. He was famous as a player of

Chopin's music and received the Royal Philharmonic Society's medal, 1916.

**Pachmarhi**, hill station of the Deccan, in the Central Provs., India, on the Mahadeo range, at an altitude of 3500 ft. It is the summer seat of gov. for the Central Provs. Pop. 6700.

**Pachomius**, see under MONASTICISM.

**Pachuca**, cap. of the state of Hidalgo, Mexico, 55 m. N.E. of Mexico city. In the vicinity are silver mines of great antiquity, yielding at the present time a considerable quantity of ore. The surrounding hills are honeycombed with old workings. Three railways and a good motor road lead to Mexico city. Buildings of the Sp. colonial period include Las Casas (1670), now used as offices; Las Casas Coloradas (1785), now courts of justice; and a former Franciscan convent (1596). It has a fine modern theatre and another modern building is the Bank of Hidalgo. Pop. 54,000.

**Pachydermata**, classification of mammals, founded by Cuvier, for a number of thick-skinned, non-ruminant, hoofed animals, e.g. elephant and hippopotamus.

**Pacific Affairs**, Institute of, an official non-sectarian, non-controversial organization which aims at the improvement of the relations between the peoples of the Pacific area. It is directed by a Pacific Council on which each of its constituent national units elects a member. The countries represented before the Second World War were the U.S.A., Japan, China, Hawaii, Australia, Canada, and New Zealand. It has a permanent secretariat, with headquarters in Honolulu, which is responsible for the preparation and conduct of conferences and the promotion of research. It derives its support from research foundations and private contributions. The origin of the I. P. A. is traced to a group of business and professional men in Hawaii, and the proposal that representatives of the various peoples around the Pacific should meet and exchange views was carried out in the first conference, which met at Honolulu in 1925. Many conferences have been held since then and the proceedings published by the Univ. of Chicago Press. Many painstaking books on different topics have been published by members under the aegis of the institute which, however, is not responsible for the opinions expressed in them. The I. P. A. series of monographs by various authors includes among the most recent K. Feltzer, *Katrine Greene*, J. D. Phillips, and Kate L. Mitchell, *Economic Survey of the Pacific Area*, 1912. Its periodical, *Pacific Affairs*, is published in the U.S.A.

**Pacific Campaigns or Far Eastern Front, in Second World War.** *Japanese Invasion of the Southern Pacific and Eastern Asia.* — For some time it had been evident that the more moderate elements in the Jap. Gov. had been reduced to impotence by the military party (see JAPAN, History). Allied diplomatic circles conceived the idea that Japan's military and financial resources were too deeply committed in China to permit her to attempt further military adventures elsewhere, and it

was even supposed that the Jap. Gov. was anxious to 'liquidate' the Chinese 'incident' and to extricate its armies. This idea was, of course, sedulously fostered by Jap. propaganda, and colour was lent to the belief by the 'negotiations' which were being ostentatiously conducted at Washington by Adm. Nomura and M. Kuroki to settle Amer.-Jap. relations. In the midst of these bogus negotiations the Jap., without any formal declaration of war, swept down with their bombers and two-man submarines on Pearl Harbour (q.v.) (Hawaii) and other Amer. bases in the Pacific, and sank a Brit. gunboat in Shanghai (Dec. 7, 1941). Within a day or two, apart from the severe damage in Pearl Harbour, Jap. bombers damaged the smaller Amer. bases at Wake Is. and Midway Is., attacked the Nanai Is. (Australian mandated ter.), bombed Guam (U.S. ter.), Hong Kong, the Philippines and other is., and attacked Sarawak and Borneo. In the attack on Pearl Harbour the Amers. lost two battleships (*Arizona*, 32,600 tons, and *Oklahoma*, 29,000 tons) and two destroyers sunk. Six other battleships, three cruisers, and sev. smaller vessels were damaged, 2750 men were killed and wounded. At the same time Jap. troops landed in N.E. Malaya and attacked Kota Bharu aerodrome, Thailand (Siam), which the Allies had expected, though without good reason, to resist a Jap. invasion, surrendered at once and granted passage to Jap. forces landing in S. It was therefore obvious from the widespread nature of these attacks and their thoroughness that Japan had been preparing the blow for sev. months or even years. Britain and the U.S.A. had no other course open to them than formally to declare war on Japan.

The hist. of the first few months' campaigns, following Japan's entry into the war, was one of futile bravery on the part of the allied forces against overwhelming odds. The crux of the whole situation was, as ever in the hist. of war, sea-power, and the Jap. Navy was in control at the very outset. The Amer. Navy had suffered at Pearl Harbour and in the loss of Guam and Wake Is., the worst blows in its hist. As early in the campaign as Dec. 10, Britain lost the great new battleship, *Prince of Wales*, and the *Repulse*, bombed and torpedoed by sixty Jap. bombers and twenty-seven torpedo-carrying planes, while engaged in operations against Jap. landings off the Malaya coast, a hopeless if gallant mission, since the ships had no air- or anti-aircraft protection. In quick succession the Jap. overran most of the Philippines, subduing the open city of Manila to merciless and indiscriminate bombing, seized Hong Kong, swept over the Malaya Peninsula and captured Singapore, prin. bastion and base of the allied nations in the Far E., and reduced one by one various strategic points in the Netherlands E. Indies. Then the tide of conquest approached Rangoon, entry port for the all-important Burma Road (see BURMA ROAD) down which Britain sent munitions to Chiang Kai-shek.

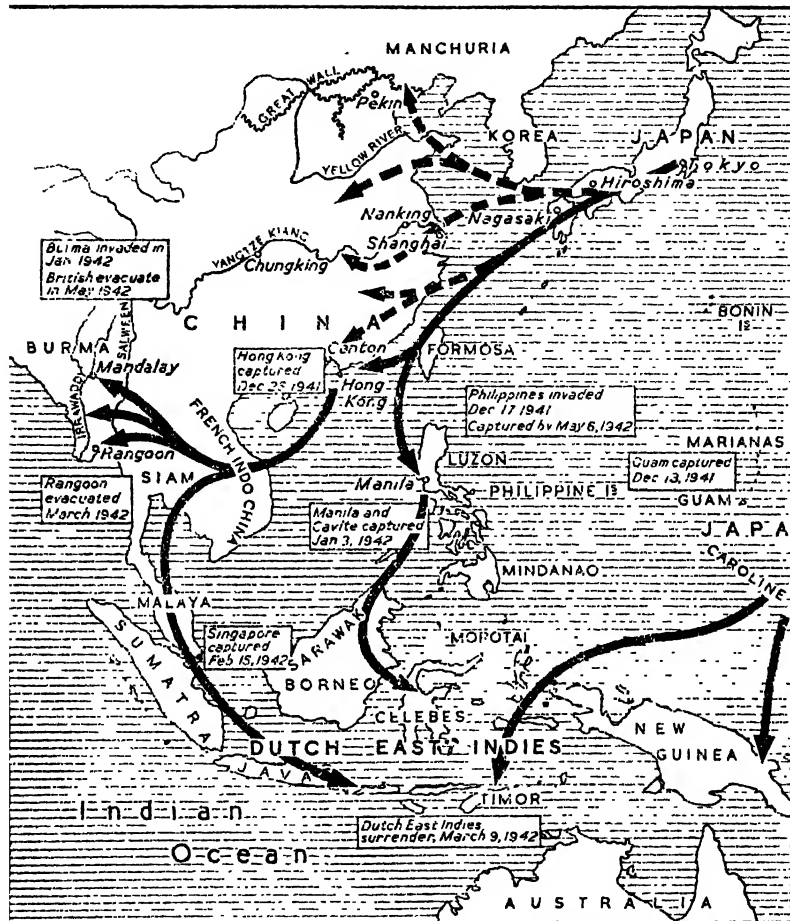

and was imperilling India itself. Southward it now began to menace Australia. By the first days of May Mandalay had fallen and a large part of Burma was in the enemy's hands. The general strategic plan developed quickly from the opening day of the Jap. attacks, their first aim being to break the ring of 'encirclement' constituted by the Aleutian Is., Pearl Harbour, Guam, Manila, Hong Kong, Malaya, and Singapore, by simultaneous attacks on all of them, and then, by breaking Amer. and Brit. resistance in these centres, to render it impossible for the Allies to get near enough to Japan to bomb Jap. cities. In the gloom of these early months from Dec. to April 9 the one bright outstanding feature was the heroic and protracted Amer. defence of the Bataan Peninsula by the forces under Gen. MacArthur. When at length the resistance ended (Gen. MacArthur had already been in Australia for three weeks, where he took supreme command of Australian, Brit., Dutch, and Amer. troops).

In the course of the Jap. conquest of the numerous Is. of the S. Pacific the hardest fighting took place in the Philippines. Manila and Cavite were captured on Jan. 3, 1942. Jap. landings were made in Mindanao and Mindoro on March 7, and in Cebu on April 11. Most of the Philippines had been conquered by May, though Corregidor still held out for a brief space under Gen. Wainwright. Organised resistance by the U.S.-Filipino armed forces on the Bataan Peninsula came to an end by April 9. Much credit must be given to the defence for the maintenance of their positions for over four months against vastly superior forces. Approximately 200,000 Jap. troops were employed against a defending army of some 38,000. Weight of numbers, however, was not the sole cause of the Jap. success. Japan was operating in close proximity to her main bases of supply and could therefore provide a constant stream of food, armaments, and equipment to ensure continuity of effort on the land. But the U.S.-Filipino defence was by no means vain. It had succeeded in containing a huge Jap. army which might have been effectively employed in other theatres of war; a proportion of the Jap. fleet and a large number of valuable transports had been immobilised for four months; the struggle had cost a great many Jap. lives and made a severe drain on Jap. resources of material; and, finally, the U.S.A. had been given time to recover from the shocks of the lightning attacks on her bases in Hawaii and elsewhere and to take steps to organise her forces for a continuation of the struggle.

In the E. Indies the Jap. landed in Brit. Borneo on Dec. 16 and occupied Tarakan a week later. Then followed landings in Celebes and Amboyna, and heavy air raids on Surabaya, Palembang, Kupang, and Banka. The Dutch authorities, however, destroyed many of the oil wells at Palembang before leaving the place. Bali was invaded in mid Feb., and both that Is. and Banka were seized soon after-

wards. The Jap. then advanced on Java, captured Batavia, pierced the Dutch defences at Bandoeng and completed the conquest of the Dutch E. Indies by mid March. Hong Kong succeeded in holding out for only a little over a fortnight (for details see HONG KONG). The earliest Jap. landings in Brit. Malaya took place on Dec. 8 in Kedah, when there were raids on Penang and Singapore. This campaign ended by Feb. 15, the whole of Brit. Malaya being conquered in the space of ten weeks (see MALAYA, BRITISH, JAPANESE INVASION OF, 1941-42). Sarawak was not in a position to resist for long, and the Brit. garrison was withdrawn to witch Borneo which itself soon fell. In Thailand the Allies made numerous air attacks on Bangkok, Singgora, Sungal, and Patana, while the Chinese forces invaded the N. part of the country with the aim of joining forces with their allies. The threat to Australia came first with the bombing of Rabaul in the mandated ter. of New Guinea (Jan. 10), followed by invasion shortly afterwards. Rabaul was seized on Jan. 22. Then came numerous Jap. air raids on Port Moresby, an important Australian base in New Guinea. In Burma Jap. air attacks were first made on Rangoon and Moulmein on Jan. 10, the surrender of Slim giving their forces an immense advantage over the Brit. defences. Moulmein was evacuated at the end of Jan. and the important ter. of Moulmein on the Salween R., 10 m. distant from Moulmein was occupied on Feb. 11. Then followed heavy fighting on the Billa and Sittang Rs., the chief forces on the Brit. side comprising Indian troops, notably Gurkhas, and their Chinese allies, who took up positions on the intractably and shifting fronts. Rangoon was evacuated on March 8. For operations in Burma see BURMA, SECOND WORLD WAR CAMPAIGNS IN.

*Southern Pacific Campaign, 1942-43.* During the first six months of the war against Japan allied naval losses had also been severe and included two aircraft carriers, eleven cruisers, twenty-two destroyers, and five submarines. Early in April strong Jap. forces had even raided into the bay of Bengal where they sank the Brit. aircraft carrier *Hermes* and two heavy cruisers, but ten days later had their first taste of what they were to suffer later when aircraft from the U.S. carrier *Hornet* raided Tokyo. The Jap. advance, nevertheless, continued, and on June 1 Jap. midget submarines actually penetrated Sydney harbour. But five days later Jap. forces received their first real check at the battle of Midway Is., when four of their latest carriers were destroyed, in addition to a heavy cruiser, and they also lost 253 aircraft and 3,500 men. The U.S. losses were one aircraft carrier, 150 aircraft, and 307 men. After this the Jap. reorganised their forces and, for in the mid year, again began to assume the offensive in the S. Pacific. Their jungle troops broke over the serrated crest of the Owen Stanley Mts. in New Guinea and began to push towards Port Moresby. They also sent

forces to occupy some of the Gilbert Is. and began to build an airfield on Guadalcanal (g.v.) in the S. Solomon Is. But suddenly, on Aug. 7, the whole aspect of the Pacific warfare underwent a change, when Amer. task forces, with the support of shock troops, seized Tulagi Is. in the Brit. Solomons, and a beach-head, which included the almost-completed enemy airfield on Guadalcanal. There was, however, a strong enemy reaction to this necessarily somewhat hastily planned manoeuvre. On the night of Aug. 8-9 a Jap. cruiser div. and destroyers surprised the Amer. ships and sank three Amer. heavy cruisers and one Australian cruiser without much loss to themselves. Thus the supply problem for the Amer.

marines who had been landed in the S. Solomons became serious, especially as the Jap., landing men at night on Guadalcanal, now began a campaign of attrition. Yet every attempt made by the enemy in August to recover his lost positions in the Solomons resulted in the annihilation or capture by U.S. marines of all the enemy troops that had been landed, and Amer. forces had now well established their positions in the Guadalcanal and Tulagi area. Not until Feb. 9, 1943, did organised resistance end in the Is. of Guadalcanal, Tulagi, Gavatu, Tananibogo, Makambo, and on parts of Florida. Against tenacious resistance, every sort of fire, and also dynamite was used. Few Jap. surrendered. At the end of Aug. the

Jap. entered Milne Bay, New Guinea, with some light reinforcements, but mainly with the aim of evacuating their invading troops. Their escorts were eight destroyers and one cruiser; but very soon Australian combat troops, supported by Amer. and Australian air units, threw them back with heavy losses into the narrow confines of the peninsula N. of the bay, where large numbers were destroyed and all their heavy equipment, including tanks, was lost.

The collapse of the Jap. attempt to take Milne Bay was the first serious reverse which their land forces had suffered in the New Guinea area. It was realised by the allied command that the effect of the recapture of the above-mentioned

Solomon Is. would be largely counteracted if their forces were driven out of New Guinea. By retaking the Solomons they checked a threat to the sea communications between the U.S.A. and Australia, besides securing a possible base for future operations. The continued possession of New Guinea, and particularly of Port Moresby on its S. side, was essential to the defence of N. Australia. Australian opinion had naturally been apprehensive from the day in the previous March when the enemy had seized Lae and Salamaua on the N. coast, and later Buna, from which there was a track southwards direct to Port Moresby. The Jap. troops landed at Buna, advanced and occupied Kokoda and its small aerodrome, on the N. slopes of the Owen Stanley range and, in the early days of Sept., were steadily climbing towards the pass 7500 ft. above sea level in the mt. range which constitutes the real defence line of Port Moresby. The formidable Jap. advance across the range had surged southwards through the jungle to within 30 m. of Port Moresby when it was abruptly swung back into a precipitate retreat. Fighting in some of the worst terrain in the world, covered with dense jungle, the Australians gallantly saved the greatest threat of all to their homeland. The chief contributory factors in this were the effective bombing of Jap. supply lines and the Jap. defeats in the Solomons, and also the outflanking part played by Amer. ground forces flown in haste to New Guinea. The Jap. had now been driven back to the N. down-slope of the Owen Stanley range and were fighting desperately to retain their foothold near Buna on the N. coast. Great changes had taken place in the few months previous to the time (Nov.) when the Allies were pressing on towards Buna, the main Jap. base on the N. Papuan coast. Improved trails through the jungle, roads, and airfields had now been made so as to enable the forces to operate effectively outside the Moresby perimeter and so check, if possible, the enemy control of the sea lanes N. of Australia, which was almost as strong as his command of the air.

The position in the Solomons, however, had slightly deteriorated in Sept. and Oct., when the enemy began a heavy attack by land, sea, and air. But in the large-scale naval fight between surface vessels off Savo Is. between Guadalcanal and Florida the Jap. were successfully repelled in this, their strongest bid to recapture the S. Solomon Is. (see NAVAL OPERATIONS IN SECOND WORLD WAR). Except for losses of warships on either side the situation, broadly, had remained unchanged since the previous Aug., after the Amers. had seized Tulagi and the new airfield on Guadalcanal. But the Jap. held Bougainville, the northernmost of the group, in some force with airfields and anchorages, and they held anchorages in most of the intermediate is., such as Shortland and the New Georgia group. But Guadalcanal and Florida, with the harbour of Tulagi, remained firmly in the grip of the Allies, and the seizure of these two key

positions had disrupted the whole Jap. plan of campaign. Whether or not the Jap. planned to invade Australia at that stage, they certainly aimed at dominating the approaches to it and cutting the supply lines to it from the U.S.A., and with that object in view they had been methodically extending their occupations to the south-eastward, occupying is. after is. in that direction and establishing at intervals airfields whence their air forces could operate in conjunction with warships, in controlling sea traffic and exercising command of the whole area. The Amer. coup in Aug. had resulted in a race between the two opposed commands to strengthen their forces, the Jap. so as to regain control over the S. is. of the Solomons, the Amers. in order to repel them and to acquire a permanent *point d'appui* for subsequent operations northward. Towards the end of Oct. the Jap. pierced the Amer. lines S. of the airfield of Guadalcanal but were thrown back again. About the same time the Amers. hit a Jap. battleship and three cruisers and sank some destroyers. But a much heavier naval action was fought in the Solomons area between Nov. 13 and 15 when the Jap. suffered severe losses: two battleships, one heavy cruiser, three destroyers, and six transports, besides having two heavy cruisers, one light cruiser, six destroyers, and four cargo transports damaged; the Amer. losses being two light cruisers and seven destroyers (see under NAVAL OPERATIONS). This action marked the conclusion of by far the strongest Jap. attempt to recapture Guadalcanal, and it was very completely frustrated by the aggressive action of Vice-Adm. Halsey in the S. Pacific area. This action enabled the Allies to threaten the enemy position in New Guinea and their advance on Buna on the N. coast now developed under MacArthur. The Jap., as noted above, were driven back to the N. slope of the Owen Stanley range and were now fighting desperately to keep their foothold near Buna. Allied troops occupied Buna on Jan. 2, 1943, after especially bitter fighting. But though the Papuan campaign was now ended, there remained in New Guinea heavy tasks against a formidable foe. The Jap. garrison at Sanananda near Buna was not yet overcome, and the enemy was also entrenched at various other points near the coast from Amboga to Madang. Further, though the work of the allied air force was improving, it had not prevented the Jap. from sending reinforcements into Lae, Salamaua, Finschhafen, and Madang. There was no short cut to victory here. But the Allies had learned many useful lessons: e.g. that tanks could play an important part in terrain utterly unlike the desert; that armies of native carriers provided a solution of many transport difficulties; that roads could be paved with a corduroy of saplings on which jeeps could operate. All branches of the forces had acquired experience which augured well for any future operations in S. Asia.

In the course of the first six weeks of 1943 Jap. resistance in Papua, on Guadal-

canal, and in the Solomons was brought to an end, but from that time until July the Allies stood on the defensive in this area of the Pacific, checking severe Jap. counter-offensives. At the same time the ascendancy won by their air forces prevented any further aggressive enemy movement by sea. But there were no signs of decreasing Jap. strength at any point, and the prin. Jap. bases in N. Britain (a long is. lying off the N. coast of New Guinea) showed no sign of diminution in aircraft, shipping, or troops. Japan, although at the fullest reach of her arm, hung on grimly and the situation could only be altered with any reasonable speed by another allied offensive. This offensive began at the end of June under Gen. MacArthur. The Allies seized Rendova, an is. 5 m. S. of New Georgia. On New Georgia itself a landing was made without opposition. Viru harbour was taken, but stiff resistance began when the Allies approached the Jap. chief base in the central Solomons at Munda, on New Georgia. In New Guinea a fresh landing was made in Nassau Bay, where Australian and Amer. forces joined hands close to Salamaua. Simultaneously the Trobriand and Woodlark is. groups, which had never been in Jap. hands, were occupied, thus bringing the Amers. within relatively close air range of New Guinea. The port of Rabaul, which had been the Jap. advanced base in the Pacific since Jan. 1942, was the palpable objective of the Allies, but the struggle for it was likely to be hard. Long-range guns put ashore at Rendova islet were now shelling Munda airfield, only 5 m. distant. A naval action in the Kula Gulf near New Georgia resulted in the loss of an Amer. light cruiser and a destroyer, but the Jap. also lost a number of warships. Between July 6 and 17 the Jap. lost six warships, and their naval position in the 'S. seas' was certainly becoming strained. But though Munda at length fell on Aug. 6, with the wiping out of 1671 of the garrison of 5000 men, and 1900 Jap. soldiers were killed or captured on Aug. 17 when allied ships intercepted Jap. barges and a destroyer escort in Vella Gulf, the whole converging movement on Rabaul, begun late in June, made but slow progress. The attack in New Guinea had come to a standstill and, after the fall of Munda, the Jap. dug themselves in on Balroka, with reinforcements. The Allies were in fact struggling in a vile country, thick jungles, dense thickets, and gullies, against carefully entrenched enemy positions. The scale of the original operation had to be modified. Is.-hopping was proving expensive and dilatory. The factor compensating for the slowness and costliness of the land fighting, however, was the scale of Jap. losses in the air and on sea. Thus, on July 17, 200 Amer. aircraft in the N. Solomons sank seven Jap. ships and destroyed forty-nine planes for the loss of only six Amer. aircraft. This fact was significant not merely for the fighting in the Solomons area, but for the whole 'co-prosperity' (see NEW ORDER) sphere which Japan had to patrol and supply.

A strong force of U.S. and Canadian troops, supported by naval vessels, occupied Kiska in the Aleutians after landings which began on Aug. 15. No Jap. troops were found there as they had abandoned the is. under cover of fog, their positions being untenable after the occupation of Attu. Gen. MacArthur, in a combined operation in New Guinea, brought off a notable success in effecting a strong landing near Lae, the result of which was to draw a ring round the powerful Jap. bases there and at Salamaua. The Jap., despite the continual bombing of the base, which lies at the head of Huon Bay, did not suspect that a land attack would follow and they were taken by surprise when an Australian force was put ashore (Sept. 4) to the N.E. of Lae, thereby cutting it off from Finschhafen at the mouth of the bay. The next day Amer. paratroops were dropped in the Markham valley behind Lae, where they were joined by Australians who had covered over 50 m. through jungle and swamp from the Salamaua area to meet them, a remarkable feat of endurance involving a forced march of five days. The expeditionary force was protected by a strong screen of Amer. warships as well as aircraft, and prior to the actual landing the ships went close inshore and fired hundreds of shells into the jungle fringing the beaches. Heavy raids on the night of Sept. 3 had temporarily neutralised the Jap. bases on Vewak, Madang, and Rabaul. Jap. aeroplanes rarely appeared and their navy did not try to intervene. The pressure exercised previously by Amer. and Australian ground forces on Salamaua had so completely diverted Jap. attention to the battlefield E. of Lae that the landing troops poured ashore without hearing a single shot and Lae fell to allied forces on Sept. 10. The absence of the Jap. navy in the series of actions which began at Guadalcanal in Aug. 1942; for, though it was still formidable in battleship strength, these require the support of large numbers of aircraft-carriers, cruisers, and destroyers to be able to bring full weight to bear in modern warfare. Lae was an important victory because it was from this base, with its good anchorage, its airfields, and its coastal connections running in E. and W., that the Japs. directed the defence by land and air of their chain of strongholds which at one time stretched as far as Buna and Gona. Salamaua fell to Gen. MacArthur a few days after the landing near Lae. Since March 7, 1942. Its capture by the Allies was a triumph over natural obstacles in the shape of great cliffs and gorges, an almost impenetrable jungle country, and strongly prepared positions on precipitous spurs and knolls. From these, however, the Japs. were now in retreat, leaving hundreds of dead and much equipment, allied losses being light. When on Sept. 16 the Allies entered Lae itself they found a scene of utter desolation. It was evident too that the Japs., since their occupation (March 17, 1942), had built but few roads

or bridges. Demoralisation had set in with the garrison and no longer did they fight fanatically to the last man. Many had retreated into the jungle. Soon after, the Japs. were turned out of Finschhafen by Gen. Blamey, the Australian commander, after making a daring landing in the enemy's rear and some eleven days of fighting. Australian artillery played an important part in these operations, which also included a second landing behind Lae. But the pivotal place remained, as always, Rabaul in New Britain. With the hope of at least temporarily neutralising it, a very heavy air attack was launched by the Allies on Oct. 12. One hundred Jap. planes on the ground were destroyed and 50 per cent of the air strength of Rabaul was lost to the Japs. Three destroyers, two medium-sized merchant ships, forty-three small sea-going vessels, and seventy harbour craft were sunk. The Japs. made what seemed to be a strong counter-offensive against Finschhafen, having landed barge-borne troops between that place and Madang. They were too late to relieve Finschhafen, but succeeded in escaping notice in the dense jungle and among the rocks of the Sattelberg range, where they were joined by remnants of the garrison and now offered a stiff resistance to Australian patrols. On Oct. 21 they broke cover in strength and took a vil. near Finschhafen, but though supported by air strength they were thrown back into the Sattelberg. Bougainville Is. was at this time the only Jap. stronghold barring the Allies' way from the central Solomons to Rabaul. There was a second raid on Jap. shipping there on Nov. 2. To forestall a probable Jap. counter-attack on the beach-head established by the Amer. at Empress Augusta Bay on Bougainville, where the previous night the Amer. had sunk a Jap. cruiser and two destroyers, besides damaging two heavy cruisers, the Amer. carrier-based aircraft from the *Saratoga* and *Princeton* attacked Rabaul and practically swept the harbour clean, nearly every ship in it being heavily hit or sunk by 1000-lb. bombs. Among these were sev. warships. In addition the Japs. lost over eighty aircraft in an air encounter over the harbour and ten fighters. The Amer. had previously observed some fifty-three warships (cruisers, destroyers, and light craft) escorting eleven transports, the number of warships sighted giving evidence of the importance attached by the Japs. high command to the operation. These ships and their convoy had left the base of Truk in the Caroline Is., but were spotted by long-range Amer. aircraft, with the result that when the ships approached Rabaul they were the targets of fierce Amer. air attacks for some days from Nov. 2, both at Rabaul (as shown above) and at Kavlieng (New Ireland) and out at sea. Sev. heavy cruisers were hit and one blew up, and five others were either lost or completely disabled, apart from many other craft and a multitude of planes.

A substantial improvement of the

Allies' position in the S. Pacific was effected by the capture on Nov. 20 of the Gilbert Is. (a Brit. colonial dependency) after a short and remarkably successful Amer. combined operation. The recapture of the airfields and harbourage of the is. was calculated appreciably to extend the effective range of allied action in the Pacific and, correspondingly, to increase greatly the strain on Japan's naval position, besides bringing nearer the fulfilment of the hope of menacing the big Jap. base at Truk and of the positions in their mandated areas, the Caroline and Marshall Is. Yet perhaps the more immediately important consequence of the capture of the Gilbert Is. was the evidence it afforded of the Allies' growing naval strength in the Pacific. The capture of Betio within the Tarawa atoll by U.S. marines was a gallant exploit under heavy fire and amid a dangerous and complicated conformation of coral reefs through which the men waded in three feet of water, often for half a mile or more. Their losses were grievous, especially as the Jap. garrison of 4000 picked troops on the Gilberts fought with fanatical courage, and with more skill than their fellow countrymen displayed in their none the less obstinate resistance to the Australians in the jungles, swamps, and forest-clad Sattelberg position near Finnschafen, which place was captured by the Australians about this time.

The battle of New Britain began in mid December, when contingents of the Sixth Amer. Army landed on the S. coast of the is. between Gasmata and Cape Gloucester. Their main assault on Cape Merkus was unopposed, but a subsidiary attempt elsewhere met with a severe repulse. The failure of any Jap. warships and of all but a small fraction of the strong Jap. Air Force in the is. to appear, was perhaps to be expected in view of the fact that the naval forces, Amer. and Australian, which covered the landing were the largest that had yet appeared in this part of the Pacific. But the great and increasing activity of the Amer. bomber squadrons over the aerodromes and harbours of New Britain was no doubt the chief cause of the Jap. loss of the initiative by sea and air which was noticeable at Lae, again in the capture of the Gilbert and Marshall Is., and now again in New Britain. The end of the year, however, found the Jap. still firmly installed in the Ramu valley and on Huon Peninsula in New Guinea, and still holding Madang there, while in New Britain the Amers. near Cape Gloucester were meeting with stiff resistance.

It is evident that throughout the period from the early Jap. conquests in the Pacific down to the sinking of the Bismarck Sea convoy on March 3-4, 1943, and even later in the year, the initiative rested mostly with Japan. The Allies, however, took the initiative in occupying the S. Solomons (Aug. 1942), and again in the limited counter-offensive which F.-M. Wavell's forces began in W. Burma in mid Dec. 1942. The allied victories in the battles of the Coral Sea (May 4-8,

1942), Midway (June 4), the Solomons Sea (Nov. 13-15), the Bismarck Sea (March 3-4, 1943), the Papuan campaign (Aug.-Nov. 1942), the action in Milne Bay (Aug. 31), and at Wau (Jan. 30, 1943) were all essentially defensive victories in which the Allies thwarted the designs of the enemy and resisted further aggressive moves on his part. Jap. success in the first six months of the war was of so sweeping a character that the Allies could not hope to recover until preparations on the largest scale were completed, and indeed it seemed that the initiative must remain with the Jap. until Germany was defeated, so as to relieve a great weight of sea and air power for concentration in the Pacific. Japan had, in the early months, occupied the richest colonial area in the world and thereby secured unrestricted access to the raw materials, the lack of which had been the great weakness in her economy. Her success was only in part due to the fact that she had attacked when Russia was pre-occupied elsewhere and when America was still unprepared, even psychologically, for war at all. Other factors which contributed to Japan's success were the utter inadequacy of the defences of the E. possessions of the W. powers (even the conception of the Singapore base was technically unsound), and the fact that they underestimated the quality of the Jap. armed forces and Jap. powers of strategy, and also the disparity in lines of communications. Thus all those areas which Japan had coveted as essential units of her 'co-prosperity' sphere were conquered with but slight loss and in less than six months. Yet, curiously enough, the Jap. then seemed to falter. The enemy had occupied Burma and yet did not proceed to the invasion of India, and the probable explanation of this hesitancy was that the speedy progress of her forces had strained her lines of communication. At all events the Jap. then directed their efforts southward, in the direction of the Solomons and New Guinea, apparently for seizure as stepping-stones to the occupation of Australia and New Zealand. But they sustained an unqualified defeat in Milne Bay and again in the major naval engagement off Guadalcanal (Nov. 13-15, 1942), while in Papua the Australians had checked their hazardous overland advance on Port Moresby, the Owen Stanley range proving to be too formidable a natural obstacle for their troops. But they stabilised their positions at Gona, Sanananda, and Buna, and so compelled the Allies to begin long siege operations against all three. After being expelled from these points their forces, operating from Mubo, S. of Salamaua, tried to take Wau, the main allied base in the goldfields area in N.E. New Guinea, their chief objective being the strategic airfield there, but they were foiled. In all this difficult period of the Allies' ordeal the severest strain was that imposed by the Papuan campaign, which involved dour and bitter fighting in which no quarter was given and none expected. Only the toughest troops were of any avail in such a campaign, but the

splendid battalions of the Australian Imperial Force with a long campaign of stiff fighting in the Middle East behind them were more than a match for the Jap soldiers, whose fanaticism made up for their overestimated capabilities in other respects. The arduous nature of the New Guinea campaign was aggravated by the conditions of living: heavy rains and chilly nights on the mts., scarcity of fuel, uncertain communications, shortage of food, dysentery, and scrub itch, all of which called for great courage and endurance.

Whether or not Japan could be defeated by taking the war into China was very doubtful. Some believed that if the Allies could get sufficient supplies into China to enable them to establish air bases from which to bomb Japan itself the war would soon be won. But Japan is essentially a maritime power and no establishment of bases on the Chinese mainland could by itself defeat such a power any more than Britain was defeated when after mid 1910 the Germans controlled all the nearby mainland of Europe. The chief munition base, as

and strong nerves. The air arm played a great part in the Papuan campaign. The machines which bombed the Japs at Kokoda were perhaps the dominating factor in forcing them out of Ioribaiwa near Port Moresby. But more than all the Papuan campaign established the interdependence of land, sea and air. Swift efficient co-ordination in the use of all arms marked the early Jap successes and demonstrated to the Allies that only a tremendous development of air and sea power, either alone or in co-operation with land forces operating either from Burma so as to reach the China coast, or from Australia, or from both, could be expected to achieve the task of expelling the enemy from his numerous consolidated positions in the S. Pacific, in Burma, and in S. E. Asia.

well as the man power of Japan is in her home islands and in any case Japan is much further from the Chinese mainland than is Britain from the European mainland. Moreover most of Japan's coal and oil, mineral oil, and raw material came from abroad and therefore the one obvious way to defeat her was to cut off her command of the Jap seas. That alone would make it possible for the Allies to blockade the country and to construct airfields on small islands within a range from which to maintain a constant air attack on Japan's home bases and so gradually to cut off reinforcements and supplies from the Jap armies on the Chinese mainland and elsewhere. Thus the vital war against Japan was the war at sea and the advances being made into Jap-controlled seas and the whittling down of Japan's sea power

by the destruction of both warships and merchant ships were bringing nearer the day when the Jap. fleet must emerge and try to repel the allied fleets. The longer Japan postponed this decisive action the greater grew the odds against it.

By the beginning of 1944 the initiative on and above the seas and among the multitudinous is. was entirely in the hands of the Allies. Off the New Georgian Is. group and Bougainville an occasional Jap. light cruiser and a few destroyers had taken the place of the battleships, aircraft-carriers, and heavy cruisers which more than once had challenged the Amer. squadrons off Guadalcanal. On the ground, too, the balance was against the Jap., the Amers. and Australians being now their equals in the arts of jungle warfare. Of the Jap. garrisons previously located among the Solomons only a few troops remained, marooned on Choiseul, and the garrison of Bougainville. In New Britain itself, apart from the strong Rabaul garrison, the Jap. troops were in occupation of a number of ports, which could only communicate with each other by sea, the is. being as dense with jungle and as trackless as New Guinea. From the Jap. failure to intervene in the defence of the Gilbert Is. or to attack the escorts of the expeditionary forces disembarked on New Britain or on the N. coast of New Guinea, it was evident that their offensive strength at sea had been so impaired by their losses of aircraft-carriers, cruisers, and destroyers that they had resigned the initiative and were condemned to a naval defensive of diminishing strength. Also, since the development of the allied counter-offensive, the Jap. mercantile marine had been subjected to almost daily air attack, and Amer. airmen and their Chinese allies had begun to strike hard at its vessels in S. Chinese and Indo-Chinese ports; Brit. and Amer. aircraft were making the Singapore-Rangoon route perilous; and all over the W. Pacific from the Jap. coasts to the E. Indies it was being subjected to relentless attrition by Amer. submarines. The allied successes did not of course preclude a speedy termination of the Pacific campaign, nor mark the end of 'island-hopping,' since the seizure of is. air-bases was a necessary condition of the allied advance either in this theatre or further W.; but they revealed the ability of the Allies to hold and to exploit the initiative which their sea power had regained.

**Attacks on Marshall and Caroline Islands; Paramushir, Kuriles, Northern Pacific.**—Powerful Amer. air forces, land-based and carrier-borne, were sent by Adm. Nimitz, at the end of Jan. 1944, to attack Jap. bases in the Marshalls. Very strong attacks were made on Kwajalein atoll, Roi, and Makelap in the central Marshalls; while battleships and light surface units also bombarded the same objectives. Amphibious forces then landed in the Roi and Kwajalein areas and estab. beach-heads near the enemy bases. Strong F.-M. action was encountered, but Namur in mid-Jon captured, and of the Kwajalein the bath of 2000 some 1250 were slain for

nominal Amer. losses (Feb. 2). On Feb. 4, by bright moonlight, an Amer. fleet under Rear-Adm. W. D. Baker poured hundreds of tons of shells into Paramushir, in the Kuriles, the prin. Jap. naval and air base in the N. Pacific. The naval bombardment was followed by a bombing attack by naval aircraft, the Jap. being taken by surprise and evidently demoralised. When the fleet began to shell them, the Jap. fired wildly along their own beaches and at the ocean and at the sea of Okhotsk. These operations marked the first attack of the war on Jap. home ter., apart from the Amer. air raid on Tokyo early in the war. In the seven days' fighting (Feb. 2-8) in the Marshalls, 8122 Jap. were killed for 286 Amers. On Feb. 16 strong Amer. task forces of hundreds of aeroplanes by daylight attacked Truk, the great Jap. naval base in the heart of the Carolines. Truk is a very large atoll, 30 m. across, but, unlike Kwajalein, which is low and sandy, the lagoon of Truk contains a number of mountainous is., running up to 1500 ft., being extinct volcanoes of basalt. Not much was known about the works the Jap. had constructed there, in defiance of mandatory prohibitions, though doubtless the U.S. naval authorities had learned much from air reconnaissance. The rocky is. of Truk, lying well inside the ring of the reef and unapproachable without penetrating the lagoon, lent themselves far more to a stubborn defence than did the sandy is. of the Marshalls. Towards the end of March the U.S. Pacific Fleet made heavy attacks on the Jap.-held Palau Is., some 550 m. E. of the Philippines. The attacking force included aircraft carriers and battleships and the attacks were co-ordinated with other attacks made by bombers on the Carolines. In these attacks twenty-five Jap. ships, including two destroyers, were sunk, and 200 aircraft destroyed.

**New Guinea Landings.**—Early in the New Guinea campaign small garrisons of Dutch E. Indian troops manned isolated outposts in Dutch New Guinea, supported by small detachments of Amers. Towards the end of March Australian troops were landed, strategic considerations demanding that these outposts, which guarded the approaches through Torres Strait to Port Moresby and Darwin, should be consolidated. This part of New Guinea has a central mt. barrier even more formidable than the Owen Stanley range and no white man has ever crossed it. The coastal region is a large swamp covering tens of thousands of square miles, intersected by countless streams and creeks infested by crocodiles. The Australians had to wade waist-deep through mud with lanterns to guide the barges into narrow channels, and rifles were fired to frighten away the hundreds of crocodiles. A month later allied forces landed at three different points in N.E. New Guinea, capturing the Humboldt Bay region and Hollandia. This move was a spectacular development in the long-range plan designed to free New Guinea from Jap. control. The operation involved the biggest assembly

of air, sea, and land forces yet seen in the S W Pacific including a formidable air craft carrier force which kept watch for possible enemy interference which might come from the air. By the end of May the end was in sight for the Jap in New Guinea. Strong isolated centres of resistance survived in the coastline between Alexishafen and Hollandia but they were a diminishing quantity. The sea power of the Allies was unchallenged in a circle radiating from their powerful New Guinea bases. MacArthur's forces were steadily edging westwards. Land operations in the S W Pacific for months past were less a war of combat than a war of supply and quick construction. Hollandia, like other selected spots, was attacked from the air, and convoys with strong naval support took in troops and much equipment for the capture and reconstruction of strategic

airfields. No considerable opposing force was met in these months and no great retaliation from the enemy. Hollandia would probably have been the last big delivering base the Jap would have used in New Guinea had not the unexpected arrival of allied forces forestalled them. Remarkable work was done by the Americans on this newly recovered ground. It was well suited to spanning the gap of ocean and is between allied ter in the Pacific and Japan. It was an engineering expedition rather than a plan of battle. Moreover by expending the maximum in explosives ammunition, and supplies, the Americans conserved the lives of their soldiers. They realised that it did not pay to risk man power to attain an objective that could be won as easily with arms or machinery. Thus highways were carved out of mts or thrown across sago swamps as occasion required, huge bulldozers forced their way through kapok plantations and diverted rivers. Amphibious craft plied from ship to shore in the rush to bring up supplies. Air strips were laid down swiftly and having served their brief purpose were discarded. Possession of advanced fields enabled bombers and fighters to be over enemy ter at all hours and all the nearer enemy fields had now come under persistent Amer and Australian bombing. At night patrolling torpedo boats were destroying all surface craft they could find. Indians and Japanese who had been forced into slave labour and tortured and flogged by the Jap were eager to co-operate with the Amer Army and the Dutch civil administration now set up at Hollandia. Doomed and disolate at the other end of New Guinea stood Rabaul a monument to the art of encirclement in war. It was now a target for allied bombers whenever they chose to attack it.

**Invasion and Capture of Saipan. Guam retaken**—The next important operation was that of the Amer expeditionary force on Saipan. On June 15, most important of the Marianas 1500 m S of Japan. This bold Amer action was a direct challenge to the enemy in a vital area for the loss of Saipan would threaten the inner ring of Japan's conquests and her communications through the China Sea. Unwilling to risk her main fleet Japan tried a surprise attack on the U.S. Fifth Pacific Fleet which together with British naval units was engaged in protecting the forces invading Saipan. The Amer commander, however, was well informed about the enemy's manoeuvres and was ready to bring the enemy fleet to battle if possible. His latter consisted of five or six aircraft carriers with a escort of four battleships of the second line *Kongo* class and a number of cruisers and destroyers. But, discouraged by the fact that the Amer carrier forces on June 19 had shot down a large number of Jap aircraft off Saipan, the Jap commander decided not to risk a naval engagement. On the evening of the next day however an attack on his fleet was made by Amer aircraft and naval units which bombed and sank three carriers, one battleship, a

destroyer, and smaller vessels, there being no loss of ships on the Amer. side, although slight damage was sustained by two Amer. carriers and one battleship. In these engagements the Amers. lost 110 aircraft as against 335 Jap. Saipan was now virtually lost to the enemy. Originally it had a Jap. garrison of 20,000, in an area of 70 sq. mi. Of that garrison 19,000 died fighting. Amer. casualties were correspondingly heavy, 15,000, of whom 2359 were killed and 1213 missing. This was by far the biggest-scale fighting in the is., as also the most ferocious. It was found that there remained at least 45,000 Jap. in the Wewak-Aitape area of New Guinea and there were signs that they too, cut off by allied sea-power, would, like the Saipan garrison, fight to the last. But the Saipan victory proved that the Allies were on the right road and the success of the landing force showed that there was no lack of guns and tanks. That Adm. Nimitz was able to send so far a force so strong and well-equipped was proof alike of the Allies' supremacy at sea and of the great number of soldiers they could spare, even at a time when the Pacific was, perforce, still regarded as an operation secondary to the war in Europe. The gradual, if slow, approach of allied arms to Japan proper was marked on the night of July 9, when Amer. Superfortresses attacked the Jap. mainland for the second time within a month, bombing installations at the great naval base of Sasebo, on Kyushu Is., and industrial objectives at Yawata, 65 m. further E. on the same is. Yawata, with the largest steel works in Japan, was the target for the earlier raid on June 15. The loss of Saipan precipitated a political crisis in Japan, for Gen. Tojo ceased to be Prime Minister, a new ministry being formed under an admiral and a general. Added to the loss of Saipan was the knowledge of the military and naval chiefs that utter disaster threatened Japan in the S. seas, and in that 'co-prosperity' sphere which Japan had marked out as her own. Defeat in Burma, where the much-publicised invasion of India had proved a costly failure; the mounting losses of the Jap. mercantile marine (Brit. submarines at this time sank over a score of Jap. supply vessels, besides damaging others); the impotence of the navy to rescue, reinforce, or even revictual the starving and fever-stricken armies marooned in New Guinea and other Pacific Is.—these were the fruits of Gen. Tojo's stewardship. It remained to be seen whether his successors could wrest victory from failure; but they could have no very good hope of extricating Japan from the plight into which Tojo had led her by his policy of dispersing Jap. strength over a multitude of is. which failing sea-power could not defend. On July 31 an Amer. expeditionary force of marines and infantry invaded the much-battered and important is. of Guam, which had fallen to the Jap. on Dec. 12, 1941, and which is the southernmost and largest of the Marianas, 130 m. S. of Saipan. The invading force went ashore

under cover of a heavy bombardment from carrier aircraft and warships of the Fifth Fleet and estab. beach-heads at all predetermined points. The preliminary bombardment by ships and aircraft was the longest theretofore of the Pacific war; it began, appropriately enough, on Amer. Independence Day, July 4 (for Guam was the first of America's dependencies to be taken by the Jap.), and lasted seventeen days. Its importance to Japan lay in the fact that it covered her supply line through Burma and the Dutch E. Indies. Amer. tanks were landed within four hours of the attack on July 21. The struggle, however, promised to be a hard one, comparable to the fighting in Guadalcanal, for like that is. Guam is remarkable for its broken hills, steep valleys, and jungles. But by Aug. 7 the Amers. had buried more than 8000 Jap. dead. The sole area remaining to the Jap. on Aug. 8 was Pati Point on the E. coast, but on Aug. 10 all organised resistance ceased. Jap. attempts to escape were prevented by the naval patrol maintained off the N. coasts. Isolated groups of the enemy were soon wiped out.

*American Invasion of the Philippines.*—The position in the S. Pacific at this time was that thousands of Jap. still remained in Brit. New Guinea, New Britain, New Ireland, and the Solomons; but all were watched by allied garrisons at well-chosen vantage-points and almost daily bombed or machine-gunned by allied airmen, besides being deprived of supplies and worn down by starvation and disease. Hence these large bodies of enemy troops were no longer a menace, though sooner or later they would have to be dealt with. The Jap. remaining in Dutch New Guinea continued to drift westwards, seeking a way of escape, but their luggers were being sunk every day by air patrols. Thus the Allies were free to develop their campaign against the Philippines. By bombing Davao the Amers. increased their growing threat to the Philippines and their pressure on the enemy air bases at Mindanao. On Sept. 15 Amer. marines and army assault forces of Adm. Nimitz's command landed in the Palau Is., Japan's nearest and strongest bastion E. of the Philippines, 550 m. away. Simultaneously Gen. MacArthur's force successfully occupied the Morotal Is., 300 m. S.E. of the Philippines. The way for both landings had been prepared by massive attacks on the central Philippines by carrier aircraft of the Pacific Fleet a few days earlier. A week later, on two consecutive days, carrier-based aircraft raided Manila for the first time, a convincing proof of the Allies' rapidly growing superiority in carriers. In this raid 367 Jap. aircraft were destroyed and 46 ships sunk or damaged, and a floating dock destroyed, the enemy being caught by surprise. By this date (Sept. 25) the U.S. Third Fleet in the far W. Pacific had sunk 122 ships (excluding 61 small craft), damaged 137 ships and 109 small craft, and destroyed 980 aircraft, Amer. losses being 51 aeroplanes and 57 airmen. These operations of the Third Fleet had forced

the Jap. to withdraw their naval forces from their former anchorages in the Philippines and seek new refuges in the same general area. Japan's sea lanes were now confined to the China Seas, the rest of the wide Pacific being dominated by the U.S. fleet, while the Jap. Navy stood off, unwilling to risk an encounter. The war-makers of Japan before 1941 evidently believed that if they could get all the known is. airfields and build a few others in the outer perimeter they would be unassailable. They omitted from their calculation the tremendous industrial potential which permitted the Amers. to go into any is. or atoll, tear down tracts of jungle, and build first-class air-strips in days or weeks. Some of the is. so used were mere coral specks which, in the war, became magnified into important airbases. Morotal was a good case in point. Heavy blows now rained down on Jap. shipping resources. The expected Amer. invasion of the Philippines began on Oct. 20 when, in a great amphibious operation, Gen. MacArthur's forces seized the E. coast of Leyte Is., 600 m. N. of Morotal and 2500 m. from Milne Bay, whence the offensive, in effect, had begun sixteen months previously. By seizing Leyte, which lies between Luzon and Mindanao, the Amers. split the Jap. forces (estimated to number 225,000, under F.-M. Count Terauchi) in the Philippines in two. Again the enemy was outwitted, for his expectation of an attack on Mindanao caused him to be caught unawares in Leyte, with the result that the Amers. pushed rapidly inland with small casualties. The landing was preceded by a devastating naval and air bombardment. Supplies of heavy equipment soon arrived in great quantities. Air support was given by navy carrier forces of the Far E. Air Force and the Royal Australian Air Force. Within ten days the Amers. had disorganized the Jap. defence of Leyte, the enemy's losses in killed and wounded being 14,400, or half their force, and also captured virtually all Samar, the is. next to Luzon. Tacloban, the cap. of Leyte, and its airfield were captured soon after the landing, as also was the airfield at Dulag, thus giving the Amers. airfields from which eventually the rest of the Philippines might be won back. Great as was the real strategic significance of the invasion of Leyte the political and moral aspects of Gen. MacArthur's return to the Philippines in Filipino eyes tended to overshadow the military aspect, for in 1942 nothing so deeply underlined the truth of Japan's initial advantage as her capture of the Philippines, despite the utmost efforts of a supremely tenacious defence. Simultaneously with the advance into Leyte the Jap. Navy sustained a very heavy defeat in the Philippine Sea, some fifty-eight Jap. warships being sunk or damaged, including the super-battleship *Musashi* of 45,000 tons (sunk), her sister ship *Yamato* (damaged), and the battleships *Fuso* and *Yamashiro* (sunk) (for details see under NAVAL OPERATIONS). The conquest of Leyte was practically completed before

the end of the year, the Jap. losses being 82,514, including 63,801 killed, compared with 10,400 Amer. casualties, of whom 2176 were killed.

On the morning of Jan. 9, 1945, Gen. MacArthur led large forces to the invasion of Luzon. Jap. aircraft struck at the Amer. warships repeatedly and desperately, but seventy-nine of their machines, besides two destroyers and other vessels, were destroyed. In one day the Amer. forces had estab. themselves firmly on the S. shore of Lingayen Gulf, and at slight cost advanced southward towards Manila and eastward to secure strong hill positions. The invasion was one of the biggest amphibious operations of the war, over 100,000 men being landed, with their supplies, from an armada of 1000 ships, including 800 transports, and great quantities of tanks and guns. President Osmena, of the Philippine Commonwealth, issued a proclamation on Jan. 10 exhorting all Filipinos to rally to Gen. MacArthur's forces. Bombing of key-points and bridges on the railway from Manila to Lingayen, of airfields close to Manila, and of bases at Baguio and Rosario, to the N.E. of Lingayen Gulf, seriously obstructed the movement of Jap. reinforcements towards Gen. MacArthur's chosen battle-ground on the great central plain. Meanwhile Amer. carrier-borne aircraft sank twenty-five Jap. ships and damaged many more in an attack on four convoys off Indo-China between Saigon and Camranh Bay, which latter, though 800 m. from Luzon, was nearer than any other Jap. base on the mainland of Asia and was serving as a concentration point for important elements of the Jap. fleet.

*Manila captured by the Americans.*—The Jap. rout in Luzon was a foregone conclusion, for their local air-power and airfields had been destroyed long before Gen. MacArthur's landings and their garrison had been much depleted in a vain effort to stave off defeat in Leyte. Moreover Gen. MacArthur and his staff had closely reconnoitred the defences for two years previously with especial attention to the central plain, and his intelligence service throughout the Jap. occupation had been remarkably reliable, being supported by Filipino co-operation. Four Amer. divs were employed at the beginning of the campaign. One held the right and two the left flanks, while the main advance was made by the 37th Infantry Div. towards Manila. Subsequently the 1st Cavalry Div. was added, and these two divs. reached the outskirts of Manila on Feb. 3. On Feb. 4 the Amer. flag was once more flying over Manila (see also MANILA). Meanwhile diversionary landings had been made in Subic Bay and on the Batangas Peninsula, while an airborne div. moved northward from Batangas to close the pincers. The whole plan was well conceived, but the Jap. so neglected their opportunities that it was never put to any severe test, and it became evident that they had lost Manila because the increasing power of the Allies had rendered local recovery by the enemy impossible; while a further

factor in the Jap. defeat was their inability to continue normal administration. The people's resentment towards the Jap. was shown by passivity and non-collaboration and, in the case of the guerrillas, by sabotage and open rebellion. A Jap. force still held out within the walls of the old Sp. city of Manila with desperate ferocity, but it was already unlikely (Feb. 16) that the rest of the Jap. garrison could be of more than a nuisance value in the country around Baguio or further N. In W. Luzon Bataan was captured (Feb. 16) by the Amers. after landings on the S. coast, the enemy's gunfire from Corregidor being neutralised by destroyers and aircraft. Cavite naval base was taken at the same time.

**Sumatra Raided.**—On Jan. 24–29, 1945, two strong attacks were made by aircraft of the E. Fleet on Jap. oil refineries on Sumatra. A powerful force, commanded by Sir Philip Vian and including the carriers *Illustrious* of Malta fame, *Victorious*, *Indomitable*, and *Indefatigable*, struck a most damaging blow at the enemy's oil supplies of major importance to his war effort in this zone. These attacks were made by carrier-borne aircraft on refineries at Palembang in S. Sumatra. At the same time as this heavy blows were struck at Iwojima in the Volcano Is. by battleships and cruisers which bombarded the Is. on Jan. 24.

**Tokyo bombed. Invasion of Iwojima.**—The first of a series of air attacks on Japan was begun on Feb. 16–17, 1945, when 1500 Amer. aircraft attacked Tokyo and Yokohama. These aircraft were launched from an immensely powerful Amer. naval force, which included a score of the fastest and largest carriers, escorted by battleships. The air attack on Tokyo under Adm. Marc Mitscher, whose force moved up to within 300 m. of the Honshu mainland, the nearest to the Jap. coast that any hostile fleet had been during the war, gave the Jap. a terrible lesson in Amer. power. The aircraft first attacked Jap. aircraft, airfields, and other targets in and around Tokyo in wave after wave for nine hours, while the sea and air bombardment of Iwojima was continued. The main weight of this great raid on Tokyo was directed against military targets rather than the industrial objectives at which the Superfortresses had aimed during the previous three months or more. Some 332 Jap. aircraft were shot out of the air, 177 definitely destroyed on the ground, and 150 probably destroyed on the first day, with an unknown number damaged on the second day; and also with much damage to naval vessels, aircraft factories, and engineering plants. The Amers. lost forty-nine aircraft and forty pilots. The Jap. found that instead of only the huge long-range bombers, formidable both for offensive and defensive powers but restricted in numbers and confined to a restricted number of bases, they now had to face attack by swarms of light and medium aircraft operating from mobile bases. The command of the sea secured by the

battles off the Visayas in Oct. 1944 had given the Amer. high command the opportunity of carrying the war to the heart of Japan when it chose. While Adm. Mitscher's task force of carriers and escorts was thus engaged, another force was in action off the Bonins, which are less than 700 sea miles from Tokyo Bay. This force under Adm. Spruance contained battleships as well as carriers, and was now bombarding and bombing the enemy's positions on the already much-bombed Is. of Iwojima as a prelude to landing. Amer. marines landed on Iwojima on Feb. 19. Some 800 vessels, including battleships, took part in the attack. The invasion of Iwojima was one of the sternest tests in the hist. of America's wars and Amer. casualties were heavy, for the enemy was seasoned and expert and took every advantage of the broken, boulder-strewn terrain, and was strongly supported by artillery, mortars, rockets, and machine-guns, besides extensive minefields.

**Battle for Intramuros ended.**—In Manila there had been some weeks of most bitter fighting, but by Feb. 20 the Japs. had been compressed into an area of only 1200 yds. by 800 yds. in the walled city of Intramuros. Jap. casualties in the six weeks' campaign on Luzon were at this date (Feb. 20) 92,000 and the Amer. 12,929. The battle for Manila ended on Feb. 24, or three weeks after the Amers. had entered the city. Terrible sights met the eyes of those who took the city; for the Jap., by forcing civilians to remain there, had turned Intramuros into a charnel-house, where the bodies of those who died violent deaths were littered among the ruins. It was a repetition of all the barbarities the Jap. had committed since Manila was attacked, with a new kind of cruelty superadded.

**The Americans in Corregidor.**—Gen. MacArthur returned to Corregidor on March 2, three years after the Jap. had overpowered the exhausted Amer. garrison and he himself had flown to Australia. Its reconquest began on Feb. 18, when the first Amer. assault troops landed after a massive bombardment had silenced the great guns of the forts. The reduction of the defences was achieved with the thoroughness, patience, and skill which the Amer. Army had acquired in the capture of many a Pacific Is. stronghold. Some 3000 Amer. infantry and paratroops, who carried out the attack, were opposed by double the number of Jap.; but their casualties were relatively light, while the Jap. left over 4200 dead. The battle for Luzon was now reaching its end. Amer. airborne troops having captured Malayan had reached the S. end of the Is.

**Further Raids on Japan.**—Further air attacks were made on Japan on March 9, by which time some 15 sq. m. of Tokyo, the heart of the city's business and industrial dist., were only a blackened and smouldering ruin. In all that once densely populated area E. and W. of the Sumida R. not a building was spared in the rain of fire sent down on the city

from more than 300 Amer. Superfortresses. At the same date other Superfortresses, which had flown from bases in the Marianas, attacked Nagoya in great strength. Osaka was pounded on March 13, when about one-seventh of the whole area of the Eitoku plant of the Alchi Aircraft Company was destroyed and seven other war plants and harbour installations were heavily damaged.

*Invasion of Okinawa. Japanese Fleet defeated South of Kyushu.* Tokyo's Arsenal Area burned out.—In a carrier-plane assault on the Inland Sea, March 18-19, a task force of Adm. Spruance's fleet, under Vice-Adm. Mitscher, damaged a score of Jap. ships and destroyed about 500 planes. No Amer. ships were lost, despite the fact that Mitscher's force lay in close proximity to the Jap. mainland. Among the damaged ships were two battleships, two carriers, four escort carriers, two cruisers, and four destroyers. Amer. aircraft losses were extremely light.

An Amer. force of about 100,000 men, supported by a large fleet of warships, including a Brit. task force under Sir Bernard Rawlings, invaded Okinawa, largest of the Ryukyu Is. (67 m. long), some 325 m. S.W. of Kyushu, in the biggest amphibious operation of the Pacific war. The landings began on the W. coast on April 1, and very soon two airfields were captured. More than 1400 ships were involved in the operations, which were under the tactical command of Adm. Spruance. The role of the Brit. fleet consisted in the bombing and bombardment of the airfields of an Is. to the S. of Okinawa itself and, later, of Formosa. The Jap. garrison numbered some 100,000 men. It was to be expected that the Jap. would offer fanatical resistance, especially as the distance of the Is. from the Jap. mainland was only half that between Japan and the Is. of Iwojima (660 m.), which latter was now in Amer. hands. The Jap. fleet slipped out from its Inland Sea bases with the evident intention of attacking the Amer. invaders of Okinawa or the allied warships protecting the land forces there. But on April 7 six of the enemy warships, the 45,000-ton *Famato*, one light cruiser, and four destroyers, were sent to the bottom, while another destroyer was set on fire. In a two-hour engagement with aircraft of Mitscher's carrier force, 60 m. S. of Kyushu. Of all the enemy ships engaged only three destroyers escaped. Only one ship of the U.S. force suffered minor damage and seven naval aircraft were lost. In all engagements during the two days the Jap. lost 417 aircraft. It was calculated by Amer. naval officers that in this engagement Japan lost about a quarter of what remained of her navy.

Meanwhile Amer. marines were pushing northwards in Okinawa against negligible resistance, but Amer. troops moving southwards were making only slow progress against an extensive system of strong-points, blockhouses, pill-boxes, and burial vaults and caves. On April 20 in one of the fiercest battles of the Pacific war, three Amer. infantry divs., after a dead-

lock of a fortnight, launched an attack against these intricate defences following one of the heaviest bombardments ever made in the support of amphibious troops. Up to April 25 21,269 Jap. troops were killed on Okinawa and surrounding Is. and only 399 prisoners taken. Meanwhile Amer. Superfortresses continued their series of attacks on Tokyo and other tns. in Japan. In a raid on April 14 some 11 sq. m. of Tokyo's arsenal area in the centre of the city were burned out. In a raid on Nagoya (April 7) practically the whole of the Mitsubishi engine works, producing three-quarters of all Jap. aircraft engines, was destroyed.

*The Battles for Okinawa.*—There was to be no easy conquest of Okinawa. As a vital outer defence to the Jap. mainland the Jap. troops in Okinawa meant to fight to the death. The number of their dead had risen to nearly 39,000 by May 10, at which date the N. half of the Is. was under Amer. control. A few days later Amer. infantry were fighting in Naha, chief tn. of the Is. Marines crossed the Asato R. and fought through the ruins of the tn. to within 1000 yds. of its centre. The city abounds in natural and artificial caves and tunnels going down in places scores of feet below ground, thus constituting admirable defensive positions for small men like the Jap. By May 15 the Jap. had been driven from Conical Hill dominating their position in the outskirts of Naha. Shuri, the E. hub of the defence line and the old cap., was outflanked. But though allied progress was made on both the E. and W. coasts the tenacity of the enemy showed no abatement. The allied objective was to secure airfields on Okinawa for intensified air raids on the Jap. mainland, and the Jap. had to prevent this at all costs. There were furious counter-attacks in the battle of Naha and the Amer. infantry, who had taken Conical Hill, found the summit untenable owing to artillery fire from three other hills. Up to May 14 Jap. casualties were 47,000 (mostly killed), Amer. 20,950, of which 2770 soldiers and 1010 marines were killed. Many 'suicide' attacks were made by Jap. planes against Amer. warships and ground forces at Okinawa. Hundreds were destroyed, but still the 'suicide' planes persisted. Carrier aircraft of the Brit. Pacific fleet, in strategic support of their allies, heavily bombed tns. and airfields in the Sakishima group of Is. on May 16-17. By the beginning of the eighth week of the great battle for the S. part of the Is. the Amer. troops had not yet broken the main line of the Jap. defence. Though they had made their initial landings without opposition they had been able to advance only 7 m. in as many weeks. Their task was the more difficult from having to fight over and through hills honeycombed with caves and tunnels and the most elaborate system of concealed pill-boxes and other field works they had encountered in the whole Pacific war; and though the total of Jap. dead by May 20 had risen to more than 48,000 out of a force estimated to have been in the

beginning 85,000, their fighting was still as resolute, skilled, and fierce as ever, though they were constantly under fire from naval guns, ground artillery, and small guns, and from aircraft many times greater than the fire they could return. The Amer. losses by this date were 8300 dead and 22,200 wounded. Their immediate objective was Shuri, a walled and moated citadel, for without it any further advance in the Naha region would only render them open to dangerous flank attack. One of the chief Jap. fortresses was a 160-ft. high tunnelled hill called Sugar Loaf Hill, which was an important bastion for both Naha and Shuri, lying N.E. of Naha and W. of Shuri, and this position changed hands repeatedly; but the Amers. held Takamotaji, a suburb of Naha, which enabled them to repel the numerous counter-attacks. On May 22 the peak of Sugar Loaf Hill, after changing hands eleven times, was finally secured by the Amers. Yonabaru, almost opposite Naha on the E. coast and the second largest tn. of the Is., was taken on that date. Reinforced Amer. infantry and marines were now driving through pelting rains and deep mud into the Jap. line, whose E. extremity between Shuri and Yonabaru at last began to show signs of cracking. Brit. carrier planes again struck at the Sakishima Is., between Formosa and Okinawa, to neutralise Jap. airfields. Occasional aircraft attacks on Amer. ships were literally 'suicidal.' Off the Is. the Amer. destroyer *Laffey* was attacked a week previously by twenty Jap. planes, was hit six times by suicide planes, thirty-one officers and men being killed and sixty wounded. The ship's rudder being damaged she could move only in a circle, but though ablaze at sev. points she held out until the last enemy plane was driven off, her gunners having brought down nine, while six crashed on her deck. Hundreds of Jap. planes were lost during the Okinawa campaign, often more than 200 in a couple of days.

**Tarakan Invaded.**—Australian and Dutch troops, who landed on Tarakan Is., off the N.E. coast of Borneo, on May 1, soon gained control of nearly all the practicable area, including the cap., the roads, and the oilfields, leaving the Jap. with only the central hilly part. Here again, as on Okinawa, Jap. resistance was most tenacious and the natural obstacles were great. The Australians had to fight along a series of ridges, gullies, and spurs, and the heavy undergrowth and concealed positions made it exceedingly close fighting. On May 29 six squadrons of Liberators dropped a hundred tons of high explosives over a wide area of Jap. resistance, the Australian infantry following up with a swift advance on the enemy's narrow defence line in the S.

**Japanese Cities bombed.**—Meanwhile massive air raids were being constantly carried out against the Jap. mainland cities. Some 9 sq. m. of densely populated Nagoya, one of the largest centres of Jap. aircraft and machine-tool production, were laid waste on May 13 when 500 Superfortresses from the Marianas

bombed the N. and N.E. areas of the city with 3500 tons of incendiary and explosive bombs. During 1½ hrs. over a million of the new 6-lb. jelly fire bombs, which spread unquenchable flames for many yards in every direction, were showered on the target area. This was the fourth time Nagoya had been heavily attacked by Superfortresses, the previous dates being March 12 and 19, and April 7, but this fourth attack was the biggest assault theretofore made with fire bombs in the Pacific war, the weight of bombs dropped exceeding even that of most of the 1000-aeroplane attacks by Liberators and Fortresses in Europe. There was great loss of life as well as destruction of shadow factories, where in thousands of homes sub-assemblies were made for aircraft and aircraft engines. Jap. opposition was weak to moderate and only two Amer. aircraft were lost. Two days later Nagoya was again attacked with incendiaries, and on May 26 a strong force of Superfortresses dropped 4000 tons of incendiary bombs on the heart of Tokyo, reducing it to a smouldering ruin, the flames devouring in their path gov. buildings, foreign legations, and the big departmental stores and shops that were clustered around the grounds of the imperial palace. The palace was burnt, but the emperor and the royal family escaped injury. Some nineteen Superfortresses were lost in this attack. Twelve were lost in an attack made two days previously on the Shinagawa industrial dist. of Tokyo, S. of the area hit on May 26. Yokohama was attacked for the first time by Superfortresses on May 28. Some 450 aircraft dropped 3200 tons of incendiaries in 30 min. on the city's extensive docks, shipyards, and industrial plants. Two Amer. aircraft were lost in this attack. At the same time further blows were struck at Tokyo and at Kawasaki, between the cap. and Yokohama. By the end of May some 51 sq. m. of Tokyo had been destroyed in attacks by Superfortresses. On June 5 nearly 500 Superfortresses made an incendiary attack on Kobe, the targets being railway stations, steel works, and shipyards. A similar force of bombers made a daylight raid with incendiaries on May 31 on Osaka, one of Japan's most congested cities, the targets being harbour facilities, shipyards, aircraft propeller works, and electric power stations. Six days later the city, then largely in ruins, was attacked by bombers with high explosives as well as incendiaries, the arsenal being the target.

**Wewak and Bougainville Battles.**—Meanwhile it remained to reduce the Jap. troops still holding out in parts of New Guinea and the Solomons. In an amphibious operation Australian troops captured Wewak Peninsula and Wewak airfield in N. New Guinea in an assault aimed at the capture of the major Jap. base of Wewak (May 11-13). By May 16 the Australians were in control of Wewak harbour. Elsewhere in the S. Pacific there was heavy fighting in Bougainville Is. In six months of fighting on this Is.

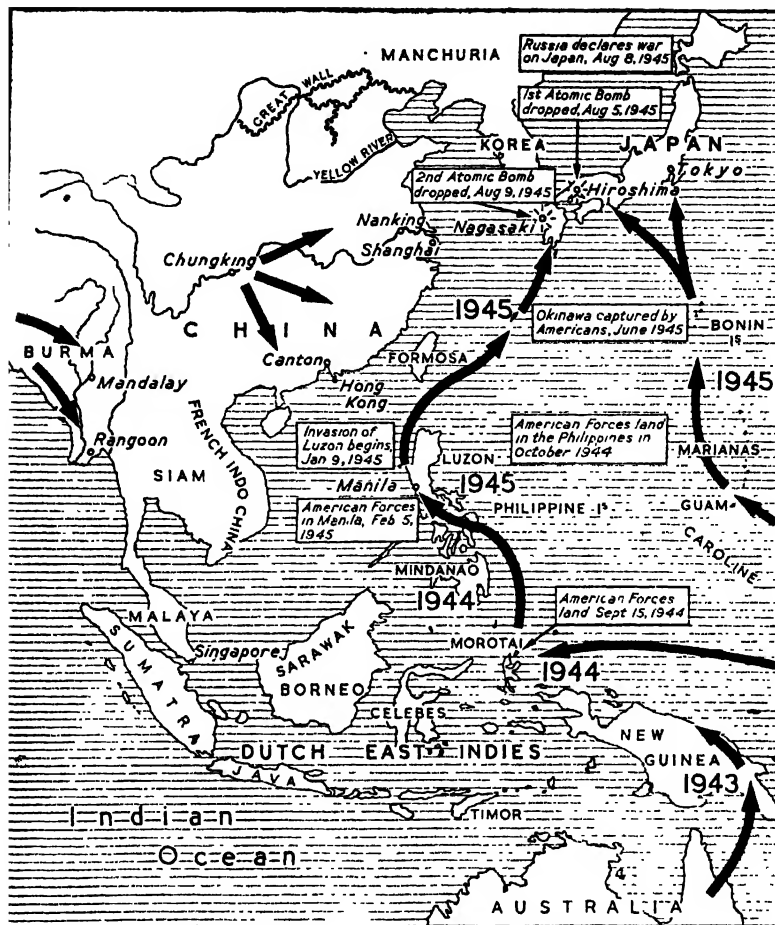

the Australians had killed 5000 Jap. and advanced 80 m. S. to the Pororei R. and 75 m. N. to Bona Peninsula and estab. themselves across the Hongorai R.

*Okinawa almost conquered.*—It cannot be said that the conduct of the Okinawa campaign satisfied all Amer. critics, some of whom pronounced the campaign to be a set-back. It was said that the navy sustained heavier losses than those sustained in all the weeks in protecting the army's landings in Normandy. President Truman, however, announced that army casualties on Okinawa between March 18 and May 29 were 10,221 killed and missing and 27,704 wounded. Jap. deaths were sixfold those of the U.S.A. Jap. suicide pilots also made a number of desperate attempts, but without very much success, to damage the allied fleets. It appeared that the entire Jap. Navy was being turned into a suicide force, with every man sworn to sacrifice his plane, his ship, or his life for the emperor. On June 2 a fresh landing was made by Amer. troops on the Chinen Peninsula, which is near the S. tip of the is. on the E. coast and forms the finest fleet anchorage in the S. approaches to Japan. Most of the peninsula was occupied on the 4th, together with almost all the Naha airfield. Thus the conquest of Okinawa was all but complete. Only 16 sq. m. of the is. remained in Jap. hands on June 11, but the campaign was still difficult. On that date three divs. made a heavy attack in the Yaeju Dake escarpment in S. Okinawa against some 10,000 Jap. In the Oroku caves Amer. marines found the body of Adm. Minoru Ota, commander of the Jap. base forces; he had cut his throat. Scores of Jap. whose retreat was cut off by rocket-firing landing craft threw themselves off the 160-ft. cliffs at Udo. On June 20 the Jap. defence of Okinawa was in its last stage, for of the original garrison estimated at 100,000 only some 2000 were now still alive and these were trapped. With the reduction of the is., the Amers. had secured an air base of incalculable value, being only 330 m. from the nearest Jap. home is. From this base and from bases in Iwojima and the Marianas the Amers. were now able to bomb Japan daily with such a weight of explosives as were never dropped anywhere before. Moreover from Okinawa they could now maintain such a command of the approaches to Japan from the S., from the Chinese mainland, and from Korea, that the Jap. dwindling stream of supplies from the outside world would soon be almost stopped; for on its E. coast Okinawa has a deep-water anchorage big enough for a great fleet, and sheltered from typhoons.

*Japanese Garrisons in the Philippines, Solomons, and New Guinea marooned. Truk bombarded by British Fleet.*—While the weight of the allied attack on the heart of Japan was now increasing rapidly, its front was being steadily broadened. In the Philippines the enemy's situation was desperate, for MacArthur's forces were crushing the remnants of the largest army which the Jap. had sent overseas

since they attacked Britain and America. One force under Gen. Yamashita was resisting in the mt. fastnesses of Luzon; another was holding out in the interior of Mindanao; but neither could hope to escape or delay the end for many weeks longer. What now the Jap. Imperialists feared above all was the explosion of the legend of a divinely assured inviolability of the Jap. homeland, and so far allied bombers had destroyed nearly 1,250,000 buildings and rendered 5,000,000 persons homeless in half a dozen of the chief cities from March to May, and still the attacks were mounting in power. In the S.W. Pacific the Australians were steadily wearing down the resistance of the marooned garrisons in New Guinea, New Britain, and Bougainville. In the central Pacific large garrisons, by-passed by the Amers., sat aimlessly in Truk and other atolls awaiting the supplies that never came. Truk atoll, the 'Gibraltar' of Japan, was attacked by the Brit. Pacific Fleet on June 14-15. Aircraft carriers, cruisers, and destroyers left the place a battered wreck; but it was still estimated to hold a garrison of 40,000 and therefore still constituted a threat to allied forces and bases in the S.W. Pacific area. Meanwhile the Allies opened new fronts in Borneo and in China. While Australian and Dutch troops were overcoming Tarakan, other Australian forces landed on Labuan and at points near Brunel in the N. of Borneo. In China the Jap. at length seemed to be losing ground, for a Chinese advance won back Poochow, while another Chinese attack from Kweichow was threatening the Jap. land communications from Indo-China.

*Japanese Key Defences on Borneo isolated. The Battle for Balikpapan.*—Australian troops made a further landing in N. Borneo on June 19 at the refinery centre of Lutong in the Brit.-protected state of Sarawak, the Jap. making no attempt to hinder the landing. A naval force of light Amer. warships, with Australian gunboats and a destroyer, standing well in-shore, gave the landing beach a furious pounding, and did not cease until the assault troops were within a quarter of a mile of the land. The landing of guns and supplies by steel cables and tractors through a dangerous sea was a fine feat. Other Australians landed on July 1 at Balikpapan, in S.E. Borneo, after a heavy naval and air bombardment by U.S. forces. Gen. MacArthur went ashore with the first wave of assault troops. The Jap. key defences on Borneo had now been isolated by this new landing, following on the seizure of the bases of Tarakan Is. and the Brunel Bay area and Miri oilfield. Furthermore the strategic Macassar Straits, gateway to the Java Seas, were now controlled by allied surface craft, as well as by aircraft and submarine. The whole extent of Java and the important ports of Surabaya and Batavia were now within easy flight range. Allied ships could now, with land-based cover, go to any point in the S.W. Pacific. But there was very heavy fighting for Balikpapan. The Australians

found little opposition at the beach owing to the effectiveness of the fifteen-day naval bombardment of Balikpapan which preceded the landing. By July 3 the Australian 8th Div. had secured a three-mile strip of beach E. of the port and had driven inland for a mile or two against ever stiffening resistance. A day later they were 6 m. inland. Meanwhile the 9th Australian Div. in the Brunel Bay area were advancing with little opposition at both ends of a 125-m. coast-line now in their occupation. The main part of the tn. of Balikpapan fell to the Australians on July 3. The capture of Sepinggan air-strip and tn., 6 m. E. of Balikpapan, followed a 3-m. drive up the coastal highway. The rapid progress made by the

Australians was the more surprising because the Balikpapan defences were stronger than expected. The Jap. planned to flood the sea with blazing oil as an additional defensive measure. Pipelines laid to the beach and more than 100 oil tanks in the refinery area were, however, systematically destroyed by Liberators, whose bombing enveloped the whole dist. in a sea of blazing oil which flooded the streets and exploded the ammunition dumps. A scene of desolation confronted the Australians as they doubled from the encircling ridges into the centre of the tn. On either side of the main road was an almost unbroken line of gutted buildings and installations, with huge refining and storage tanks distorted by fire into fan-

tastic shapes. Bitterly as the Jap had fought to keep it, they finally surrendered the city almost without a fight, abandoning piles of ammunition and weapons, including dual purpose guns and anti aircraft guns, which were among their best weapons.

**Anglo American Naval Air Attacks on Tokyo Area**—More than 1000 naval aircraft of the Amer Third Fleet struck at Tokyo on the night of July 9, achieving complete surprise. Four battleships, four cruisers, and fourteen destroyers also took part. This was the thirty-fourth consecutive day of air attacks on the Jap mainland. The chief targets on the 8th were bases of the Jap suicide aircraft, which had been attacking Amer. naval

units and forces on Okinawa. Two days later Adm Nimitz announced confidently that the Amers. had won 'complete mastery of the skies over Tokyo'. The main 14 of Honshu came under terrific attack on July 9-10. Hundreds of carrier-borne bombers swept over the 100 m. wide Kanto plain, aircraft centre of Tokyo's defences, while incendiaries and explosive bombs rained down on half a dozen industrial towns. Huge fires, fanned by a Pacific gale, blazed at a number of points along 450 m. of the Jap coast on the night of July 13, the aftermath of Superfortresses raids on four Jap cities. Some of the biggest fires were caused by flaming oil. On the 16th Brit ships took part for the first time in air attacks in great strength against the Tokyo area. These formed part of the largest combined Anglo-Amer task force yet assembled in the Pacific. The carrier *Formidable*, commanded by Adm Sir Philip Vian, and the battleship *King George V*, were among the Brit warships engaged. Vice Adm Rawlings was in command of the Brit fleet, most of whose great ships were now in Pacific waters.

Thus the storm of attack now beat more fiercely every week on the airfields, ports, and industrial cities of the Jap homelands. Blows that at first were struck from the air alone were now also being delivered by the Amer and Brit fleets. Powerful squadrons including some of the mightiest battleships in existence, supported by swarms of carrier-borne aircraft, were attacking Honshu and Hokkaido. So far the Jap battle fleet, sorely crippled by its heavy defeat off the central Philippines the previous Oct and by the great air attacks it had subsequently endured, had remained passive and had done nothing to protect coasts which the Jap people had until this period deemed inviolable and to which legend attributed the certain protection of a variety of tutelary deities. Even the suicide aircraft which had often inflicted loss and damage on the allied fleets in May-June were now conspicuously absent in these latest operations.

In Jap home waters, most important of the sea theatres in which the Far East war was being fought out, the concentration of allied strength had now reached massive dimensions. Great fleets had gathered together. The ring of allied air bases was contracting and closing in on Japan. Attack which in the previous spring could only be launched by bombers of the longest range from the Marianas and Guam could now be delivered from Okinawa, where new airfields were being added to those captured from the Jap. The increase in the number of aircraft-carriers now at the disposal of the Allies had reached a point when these powerful auxiliaries could be trusted to defend assemblies of warships and transports against any foreseeable attack even by land based aircraft. Steaming boldly inshore on July 15 where the rugged Muroran hills are plainly visible, the Amer. battleship *Iowa* and other ships of the bombardment group pounded the great

Nihon steelworks and Waniishi iron-mills on Hokkaido. Not a single Jap. plane appeared, nor did the shore batteries reply. Extensive damage was inflicted by Brit. and Amer. carrier-aircraft on July 18 on Jap. warships, merchantmen, and airfields in the Tokyo area. A force of 800 Superfortresses, the largest theretofore used against Japan, in the early hours of July 20, dropped 4000 tons of incendiary and other bombs on the cities of Choshi, Hitachi, Fukui, and Okasaki, the first being the chief fishing harbour on the E. coast of Honshu, the others large industrial centres. At this point nearly fifty Jap. cities had been bombed by Superfortresses in fifty-seven raids.

**Australian Victories in Borneo.**—Meanwhile the Australians in Borneo crossed Balikpapan Bay, landing on its W. coast and pressing inland against negligible resistance. But in the N. and N.E. there was bitter resistance. The Jap. used barriers of flaming petrol in an attempt to halt the progress of the Australians' armoured and mechanised transport in the Manggar area E. of Balikpapan, but the Australians took the Manggar airfield on July 10 and on the 18th captured Mt. Batochamper, the fall of which bastion marked an important stage in the campaign. Samboja, two-thirds of the way to the main oil production area, was taken on July 20.

**Anglo-American Air Attack on Japanese Fleet. Further Superfortress Raids on Japanese Cities.**—Adm. Halsey's Anglo-Amer. carrier aircraft, towards the end of July, attacked the Jap. fleet in its bases at Kure and Kobe. The battleships *Haruna*, carriers *Hyuga* and *Ise*, the cruisers *Tone*, *Aoba*, and *Oyodo*, a destroyer, and three submarines were sunk, and four destroyers, two destroyer escorts, and six freighters damaged. Some ninety-four Jap. planes were wrecked and fifty-six others damaged. Opposition was negligible.

Meanwhile seven task formations of the 20th Air Force of Superfortresses started great fires in some six of eleven cities which had been previously warned by leaflets to expect an attack. All the cities attacked were munition, transport, and industrial centres. Not a single Amer. plane was lost. On July 29 150 Mustangs crossed and recrossed Tokyo in attacks on airfields, railway stations, and shipping. On the morning of Aug. 1 800 Superfortresses, the largest force launched against Japan in the war, dropped a record load of 6000 tons of bombs on the industrial tns. of Hiroshi, Toyama, Nagasaki, Mito, and the petroleum estab. at Kawasaki.

**Mounting Toll of Japanese Naval Losses.**—Jap. shipping continued to suffer ever-increasing losses. During July Amer. aircraft from Okinawa destroyed or damaged 250 Jap. vessels totalling 250,000 tons. The object of this intensified air war was to cut off Japan from her sources of raw materials, food, and fuel, but irreparable damage was also done to her internal communications, naval bases, airfields, and factories. To accomplish

these purposes Okinawa was being expanded into the greatest air base in the world. Mitsuru, a naval base which by Brit. standards would rank with Plymouth, was now under constant air attack and the Jap. ships which had taken refuge there were doomed to destruction. All these losses were particularly depressing for a navy which had previously suffered crippling losses; for in the battle off the Philippines in Oct. 1944, between a quarter and a third of the Jap. battle fleet had been sunk, and since then Japan had lost the *Yamato*, the most powerful of her then remaining ships, while many warships had been sunk in abortive attempts to relieve Jap. garrisons marooned in the is. of the S.W. Pacific and in Indo-Malayan waters. Jap. naval strength was now only the ghost of what it was in 1941 and had virtually disappeared as a fighting force. Japan seemed to repose some hopes on the suicide aeroplane as a secret weapon, but while this aeroplane had unquestionably done damage it was negligible as an effort to diminish the terrible crescendo of air attack that was now crashing down upon the ports and cities of the homeland. Japan was now a power in decline and still greater blows were imminent.

**The Atomic Bomb. Russia declares War on Japan.**—On Aug. 6 a selected port, Hiroshima, was made the victim of the Anglo-Amer. new secret weapon, the first atomic bomb. Only one bomb was dropped on that day, but it had an explosive power equal to 20,000 tons of trinitrotoluene and had more than 2000 times the blast power of the largest bomb used up to that time. Small wonder that part of Hiroshima, a tn. or base of 244,000 inhab., was wiped out at one single blow. Reconnaissance photographs showed that over 4 sq. m. of the tn.'s total area of 7 sq. m. were destroyed and heavy additional damage was done outside the completely devastated area (see further under HIROSHIMA). On the succeeding day 800 tons of ordinary high explosive were dropped on the Toyokawa naval arsenal. Then on Aug. 8 came a second blow to Japan, when Russia declared war on her, and on the next day the Red Army attacked along the Manchurian border.

**Japan surrenders.**—A second atomic bomb was dropped on Aug. 9, this time on Nagasaki. The bomb used here was said to have rendered obsolete that used against Hiroshima, being easier to assemble. Already great laboratories had been estab. in the Marianas, with a large staff of scientists to test materials and assemble the bombs. One-third of Nagasaki was wiped out, including the Mitsubishi steel and arms works and the Mitsubishi-Urakami ordnance plant. The use of the epoch-shaking atomic bomb received a mixed reception from public opinion both in America and in Britain, but in the ultimate analysis it would seem impracticable to 'humanise' war or the weapons of war. It is only necessary to state here that the bombs were a means of hastening the collapse of Jap.

resistance. On the day that the second atomic bomb was dropped allied aircraft based on Okinawa destroyed sixty more Jap. ships. This proved the last straw, though it is to be borne in mind that Japan was already on the edge of defeat. For apart from having no defence to the new bomb, Japan's sole recent successes in the war were those won by suicide aircraft which had sunk twenty-four warships (including three escort carriers and eleven destroyers) and damaged 164 others (including seven battleships) with great loss of life. They did not succeed, however, in sinking any armoured vessel and they did not put any Brit. warship out of action. But a truer picture of Japan's plight was that shown by the wreckage of the Jap. Navy which strewn the is. shores after Japan had lost all but forty-nine of her 369 warships. Months before the dropping of the first atomic bomb Japan had been brought to measurable distance of collapse as a result of the destruction of its fleet and the increasing air blows at the homeland, although Japan still had a very strong army (in the homeland 2,000,000 trained professional military personnel, in China, Manchuria, and Formosa 3,000,000 men), and a considerable air force (11,000 aircraft, of which 6000 were combatant types). In fact the situation in which what once had been one of the strongest military powers had been brought to surrender without the defeat of its army was unparalleled in hist. and created problems which had to be solved without guidance from the past. Japan entered the war with twelve battleships and now had but one, the *Nagato*, and even that was heavily damaged and without a crew. Of her nine front-line carriers the *Hatoka* and the *Katsuragi*, both heavily damaged, alone remained. Of nineteen heavy cruisers, only two remained, both being at Singapore, badly damaged. Similarly, of twenty-four light cruisers, but two were left. The number of destroyers, estimated originally at 163, was now reduced to twenty-six, sev. of which were badly damaged. Of the original 140 first-line submarines only sixteen remained, in addition to six former Ger. U-boats. Even so, however, the invasion of Japan might have been resisted a *outrance* and would no doubt have entailed enormous casualties, a prospect which was unquestionably exercised by the atomic bomb. The same day the atomic bomb was dropped on Nagasaki the Jap. Gov. announced their readiness to accept the Allies' Potsdam terms of surrender, provided they did not prejudice the prerogatives of the emperor. The Allies' reply, while not asking for the emperor's abdication or dethronement, made it clear that his authority, together with that of the Jap. Gov., should be subject to the allied supreme commander from the moment of surrender and that the emperor himself would be required to authorise and ensure the signature by the Jap. Gov. and the imperial general headquarters of the surrender terms, and, further, that the emperor must issue orders to commanders in the field to cease

fire and surrender their arms, and be ready to issue any other orders which the allied supreme commander might demand in order to give effect to the surrender terms. In a word, the Allies intended that the emperor should acknowledge and bear his share of responsibility in ending the war which he sanctioned and that this 'semi-divine being' must be acknowledged to have been led away by the wrong advice of ministers and generals, a bitter pill for the Jap. people to swallow, the more especially as the traditional military caste was built round the fiction of the emperor's sacrosanctity as the 'Son of Heaven.' On Aug. 14 Japan surrendered, and it was on that date therefore that the Second World War came to an end. The emperor issued orders for all Jap. forces to cease fire, though it was estimated, through broadcasts from Tokyo, that it would take six days for the orders to become effective in China and Bougainville, twelve days in New Guinea and the Philippines, and still longer in Burma. At the same time Marshal Vassilevsky sent the Jap. Kwantung Army an ultimatum to surrender its arms by Aug. 20. The continued resistance of the Jap. armies in Kwantung after the surrender of the metropolis was an eventuality which the Russians had foreseen, and it caused no hitch in the steady development of operations in Manchuria and Korea. But by Aug. 17 Jap. forces had begun to surrender on sev. sectors of the Manchurian front. Hostilities in Bougainville ceased by Aug. 19. In Burma, in the Karen Hills, the war went on as if nothing had happened, but the surrender here was confused by the great distances involved. On Aug. 20 Lord Mountbatten, supreme allied commander of the S.E. Asia Command, broadcast directions to F.-M. Count Terauchi, commander of the Jap. Southern Army, to send a representative with plenipotentiary powers to meet his chief of staff at Rangoon, and the meeting took place there on Aug. 26. By Aug. 23 the Jap. in the Philippines were beginning to surrender in large numbers as the news of the capitulation reached the mt. fastnesses.

**Russian Campaign in Manchuria.**—In broad outline this whirlwind sixteen-day campaign, in which the Russian armies were under the supreme command of Marshal Vassilevsky, consisted in the envelopment of the three main Jap. fortified areas: the Hailar-Solun area in W. Manchuria, the Sungari-Sakhalyan in N. Manchuria, and the maritime area in E. Manchuria. Operations were planned to take every advantage of the superiority of Russian armour over Jap. anti-tank weapons. Attacking on a broad front in the E., Marshal Meretkov's forces came to grips with the main forces of the Jap. Third Army in the first days of the campaign by outflanking the frontier defence zone. From the N. Gen. Purkayev, by a wide manoeuvre to Mergen, surrounded the Jap. 123rd Infantry Brigade and blockaded the Sukhalyan defence zone. Up the valley of the Sungari other forces of Gen. Purkayev's command thrust

towards Harbin. From the W. Marshal Malinovsky by-passed all Jap. positions W. of the great Khingan range by throwing armour forward in a spectacular advance. Relying on transport aircraft for water and fuel, Russian tanks were at times operating 500 m. from their bases. They crossed country which for hundreds of miles was without either shelter or wells. Great belts of grasslands were set ablaze by the retreating Jap. By Aug. 20 the Russians had conducted vast enveloping moves which brought the whole of Manchuria from the borders of Inner Mongolia to the sea of Japan, and from the middle Amur to the Yellow Sea, within the grasp of their armies. Soon afterwards Russian airborne troops landed in the tns. of Dairen and Port Arthur and began to disarm the garrisons. On the 31st the Russians took prisoner 71,000 Jap. officers and men. By the 23rd the Russians were in occupation of the whole of Manchuria, S. Sakhalin, and the is. of Shumshu and Paramushiro in the Kurile archipelago. On that day the Jap. Kwantung Army, after unsuccessful counter-attacks, laid down their arms and surrendered to the Red Army.

*Allied Troops enter Japan.*—Amer. airborne troops landed at Atsugi airfield, 18 m. from Tokyo, on Aug. 28 to prepare for the formal occupation under Gen. MacArthur. A huge armada of allied warships had now assembled off the coast of Japan. Four-fifths were Amer. ships, the rest mainly Brit., together with Brit. Dominion and some Dutch. Some nine allied ships entered Tokyo Bay on the same date. The main landing of allied troops began the next day, airborne forces arriving in strength at the Atsugi airfield, while Amer. and Brit. marines disembarked at Yokosuka naval base. The allied forces, spreading out over Yokosuka, Yokohama, and a large portion of the Tokyo plain, now had a strategic grip on the Tokyo Bay region. Meanwhile (Aug. 30) a strong Brit. naval force, under Rear-Adm. Harcourt, entered the harbour of Hong Kong, which had been in Jap. occupation since Dec. 27, 1941. They seized the naval dockyard and ejected all Jap., including the naval and military commanders. No actual instruments of surrender had yet been signed owing to the physical difficulties imposed by great distances and the fact that large numbers of Jap. forces were scattered over far-flung areas of the Pacific. But on Sept. 2 Jap. envoys, in the presence of fifty allied generals and other senior officers, signed the allied instrument of unconditional surrender aboard the Amer. battleship *Missouri* in Tokyo Bay, and immediately afterwards a convoy of forty-two ships entered the bay and landed 13,000 Amer. troops for the march on the cap. The new Jap. Prime Minister, Prince Higashi Kuni, broadcast an appeal to the Jap. people to carry out faithfully the terms of the surrender and the orders of the emperor. There were other formal surrenders to be made in Luzon, New Guinea, the Solomons, Malaya, and Burma, but with the signing of the instrument of

surrender on the *Missouri*, Japan had at last come to the end of her dream of conquest. When the Jap. representatives, comprising either senior army officers or silk-hatted officials, came on board the Amer. warship in the early morning clouds covered the bay, but it was light enough for them to see and to wonder at the armada of Amer. and Brit. ships dominating their cap., including H.M.S. *Duke of York* and *King George V*. Gen. MacArthur signed the surrender documents as supreme commander, Adm. Nimitz signed for the U.S.A., Adm. Sir Bruce Fraser for Britain, Gen. Hsu Yung-chang for China, Lt.-Gen. Kuzma Deev-yanko for Russia, Gen. Blamey for Australia, Air-Vice Marshal Isitt for New Zealand, Gen. le Clercq for France, and Gen. L. H. van Oyen for the Netherlands. Mamoru Shigemitsu, former ambas. in London and now foreign minister, signed for the emperor, and Gen. Yoshijiro Umezu on behalf of the Jap. Imperial General Staff. On this occasion the Amer. flag flown by the *Missouri* contained only thirty-one stars as opposed to the forty-eight of to-day. It was the flag flown by Commodore Perry, U.S.N., when he entered Jap. waters ninety-two years earlier. Some 200,000 Jap. troops on various by-passed Pacific is. laid down their arms on Sept. 3 at five minor surrender ceremonies aboard Amer. warships in the S.W. Pacific. These were Truk, naval strongholds in the central Carolinas, Palau, the Bouina, N. of Guam, Rota in the Marianas, and Pagan, N. of Saipan.

*British Forces enter Singapore.*—Adm. Sir Arthur Power, commander in chief of the E. Indies Fleet arrived at Singapore on Sept. 3 with a Brit. naval force, Royal Marines having taken over Penang the same day. Brit. and Indian troops landed at Singapore on Sept. 5. It was a peaceful entry, though as a precaution against treachery the first wave of troops came in assault craft. The return to Singapore was certainly remarkable, for the landing had been planned as a carefully phased military operation, so that if the enemy offered resistance it could be overcome. But in the result the operation resembled a civic reception, the Jap. general representing Gen. Itagaki, commander in the Seventh Area (Malaya, Java, and Sumatra), waiting on the dockside to greet the first allied troops.

The surrender in the S.W. Pacific was signed on board H.M.S. *Glory* in St. George's Channel, 28 m. S.E. of Tahiti, on Sept. 6. Gen. Imamura, commander-in-chief in the S.W. Pacific, handed his sword to Lt.-Gen. Sturdee, commanding the Australian First Army, and both he and Adm. Kusakabe, commanding the Jap. fleet in the area, signed the surrender.

*Surrender in South-east Asia Area.*—The official surrender in S.E. Asia took place in the council chamber of the municipal buildings in Singapore. It was an impressive ceremony. The Jap. representatives were Gen. Itagaki in place of Count Terachi, the supreme commander, who was said to be too ill to attend, and the commanders of the Jap. armies in

Siam, Burma, and Singapore, and of the enemy fleets based on Singapore and Surabaya. At the head of the allied officers was Adm. Mountbatten, the supreme commander of the area, with Lt.-Gen. Slim, commanding the forces in the area of S.E. Asia, Adm. Sir Arthur Power, Air Marshal Sir Keith Park, and Lt.-Gen. Wheeler, deputy supreme commander. It was evident that in a combined area of 1,500,000 sq. m., with a pop. of nearly 130,000,000, the command would have months of planning before it could complete the removal of some 500,000 Jap. soldiers and the bringing them back to peace conditions, and the repatriation of prisoners of war and civilian internees numbered over 200,000.

**Japanese surrender in New Guinea.**—It was not until Sept. 13 that Gen. Adachi, commander of the Jap. Eighteenth Army, after an ultimatum had ended his long procrastination, surrendered the Jap. forces in New Guinea to Maj.-Gen. H. C. H. Robertson, commander of the 6th Australian Div. Thus ended a long and arduous campaign in which the Australians encountered some of the toughest enemy forces in the Pacific. The Australians had succeeded the Amers. in Nov. 1944, but for some time could only act on the defensive in New Guinea and in its satellite in Bougainville. Wewak, garrisoned by 20,000 Jap., was not taken until the end of March 1945, and the final offensive in Bougainville was not launched by the Australians until early in April. But by the end of July the Jap. 41st Div. had been virtually annihilated, while in Rabaul the Australians were effectively containing as if in an internment camp an enemy force of no fewer than 50,000 men, who, however, despite daily bombing were well supplied with ammunition and food, and indeed able to supply themselves indigenously for an unlimited time.

**Burma and Hong Kong surrendered.**—On the same day (Sept. 13) Gen. Ichida signed the instrument for the surrender of Burma to the Brit. Twelfth Army at Rangoon (see further under **BURMESE CAMPAIGNS IN SECOND WORLD WAR**). The Jap. in Hong Kong did not surrender until Sept. 16, though the R.N. had been in possession of the dockyard since Aug. 30.

**Japanese Atrocities.**—The State Dept. in Washington lost no time in apprising the world of Jap. atrocities. The dept. on Sept. 5 pub. a long document containing the unsavoury story of 'Japan's barbaric torture and wanton murder' of Amer. prisoners of war and charging Japan with the violation of practically every law concerning the treatment of prisoners of war and internees. It accused the Jap., *inter alia*, of ordering all the prisoners taken in the closing days of the Philippine campaign to be killed, of tossing grenades in the hold of a sinking ship containing 750 Amer. prisoners, and of making a bonfire with petrol out of an air raid shelter and burying alive the survivors of the 150 Amer. prisoners in it. The stories of prison ships were equally horrifying.

See S. Morrison, *This War against Japan*, 1943, and *Ocean Front*, 1945; O. Tellachius, *Tokyo Record*, 1943; Adm. Sir W. M. James, *The British Navies in the Second World War*, 1946; Lt.-Gen. B. E. Lippincott and others, *From Fiji through the Philippines with the Thirteenth Air Force*, 1948; Lt.-Gen. A. E. Percival, *The War in Malaya*, 1949; V. Spencer Chapman, *The Jungle is Neutral*, 1949; and J. E. Cresswell, *Sea Warfare*, 1939-1945, 1949.

**Pacific Girdle, see under IGNEOUS ROCKS.**

**Pacific Ocean**, largest div. of the hydrosphere, extends from the Southern Ocean (lat. 40° S.) to Behring Strait, *e.g.* practically to the Arctic Ocean; it is, however, continuous with the Southern Ocean to 80° S. lat.; it divides the Old and New Worlds, and is roughly bisected by 170° W. long.; greatest breadth, 10,000 in.; length, 7000 m. In shape it is very roughly pentagonal, very broken to the W. and S.W., where it communicates with the Indian Ocean; it has an area of 63,634,000 sq. m., nearly 40 per cent. of the whole water extent of the world.

**Coast-line.**—The coasts of America which meet the P. O. are steep and even, with fjord formation in the N. and S. Australia shows a somewhat similar coast, but the Old World presents a series of fringing seas with festooned is. enclosing them, and a much gentler slope of coast; the continental shelf is here more extensive. At a mean distance of 475 m. as against 386 m., the P. O. has a coast-line of only 49,000 m. as against 90,000 m. of the Atlantic. The drainage area is very small, only a little more than one-quarter that of the Atlantic, although the actual ocean surface is 12 times as great. The terrigenous deposits are correspondingly small and nearer land, mostly covering the fringing seas. Red clay occupies about three-fifths of the whole area lying towards the E.; globigerina ooze, two-thirds of that in the Atlantic, occupies the intermediate depths towards the W. and off S. America.

**Depth.**—The mean depth of the P. O. is 3870 metres, and it exceeds that of the other oceans; the W. is deeper than the E., and the N. than the S. Some of the great depths appear to lie up against the festooned is., *e.g.* the Tuscaraora Deep (max. 4665 fathoms) lying along Japan and the Kuriles for 400 m.; the Aldrich Deep, E. of New Zealand (max. 3155 fathoms). The greatest depth sounded is 5269 ft. between Midway Is. and Guam. Soundings in 1921 revealed the greatest depths in the Aleutian trench, 7382 metres, and in the year 1927 the greatest recorded ocean depth was made by the Ger. cruiser *Emden* of 10,800 metres, near the Philippine trench E. of Mindanao.

**Islands.**—The P. O. is notable for its large number of oceanic is. grouped in the central and W. regions; they are all volcanic or coral, many being atolls, and number over 2500, with an area of 70,000 sq. m. The P. O. is unique in its complete girdle of volcanoes of the continental coast and is, with accompanying manifestations of earthquakes. The temp.

and salinity show no very marked abnormalities, though the P. O. is in general less saline than the others.

**Currents.**—Under the influence of the winds a clockwise swirl is formed in the N. Pacific; the waves produce a N. equatorial current along lat. 15°, turning N. by the Philippines, and joining irregular branches from the E. Indies and China Sea to form the Kuro Siwo, the Gulf Stream equivalent, at Formosa; this becomes a W. wind drift in lat. 45° N., branching opposite Vancouver to form the California current, N. an independent swirl following the Alaskan coast to join the W. wind drift again. A cold Arctic current enters from Behring Strait and circulates through the sea of Okhotsk and the Japan Sea, making the mainland coast ice-bound in winter. An equatorial swirl following the Alaskan coast to join the E. part, but less so in the W. In the S. Pacific the trades cause a S. equatorial current along the equator and to 15° S., branching very irregularly in its westward course, among the is. to the W., and forming four distinct currents, turning southward to form the great anti-clockwise swirl. These unite in their eastward course about lat. 40°, to branch opposite S. Chile, N. forming the Peru current, S. joining the W. wind drift round Cape Horn.

**History.**—Balboa sighted the P. O. from Panama in 1513. Magellan sailed through the strait bearing his name in 1520, and gave the name to the ocean. In 1577 Drake, the first Englishman to enter the P. O., sailed N. to California and across to the Molucces. In the seventeenth century the Australasian region was explored, and a more careful and detailed extension of the work occupied the eighteenth century. Many scientific expeditions were carried out during the nineteenth. Valuable contributions to the survey work of the P. O. have been made by the Jap. Gov. as well as by the U.S. oceanographical dept. of the navy. For campaigns in the Second World War see PACIFIC CAMPAIGNS or FAR EASTERN FRONT in SECOND WORLD WAR. See A. Brigham, *Index to the Islands of the Pacific*, 1900; T. R. Saint-Johnston, *South Sea Reminiscences*, 1922; F. Zorck, *Annalen der Hydrographie*, 1928; W. G. Ivens, *Island Builders*, 1930; G. E. R. Deacon, *Dynamics of the South Ocean*, 1937; J. W. Vandercook, *Dark Islands*, 1938; J. A. Williamson, *Cook and the Opening of the Pacific*, 1949; R. Gibbins, *Over the Reefs*, 1949; and bibliography of OCEAN and OCEANOGRAPHY. See also OCEAN; TERRA AUSTRALIS INCOGNITA.

**Pacific Steam Navigation Company** obtained a charter in 1840 and ran two steamers along the coast of S. America from Valparaiso to Panama. It was the pioneer of the steam trade along the coast, but in its early years the company suffered very heavy losses owing to the difficulty of obtaining fuel. One result of this was that it used compound engines long before the Atlantic companies, and thenceforward achieved prosperity. In 1870 their ships ran from Callao to Liverpool,

and by 1874 they had a fleet of fifty-four steamers running. In conjunction with the Orient Navigation Company the Pacific Company had estab. the Orient Line, from which they withdrew in 1906. In 1910 the whole of the P. S. N. Co.'s ordinary capital was purchased by the Royal Mail Steam Packet Company, which company still has the controlling interest in it. Its services are to the E. and W. coast of S. America via the Panama Canal and the straits of Magellan from Europe, to the W. coast of S. America and to Colombian and Ecuadorian ports from New York; and there are also Central Amer. services.

**Pacifism**, see PEACE; PEACE SOCIETIES.

**Pactolus**, in anct. times the name of a brook in Lydia, Asia Minor, now called Sarabat. It rises in Mt. Tmolus, and flows past Sardis into the gulf of Smyrna. Its sands were once famous for gold, and tradition attributes the wealth of Croesus to them.

**Pacuvius, Marcus** (c. 220-130 B.C.), the greatest of the Rom. tragic poets, b. at Brundisium. He was the nephew of Ennius, on whose style he modelled his dramas. He also devoted some of his time to painting. He died at Tarentum. Among his works are *Antiope* and *Armorum Iudicium*. See O. Ribbeck, *Scenica romanorum poesis fragmenta*, 1897, for a collection of his writings, and W. Y. Sellar, *Roman Poets of the Republic*, 1863.

**Padang**, tn. of Sumatra, Indonesia. It is on the S.W. coast, and trades chiefly in coffee, tobacco, copra, hides, gold dust, and spices. P. fell to the Jap. forces in Feb. 1942. Pop. 52,000.

**Paddington**: 1. Dist. and parl. bor. of London, 4 m. N.W. of St. Paul's. It is divided into two divs., N. and S., each of which sends a member to Parliament. The terminus of the Western Region Railway is at P. Pop. 97,000. See LONDON. 2. Suburb of Sydney, New S. Wales, Australia, 3 m. S.E. thereof. It has industries of brewing, tanning, and soap making. Pop. 36,000.

**Paddle-steamers**, forerunners of screw-driven steamships, are boats propelled by paddle-wheels, which are driven by steam. The use of boats with paddle-wheels dates from very anct. times, both the Romans and Egyptians being acquainted with some form of them; in later times R. Valturinus in his work, *De Re Militari* (1172), records the use of paddle-boats. Dr. Denis Papin, a native of Blois, suggested towards the close of the seventeenth century that his invention of a steam cylinder fitted with a piston could be applied to work paddle-wheels, but the idea does not appear to have been successfully carried out. T. Savery invented a steam-condensing system, which he claimed could be applied to ships; J. Hulls claimed that he was the actual inventor of the paddle-steamer, in which he used ideas of Savery and Papin, but his boat does not seem to have worked successfully. The *Pyroscopie* of the Marquis de Jouffroy was successful in travelling up the Saône unaided in 1783, but no commercial success followed. The

boat built by S. Moray in 1797, with two paddle-wheels, gave the best results experienced till then. In 1803 Robert Fulton made his first trip, and in 1807 Stevens built a paddle-steamer, the *Phoenix*, which plied for six years on the Delaware, whilst in the same year the *Clermont* of Fulton reached a speed of 5 m.p.h. on a trial trip. During the next decade the number of steamers on the Mississippi increased, and from 1835 the speed attained was greater. In England Symington in 1802 built a stern-wheel steamer, but the *Comet* of Henry Bell, first built in 1804 and wrecked in 1820, was the first paddle-steamer employed regularly and successfully in Great Britain. For the varieties of wheels see PADDLE-WHEEL. See R. Murray, *Marine Engineering and Steam Vessels*, 1852, and E. C. Smith, *Short History of Naval and Marine Engineering*, 1938.

**Paddle-wheel**, wheel used for propelling a boat or ship. As originally tried, it consisted essentially of a series of paddles or paddle-like spokes inserted in an axle drum or wheel. The term was avoided by the eighteenth-century inventors and theorists, who spoke of a 'water-wheel,' a 'rowing-wheel,' 'revolving oars,' etc. The name P. gradually came into use after 1815. In its eventual development flat boards were fitted more or less radially round the circumference, so as to press backward like a succession of paddles against the water. Two wheels are generally used, one on each side of the vessel, a little aft of midship, so as to catch the tops of waves; in riv. steamers, where there is no great depth of water, one only, placed at the stern, is sometimes used. The floats of the earlier paddle-boats were fixed rigidly to the wheel. Later feathering Ps. in which each float is fixed to a pin at the back and connected at the centre of the wheel to a small eccentric by means of a lever connecting with a small arm fixed rigidly to the back of the float, were used: the eccentric is rigidly attached to one of the levers, causing it to rotate with the wheel. By this method the old 'churning of the water' is lessened. The use of paddles has been discontinued in favour of screws for cargo boats and ocean-going ships. The efficiency of the paddle is greatest at a certain constant immersion; and when draughts vary the level of floats must vary also. Rolling affects the paddles and strains the engines, as one paddle offers very great resistance while the other is racing. The speed of the floats depends on the diameter of the wheel; more breadth is required for vessels with paddles, as each paddle is about one-fourth of the breadth of the boat, but they are very suitable for excursion steamers, being fast, easily managed and started.

**Paddy and Paddy Bird**, see RICE and RICE BIRD.

**Paderborn**, tn. in Westphalia, Germany, formerly a Hanse tn. One of the chief buildings of note is the cathedral, part of which was built during the twelfth and thirteenth centuries. In it is the silver coffin of St. Liborius. P. was heavily

damaged during the Second World War the cathedral, tn. hall, and sev. churches suffering in varying degrees. Pop. 37,300.

**Paderewski**, Ignace Jan (1860-1941), Polish pianist, composer, and statesman, b. at Kurylowka, in Podolia, son of a Polish gentleman farmer; studied at Warsaw and Berlin. Always remarkable for strong personal views as an artist, he developed his talent in his own way from the first, and such piano instruction as he received at Warsaw was merely part of the curriculum; and when, in 1876, he made his first public appearance, it was mainly with the purpose of introducing his own compositions (pieces in the form of Polish dances), which at that time he was not technically proficient enough to play more than passably well. His first wife was the young pianist, Antonina de Korsak, who d. in childbirth in 1881. He taught at Warsaw and Strassburg 1878-84. It was at Strassburg that he met the actress, Modjeska, a gifted countrywoman of his, who first perceived the true bent of P.'s genius, and persuaded him to become an interpretative artist, and be placed himself under Leschetizky in Vienna, three years' intensive work with that accomplished master turning him into a finished executant. He appeared at Vienna, 1887; toured Germany, 1888; visited Paris, 1889; London, 1890 (when he first came to England he was known only as the composer of the *Minuet in G*, which comes from his *Humoresques de Concert*, op. 14); and America, 1891. His name became a synonym for a perfect pianist. He toured Europe extensively until his second marriage, in 1899, to baroness de Rosen, afterwards devoting himself principally to composition, although he still played occasionally. He wrote some good piano music, especially his popular *Polish Fantasy* with orchestra; his opera *Manru* was produced at Dresden (1901) and New York (1902), and his symphony at London (1912). His idol was his countryman, Chopin. In the interpretation of whose passionate, whimsical, and splenetic moods he was unapproached.

He was politically active in the cause of Poland during the First World War, and was first Prime Minister and minister of foreign affairs of the Polish Republic, 1919-20. The idea of creating a Polish army outside Poland was his (1916), and with that aim he was sent to America as delegate of the Polish National Committee which had been formed in Paris. Soon after the armistice he came to London to seek help in reconstituting the new Polish state. His presence, subsequently, in Poznan at a time when there was danger of Poland having some association with Germany, roused the Poles there to tremendous enthusiasm, and a revolt broke out which resulted in most of the prov. of Posenania being wrested from the Gers.; its transfer was confirmed by the treaty of Versailles. It was at the peace conference that he was at his best as a statesman; if he claimed less than his countrymen desired, he acquired for Poland the good will and confidence of the other delegations. He retired to his estate in

California in 1920, and in 1922 returned with *éclat* to the concert stage. P. received many honours, including, in 1925, the G.B.E. Univs. in all parts of the world conferred honorary degrees on him. Oxford made him D.O.L. and Cambridge Mus.D. See lives by E. A. Vaughan, 1907; J. F. Looke, 1928; H. Opienski, 1929; A. Henderson (*Contemporary Immortals*), 1930; R. Landau, 1934; O. Phillips, 1934; and *Memoirs*, ed. by Mary Lawton, 1939.

**Padiham**, tn. of Lancashire, England, 3 m. N.W. of Burnley. The inhab. are engaged in the manuf. of textile goods, engineering, furniture manuf., mining, etc. Pop. 10,000.

**Padişah** (*pad*, throne, and *shah*, sovereign), title assumed by the sultan of Turkey. The Ottoman Porte formerly called only the Fr. king P., calling the other sovereigns of Europe 'kral,' but the name has now been applied to other leading sovereigns.

**Padova**, see **PADUA**.

**Padstow**, seaport of Cornwall, England, on the estuary of the Camel, 5 m. N.W. of Wadebridge. Pop. 2400.

**Padua**, Duke of, see **ARRIGHI, TOS-SAINT**.

**Padua** (It. *Padova*, anct. *Patavium*): 1. Episcopal city, cap. of the prov. of P., Italy, on the canalised part of the Bacchiglione, 22 m. W.S.W. of Venice. The cathedral (sixteenth century) has a baptistery dating from the twelfth century. The church of the Eremitani (destroyed in 1944) was an old Augustinian church of the middle thirteenth century (restored in 1880), containing frescoes by Andrea Mantegna and his contemporaries of the school of Squarcione, which were amongst the most important examples of N. It. art. The campanile is intact, and reconstruction of the roof, apse, and façade has been completed. The church of San Antonio (1307) contains the tomb of the patron saint of P. and a high altar designed by Donatello; his magnificent equestrian statue of Gattamelata stands outside. Other notable buildings of P. are the observatory, occupying the tower of the palace of Ezzelino da Romano (thirteenth century), and the univ., founded in 1222 and famous as a seat of learning in the Middle Ages. There is a modern engineering college here. In the S. part of the city is the Piazza Vittorio Emmanuele, adorned with numerous statues, some by Canova. The botanical garden connected with the univ. is the oldest in Europe. The chief industries of P. are breweries, distilleries, foundries, corn and saw mills, motor car and chemical factories. P. claims its origin from the time of Troy. It was formerly the most important tn. of Venetia; Livy was born here in 59 B.C., and the painter Mantegna (1431-1506). It was sacked by Alaric the Goth and by Attila the Hun in 452. In 1337 it came under the rule of the Carrara family, and was taken by Venice in 1405. It was occupied by the Fr. in 1797, and in 1811 ceded to Austria, who retained it until Venetia passed to Italy in 1866. Pop.

181,900. See C. Foligno, *The Story of Padua*, 1910 (Medieval Towns); G. Newman, *A Century of Medicine at Padua*, 1922; and H. la Farge, *Lost Treasures of Europe*, 1946. 2. Prov. of Venetia, Italy, traversed by the Rs. Bacchiglione, Adige, and Brenta, and intersected by a network of canals which connect it with the Adriatic; it is a fertile plain, producing grain, wine, rice and fruit, and grazing for cattle. It has stone quarries and mineral springs. Area 826 sq. m. Pop. (1936) 640,000.

**Paducah**, co. seat of McCracken co., Kentucky, U.S.A., 48 m. N.E. of Cairo, Illinois. It manufs. iron goods, machinery, flour, and pottery, and is an important strawberry and tobacco market. Pop. 33,700.

**Padus**, see **PO**.

**Pæan** (Gk. *ἰατρ*), in Gk. mythology, the physician of the gods, but later Gk. writers invariably use P. as a title of Apollo in his aspect of healer. Later the word was synonymous with 'song of thanksgiving' and 'hymn of victory,' meanings derived apparently from *ἰατρ*, an invocation to Apollo and other deities.

**Pædo-Baptists** (Gk. *παῖς*, *παῖδ*, a child, and baptist), one who holds and practises infant baptism. Since this is the normal practice in most Christian communities, the term is used but rarely. See also **ANTI-PÆDOBAPTISTS**.

**Pælgian Dialect**, see under **LATIN LANGUAGE AND LITERATURE**.

**Pæony**, genus of herbaceous and shrubby perennials (family Ranunculaceæ) which includes some of the most magnificent garden flowers. The herbaceous kinds are the hardier and are more widely cultivated than the shrubby tree of mt. Ps. These, if grown out of doors, need protection from spring frosts; they are very valuable for gentle forcing under glass. *P. corallina* is naturalised on an is. in the Severn, and by some authorities is considered a true Brit. native.

**Pæstum** (Gk. *Παῖστου*, modern *Pesto*), Gk. colony in Lucania, S. Italy, situated near the bay which took its name from the tn. (Pæstunus Sinus—gulf of Salerno). It is supposed to have been founded by colonists from Sybaris about 600 B.C. After the Lucanians had conquered the city it fell into the hands of the Romans, who, in 273 B.C., also founded a colony there. After suffering at the hands of the Samnites during the fifth century, and being partially destroyed during the eleventh, it was eventually abandoned during the sixteenth century. The ruins of two Doric temples at P. are among the most remarkable remains of antiquity. Although the battle of the Salerno beach raged all around them in the Second World War, the temples of P. escaped all damage. Indeed the war actually helped archaeological interests, for, while digging a gun-emplacment near the site, Brit. troops came upon evidence of a prehistoric cemetery. Regular excavations were subsequently conducted under the auspices of the Neapolitan Museum.

**Pæstum**, see **THRASIA, P. Pætrum**.

**Pagan**, anct. ruined city of Upper Burma, 92 m. S.W. of Mandalay. From the second century A.D. to the day it was sacked by the barbarian hordes of Kubla Khan in 1284 it served as Burma's cap. It is one of the archaeological wonders of the E. Perched on the 70-ft. cliffs of the E. bank of the riv. stretch the shrines, monasteries, and bell-shaped pagodas of the city which make it a resort of Buddhist pilgrims. There are 5000 of these monuments still standing. The Brit. Fourteenth Army crossed the Irrawaddy near P. in Feb. 1945, in the advance against the Jap. in Mandalay, but fortunately P. was spared the ravages of war. Pop. 7000.

**Pagani, Gregorio** (1558-1605), It. painter, learnt his craft from Santo di Titi and Lodovico Cordini (Cigoli). A fine colourist, he helped to renew the inspiration of his native school of Florence. The 'Family of Tobit' and some frescoes in the church of Santa Maria Novella, which are his best-known works, are all in that city.

**Paganini, Niccolò** (1784-1840), violin virtuoso, b. at Genoa, where he studied under Costa; later he worked also under Rolla and Ghisetti at Parma. After an adventurous youth, having put in a prodigious amount of technical practice, he began his actual career when twenty-two years old. Twenty-five years later he toured Vienna, Berlin, Paris, London, and elsewhere, amassing a very considerable fortune. After 1835 he lived in semi-retirement, dividing his time between Parma and Paris (see Berlioz, *Autobiography*), where his gambling propensities led almost to his ruin (1836). He is remembered chiefly for his wonderful technique, his double-stopping and harmonics being unsurpassed, as were also his roundness and beauty of tone in soft passages. But his dissolute and coarse character and general lack of refinement marred the sentiment of his interpretations and precluded him from truly artistic composition. See life by J. Pulver, 1936, and A. Vinogradov, *The Condemnation of Paganini*, 1946.

**Paganism** (Lat. *paganus*, countryman), word supposed to have been first applied by the early Christians to the country folk who were the last to abandon the anct. beliefs and practices. P. is a form of religion which worships a god or gods other than the One True God of the Christians, Jews, and Muslims, though religious feeling in the Middle Ages led Christians to describe as pagans both Muslims and Jews. P. is in fact identical with polytheism. It is probable that the earliest manifestation of religion was monotheistic and that P. arose from a tendency in primitive man not only to distinguish the divine attributes but to deify natural phenomena. These phenomena are easily recognisable in the familiar deities of Greece and Rome. The anthropomorphic character of the pagan gods led inevitably to the exaltation of human passions. The Jews appear to have been the first to recognise the intimate link between P. and morality, and the

denunciations of their law and prophets are summed up in the magnificent epistle of St. Paul to the Romans. From that time human hist. has been the story of man's loyalty now to the One, now to the Many. Though P. has long been officially abandoned in the W. world it may be said that neither camp has finally rid itself of the influence of the other. The effects of Babylon, Assyria, and Rome failed to destroy the monotheism of the Jews and Christians, though the superstitions of the anct. world are not dead in our time. The influence of P. can be detected in the fierce monotheism of Islam; and the general councils of the E. Church have been mainly concerned to rebut the influence upon its theology of the pagan world. See M. A. Beugnot, *Histoire de la destruction du paganisme en Occident*, 1835; E. de Pressensac, *The Ancient World and Christianity*, 1888; and F. C. Conybeare, *Myth, Magic, and Morals*, 1909.

**Page, Sir Frederick Handley** (b. 1885), Eng. aeronautical pioneer, and inventor of the slotted wing aircraft. He was one of the early pioneers of flying, and founded Handley Page Ltd. in 1909. In 1908 he joined the Royal Aeronautical Society, and was its president from 1945 to 1947. In the First World War P. designed and built the heavy bomber, the world's first multi-engined aircraft, and in 1919 he was running a civil aircraft service to the Continent. Under his direction Handley Page Ltd. became one of the leading aircraft manufacturers, and comprised 65 per cent of the Imperial Airways fleet when the two concerns were merged in 1924. During the Second World War Handley Page Ltd. produced the Harrow, Hampden, and Halifax bombers, and the Hastings military transport. Among P.'s other designs are W8's, Hannibals, and Hermes. He was president of the Society of Brit. Aircraft Constructors in 1938, and of the Institute of Transport from 1945 to 1946.

**Page, Thomas Nelson** (1853-1922), Amer. author and diplomat; b. at Oakland, Hanover co., Virginia; practised law at Richmond, 1875-93; was amb. to Italy, 1913-19. His literary work after the First World War showed an intense admiration of Italy. Pubs. include *In Old Virginia* (1887); *The Old South* (1891); *Marse Chan* (1893); *Pastime Stories* (1894); *The Old Gentleman of the Black Stock* (1896); *The Negro—the Southerner's Problem* (1904); *Robert E. Lee* (1908, 1912); *Life of Thomas Jefferson* (in lt. 1918); *Italy and the World War* (1926). He will live in Amer. literature by his charming sentimental stories of Virginia, in which the protagonists are the plantation owners and their devoted slaves and body servants. He was one of the first and most successful in employing negro dialect. See R. Page, *Thomas Nelson Page a Memoir of a Virginia Gentleman*, 1923.

**Page**, youth of noble and gentle birth who waits on royal and noble personages. In the days of chivalry, down to the fifteenth century that is, a boy desirous of becoming an esquire and afterwards a knight served an apprenticeship as P.

at court or in the castle of some nobleman. The modern Ps. of honour or Ps. of the presence, etc., who are attached to royal households and who figure on ceremonial and state occasions, are not unlike the *pueri pædagogiani* who served the Rom. emperors.

**Pagellus**, well-known genus of the acanthopterygian family Sparidae, belongs to the sub-div. *Pagrina*, in which the members have a single series of long front teeth and rounded molars on the sides of the jaw. The species live in the warmer seas; all are carnivorous and many are edible. *P. centrodontus* is the sea-bream, gilt-head, or chad.

**Pagenstecher**, Hermann (1844-1932), Ger. ophthalmologist, b. at Langenschwalbach, Sept. 16, brother of Alexander P. (1828-79), founder of the Wiesbaden Eye Hospital (1857). Educated at Wiesbaden and at the univs. of Würzburg, Berlin, and Prague, in 1868 he was assistant at the Univ. Hospital of Greifswald, and in 1869 at the Wiesbaden Eye Hospital. At his clinic in the Taunusstrasse he received patients from all over the world, effecting many remarkable cures. Queen Victoria, the Empress Frederick, and many other royal persons were among his patients, but he made no distinction between the rich and eminent and the poorest patient, treating all alike with the same degree of skill and care. P. wrote many essays on professional subjects, his *Atlas of the Pathological Anatomy of the Eye* being the best known.

**Pages**, Louis Antoine, see GARNIER-PAGES.

**Paget**, Sir George Edward (1809-92), Eng. physician, b. at Great Yarmouth, Norfolk, became a fellow of Caius College, Cambridge, in 1832, took his M.D. degree in 1838, and was made a fellow of the Royal Society in 1855. From 1839 to 1884 he was physician to Aldenbrooke's Hospital, and in 1872 he accepted the chair of physic at his own univ. He will be remembered for the stimulus he gave to the education of medical practitioners.

**Paget**, Henry William, see ANGLESEY, MARQUESS OF.

**Paget**, Sir James (1814-99), Eng. surgeon; b. at Great Yarmouth, Norfolk, entered St. Bartholemew's Hospital in 1834. Here he discovered the parasite, *Trichina spiralis*, in the human body, and proved a very brilliant student. In his early manhood he was heavily handicapped by his father's debts; but strenuous devotion to physiology, and especially to pathology, wherein he showed the vital importance of the microscope, soon brought him to the top of his profession as a scientist on the one hand and a surgeon and consulting physician on the other. He wrote *Lectures on Surgical Pathology* (1853) and *Clinical Lectures* (1875). He was resident of the Royal College of Surgeons (1875) and vice-chancellor of London Univ. (1883). See S. Paget, *Memoirs and Letters of Sir James Paget*, 1901.

**Pagi Islands**, see NASSAU.

**Pagoda**, Portuguese word, possibly a corruption of the Persian *but-kadah*, which

means an 'idol-house.' It is a term used in the E. for a temple, more especially one pyramidal in shape. There is a very handsome and massive P. at Tanjore, the upper portion being an elongated and elaborately sculptured pyramid 100 ft. in height. The most imposing and, at the same time, the most holy of the Burmese Ps. is the Shwgy Dagon P. at Rangoon. The Siamese *phra* is either pyramidal with a cylindrical turret, or bell-shaped with a slender spire. Unfortunately the marvellous Chinese P., known as the Porcelain Tower of Nanking, was destroyed by the Taipings in 1856. The P. belonging to the temple of Horiuji in Japan has only five storeys; large ones have as many as thirteen.

**Pago-Pago**, harbour of the is. of Tutuila, Amer. Samoa, which nearly bisects the is. It was ceded to America in 1872 for a coaling station and is now a U.S. naval station.

**Pagus Aurelianensis**, see ORLEANAIS.

**Pahang**, state of the Federation of Malaya and, formerly, one of the narrower group known as the Federated Malay States (see MALAYA) under Brit. protection. It lies entirely on the E. side of the main range and has 130 m. of its E. border on the China Sea. It comprises 13,820 sq. m. or about half the area of the former federation. The major portion of P. is fairly flat though varied with low hills, but on the S.W., W., and N.W. there is a mountainous chain separating P. from Selangor (q.v.) and Perak (q.v.) and rising to a height of over 6000 ft. in the area called the Cameron Highlands. On the N. range separating P. from Kelantan (q.v.) and Trengganu (q.v.) the highest peak, Gunung Tahan, reaches 7186 ft. The country is fairly well intersected with rivs. and streams, the longest being the P. R. (over 200 m.) which, as the Telom, rises in the hilly regions of the N.W. and, fed by many tribs., the largest of which are the Tembeling, Jelut, and Lipis, flows first in a southerly direction, through the middle of the state, and thence in an easterly direction, and has its outlet at Pekan on the E. coast. The state includes the is. of Tioman, some 25 m. off the coast in the China Sea. The seat of gov. is at Kuala Lipis. The sultan resides at Pekan, near the mouth of the P. R. The country is rich in gold, tin, and galena, and produces fine specimens of mats, buckets, etc., woven from pandanus fibre. The dynasty that once ruled P. was descended from the rulers of the royal house of Malacca and before that house became extinct in 1699 its P. branch provided many rulers for the older throne of Johore, which directly represented the Malacca dynasty (see MALAYA, History). Thereafter P. came under the suzerainty of the new sultans of Johore who, when they removed to Ithio and Lingga (is. states S. of Singapore), left a member of their own house as *dato' bendahara* in charge of P. In 1857 Sir Frederick Weld negotiated a treaty with the bendahara, promising Brit. help in the event of external aggression and arranging for a Brit. agent to be stationed at his cap. At the same time the title of sultan was

substituted for bendahara. In 1888 the sultan applied for and obtained British protection, and the appointment of a resident. P. was invaded by the Jap. in Jan. 1942 and the Brit. forces, outnumbered, withdrew from the Kuantan area (Jan. 6) after flooding the large P. Consolidated tin mine. Area 13,820 sq. m. Pop. 221,800.

**Pahari**, see under INDO-EUROPEAN LANGUAGES.

**Pahlavi** (tn. see ENZELI; PEHLEIR).

**Pahlavi**, Middle Persian, or Middle Iranian, terms employed for the dialects and scripts used in the ter. of Persia, or Iran, under the Arsacid and Sasanian dynasties (see PERSIA, *Language and Literature*). The term P., which is a phonetic modification of *Parthavi* or *Parthava*, as on the inscriptions of Darius, meaning 'Parthian' (Gk. *Parthiyanos*, Lat. *Parthi*), does not indicate that P. was the language of the Parthians, but that both the speech and the script developed in Parthian times, i.e. when Parthia dominated Iran, and Iranian and Parthian became practically synonymous terms.

Alexander the Great's conquest of Persia in 331 B.C. not only put an end to the Achaemenian dynasty of Persia and to its script (cuneiform writing, q.v.), but also dealt a heavy blow at its religion (Zoroastrianism), its language (Old Persian), and its national culture. In the troubled years which followed the collapse of Alexander's empire there arose the Arsacid dynasty of Parthia, while the language of Persia had undergone considerable modification and new scripts were devised. The ultimate decline of Parthian power helped the renaissance of the Persian national spirit, which found expression, in A.D. 226, in the founding of the Sasanian dynasty; while the Arsacid dynasty was considered to be foreign, the Sasanians rated themselves as a national dynasty, and its founder, Ardashir or Artakhsir (in grecised form, Artaxerxes), traced his descent from the Achaemenians. The Sasanians, following the tradition of their great 'ancestors,' immortalised their deeds in rock sculptures, and inscriptions written in P. Until the Arab invasion of Persia there must have been considerable production of P. literature, particularly on subjects connected with Zoroastrianism. The destructiveness of the Muslim conquest and the imposition of the Arabic alphabet on the newly converted Persians account for the fact that comparatively few P. works have survived. For this survival we are indebted to the Persians, the descendants of the Persian Zoroastrians, who were compelled to flee to India in the eighth century A.D. The survived books owe their preservation to their religious character or to their connection with the Avesta (i.e. the Zoroastrian sacred literature), written in an Old Persian dialect, now called Avesta, and in a most cursive script (probably of P. origin) of fifty signs, also termed Avesta. The book Avesta is invariably accompanied by the Zand, which is the traditional commentary of the Avesta, and is written in P. While the origin of the P.

forms of speech is more or less clear, being a natural development of Old Persian dialects, it is far from clear how the P. systems of writing developed. They cannot have been creations of an individual, because in that case the P. script would have been more consistently worked out, and the almost contemporary appearance of two or more varieties would be inexplicable. It may, therefore, be assumed that the P. scripts were a natural development from local cursive Aramaic scripts (see under ALPHABET). At least three varieties of the P. alphabets are distinguishable: (1) The N.W. P., termed also Pahlavik or Arsacid, the script of the Parthians; it appears on coins and gems of the Arsacid dynasty; (2) the S.W. P., termed also Parsik or Sasanian, the script of the Persians proper; it appears in two forms, monumental (on the Sasanian inscriptions) and cursive (of the P. books); (3) the E. P., of which only a cursive form is known.

**Paiforce**, officially the Persia and Iraq Command, a force which came into existence in April 1941 at about the time of the Iraq rebellion (see IRAQ, *Revolt (1941)*), its purpose being to check a possible move by the Nazis to conquer the Middle E. In the nature of things, thus early in the war, large forces could hardly be created by the Allies at a moment's notice, and the nucleus of P. was a single brigade and a field regiment of Royal Engineers. The force expanded and contracted according to military exigencies and, again, according to exigencies, changed its role. After Syria had been occupied by the Allies and Iraq recovered, P. went into Persia and prepared to meet a Ger. attack either through Turkey or via the Caucasus or both. When that threat had vanished, P. became the indispensable link with Russia, and responsible for the deliveries of war material to the Red Army. This Russian 'lift' was in fact the chief achievement of P., and a triumph of human resolution over difficulties, physical and moral, by a force that comprised men of many nations all from their homeland, and exposed to rigours of climate, hardship, and boredom. Their story is told in a Stationery Office book (with illustrations) issued in 1949.

**Paignton**, tn. of Devonshire, England, on Tor Bay, 2½ m. S.W. of Torquay. Among its places of interest are the remains of the bishop's palace, once the residence of Miles Coverdale. This tn. is a popular seaside resort, and has excellent bathing facilities. Pop. 25,200.

**Paiho**, see PEIHO.

**Paika, Paraire Karaka (1894-1943)**, New Zealand (Maori) politician and Methodist minister. He was a minister of the Methodist Church from 1915 to 1925. In 1938 he was elected a Labour member to the New Zealand House of Representatives, and after the war broke out was made minister for native affairs (1941) and later minister in charge of the Maori war effort.

**Paille Maille**, see MAILLÉ, THÉ.

**Pain, Barry Eric Odell (1864-1928)**, Eng. humorous author, b. at Cambridge.

He was educated at Sedbergh and Corpus Christi College, Cambridge. A story of his, entitled *The Hundred Gates*, appeared in the *Cornhill* in 1889. After leaving college he went to London, took to literature as a profession, and became known as a clever and humorous writer of fiction. His works include *Eliza* (1900); *Eliza Getting On* (1900); *The Memoirs of Constantine Dic* (1905); *Wilhelmina in London* (1906); *The New Gulliver* (1913); *Me and Harris* (1916); *The Problem Club* (1919); *If Summer Don't* (parody of *If Winter Comes*) (1922); *Dumphry* (1927); and *The Later Years* (1927).

**Pain, see under EMOTIONS; FEELING; THERAPEUTICS; TOUCH.**

**Paine, Thomas** (1737-1809), Eng. author and politician, the son of a small farmer

THOMAS PAINE.

at Thetford, Norfolk, became an excise officer in 1761, but, agitating for the removal of grievances, was dismissed from the service. In 1774 he went to America with a note of introduction from Benjamin Franklin, and two years later pub. *Common Sense*, in which he discussed the causes of the war with England. He held various posts in the Amer. Army and under the Amer. Gov. until 1787, when he returned to England. In 1790, in reply to Burke's *Reflections on the French Revolution*, he pub. the first part of *The Rights of Man*, and when two years later he issued the second part he had to flee to France to escape prosecution. He was at once elected a member of the Convention, in which (1793) he opposed the execution of Louis XVI., and was imprisoned until the death of Robespierre. He pub. *The Age of Reason* in 1793. He went again to America in 1802, to find neither welcome nor even charity, and died seven years later in New York. His writings were forcible enunciations of the abstract rights of men, and were highly regarded by the Radical party in England. See lives by E. Sedgwick, 1900; M. A. Best, 1927; C.

Cohen, 1945; W. E. Woodward, 1945; H. M. Fast, 1946; and J. Dos Passos, 1948.

**Painesville**, co. seat of Lake co., Ohio, U.S.A., 30 m. N. of Cleveland, on the Grand R.; 3 m. to the N. of the city is the best harbour on Lake Erie, affording excellent trading facilities. Nursery gardening is carried on, and the industries include the manuf. of motors. Pop. 12,200.

**Painlevé, Paul** (1863-1933), Fr. statesman, b. in Paris, was successively prof. at Lille Univ. and the Sorbonne, and in 1904 prof. of mechanics and engineering at the Ecole Polytechnique. He wrote a book on aeronautics, which is recognised as a classic, and founded the Fr. Air League. A deputy in 1906, as chairman of the Navy Committee he initiated the policy of concentrating the Fr. fleet in the Mediterranean and thereby promoted the development of the Entente Cordiale; minister of public instruction, 1915, and war minister, 1916, he was responsible for appointing Pétain, with Foch as chief of staff, to succeed Nivelle. Prime Minister, for a few months in 1917, he was defeated as a candidate for the presidency in 1924, but became Prime Minister again in 1925, and also finance minister. He wrote many philosophical and scientific works, including a book on the analytical theory of differential equations. See life by E. Charles, 1925.

**Pains and Penalties Bill, see ATTAINDER.**

**Painted Lady** (*Vanessa cardui*), butterfly of the family Nymphalidae, migrates to Britain from N. Africa. The caterpillar breeds on thistles and other plants.

**Painter's Colic, see COLIC; LEAD POISONING.**

**Painting**, in art, may be defined as the imitation or representation of objects by colour laid upon a uniform surface.

**PRIMITIVE MAN.**—Primitive paintings, largely to secure food by magic intent, were made by Palaeolithic man on the walls of his caves. Cave-paintings in France and in Spain are of special interest. These Ps., executed in little more than red and black, as records of animals in movement and as drawings, have never been surpassed. The artists had remarkable qualities of vision, feeling for mass, rhythm, and expressive line. The drawings, while near perfection in themselves, are scarcely related to each other. Possibly they were made for religious as well as for magical purposes, and to convey practical information in connection with hunting and possibly also because to make them gave pleasure to the artist. Their strength and delicacy, feeling for line, tone, and movement, make a curious link with the sophisticated nineteenth-century painter Degas.

**PAINTING IN ANTIQUITY.**—In primitive form the existence of this art may be traced among the earliest known civilisations, as in Babylon, Egypt, India, Mexico, and Greece. Painted tiles, bas-reliefs, and statues have been found. Historical wall-paintings, especially on the walls of tombs, were common among

many early races. The wooden cases of the Egyptian mummies were brilliantly coloured, as may be seen from the specimens in the Brit. Museum, and the Ps. on the walls of the Etruscan tombs are also famous. There is some ground for believing that the art of P. in Greece may have been brought to the same degree of perfection as the arts of sculpture and architecture, though probably lacking in any feeling for perspective, linear or aerial. It was not an independent art in its beginnings, but subservient to sculpture, architecture, or primitive engraving. Hard and definite linear drawing filled up with colour marked the first attempts in the grand art which has since been developed both technically and intellectually to express infinitely more than mere outline. Egyptian art was intended more as a decoration, a record, and a symbol

ETRUSCAN PAINTING

A drawing from Etruscan painting. It shows a sphinx, panther, and deer (or deer), and was painted, with dazzling effect, in red, yellow, and black.

than as an imitation of nature, and probably Assyrian and Babylonian Ps. had the same aim. Later on a faithful representation of nature became one of the most important results the painter desired to achieve; while according to modern ideas something far higher and more elusive than mere resemblance to, or imitation of, external nature—the delineation of the inner soul by the artist's sympathy and insight, must be added to beauty of composition, arrangement, and detail to constitute a truly great picture. The Egyptians apparently knew a variety of pigments, while the Gks., at least till the time of Apelles, used mainly four—white, red, yellow, and black (perhaps including blues). The designs on Gk. vases and pottery are the prin. means left to us for forming any estimate of the art of P. among the Gks. The discoveries at Mycenae, Croton, round the Aegean, and elsewhere by Sir Arthur Evans and others have also made important additions to our knowledge. To Cimón of Cleonae (c. sixth century B.C.) was ascribed, among other innovations, the introduction of 'cata-grapha' (foreshortenings) and an attempt to apply the rules of perspective. Polygnotus of Thasos, who settled at Athens about 563 B.C., was one of the greatest

masters of antiquity, and was praised by Aristotle, Pliny, and Pausanias. To his 'Athenian school' succeeded those of Ionia and Sicily, among the chief names being those of Parrhasius, Timanthes, Zeuxis, Pampylus, and Apelles (fifth and fourth centuries B.C.). The remains of early Rom. art are more abundant. After the sack of Corinth by Mummius (146 B.C.) many fine works of art were brought to Rome and exhibited. Valuable wall-paintings have been excavated from the ruins of Pompeii, the baths of Titus, and other noted buildings in Rome.

The introduction of Christianity marked a new period in the hist. of P. With it the purely decorative representations of mythology were superseded by the symbols of Christianity. Pictorial expression was made to serve a double end—that of commemorating Christ's Passion, and of keeping the truths of the Christian faith alive in the hearts of the early catechumens. Thus in the catacombs one finds constant repetition of symbols such as the Lamb, the Good Shepherd, and others, which, while being purposely unintelligible to the uninitiated, held for the initiate encouragement and hope. Later, after the official estab. of Christianity, in the reign of Constantine, the great pagan basilicas turned into Christian churches were decorated with mosaics, mostly of a symbolical character, or with figures of the Trinity and the saints, such as are to be still seen in the churches of S. Maria Maggiore, S. Giovanni Laterano in Rome, and those of Ravenna (see under separate ins.). To this period belong also sev. illuminated MSS. and images after the style of the Russian *ikons*, all of which betray Byzantine influence and manner of expression. After the eighth-century fresco P. was introduced, and took the place of the mosaics, and while affording a wider scope to the imagination, continued for some time to be tied down by the old tradition, both in composition and in design.

MIDIEVAL PAINTING. —From the Carolingian period till the twelfth century Germany was the chief European centre of art, followed in 1150 by France and in 1250 by Italy. The Gothic influence, full of refinement and tenderness of feeling, and characterised by a return to nature, which contrasted violently with the formal shapes of Byzantinism, dominated the whole art of this period, as is testified by the numerous Ps. on wood and glass, the illuminated MSS., frescoes and engravings still extant.

Early Italian Schools. —The revival of art in Italy and the reaction against the Byzantine tradition commenced with the panel Ps.: the painted crucifixes with black outlines, stiff, contorted, and hard, with a great use of blues and greens in the flesh tints, are rather hard in appearance. The first sign of a new life was given by Nicola Pisano in his realistic alto-relievs at the baptistery of Florence and at Pisa, and was followed in P. by Pietro Cavallini at Rome, Innocenzo di Buoninsegna at Siena, and Cimabue at Florence (1255-1315). The first great It. painter of this period,

however, is Giotto, at Florence (1267-1337), who introduced the natural and dramatic treatment of sacred subjects, and greatly developed the science of composition and colour. With his frescoes at Assisi, in the church of S. Croce in Florence, and at Padua, this medium attains the loftiest heights. Fresco P., in its true sense of P. on fresh (still wet) plaster, is believed to have been one of the earliest forms of P. known and practised. The term is often loosely used, however, to express P. on dry plaster as well. A characteristic of true fresco is the permanence of its colours. This process was largely used for mural Ps. in churches. The designs and figures were painted from sketches or cartoons or entirely from the imagination. The influence of Giotto dominated the Florentine school until the end of the century, and was instrumental in the forming of the famous Painters' Company in 1349. The other prin. painters of this school are Andrea Orcagna (see Pisa), Taddeo Gaddi, Spinello Aretino, and others. Parallel to the Florentine school a fine body of painters, headed by Simone Martini (1283-1344), formed the Siena school, which is characterised by a pensive sweetness of expression, devout feeling, and decorative charm, and founded the Company of Painters (1355), among whom Lippo Memmi and the Lorenzetti were the most conspicuous members. The medieval Tuscan painters end with Fra Angelico da Fiesole (1387-1455), who, in his wonderfully inspired altar-pieces and frescoes in the convent of S. Marco in Florence (see FLORENCE), brings religious art of this period to its highest expression. The other parts of Italy were affected much later by the Tuscan revival.

**The Fifteenth Century.**—The schools of the early It. Renaissance can be roughly classed under four prin. divs., viz. Florence, Siena, Umbria, and N. Italy, divided into Verona and Venice. **Florence.**—The two greatest painters of Florence are Masaccio (1402-29), who developed and perfected Giotto's ideas, and Sandro Botticelli (1444-1510), who is the true representative of the humanistic spirit, and realised, in his Ps., an extraordinary feeling for beauty and the power of 'tactile values.' With these are closely connected Filippino Lippi (1466-1505), Benozzo Gozzoli (1428-1498), Piero di Cosimo, and Cosimo Rosselli, all of whom represent the popular side of the P. of this century, as opposed to the more academic and formal in Paolo Uccello (1397-1475), who first carried perspective to any perfection, Andrea del Castagno, Alessio Baldovinetti, and Antonio Pollaiuolo (1429-98). To these one must add Verrocchio (1435-88), master of Leonardo, Giulianajo (1449-1494), Fra Bartolommeo, and Andrea del Sarto. **Siena.**—This period marks the decline of the Sienese school, the only interesting representatives being Taddeo Bartoli, Sano di Pietro, and a few others. **Umbria.**—Gentile da Fabriano (1378-1460), Piero della Francesca (1416-92), Melozzo da Forlì (1438-94), Luca Signorelli (1442-1524), Pietro Perugino (1446-1524), and Giovanni Sanzio, father of

Raphael, develop all, in different ways, that peculiar quality of suavity, softness, and tender beauty which is characteristic of the Umbrian school of painters, and which influenced considerably the art of the Renaissance. **Northern Italy.**—Padua: Andrea Mantegna (1431-1506); Bologna: Francesco Francia (1450-1517); Venice: Antonello da Messina, who is said to have introduced oil P., Cima da Conoglian, Carpaccio Gentile (1429-1507) and Giovanni Bellini (1430-1516), who have a beauty of colour and design which preludes the advent of the High Renaissance.

**The Sixteenth Century.**—This is the period of the great It. masters. At Florence, Leonardo da Vinci (1452-1519), Michelangelo Buonarroti (1475-1564), Sebastiano del Piombo (1485-1547), who overshadowed and modified the whole of It. P. In Umbria, Raffaello Sanzio (1483-1520), Giulio Romano (1492-1546); Bernardino Luini (1465-1540) at Milan; Correggio (1494-1534) and Parmigianino at Parma; Moroni at Bergamo; Giorgione (1477-1510), Lorenzo Lotto (1480-1556), Palma Vecchio (1480-1528), Titian (c. 1477-1576), Paolo Veronese (c. 1528-88), and Tintoretto (c. 1518-94) at Venice. The discovery of oil P. and the use of varnishes during the progress of the work is commonly assigned to the Van Eycks in the early fifteenth century, and this process was introduced from Flanders into Italy by way of Venice, Florence, and Naples. It soon became the favourite medium, as needing less speed and decision than fresco and admitting of retouching and correction.

**The Seventeenth Century.**—As the Renaissance gradually made its influence felt, a far larger variety of subjects suggested themselves for representation. This influence spread over the whole of Europe and affected the painters of all nations. Among the most important one may name Annibale Carracci (1580-1620), founder of the Eclectic school at Bologna; Guido Reni (1575-1642); Domenichino; Sassoterrato; Caravaggio (1567-1607), one of the best painters of the Naturalist school; Ribera; Salvatore Rosa; and at Venice, Paris Bordone, the Bassani, Padocaulino (1590-1650), G. B. Tiepolo (1692-1769), the It. Watteau, Canaletto, and Longhi, the latter two almost exclusively painters of Venetian scenes.

**British.**—Though Brit. art made a beginning in early times, examples of P. being found in Gothic cathedrals, glass P., and miniatures, foreign artists were largely employed by the sovereigns up to the sixteenth and seventeenth centuries. The finest native work is found in the miniature Ps. of Hilliard, Oliver, Jameson, and Walker (portrait painters).

**The Fourteenth-Eighteenth Centuries in Germany, Holland, and Flanders.**—Germany: One of the earliest Ger. painters is Wilhelm of Cologne (d. 1378), from whom the Gothic tradition was handed down in uninterrupted succession by Martin Schongauer, who is the first Ger. realist, Albrecht Dürer (1471-1528), Lucas Cranach (1472-1553), Mathias Grunwald (1476-1530), Hans Holbein (1497-1543),

who developed and modified it. At the end of the sixteenth century Ger. P. seems to die out completely. *Flanders*: The first great artists who emerge are Hubert and Jan Van Eyck, followed by R. Van der Weyden (1395-1449), Hans Memling (1430-94), Hugo Van der Goes (1435-82), Quintin Matsys, Brueghel, Mabuse, and Peter Paul Rubens (1577-1640), who was one of the greatest painters of his time; Anthony Van Dyck (1593-1641), Teniers, Snyders, Brouwen, whose works exerted a very wide influence on the further

*Spain*.—All the early Sp. schools are marked by It. influence, and were little known outside Spain. It was only in the seventeenth century, with Velazquez (1599-1660), El Greco, Murillo (1617-81), Alonzo Cano (1601-87), and later Ribera (1588-1858) and Zurbaran (1598-1662), that Sp. P. became doubly famous, on account of the new style it exhibited, and for the influence which it has exerted on modern European art.

*THE MODERN SCHOOLS, 1600-1900*.—From Rembrandt and Rubens, from the

SIR ANTHONY VAN DYCK: 'THE CHILDREN OF CHARLES I.' SEVENTEENTH CENTURY  
Turin Gallery.

developments of Flem. art. *Holland*: The Dutch school, which during the early centuries had few representatives of any note, with the exception of Lucas van Leyden (1494-1533), in the seventeenth century takes a sudden leap forward with Rembrandt (1606-76), whose followers make a considerable school. Franz Hals (1580-1666) and Van der Helst (1613-70) develop their own, and are followed by a tribe of painters in *genre*, such as Ter Borch, Metsu, Van Steen (satirical), Van Meer, Van Ostade, Wouwerman; landscape painters, Van der Velde, Ruysdael, and Hobbema, and painters of still life, cattle, and lands, such as Cuyp, Potter, A. Van der Velde, J. Van der Heyden. To these who express art of an essentially national and local type may be added a school of so-called 'Romanists,' such as Jan Both, Van Mieris, and Van de Werf, who were largely affected by It. influences.

Venetian and Florentine schools of the Renaissance, one can trace the descent and the development of modern art.

*England*.—Modern Eng. art begins with Hogarth (1697-1764), directly influenced by the Dutch school. The emphasis is on figure P. and portraits. Gainsborough (1727-88), Reynolds (1723-92), Romney, Lawrence, and Raeburn are influenced by Van Dyck. With Gainsborough landscape starts to detach itself as a separate branch of art, and Wilson, Crome, Turner (1775-1851), Constable (1776-1837) raise it to magnificent heights. Parallel to this runs a school of water-colour P. unique in European art at the time. A. Cozens, J. R. Cozens, Turner, Girtin, and Cotman. Stubbs, the animal painter, is a lonely figure and notable craftsman in oil P. Rowlandson, heir to Hogarth, uses water-colour drawing superbly. Standing apart from the main stream Blake, the

post-painter, also relies on water-colour drawing, metal engraving, and wood engraving. Reaction to the tired convention of the eighteenth century in figure composition comes with the Pre-Raphaelite Brotherhood: Millais, Holman Hunt, Ford Madox Brown, under the leadership of Rossetti. Relying chiefly on literature for subjects, they sought out living models and actual backgrounds which they painted from directly. Associated are A. Hughes, Burne-Jones, Wm. Morris and others, and Watts and W. Crane. This movement had a powerful effect on Eng. book illustration in the second half of the century.

A new direction was given to P. by the Amer. J. McNeil Whistler, Paris trained, whose work reflects interest in the tonal P. of Velazquez and the decorative effect of the Jap. print—destined to be a great inspiration in France and England. Mention must be made of a Scottish school: Orchardson, Lavery, MacWhirter, etc., and of Sargent, the portrait painter, Nicholson, and Fryde (also known for their posters as the Beggar-staff brothers), and Beardsley (book illustration) and Beerbohm (caricature), associated particularly with the nineties.

**France.**—In modern P. one can distinguish two great influences, both It., one Florentine and the other Venetian. The figure painters of the age of Louis XIV. followed very closely the methods of Raphael, as may be seen in Lebrun (1619–1690) and others, as also, later, David, Ingres, Delaroche, Laurens, and Delacroix during the nineteenth century. The landscape painters, on the other hand, were more closely allied to the Venetians. Such were the great masters of the seventeenth century, Poussin (1594–1665), Claude (1600–82), and afterwards Watteau (1684–1721), Boucher, Fragonard, Chardin (1699–1779), Greuze (1725–1805), Corot (1796–1875). The latter, with Millet (1814–75), Rousseau, Daubigny, and Monticelli, were influenced by the poetical Impressionism of Turner and, as in England, gave rise to a sort of romantic revival, in antagonism to the realistic schools of Bouguereau, Cabanel, Courbet, and Manet. Of these Gustave Moreau, perhaps the greatest, and Pavis de Chavannes are the best.

**Germany.**—At the end of the eighteenth century a classical reaction set in against the neo-classicism, headed by A. von Schlegel, pioneer and founder of New Ger. art, Rafael Mengs, and A. Kauffmann, based on the teachings of Winckelmann on Gk. art. To these were opposed the so-called 'Nazarenes,' who represent a national romantic art, led by Cornelius, Kaulbach, and Overbeck. Steinle, the Viennese, is a representative of the group. Schadow formed a Düsseldorf school, and was followed by Bethel and the Viennese Schwind. Under the influence of Fr. and Dutch art, Feuerbach and Piloty founded the powerful Munich school. As in France and elsewhere, so in Germany, the need for a completer expression was felt, and gave rise to idealism as expressed in Becklin, Maries, Schwind, etc.

In other countries one cannot trace

the individual developments so closely. **Holland:** Modern Dutch art revived through Fr. influence in Israels and his contemporaries, Mesdag, Bisschop, Neuhuys, Jongkind, Mauve, and the brothers Maris. Later artists are Bauer, Van Looy, Prikker, and Tholen. **Belgium:** Modern Belgian art begins with Boulenger who founded the Terouwen school, including Buron, Hoymans, Claus, Marie Collaert, and Clays. Flem. painters are Meunier and De Groux. Stevens, Dubois, Stobbaerts, and Khnopff are also well known. **Spain:** Goya is the only important artist of the eighteenth century, and modern art arose with Fortuny. The chief modern painter is Pradilla. Other distinguished names are Gaudara, Zuloaga, and Sorolla. **Italy:** The most striking figure is Segantini. Painters influenced by Fortuny are Morelli, Michetti, Dalbano, and Fucito. Nature painters are Costa, Tito, Belloni, and Fracalomo, the best water-colour painter of Italy.

The Scandinavian countries form a group of their own, which has to be dealt with separately. **Denmark:** There is a close kinship between Dan. and Dutch art. Only in the seventeenth century, under Christian IV., was the cultivation of art begun at all seriously. Under Frederik V. (1746–66) the Academy of Art was founded. Among these early painters may be mentioned Jens Juel, Gebauer, Abildgaard, Witt, Eckersberg, Sorme, Marstrand, Vermehan, Bloch, Helsted, Tuxen, Johannsen, and Paulsen. Dan. P. gradually evolved, and principally dealt with home and national life. Among the twentieth-century Dan. painters special mention should be made of Paul S. Christiansen, Fritz Syberg, J. F. Willumsen, Harald Gierding, the two brothers Joakim and Niels Skovgaard, Nolla Larsen Stevns, Edvard Weie, Olaf Rude, and Knud Agger. **Sweden:** Much more advanced than her sister country, Sweden was greatly influenced by Fr. and Ger. art. Among the earlier painters are Haecker, Rosen, and Kruberg; and among the moderns Bergh, Hagborg, and Andreas Zorn. **Norway:** The P. of Norway reflects the temperament of its people. Among the early painters are Johann Kristen Dahl, H. F. Gude, Adolf Tidemand, the greatest painter of national life, Ludw. Munthe, and others. Under the influence of Fr. Impressionism Edvard Munch is outstanding. Later names include Erichsen, Kertens, Solberg, Astrup, and Svastad. Moderns include Jørgensen, Johnsen, Aulie, Jell, and Egeland.

**Russia.**—The early Russian art properly belongs to the E. rather than the W. Only within recent years has a national school grown up in Russia; the earlier painters were all greatly under the influence of the Fr. schools. To give a few names, Kuindshi (the creator of the open-air school), Makowsky, Repin, Bogachevsky, Kravskoy, and among the more recent, Stelletsky, Roerich, and Bennis, to which may be added a large Impressionist school.

**United States.**—Modern art can be divided into two periods, colonial and revolutionary. The first includes Brit.-

Amer. painters, such as Copley, West, Lesley, Newton; the second, dominated at first by Eng. influences, are later considerably affected by It. influences. Among these may be included Trumbull, Gilbert Stuart, Alston, and Sully, who is the most eminent. Indigenous art begins about 1825 with the landscape painters, Thomas Cole and those of the Hudson R. school, and others, Bierstadt, Sandford, Richards. The prin. foreign influences were those of the Düsseldorf school (Leutze) and the Fr. (Hicks, W. H. Hunt). Among the prin. figure painters, John La Farge, Winslow Homer, George Fuller, etc. With the Centennial Exhibition in 1876 a new phase of Amer. art commenced, characterised by the strong influences of modern European P., especially of such art centres as Munich and Paris, the former predominating. Among the best may be mentioned W. M. Chase, Kenyon Cox, Wilce, Blashfield, Turner (figure and genre), Lockwood, Tarbell, Vinton (portraiture), Weir, Robinson, and Horatio Walker (landscape).

NEW MOVEMENTS (1870-1931).—France for the last sixty years has been the active centre of European P., and the successive movements which rose there, although greeted at the time with opposition and comic nicknames, came later to be treated seriously, under these same rough-and-ready names, by critics and historians. Some confusion has resulted, as when Braque, who is a quiet colourist, is labelled 'Fauve,' i.e. wild beast: but no other system of naming is in common use. The order of appearance of these various -isms, and their relation to one another, is as follows.

Turner in England had already evolved his own form of Impressionism (q.v.) in which the disintegration of forms by light had brought P. to the borders of the abstract. In 1870 (following Turner's example) two Fr. painters were confirmed in the direction that they had taken, acting on the hints already given by Corot, Delacroix, and Watteau. They were inspired considerably by the recent scientific researches on colour and by photography. So the first exhibition (1874) embodied two main principles: (1) Landscape, done out of doors, was treated as a single vision seen in a flash, not as a collection of separate objects seen successively. (2) The use of spectrum colours and of 'complementary' colour to give a more vivid interpretation of light, i.e. the shadows on a stone, instead of being a deeper stone colour, would be green or violet, according as the light which fell upon the stone tended in itself to be red or yellow. Claude Monet's work is one example of this approach. Monet's Impressionism depends more on a free sketch, handling of the brush, and loose treatment of forms due to quick work in the face of nature. Picasso also practised for a time a severe form of Impressionism under the influence of Seurat's *pointillisme* (1886). This consisted in laying spots of pure colour side by side on the canvas so as to blend when seen at the right distance. But this proved too mechanical, and

with the general loosening of shapes and slackness of design provoked a reaction. Renoir and Degas both turned their backs on this form of Impressionism. Renoir, who left enchanting works while still under the inspiration of the new-found methods, turned to a solid treatment of form with rich glowing colour recalling the Venetians and Rubens, while Degas, retaining much of the love of light effect, felt himself to be first a draughtsman and urged his colleagues to consider new combinations of drawing rather than colour. These two great painters stand out by reason of their superb draughtsmanship, lovely colour, and sound picture making—Renoir with his lyrical enthusiasm for flowers, sunny landscape, and women, Degas with his passion for figures in movement and his original composition.

The Post-Impressionists (q.v.), innovators in their separate ways, brought back a feeling for rhythm and pattern, line and silhouette. Cézanne in particular wanted a return to solid and secure picture-making. He realised that there must be a balance between designing in the second dimension and in the third. Shapes must suggest weight and solidity and be welded together in a more architectural treatment. All this had to be done by means of patches of perfectly related colour which neither denied the colour of light or the local colour of objects. His later work, however, foreshadows the abstract painters of the twentieth century. Van Gogh, too fiery to be content with Seurat's method, evolved a violently linear method of drawing in paint with bright coloured lines laid on flat bright areas of colour, with an almost complete absence of shadow effects. Gauguin in the S. Seas found the subjects he needed for his rich decorative treatment of shapes by silhouette and local colour.

Fauvism (1906) arose from a feeling that previous movements were exhausted. Matisse produced a shorthand system of colour and drawing which, emptying out all photographic influence, makes excellent decoration. It looks spontaneous, but is the result of study and knowledge. Of the others (who included Utrillo, Friesz, Dufy, Segonzac), Picasso, Braque, Derain went on to Cubism (q.v.). The nature of Cubism and the many phases make it difficult to describe in words. Study of Cézanne's later method led to a splitting up of forms into separate planes, to geometrical essentials, to something crystalline. These planes are recombined so that an effective design transpires, but the original recognisable form frequently disappears. The partly recognised form is probably the chief cause of annoyance to those who do not understand Cubism. Periods of analysis and mathematical abstraction followed. Designs in superimposed layers of coloured or patterned papers, small objects fixed to the surface, with drawing and P. linking these effects together. In 1931 Picasso, Léger, and Ozenfant each had their own following. In Italy Futurism (q.v., 1911) was a

protest against classic calm as seen in the dead atmosphere of museums. Violent action was to be painted—an aim more suited to the cinema. Marinetti's poems gave it a flying start and Severini's decorative sense survived both this and Cubism; but the attempts by Hilla to show successive movements on the same canvas now seem curiosities. Expressionism (*g.v.*) arose independently in Germany about 1906. The emphasis is on feeling rather than form. Kandinsky (a Russian), Franz Marc, and Paul Klee founded a group while influenced by Picasso. Kandinsky's art is a compound of Cubism, Ger. Mysticism, psycho-analysis. Klee, an early surrealist, has a feeling for

and bourgeois scenes in a naive style which is poetical and decorative. Vuillard and Bonnard have remained faithfully to the portrayal of quiet domestic life in bourgeois surroundings—Vuillard a lovely colourist with a strong feeling for pattern, Bonnard more a follower of Renoir and his glowing colour. Both have continued unshaken by Cubism. Bonalt, a designer of stained glass originally, portrays the horror and agony of life in his tragic figures and faces. His style is violent, even brutal.

The F1 artistic movements which may arise from discussion in restaurants and cafes are seldom found in England. Impressionism, however, found a footing at

*Copyright Trustees of the Imperial War Museum*

PAUL NASH THE MINE ROAD, 1915

pattern and the patterns of peasant art. He once described one of his pictures as 'taking a walk with a line'—a fair enough description of many of them. Georg Grosz in his scenes of night life reveals the hysteria prevalent in Germany after the close of the 1914-18 war.

Surrealism (1925) chiefly consists in the relating of forms seldom found together in everyday life, and to give the impression of a dream-world or a nightmare. Its chief value has been to explore the 'unconscious,' but it is an art liable to be used merely to astonish the spectator. Dalí remains its most striking exponent, but as a movement it has now shot its bolt. But Chirico in 1913 was already doing remarkable Ps. of classical landscapes, buildings, horses on the seashore. Since then he has repudiated his early work. Dadaism was the final expression of frustration after the first World War, but left nothing noteworthy. Henri Rousseau stands apart as a genuine modern primitive. An official in the customs, he painted at week-ends jungle

the Grosvenor Gallery Exhibition of 1877, and later in the New Eng. Art Club (1886), which also reflected the revival of drawing centred in the Slade school. The N.E.C. has included John Sergeant, the Amer. portrait painter, W. R. Sickert, a link with the Impressionism of Whistler and Degas, who painted with gusto racy or drab subjects, Augustus John, a great Romantic artist and brilliant draughtsman famous for portraits and for compositions of gipsy life. Wilson Steer, O.M., whose Impressionism derived originally from France returned to the Eng. tradition of Constable. The first Post-Impressionist exhibition in England was held in 1910, created an uproar, and gave a great impetus to many Brit. painters. Duncan Grant is an example with his robust treatment of solid forms in resonant colour. The war artists of 1914-18 also did striking work in the new idiom. G. R. W. Nevison relied on a sharp geometrical style and a reduction of forms and the near-abstract. Edward Wadsworth did something similar in his own

style. Wm. Roberts interprets natural shapes rather in terms of machinery, his pictures being meticulously organised. Henry Lamb, Eric Kennington, Stanley Spencer, with his highly personal vision continuing a vein of Pre-Raphaelism, and the brothers Paul and John Nash are all associated with this period. Paul's formal structural Pa. show cubist influence. He was the moving spirit in 'unit one,' a group 'devoted to design as a structural pursuit,' while John's water-colour landscapes are notable for economy of means and cool planning. Wyndham Lewis was one of the few Eng. artists to be directly affected by the Cubist movement; he remains a powerful influence to-day (1950) with a flourishing school of P. under his wing. He was the founder of the 'Vorticists,' who had as their mouthpiece a pub. entitled *Blast*. His style is intensely virile and his drawing highly idiosyncratic. Later formations were the Camden Town group (1911) and the London group (*see above*).

The period between the world wars produced many prouising painters. Edward Bawden and Eric Ravilious both continued a fine tradition of Eng. water-colour drawing with gaiety and humour. Many young painters found effective scope for their topographical P. as war artists or in recording Britain. The war artists were better as recorders of the way things looked than in giving expression to the way people felt. But a few were able to convey something deeper, notably Graham Sutherland and John Piper, who did bring out the horror and the devastation of war. For this they were well equipped by a style that goes far towards the abstract. But Eng. traditional water-colour painters such as Samuel Palmer have also helped to form their style. The drawings of Henry Moore, the sculptor, go further still and remain the deepest expression of what humanity went through. Other painters, who should be mentioned are Matthew Smith, whose Hogarthian directness of handling goes with a S. Fr. warmth of colour, and Mark Gertler, a Jewish artist, whose still-lives and portraits are excellently composed and beautifully painted. Of recent tendencies the most vigorous connect with Wyndham Lewis or Piper and Sutherland and the Brit. Romantic painters. The water-colour drawing from that quarter seems in a particularly lively, enterprising state—others again travel with the Euston Road group on their way from Camden Town. The state of the artist is more precarious than even before, on account of the violent changes in the social system. Patronage in the old style is dead and the only prospect for the artist is to become a week-end painter. The crisis is now and the outlook gloomy, in spite of the excellent intentions of such bodies as the Arts Council. In Russia the painter is paid by the state, which claims his work when finished. His livelihood is thus assured, but he has to submit to a rigid direction from the state in relation to subject matter and style. Soviet P. shows the influences of European P., but at a level of

undistinguished naturalism. In France, as indeed in Europe, it is still Picasso, Matisse, and Braque who dominate the scene. *See also* DUTCH ART; ENGLISH ART; PAINTING; FLEMISH ART; FRENCH ART; GERMAN ART; IMPRESSIONISM; ITALIAN ART; LANDSCAPE; PORTRAITURE; POST-IMPRESSIONISM; SEASCAPE; SPANISH ART; STILL LIFE; and articles on art under countries.

**Painting and Decorating.** Painting is the covering of a surface with paint in order to prevent its deterioration by exposure to the air. Decorating is artistic, as well as utilitarian, in its aim. The term covers paperhanging, decorative painting, and the use of decorative paints and coloured washes on ceilings and walls. Both painting and decorating are frequently done by the amateur as well as the professional.

**Exterior Painting.**—Various types of brushes are used, differing according to the article painted. For painting door panels, gates, etc., brushes at least 2 in. wide are normally used and brushes 1½ and 1 in. respectively for painting window sashes and smaller surfaces. The latter are sometimes called sash tools. Only brushes of high quality produce a perfect finish. It is necessary to clean the brushes after use thoroughly in turpentine and soapy water. The surface to which the paint is applied, whether it is iron or wood, should be clean and dry. Dirt and moisture cause harmful chemical action, and moisture can produce blisters on the paint film. If in bad condition the old paint must be stripped with a blowlamp and scraper, holes and splits filled in with putty or one of the many special fillings such as alabastine, and the surface (if wood) sandpapered. If the old paint is not much blistered the surface should be

cleaned down with a solution of sugar soap and water, followed by a wash with clean water, and sandpapering follows, if necessary. Before painting ironwork all rust and scale is removed with a wire brush. Three coats of paint are generally used, priming, under coat, and top coat. The priming covers flaws and irregularities in the original surface, and provides a secure foundation for the subsequent coats. A red lead paint is used as a primer on wood and iron. Special primers are used for plaster surfaces. The under coat provides both good adhesion to the primer and a foundation for the top coat. As paint films change considerably in volume during drying and weathering, and also contract and expand with changes in temperature and atmosphere, it is necessary to choose paints which do not differ greatly in constitution from the paint of the following coat. An ordinary oil paint can be used as a top coat with a coat of good outside varnish as a protective, or with a varnish paint, known as 'hard gloss.'

**Interior Painting.**—It is not generally necessary to burn off the old paint. Grease marks may be removed with a weak solution of sugar soap, which is then washed off with clean warm water, and rubbed down with a soft cloth. A very fine glasspaper gives a smooth surface. If the new paint is a similar shade to the old, only one coat of paint should be necessary; but if the old paintwork is of a dark colour and a cream or light finish is required an under coat must be applied.

**Distempering Ceilings.**—Brands of distemper are obtainable in powder or paste form which require only the addition of water. The decorator should be equipped with two buckets of water, a distemper brush, and a sponge before commencing to wash off the old distemper. The brush is then filled with water and applied to the ceiling. Approximately one square yard at a time is well soaked, and the water then sponged off, the second bucket of water being used to clean the brush and sponge. When all the distemper has been removed the cracks in the ceiling and frieze are cleaned out with a pointed knife and stopped up with plaster of Paris or similar filling. A coat of size is applied to prevent the plaster from absorbing the distemper, and the distemper or white-wash follows. In order to avoid brush marks the work is done as rapidly as possible so that the edges of one section do not dry before the next is commenced. It is usually best to begin the work at a point in the room furthest away from the light. For walls an oil-bound distemper is used. The skilful decorator can choose from a wide range of colours to find the shade which will harmonise best with the situation and purpose of the room. For rooms which have little sunlight cream, primrose, and light shades are generally most suitable. Pastel blues and greens are at their best in a room facing S. In choosing colours of paint or distemper the home decorator should consider the likes and dislikes of the members of the family. The reaction of

a person to colour and preference of colour should be noted and remembered.

**Paper-hanging.**—Various types of designed paper can be used. In choosing the paper the size and use of the room in question should be considered. Repetitive patterns in a bedroom are not generally thought restful, and for small rooms neat, unobtrusive patterns are usually preferred, since the size and brightness of a pattern make the room appear smaller. The overall patterns, or patternless papers, are now the most popular. It is advisable to strip off the old wallpaper entirely before fixing the new; to do this the old paper should be thoroughly soaked in water twice, and the paper then pulled away with a stripper. Cracks and holes in the walls are then filled in with plaster of Paris, alabastine, or Keen's cement. Perfectly straight edges to the paper are essential if it is to be butt-jointed. This produces a better finish than the lap-jointed paper. Paste can be purchased which only needs mixing with cold water to be ready for use, but a flour and starch paste is also good. It is wise to use a lining paper on a bad surface, the wallpaper being pasted over it. If the paper is to be hung edge to edge (butt-joint) the first piece of paper may be hung in any corner of the room; if lap-jointed the papering should be started at the furthest corner away from the door. The paper is placed on a boarded trestle table, 21 in. wide, for pasting. When this is done the paper is pasted to the wall by attaching the top right-hand corner against the picture-rail, raising or lowering the left hand to bring the paper plumb, and pressing the paper on the wall with a paper-hanger's brush, working from the top downwards. For attaching to ceilings the paper is folded over a roll which is lifted with one hand while the end is attached with another. Embossed materials such as Lincrusta are stiffer than paper, and can, if desired, be oil-painted.

**Mass Production Methods in Painting.**—Painting by a brush is in many cases too slow a process to be economical, and often does not give such satisfactory results. Flowing is used on large flat surfaces such as the sides of trucks. The top is painted so that the paint flows over the surface, draining into a trough from which it can be pumped up for use again. Dipping is satisfactory where the paint is fulfilling an essentially protective function, since it enables the paint to penetrate parts which the brush could not touch. It can only be applied to articles where the paint can run off uniformly. The articles are put on a travelling belt which takes them through a paint bath into a drying chamber. Spraying, where the paint is sprayed through a nozzle, is chiefly used in the case of cellulose lacquer, e.g. in painting motor cars.

**Some Decorative Methods.**—Staining and graining are common methods of decoration in paintwork. Staining is the imitation in paint of hard wood, such as mahogany; graining is the imitation of natural wood. Plastic and cellulose paints and enamels are also used in

decorative work. Satisfactory results require a high degree of skill.

See C. H. Eaton, *Painting and Decorating*, 1930; E. W. Hobbs, *Painting, Enamelling, Paper-hanging, and Distemping*, 1937; D. Miller, *Interior Decorating*, 1937; J. P. Parry, *Painting and Decorating*, 1938; J. Mason, *Painting and Decorating*, 1948; W. P. Matthew, *Home Decorating*, 1948; and A. E. Hurst, *Painting and Decorating*, 1949.

Paints are mixtures of oil and pigments used for decorative purposes or for the fine arts, and are made up of the base, the vehicle, the solvent, and the driers, the pigment being added to obtain any desired colour. The base usually employed for building work is white lead, which is mixed with pure linseed oil, but red lead and oxide of iron are also used, the former as a base for red P., the latter for covering iron work. The vehicle enables a thin coat of paint to be formed uniform in colour and consistency, and usually consists of linseed oil or poppy-seed oil, but nut oils are sometimes employed on account of their cheapness. Turpentine is used as a solvent, or 'thinner', to allow the paint to be spread in a thin, even coat, and when a flat, dull surface is desired turpentine alone is used with the base, and the oil is omitted. 'Driers' are substances used to hasten the process of oxidation or drying, those most commonly used being litharge, sugar of lead, patent driers, sulphate of zinc, and manganese dioxide. Pigments are preparations obtained from minerals, animals, or vegetables, which when mixed into paint give it colour, the most ordinary being white lead, zinc white, umbers, siennas, ochres, chromes, Venetian red, Indian red, lamp black, bone black, vegetable black, ultramarine, Prussian blue, vermilion, red lead, oxide of iron, lakes, and Vandyke brown. For artists' colours the pigment is made into a paste with oil, and then put through a mill furnished with granite rollers, after which it is squeezed into tubos.

**Paisiello, Giovanni** (1741-1816), It. composer, b. at Taranto, learnt his art from Durante, Cotumacci, and Abos. After his first successes, two comic operas entitled *La Pupilla* and *Il Mondo a Rovescio*, fortune smiled on him in spite of the formidable rivalry of Piccini and Cimarosa, a rivalry which aroused endless jealousies in P. For eight years (1776-1784) he enjoyed the lavish patronage of the Empress Catherine at St. Petersburg, and he afterwards served Napoleon in Paris as musical director in his chapel. His *Barbiere di Singsia* seems archaic, mannered, and monotonous compared with Rossini's brilliant opera of the same name.

**Paisley** (in Rom. times *Vandura*), tn. on both sides of the White Cart, 3 m. above its confluence with the Clyde, and 7 m. W.S.W. of Glasgow, in Renfrewshire, Scotland. In the early eighteenth century the tn. was already noted for its manuf. of shawls (since gone out of fashion), silk-gauze, muslin, and linen; but the staple industry of to-day is the making of linen thread. Other industries

include dyeing, bleaching, distilling, engineering, ship-building, and the manuf. of chemicals, carpets, etc. There is a good harbour. In the tn. are statues to Robert Tannahill, the native poet; Robert Burns; Alexander Wilson, the Amer. ornithologist; Sir Peter Coats (d. 1890), who presented the free library and museum; Thomas Coats (d. 1883), who gave the observatory and Fountain Gardens; and George Aitken Clarke (d. 1873), the thread manufacturer, who helped to build the tn. hall. A fifteenth-century decorated nave is almost all that is left of the old abbey church, which was founded in 1163 by Walter Fitzalan as a Cluniac monastery. In 1307 the Eng. razed the abbey to the ground, and it had not long been re-built when it suffered terribly during the Reformation. St. James's Park, with its racecourse (40 ac.), and Brodie Park are the two largest open spaces. There is a sixteenth-century grammar school and a technical school. It sends one member to Parliament. Pop. 50,900.

**Paisley Terrier**, see CLYDESDALE.

**Paiza (Payta)**, port of N. Peru, in the dept. of Piura at the mouth of the Chira R. It is the outlet for the chief cotton dists. The tn. has an old-world Sp. appearance and the buildings are mostly of wood. Its anct. church has a miraculous statue of the Madonna. It exports, besides cotton, hides and skins, and Panama hats from Catacaos. Pop. 7000.

**Paivarinta, Pietari** (1827-1913), Finnish novelist, b. at Ylivieska, was the son of a peasant, and made his name as a writer with stories of peasant life. He was one of the first to write fiction in Finnish, his pubs. including *Tintti Jaakko* (1883); *Syys lehti* (1900); and *Pikku kuvia elämästä* (1904).

**Pajou, Augustin** (1730-1809), Fr. sculptor, b. in Paris, won the Prix de Rome in 1748, and thus was sent at public expense to Rome to study art. On exhibiting his 'Pluto holding Cerberus in Chains', he was elected to the Academy. He carved excellent portraits of Mme du Barry, Bossuet, Buffon, Turenne, Pascal, and Descartes, and executed also the sculptures of the Salle de l'Opéra at Versailles. His 'Psycho Forsaken' is now in the Luxembourg.

**Pakhoi**, seaport, 12 m. S.E. of Lien-shoufu in Kwangtung prov., China. The native and foreign quarters are distinct, the latter being on a hill. Since 1876, when it was opened for international trade, the volume of its exports (indigo, aniseed, cuttle-fish, sugar, and cassia-oil) has grown enormously. Manganese ore is mined near by. Pop. 36,000.

**Pakistan**, Muslim state in the N.W. of the Indian sub-continent, including also a part of Bengal, and constituting a dominion of the Brit. Commonwealth of Nations, which was formed on the partition of India under the Independence of India Act, 1947 (the name India being appropriated to the Hindu state or dominion). P. is the largest Muslim state in the world, the total area being 361,007 sq. m. and the pop. 70,103,000, of which

72.7 per cent are Muslims. It includes the provs. of Sind (48,136 sq. m., pop. in 1941, 4,335,008), W. Punjab (62,100 sq. m.; estimated pop. in 1947, 10,870,900), E. Bengal, inclusive of Sylhet (54,100 sq. m.; estimated pop. in 1947, 44,081,381), the N.W. Frontier Prov. (14,363 sq. m.; pop. in 1941, 3,038,067), Baluchistan (134,002 sq. m.; pop. in 1941, 857,835), and sev. states, including Bahawalpur (17,494 sq. m.; pop. in 1941, 1,341,209) and Khairpur (6050 sq. m.; pop. in 1941 305,787). In the Punjab the Boundary Commission of 1947 assigned Lahore city to P., while Amritsar, the holy city of the Sikhs, remained in India. The prov. of W. Punjab, including the whole of the Rawalpindi and Multan divs. and the dists. of Gujranwala, Sheikhupura, and Sialkot from the Lahore div., was also given to P. (the prov. of E. Punjab was assigned to India). The Gurdaspur and Lahore dists. of the Lahore div. were divided between the two dominions. In Bengal P. received the whole of the Chittagong and Dacca div. and most of the Sylhet div. of Assam (Calcutta went to India). In the Punjab the debatable ground proved to lie in and around the area between the Beas and Sutlej Rs., on the one hand, and the R. Ravi on the other. The fixing of the boundary here was also complicated by the existence of canal systems vital to the life of the Punjab, but developed only under the conception of a single administration, and of systems of road and rail communications which had been planned in the same way. There was also the stubborn geographical fact of the respective situations of Lahore and Amritsar, the claims to each or both of these cities being vigorously maintained by both states. During the assignment of boundaries in 1947 there were terrible communal massacres in the Punjab. Marauding gangs of Sikhs, who regarded the Punjab as their own country exclusively, burned innumerable Muslim vils. in E. Punjab and butchered thousands of Muslim villagers, while the Muslims retaliated by butchering Hindu and Sikh inhab. in W. Punjab. It is estimated that 3,800,000 non-Muslims crossed into E. Punjab and that only 100,000 remained in P., 50,000 of whom were in the N.W. Frontier Prov., while between 1,000,000 and 2,000,000 Muslims trekked into W. Punjab as a consequence of these communal massacres. By early 1948 more than 5,100,000 refugees had been settled in the sixteen dists. of W. Punjab, in place of 3,585,000 who had emigrated to India.

Prior to the formation of the new state of P., the word 'Pakistan' denoted the national movement among Indian Muslims for a separate independent state from that of the Hindus in the ultimate constitutional settlement. The word itself has often been stated to be a sort of anagram suggested by the word *Pak*, 'pure' or 'clean,' connoting all that is noble and sacred in Muslim life, but composed of letters taken from the component Muslim provs., Punjab, Afghanistan (com-

monly known as the N.W. Frontier Prov.), Kashmir, Sind, and Baluchistan. However that may be, the name was given (according to the *Encyclopædia of Islam*) to these ters. by C. Rahmat Ali, founder of the P. National Movement, in 1933, 'with a view to preserving their historical, national, and political entity as distinct from Hindustan proper.' But these do not represent the territorial limits of what was implied in P., or at any rate in the P. National Movement. There was a second part of the programme to which Mr. Jinnah, the Muslim leader (later governor-general of P.), did not subscribe, namely that Bang-i-Islam (i.e. Bengal and Assam) and Usmanistan (the Hyderabad section of the Deccan) should be added to the ultimate Muslim state. The P. National Movement was strongly opposed to the Indian Federation and, owing to the numerical superiority of the Hindus (the proportion is four Hindus to one Muslim in the total pop.), it resisted amalgamation with Hindustan, which it regarded as fatal to the future of the Muslims as an independent nation in the predominantly Muslim ters. of P. It contended that only the acceptance by Hindustan and by Great Britain of the demand of P. for the recognition of her right to her own national gov. could lead to a settlement of the age-old Hindu-Muslim conflict. It is claimed that for the first time since the fall of the Mughal Empire in India, the P. National Movement re-awakened the Muslims in India to a sense of their national future, and its religious and patriotic character did no doubt strongly attract the younger generation to its ideals. The demand for P. seems to have been first officially adopted by the Muslim League at Lahore, in March 1940. The appeal which the P. plan made to Muslims, however, had been steadily growing since the Government of India Act, 1935, though actually the conception of two Indias is much older. As long ago as 1888 Sir Syed Ahmed Khan regarded Muslims as constituting a separate nation from the Hindus. Brit. policy, however, favoured the idea of a united India and it was only since the difficulties of securing agreement on the Indian Constitution were fully understood that the Brit. Gov. began to admit the possibility of P. The Brit. Gov.'s draft declaration of March 1942 (the Cripps proposals), which proved to be unacceptable to the Indian leaders, admitted the right of any prov. not prepared to accept the prospective constitution to retain its existing constitutional position and this was recognised as permitting a form of P., though the Muslims complained that the right of non-accession applied only to the existing provs. which had been formed from time to time for administrative convenience and on no logical basis. The draft declaration of Sir Stafford Cripps, however, gave no guarantee of P., but merely kept open the issue of P. See also INDIA.

Much of the area of P. is desert and mt. It has no heavy industries. It is an agric. country, but vast regions have been

lost through erosion. An undeveloped land divided in two was expected on the advent of partition, but not a truncated state, with frontiers drawn up by political compromise, following no obvious natural barriers. At present the two segments, the larger in the N.W. and the smaller, E. Bengal, are linked only by wireless, but for most purposes communication is dependent upon the goodwill of the other dominion.

**Physical Features.**—The N.W. Frontier Prov. is very mountainous, ranging from the thickly vegetated mts. in the N., which rise to 20,000 ft., to the somewhat arid hills in the S., rising to 11,000 ft. Baluchistan is, in the main, a mass of barren hills rising in some places to 10,000 ft. The Punjab is a plain irrigated by the five rivs. of the Indus (q.v.). In Sind there are considerable stretches of arable lands lightly covered with sand. Apart from the Baluchi hills along its W. frontier Sind is flat. The R. Indus, 1700 m. long, flows right through W. P. and enters the Arabian Sea, S. of Karachi. Pakistani Assam and E. Bengal are, generally, rather flat, with a mt. range running from N. to S. near the W. Bengali border. The Brahmaputra, a riv. as long though not as important commercially as the Indus, flows through E. Bengal to the bay of Bengal. The spread of civilisation has resulted in a steady decline in the number of wild animals in P., but a few are still found. The tiger, often 8 ft. in length and weighing 25 stone, is at its best in E. Bengal and Assam, where the smaller leopards are fairly common. The nilgai, a large deer, is also found in E. Bengal. In the N. mts. of W. P. are found the Himalayan black bear, about 4 ft. long, the Himalayan brown bear, rather larger than the black, the star, and the ibex (for fauna and flora generally see under INDIA.)

The chief cities with their pop. (census of 1941) are Lahore (671,700), Karachi (cap., 359,400), Dacca (213,200), Rawalpindi (181,200), Multan (112,800), Sialkot (138,300), Peshawar (130,900), Hyderabad (102,000), Dera Ismail Khan (60,500), Chittagong (40,000), Quetta (38,500, excluding cantonment), Kohat (28,500), Bahawalpur (18,500), Kalat (15,000), Khairpur (about 15,000).

**Production.**—P. has enough oil for its own needs, and some coal, chromium, iron, copper, and other metals hitherto little exploited on account of transport difficulties. Its distinctive wealth lies in jute and cotton. The acreage under jute was returned (1948) at over 1,800,000 in E. Bengal and Sylhet. Some 1,170,000 bales of cotton were produced in P. in 1945-46, mainly grown in the Indus basin (as against 1,260,000 in the much larger dominion of India and 1,010,000 in the states). Some of the best varieties of cotton, 'Sind American' and 'Punjab American,' with inch-long staples, are grown in P. But the bulk of all the jute and cotton mills are in the dominion of India, which will need to import, for some time to come, about 1,000,000 bales a year from P. P. produces about a third of the whole

Indian yield of rice and this may well increase in Sind, owing to the Lloyd Barrage, which brought 6,000,000 ac. under cultivation, independent of rainfall. P. accounts for about 40 per cent of the total production of wheat in what was Brit. India. E. Bengal produces over 4,000,000 lb. of tea a year, and the dominion as a whole can export 30,000,000 tons (as compared with 400,000,000 from India). It is evident that the produce of P. is essential to the economy of the other dominion's factories owing to the danger of famine and the great pop. But on the other hand P.'s weakness lies in its meagre industries, for only 25,000 people are employed in factories as against 1,000,000 in India. But one compensation for the

High Commissioner for Pakistan

KARACHI: THE EMPRESS MARKET

absence of an industrial pop. is that P. is far less susceptible to Communist penetration than is India; further there are much less marked contrasts in social classes in P., a high proportion of the W. Punjabis being peasant proprietors.

**Races.**—Three distinct groups of peoples are found in P., two in W. and one in E. P. The true Punjabi is an Indo-Aryan, a descendant of the Aet. Aryan invaders of India. His height is about 5 ft. 8 in., complexion light brown, face hairy and nose prominent but narrow, and head much longer than broad. The occupations of these people are very varied, but most of them are agriculturists. Their numbers include Hindus and Sikhs. The people of the N.W. Frontier Prov. and Baluchistan are of Euro-Asiatic descent. They are tall and well built, with very light brown complexions, and the great majority are Muslims. They are credited with a keen sense of humour and much sincerity. The women generally are well favoured despite the custom of *purdah*. The third type, found in Bengal,

is the Mongolo-Dravidian, the result of the anct. Mongolian invaders meeting the Dravidian aborigines of the Indian peninsula; they are usually known as Bengal Brahmins (Hindus) and E. Bengali (Muslims). They have dark complexions, hairy faces, broad heads and noses, and average 5 ft. 7 in. in height. They are excellent at all kinds of clerical work. The masses in P., as in the dominion of India, are on the whole simple, illiterate, and gullible. Many of their political leaders, however, are highly educated and familiar with W. civilisation.

**Languages.**—It has been decreed that Eng. shall be an official language of P., although only 1 per cent of the pop. is literate in this tongue. Urdu (also an official language), which is based on Persian and Arabic, is generally understood in W. P., and Hindi in E. P. Sindhi is the natural language of Sind, Baluchi and Brahui of Baluchistan, Pushtu of the Frontier, and Punjabi of the Punjab, apart from the lesser languages. The script is in Persi-Arabic characters in all cases except Hindi, Gurmukhi, and Karachohli which are written in Hindi characters (from Sanskrit); Urdu, Punjabi, and Sindhi may be written in Hindi script; Jaki has a script of its own; the language of 7,000,000 peoples, it is often known as Lahnda or W. Punjabi. The main language of E. P. is Bengali, a lesser tongue being Assami; both are written in Hindi script (see also INDO-EUROPEAN LANGUAGES).

**Art and Science.**—None of the classic Indian works of sculpture is Mussulman, and although the Mughals produced fine paintings, these are mostly now in the dominion of India. Science has up to now played a very small part in the lives of the people, though there is a branch of the Indian Chemical Society at Lahore. The only univ. in P. is the Punjab Univ. at Lahore, which awards degrees in art, science, teaching, engineering, law, medicine, commerce, agriculture, and oriental studies.

**Constitution.**—The resolution for the framing of a constitution for P. was moved in the constituent assembly on March 7, 1949. The resolution seeks to ensure democracy, freedom, equality, tolerance, and social justice as enunciated by Islam, and it promises adequate provisions for minorities freely to express and practise their religions and develop their cultures. It also provides that P. shall be a federation whose independence and sovereign rights on land, sea, and air shall be safeguarded. The independence of the judiciary is assured in a special clause. The work of the constituent assembly in framing the constitution was not completed by 1949 and the assembly had still to evolve the best method for the distribution of powers at the centre and the federation of the units, and how the units should be defined. The provs. of Sind, E. Bengal, and the N.W. Frontier Prov. had provincial govts. functioning under the Government of India Act, 1935. In 1949 there was no gov. in W. Punjab and that prov. was ruled under section 93 of the

Government of India Act (which provides for rule by a governor in the absence of a cabinet), the governor being assisted by five advisers. Baluchistan is centrally administered, as also are sev. states, including Bahawalpur, Khairpur, Kalat, and Kharan.

**History since August 1947.**—The supporters of Mr. Jinnah adopted a pop. divided in language, culture, social habits, and degrees of development, and prov. groups more nearly akin to their neighbours in adjacent areas of the Indian Union than to their now compatriots in other parts of the dominion of P. It was vaguely believed that the 'Land of the Pure' would at least be uncontaminated by Hinduism, but, as stated above, there are in P. many millions of Hindus, and only the Sikhs have gone. Although for many years P. will be dependent on the co-operation of the Brit. Commonwealth and on the efforts and loyalty of its Brit. civil servants and service commanders, the knowledge that the fate of their new-born country ultimately depends on their own efforts is shared by most people in P. The 2nd Battalion, the Black Watch, the last Brit. army unit to leave P., sailed from Karachi on Feb. 26, 1948.

After the Brit. Gov. had accepted the principle of partition and the new dominions of India and P. were created (Aug. 15, 1947), large areas of the Punjab (as noted above) became a battleground between fanatical Muslims, Sikhs, and Hindus. Thousands of people were slaughtered or burnt alive in the flaming ruins of their vils, and soon vast numbers of panic-stricken fugitives were pouring E. and W. over the dividing line of the bisected Punjab, harried on their way by hostile bands. Delhi itself became a battlefield (Sept. 1947), and in Calcutta a communal hatred exacted its toll despite the devoted efforts of Gandhi and his followers. Faced by a common peril the new govts. of P. and India were compelled to co-operate for the time being and in two months the outrages became more or less sporadic and gradually died down. By early 1948 law and order were maintained except in a few areas troubled by tribesmen. Unlike E. Punjab, law in W. Punjab was being enforced by the police and not by the military. Everywhere there was evidence of a fairly smooth functioning administration, despite the fact that when the state was first constituted Mr. Jinnah's supporters, who had only dimly grasped the significance of his idea of P. when trans. into land, people, natural resources, and industrial potential, were in most instances appalled by the task which confronted them. The country's strongest asset was perhaps the exacerbated nationalism produced by suspicion of Indian policy.

With the passing of the immediate threat of common disaster relations between the two govts. deteriorated, though it was found possible at the Lahore conference in Dec. 1947 to reach agreement on the div. between the two dominions of the financial assets and liabilities of the former gov. of India, as well as upon questions

of military supply. The problem of the accession of independent states, however, proved especially intractable in Kashmir and Hyderabad. In Kashmir, a predominantly Muslim state with a Hindu maharajah and a well-to-do class largely of the Islamic faith, Muslims rose in revolt. They were supported by large numbers of tribesmen from across the border, to whom P. was accused of giving aid. The maharajah thereupon applied for accession to India. Delhi accepted this as a *modus vivendi* and hurriedly sent troops to save the state cap. and disperse the insurgents. This move provoked violent repercussions in P., which was naturally sympathetic to fellow Muslims. The P. Gov. refused to recognise the 'accession' and its Prime Minister, Liaquat Ali Khan (q.v.), accused Delhi of having plotted the whole affair *ab initio*. The year 1947 ended with the reference of the Kashmir dispute by the Indian Gov. to the Security Council of the United Nations (see further under KASHMIR). At one time Afghan support for the Pathanistan project (a separate state for the Pathan tribesmen of the N.W. Frontier) threatened to cause bad blood, but fortunately, this policy changed and cordial feeling was established between the two countries (see also under NORTH-WEST FRONTIER).

In looking back on the first year of Pakistan independence, with its interlocked problems of building a completely new governmental machine and the threatened chaos produced by the influx of ten million refugees, the country could derive confidence from what had been achieved by human endeavour and a deep-rooted spiritual consciousness of the essential rightness of the task it had set itself. A period of political instability followed the death of Jinnah, but it was allayed by the swift appointment of Khawaja Nazimuddin (q.v.), premier of E. Bengal, as governor-general, and by the energy of Liaquat Ali Khan (q.v.), for long the devoted lieutenant of the late governor-general. The political hist. of the provs. in 1948-49, with the exception of E. Bengal, was not encouraging, especially in Sind, which is noted for instability and faction. The proposal to form the ter. of W. P. and Baluchistan into one legislative body seemed likely to meet with determined opposition in Sind. With respect to this political friction, however, it is to be borne in mind that there was as yet in P. no opposition, in the ideological sense, to the existing regime, and political strife was usually a matter of personal faction and feud. It was averred by critics of the Muslim League that ever since independence was won, the executives of this all-powerful League had lost touch with the people and been preoccupied with their own political and personal fortunes. Whereas in India there was already an active opposition outside Congress, in P. it was unlikely that for many years an effective opposition could emerge otherwise than from the ranks of the League itself. Leaving aside political disturbances and activities abroad and at home, achievement in the first year

belonged to the designers and planners. Broad targets were set for agriculture, industries, motive power, health, and labour, and a co-ordinating master-plan for the whole of the country was prepared and, in 1950, a start was to be made in implementing the various schemes.

See Ikkal Ali Shah, *Pakistan: a Plan for India*, 1944; Pakistan Institute of International Affairs (pub.), *Introduction to Pakistan*, 1948; E. Taylor, *Richer by Asia*, 1948; T. G. Spear, *India, Pakistan, and the West*, 1949; and Sir G. Hearn (ed.), *Murray's Handbook to India, Pakistan, and Ceylon*, 1949.

**Pakokku**, dist., with an area of 6210 sq. m., in Upper Burma. Arid regions are interspersed between the fertile valleys of the Yaw, Myittha, and Mön-Sesamum. Oil is found at Yerangyat. Millet and sugar, and also maize, vegetables, rice, and tobacco are cultivated. The tn. of P. (30,000 inhab.), situated on the Irrawaddy, is a lumbering centre. Pop. 560,000.

**Palace** (Lat. *palatium*, from Mons Palatinus), word adopted in varying forms (*palais*, *palast*, *palazzo*, *palatium*, O.E. *palent*) by all European languages. Properly applied to imperial and royal residences, as to those of an emperor, a king, or pope, it is also used by extension for any sumptuous habitation. Any episcopal residence receives this name in England, as Fulham, Lambeth, and Cuddesdon palaces. Windsor Castle is the finest example of an Eng. P. in the original sense. The derived meaning of a spacious and attractive building is familiar in the modern 'picture P.' and other places of entertainment.

**Palace Court** (*Curia Palatii*), court erected by the highly unconstitutional Charles I. in 1631 to try personal actions arising within 12 m. of Whitehall Palace, whether either of the litigants was of the royal household or not. The judges were the steward of the king's household and the knight-marshal; but later it was presided over by a barrister-deputy, and held weekly in Scotland Yard. Together with the other exceptional and prerogative courts, the Court of Marshalsea and the Court for the Honour of Peveril, it was abolished in 1849, the pending causes being transferred to the common pleas (q.v.) or the co. courts, and the records handed over to the custody of the master of the rolls.

**Palace Theatre**, in Cambridge Circus, London, opened Jan. 31, 1891, as the Royal English Opera House under the management of Richard d'Oyly Carte, with Sullivan's *Ivanhoe*, which ran for 155 performances. The P. T. has always been noted for musical comedy, and among its successes have been *No, No, Nanette*, *Dinner at Eight*, *Anything Goes*, *Jack and Jill*, and *Under 100 Hat*. The theatre was damaged by bombs in the Second World War, but was reopened afterwards.

**Paladin**, name given to the twelve peers of Charlemagne, such as Roland, and also to knights-errant generally. The exploits of the P's form the theme of the French or national epic known as *Chansons de Geste*, the matter of which tended to

centralize about one person, Charlemagne, the champion of Christianity and chivalry against the hated Saracens. The word *P.* is derived from Lat. *palatinus*, and literally denotes a courtier, member of a royal household, or a person connected with a palace. The *palatium* of the Rom. emperors on the Palatine Hill supplied a name for any imperial residence of medieval Europe, and a corresponding adjective and noun for royal officials and dependants.

**Palaeobotany** (Gk. *παλαιός*, anct.), the branch of botany concerned with the flora of bygone ages. Knowledge of these flora is gained by examination of fossils, i.e. plants or their parts which were embedded and remained undisturbed in mud, sand, or ooze while the sediments hardened into rocks. Other fossil specimens were preserved by encrustation or by infiltration with silica or with salts of calcium. In many cases, although the parts of the plant have decayed, they were in such intimate contact with a plastic medium that as putrefaction occurred, very clear and detailed impressions of the plants were formed. Casts of hollow stems, bulky seeds, and of leaves yield considerable information with regard to the morphology of the plant. Some plant remains are found in amber and other fossilised secretions. The earliest plant fossils hitherto discovered were those of Proterozoic simple algae, resembling modern blue-green algae (Cyanophyceae), and of bacteria. These were 'iron' bacteria taking iron salts from the water, and forming extensive deposits of iron. In the Palaeozoic era, from the beginning of the Cambrian to the end of the Silurian periods, the only plant fossils are those of marine algae, possibly of the blue-green, green (Chlorophyceae), and red (Rhodophyceae) groups. In the Lower Devonian strata are found the earliest fossils, e.g. *Pellaphyton*, *Rhynia*, *Asteroxylon*, recognised with certainty as land plants, but these show such marked differences from fossils of earlier aquatic plants that it seems probable that there were intermediate forms hitherto undiscovered, perhaps because conditions may not have favoured preservation, or the rocks including such plants may now be inaccessible. The plants of the Upper Devonian strata were much better developed, and included seed-bearing trees from 30 to 40 ft. high. In these strata many of the plants subsequently so prolific in the Carboniferous period made their first appearance. The ancestors of modern Horsetails and Lycopods were well-developed trees during this period; ferns were abundant, and fern-like seed-bearing plants, the Pteridosperms. The abundance of vegetation at this time may be judged from the coal formed by slow decomposition of these plants under the enormous pressure of subsequent strata. In the early and middle periods of the Mesozoic era, cycads and conifers, ancestors of modern representatives of these groups, became predominant, and towards its close primitive flowering plants appeared. Some early flowering plants, the

*Caytoniales*, have been found fossilised at Cayton Bay (Yorkshire) by Dr. E. Thomas. These became increasingly abundant from the Tertiary to the Quaternary periods of the recent or Cainozoic era, and included many forms similar to those of living flowering plants. *P.* is essential to the study of relationships and the evolutionary development of plants (see *ZOOLOGY*). See D. H. Scott, *Studies in Fossil Botany*, 1920, and *Extinct Plants and Problems of Evolution*, 1924; F. H. Knowlton, *Plants of the Past*, 1927; R. Crookall, *Coal Measure Plants*, 1929; and A. C. Seward, *Plant Life through the Ages*, 1931.

**Palaeogeography**, study of climatic conditions, and of land and sea areas, in geological times. See *PALaeONTOLOGY*.

**Palaeography** (Gk. *παλαιός*, anct.; *γραφειν*, to write) is the branch of knowledge which seeks to decipher (that is, to read and interpret), to date, and place any kind of anct. writings. In the widest sense of the word it deals with all anct. written documents or engraved monuments in any language, on any writing material, from any period. There are, however, certain branches of study which treat of particular kinds of written documents, such as numismatics (*q.v.*), which deals with inscriptions on coins; sphragistics, which treats of writings on seals; and epigraphy, which deals mainly with anct. inscriptions cut, engraved, or moulded on hard material, such as stone, metal, or clay. Thus *P.* in the narrow sense of the word deals mainly with the softer materials on which handwriting, as distinguished from monumental engraving, has been inscribed; that is, with writing that is painted or traced in ink or colour, with a stylus, brush, reed, or pen, on such materials as papyrus, parchment, papyrus, linen, or wax. Still, there are certain exceptions, and sometimes *P.* has to inquire into the employment of metals, clay, potsherds, wood, and other writing materials. The line between *P.* and epigraphy is therefore not absolute. Typical examples of the border line are *ostraca* (documents written in ink on potsherds after the vases have been broken) and *graffiti* (wall-scribbles, discovered in large numbers at Pompeii).

On the other hand, the distinction between *P.* and epigraphy is less superficial than it may appear. The forms of written letters, similar at first to the engraved letters of the inscriptions, developed more swiftly, and with few exceptions the difference is maintained in all scripts. Writing materials have always played a great part in the external development of the single letters. Other causes are as follows: (1) The necessity of speed in writing, assisted by innate laziness, produces the various cursive scripts. Under the pen of the expert scribe, who sought to save time, the letters naturally assumed less exact shapes, as strokes were slurred, superfluous were dropped out, angles were curved; letters were linked together, these forms becoming similar to each other (so that it is hard to distinguish them); abbreviations were employed. (2) This tendency is counter-

acted by the reader's demand for clearness. In anct. times writing not only served as an instrument of private communication, but it was also applied to the purposes of literature. No author would allow his writings to be pub. in a form which could not be perused with ease; thus neatly written books were essential, and with the necessity for multiplying literary works, the creation of a formal kind of writing suitable for books intended for the market was the natural result.

(3) *Æsthetic reasons*: the study of the development of writing as dependent on æsthetic reasons is the subject of calligraphy. In some countries the profession of calligraphist was held in high esteem; indeed Chinese, Arabic, and Indian calligraphy have reached very high levels. According to some scholars, the importance of calligraphy in Christian MSS. was impaired by the development of the art of miniature. However, the desire for the writing to look beautiful on the whole makes for clearness, though in some cases it produced excessive uniformity, the scribe as it were forcing all the letters into one mould so that they should not spoil the regularity of his line or page. Naturally these various motives and inducements differed in relative strength with the purpose of the written document.

Hence the student of P., in its numerous branches (Indian, Gk., Lat., Heb., Arabic, etc.), generally distinguishes two classes of handwriting, the ordinary cursive script, or current hand, common to all and employed for everyday-life purposes, and the carefully written literary or book-hand, in which works of literature were usually written. The two classes, however, cannot always be kept absolutely distinct. Between them there might be a whole series of varieties which have some of the peculiarities of each group. For instance, a kind of book-hand might be employed by a trained scribe, often for some official reason, in drawing up a document which more usually would be inscribed in cursive characters; or cursive writing might be employed by a scribe copying books for private study.

In P. large letters are called *majuscule*, small letters *minuscule*. A variety of the capitals or majuscule of the Gk. and Lat. monumental scripts is known as *uncials*, which are a modification of the monumental letters, in which curves are freely introduced as being more readily inscribed with the pen on soft material. Uncials are the ordinary characters used in early Gk. papyri and vellum MSS., as well as the most anct. extant forms of the Lat. book-hand. It was doubtless the character best adapted for calligraphy. The semi-uncial script, i.e. the mixed hands of uncials and minuscule letters, which was the main book-hand from the fifth to the ninth century A.D., was easier than the uncials and more calligraphic than the cursive minuscule. The Gk. and Lat. minuscule are derived from the majuscule. Although they already appear in the last centuries B.C., a full minuscule alphabet was only slowly developed. Out of the Rom. cursive minuscule,

various national minuscule arose (It. or Lombardic; Merovingian in France; Visigothic in Spain; Germanic; and particularly the Insular or Anglo-Irish hands). From the period of Charlemagne to the close of the fifteenth century, the Caroline or Carolingian hand, to which is mainly due the blending of the majuscule and the minuscule, and later also the 'block-letter' were the more important hands. The fifteenth century witnessed the dissolution of the later 'national' hands of the Middle Ages. The neat humanistic or renaissance hand, then introduced in Florence and employed for literary productions, developed into the (1) Venetian minuscule known as *italics*, probably the most perfect form of letters and the most clearly legible which has yet been invented, and (2) the 'Rom.' type, perfected in N. Italy, chiefly at Venice. The monumental type of the Lat. alphabet, taken over for the majuscule, and both forms of the minuscule, the Rom. and the *italics*, spread all over the world. In England they were adopted, from Italy, in the sixteenth century.

The study of P., in all its branches, is of the greatest scientific and practical importance to anct. and mediæval hist., to classical philology, to textual criticism, and to other branches of historical science. A particular branch of P. termed papyrology (*q.v.*) deals with the decipherment and interpretation of writings on papyrus. See also LETTERING.

See F. M. Thompson, *Handbook of Greek and Latin Palæography*, 1894, and *The History of English Handwriting*, 1901; W. Keller, *Angelsächsische Palæographie*, 1906; D. Diringer, *The Alphabet* (2nd ed.), 1949; and A. Fairbank, *A Book of Scripts*, 1949; also bibliographies of ALPHABET; MANUSCRIPTS; WRITING; GREEK; HEBREW LANGUAGE; LATIN LANGUAGE, etc.

**Palæolithic**, see ARCHEOLOGY; FLINT IMPLEMENTS; STONE AGE.

**Palæologus**, name of an illustrious Byzantine family, which first appears in hist. about the eleventh century. The family grew in power and importance until Michael P. became in 1260 emperor of Nicea, and in 1261 emperor of Byzantium as Michael VIII. He d. in 1282, but the dynasty thus started lasted for nearly two centuries. The line of the emperors is as follows after Michael VIII.: Andronicus II. (1282-1328); Andronicus III. (1328-1341); John V. (1341-76); Andronicus IV. (1376-79), who deposed John V. for that space of time; John V., who won the throne again from 1379 to 1391; Emanuel II. (1391-1423); John VIII. (1423-48), and Constantine XI. (1448-53), who fell in the siege of Constantinople by Mohammed II. The family also furnished rulers to sev. principalities, whilst a branch ruled in Montserrat from 1305 to 1533. Andrew P., supposed to be a descendant of Constantine XI., was a claimant for the Byzantine empire, but resigned in favour of Charles VIII. of France.

**Palæontology**, science of fossils, treats of the life which existed on the globe in the past. Fossils are classified in two

ways, geologically and biologically. Geologically they may be arranged in groups in the order in which they occur in the strata, i.e. a chronological scheme of classification. As biology is subdivided into botany and zoology, so P. is regarded as consisting of Palaeobotany (q.v.) and Palaeozoology. The former branch of P. deals with fossil plants, which have been arranged into two sub-kingdoms, viz. the Phanerogams, or flowering plants, and the Cryptogams, or non-flowering plants. Palaeozoology treats of extinct animals. These are arranged by zoologists into two divs., the Vertebrata (animals with a backbone) and the Invertebrata (without backbone). The former class constitute a single phylum, while the Invertebrata are divided into eight phyla, viz.: (1) Protozoa (animals of the earliest type, such as Foraminifera, Infusoria, etc.); (2) Porifera (comprising the sponges); (3) Coelenterata (including corals and zoophytes); (4) Echinodermata (sea-urchins, starfish, and encrinurus or sea-lilies); (5) Annelida and other kinds of worms; (6) Anthropoda (lobsters, insects, centipedes, and other jointed animals); (7) Molluscoidea (including bryozoa and brachiopods or lampshells); (8) Mollusca (lamellibranchs, gastropods, cephalopods, etc.). Each of these phyla is broken up into classes and still further into orders, families, genera, and species. The fossils obtained from the rocks are generally more or less fragmentary, but from these fragments it is possible to form an accurate conception of the entire organism. The principle of the correlation of parts, first applied by Cuvier, deals with the conservative hard parts, such as the teeth, etc., and constitutes a histological discovery. According to this principle all parts of an organism bear a fixed relation to each other, so that one part cannot vary without a corresponding variation taking place in the others. The principle has been so elaborated that from a single tooth or bone, shell fragments or stem, the paleontologist can at once form a fair conception of the complete organism. From the nature of the fossils the conditions of deposition of a geological formation can be surmised, the nature of the climates of past ages may be judged, and the physical configuration of the lands of past time drawn up (see FOSSILS). To the biologist the study of fossil animals is of importance, since not only are they the ancestors of modern species, but many groups now extinct (graptolites, trilobites, etc.) often throw light on the relationship of existing animals and plants. In some cases anct. forms serve to connect groups which at present appear to be quite distinct, e.g. the earliest known bird, archæopteryx (see BIRDS), shows affinities with reptiles (q.v.).

In spite of the imperfection of the record of life in past ages, the doctrine of evolution receives great support from P.'s testimony. Many groups of animals undergo gradual modification when traced through series of strata. The early forms of life gradually become more abundant, more specialised, and then die away again,

as in the group of Ammonoidea. Then in the Tertiary mammals we have a modification of structure. The Kocene forerunner of the horse possesses five toes, but in the Pliocene the existing type had one toe with splint bones, and other changes occurred, as in the character of the teeth. The recapitulation theory, which supposes that the changes in the development of the individual (ontogeny) are generally a rapid and incomplete repetition of those which occurred in its race-hist. (phylogeny), receives considerable support from the study of fossil species. In a review of the fossils which are found in the geological systems we find that there is a passage from the lower to the higher forms of life, each type becoming more and more specialised with the progress of time. Thus trilobites and lower forms of life occur in the Cambrian system, fishes appear in the Silurian, amphibians in the Carboniferous, reptiles in the Permian, and birds and mammals in the Jurassic. On the other hand some species, such as the brachiopod *Lingula*, have persisted almost unchanged from the Ordovician period up to the present day (see EVOLUTION; FOSSILS). The fossil hist. of man is dealt with under ANTHROPOLOGY and MAN. See H. A. Nicholson, *Manual of Palaeontology*, 1872; C. A. von Zittel, *Text-book of Palaeontology* (trans. C. R. Eastman), 1900-2, and *History of Geology and Palaeontology*, 1901; H. Woods, *Palaeontology: Invertebrata*, 1902, 1946; R. S. Lull, *Organic Evolution*, 1917; A. Morley Davies, *Introduction to Palaeontology*, 1920; H. L. Hawkins, *Invertebrate Palaeontology*, 1920; Enriquè Sparr, *Bibliografía de la Geología, Mineralología y Paleontología*, 1920-22; E. Neaverson, *Stratigraphical Palaeontology*, 1928; A. S. Woodward, *Modern Progress*, 1932; and H. H. Swinerton, *Outlines of Palaeontology*, 1947.

**Palaepolis**, see EPIA.

**Paleo-Siberian Languages**, see under LINGUISTIC FAMILIES.

**Palaetherium** (Gk. παλαιος, anct.; θηρίον, wild beast), typical genus of the extinct family Palaetheriidae, which contained perissodactyle mammals related to horses and zebras. The species are found in the Upper Eocene of Europe. In general appearance they were tapir-like, but in size frequently attained that of a rhinoceros. The first species to be discovered was *P. magnus*, which was found in the gypsum of the Paris basin.

**Palaezole** (Age of Anct. Life) includes the Cambrian, Ordovician, Silurian, Devonian, Carboniferous, and Permian geological systems. In the Lower P. the only fauna were invertebrates and fishes, whilst at the end of the age reptiles appear. The characteristic fossils of P. times are the trilobites (q.v.).

**Palaephatus**, name (which is perhaps a common pseudonym) of sev. anct. Gk. writers, four of whom are mentioned by Suidas (q.v.). The first was an epic poet, a native of Athens, who flourished before Homer. The second was a writer of Paros or Priene in the time of Artaxerxes Mnemon. The third was an historian of

Abydos, the contemporary and friend of Aristotle. The fourth was an Alexandrian grammarian according to Suidas, or a peripatetic philosopher according to Tzetzes. For the last named see J. Schrader, *Palæstræ*, 1893, and N. Festa, *Mythographi graeci*, iii. 2, 1902.

**Palæstra** (Gk. *παλαίστρα*, a wrestling school, from *παλαίω*, I wrestle), name of a public place which in Grecian times was appropriated to exercises in wrestling and athletics generally. These were under official control, and were especially, though not exclusively, for the athletes training for the public and the Olympic games.

**Palafox y Melzi**, José de, Duke of Saragossa (1780-1817). Sp. patriot and soldier, descended from a distinguished Aragones family. He accompanied Ferdinand VII. to Bayonne (1808), and on the latter's imprisonment headed the patriotic party in Aragon, and tried to prevent the Fr. invasion. His bold and courageous defence of Saragossa (1808-9) was one of the most brilliant exploits of modern hist., its fame rivaling that of the anc. siege of Numantia. P. was imprisoned by the Fr. at Vincennes till 1813, and then returned to Spain. See de Madrago's Sp. trans. of L. Thiers's *Histoire du consulat et de l'empire*, 1843, and O. Oman, *Peninsular War*, i., 1902.

**Palagonite**, isotropic glass, yellow, brown, or green in section, resulting from the alteration and hydration of basic glass or basalts. P. tuff is found among the products of the volcanoes of Sicily and Iceland, and has also been observed in the Carboniferous tuffs of central Scotland.

**Palae Language**, see under INDO-EUROPEAN LANGUAGES.

**Palamau**, dist. in W. Bihar, India. It has an important coalfield, whilst tussore silk is the chief article of manuf. Area 4905 sq. m. Pop. (1941) 912,700.

**Palamedes**, Corunna, see HORNED SOREANMER.

**Palamedes**, one of the Gk. heroes in the Trojan war, son of Nauplius of Euboea, his story belonging to the post-Homeric cycle of legends (see Stasius's *Cypria*). The usual account makes him deputed by the Gks. to induce Odysseus to join in the Trojan war. This he did by exposing the latter's feigned madness, thus incurring his enmity. He was falsely accused of treason by Odysseus, Agamemnon, and Diomedes, and stoned to death. See Philostratus, *Heroica*. 10; Euripides, *Orest.*, 422; *Frag.*, 581; Ovid, *Metam.* xiii. 56; and Jahn's monograph (1836).

**Palamedes**, or Palomides, Sir, one of King Arthur's knights, the knight 'that is yet unchristened, who has many a bout with Sir Tristram,' mentioned in Malory's *Morte d'Arthur* (books ix. and x.). See ed. of *Le Morte d'Arthur* in Everyman's Library, 1906.

**Palamkotta**, Palamcottah, or Palayamkottai, tn. of Madras, India, 5 m. E. by S. of Tinnevely. It is a Church of England missionary station and a road junction. Pop. 30,900.

**Palanpur**, or Pahanpur, cap. of the state of P. Bombay, India, 80 m. N. of Ahmedabad. Pop.: state 270,000; tn. 20,300.

**Palanquin**, type of litter used in the E., and carrying one person: the present form is a closed box, an earlier form being open. Poles are passed through rings, and the P. is carried by two or by four men.

**Palas**, see PELEW ISLANDS.

**Palar**, riv. of India, rises in Mysore and flows through the E. Ghats to the bay of Bengal, S. of Madras. Its water provides irrigation, and is supplied to the Kolar goldfields, the chief dam being at Arcot. Length 230 m.

**Palate**, roof of the mouth. It is composed of the *hard P.*, a bony structure covered with mucous membrane, and the *soft P.*, an aggregation of muscles covered with mucous membrane. The hard P. is formed by the palatine processes of the superior maxillary bones and the palatal bones. It has a slight ridge called the *palatine raphe* in the middle line which ends anteriorly in a little eminence called the *palatine papilla*; a number of ridges run transversely across the anterior portion of the P. The soft P. is composed of the muscles known as *tensor palati*, *azygos uvulae*, *palatoglossus*, and *palatopharyngeus*. A soft projection known as the *uvula* hangs downwards at the rear of the oral cavity. Behind the free edge of the soft P. is the pharyngeal isthmus communicating with the *naso-pharynx*. A ridge of mucous membrane runs from the soft P. to the edge of the tongue on each side, and is known as the *anterior palatine arch*. Another ridge forming the *posterior palatine arch* is situated about  $\frac{1}{2}$  in. to the rear, and between the two ridges is an oval mass of lymphoid tissue called the *tonsil*. See also CLEFT PALATE.

**Palatinate**, The, former Ger. state of the S.W., originally belonged to the Palgraves of the line as an hereditary fief. In 1156 it was granted by the Emperor Frederick I. to his step-brother, Duke Conrad of Swabia, succeeded by Duke Henry of Brunswick. Frederick II. took away the P. from the latter in 1215 and gave it to Louis, duke of Bavaria, whose son Otto married Agnes, the daughter and heiress of Henry. Thus the P. came into the possession of the Bavarian family in whose hands it remained until 1559, when the line became extinct. Frederick III. of the Simmern dynasty, who associated himself with the Reformed Church, then became ruler of the P.; and Heidelberg, the cap. of the electors palatine, became a great centre of Calvinism. In 1648 the Lower P. was given to Charles Louis, the son of Frederick V., and a new or eighth electorate was created in his favour. During the War of the Sp. Succession John William, the elector of the Lower P., received the Upper P. also, but the latter was restored to the elector of Bavaria at the end of the war. On the death of the Elector Maximilian Joseph, the last of the Bavarian male line, in 1777, the two Ps. were reunited. In 1801 the portions of the Rhine P. on the l. b. of that riv. were taken by Franco Baden received Heidelberg, Mannheim, etc., and the rest fell to Hesse-Darmstadt, Nassau, etc. By the treaties of Paris of 1814 and 1815, the P. was again divided up, the greater portion

being granted to Bavaria and the rest to Prussia and Hesse-Darmstadt. Later the Lower P. (Ger. *Unterpfalz*) formed a dist. of Bavaria, with Speier as cap. The Upper P. (Ger. *Oberpfalz*) formed a dist. of Bavaria under the title of Upper P. and Ratisbon, with Ratisbon as cap. After 1945 the Lower P. formed part of the prov. called Rhineland P., with Koblenz as the cap. The Upper P. formed part of the prov. of Bavaria. Pop. (1939) 1,067,300.

**Palatine** (Lat. *palatium*, a palace). A count P. was, under the Merovingian kings of France, a high judicial officer. After the time of Charlemagne a similar title was given to any powerful feudal lord, to whom a prov. was made over with judicial powers, and the dist. so governed was called a palatinate or co. P. There were three co. P. in England (Lancaster, Chester, and Durham), which were made separate regalities on account of their respective proximity to the frontier of Wales and to that turbulent Northumbrian prov. which could not be accounted a portion of either England or Scotland. In virtue of their regal rights, the counts P. had their courts of law, and could pardon treasons, murders, and felonies. Lancaster seems to have been made a co. P. by Edward III. Henry VI. was hereditary duke and count P. of Lancaster, and on his attainder, the duchy and co. were forfeited to the Crown, and conferred on Edward IV., afterwards on Henry VII. and his heirs for ever. There is still a chancellor of the duchy and co. P. Chester is supposed to have become a co. P. when made over by William the Conqueror to Hugues d'Avranches. In the reign of Henry III. it was annexed to the Crown by letters patent, and since that time has been vested in the eldest son of the sovereign, or in the Crown. Durham seems to have first become a palatinate when William the Conqueror conferred upon Walcher the bishopric and dukedom of Durham. The palatinate jurisdiction continued united with the bishopric till 1836, when it was vested in William IV. and his successors. Pembroke was at one time a co. P., but ceased to be so in Henry VIII.'s reign. In very early times there were a number of similar privileges in Scotland.

**Palatine Hill** (*Mons Palatinus*), hill on which, according to tradition, Romulus founded the city of Rome (q.v.), the Capitoline Hill being occupied by Sabines. The P. H. is S.E. of the Capitoline and N.N.E. of the Aventine; traces of its fortifications are still visible. In later times it was the seat of the imperial residence, whence the Eng. words 'palace' and 'palatial'.

**Palawan**, or **Paragua**, one of the Philippine Is., to the W. of the group, between the China and Sulu Seas. The Is., which has a length of 240 m. and a breadth of 25 m., acts as a sort of breakwater, whence its name (meaning 'salute' in Buji language). The chief products are rattan, resin, and timber. It was developed as an air base by the Jap., who occupied it from May 1942 until March 1945. Area 4500 sq. m. Pop. 65,000; cap. Puerto Princess (pop. 5800).

**Palaw Islands**, see **PELEW ISLANDS**.

**Palayam-Kottai**, see **PALAMKOTTA**.

**Palazzolo Acreide**, tn. in the prov. of Syracuse, Sicily, 13 m. N.W. of Noto. It was founded by Syracusan Gks. in 664 B.C. and called Acre: there are sev. anct. remains. Pop. 13,100.

**Palazzolo sull' Oglio**, tn. in the prov. of Brescia, Italy, with trade in silk and cotton. Pop. 12,100.

**Palazzo San Gervasio**, tn. in the prov. of Basilicata, Italy, 6 m. W.S.W. of Spinazzola. Pop. 8700.

**Palembang**, dist. and tn. of Sumatra, Indonesia, 45 m. from the mouth of the Musi, or P. R. The dist. is marshy, and many of the inhab. live on rafts. One of the chief buildings of interest in the tn. is the sultan's palace. P. is the most important commercial city in the Is., the chief industries, apart from the production of oil, are wood-carving, silk-weaving, and the manuf. of gold and ivory ornaments. Dyewoods and gutta-percha are exported. P.'s output of 4,250,000 tons of petroleum annually in years before the Second World War represented 55 per cent of the net total output of the Netherlands E. Indies; hence, after the loss of Tarakan and Balikpapan, it was the only big oil-producing centre left to the Allies in this area after 1942. The Jap. landed 700 paratroops at P. (Feb. 14) and the Dutch forces wiped out two of the Jap. forces on the spot. The Dutch, however, before the Jap. landed troops from the sea, destroyed installations, refineries, and equipment. Dutch, Brit., and Amer. warships took heavy toll of the Jap. landing barges and attacked Jap. warships and transports. Brit. Hurricanes also took part in the struggle. But the Jap. succeeded in landing invasion forces on Feb. 16 and P. was lost. The residency has an area of 33,173 sq. m. Pop. 1,099,000. Pop. of cap. 109,000.

**Palencia**, Alonso de, or Alphonsus Palentinus (b. c. 1423, d. after 1492), Sp. historical geographer. He studied under George of Trebizond in Italy, and was appointed royal historiographer by Alfonso, brother of Henry IV. of Castile, later attaching himself to Isabella of Castile. His works include a *Chronicle of Henry IV.* (1454-74); *Decades* (in Lat., down to the taking of Baza from the Moors); *Los Libros de Flavio Josepho* (1491); *El Universal Vocabulario en Latin y Romance* (Sp.-Lat. dictionary) (1495); and *Las Vidas de Plutarco* (1508). See N. Antonio, *Bibliotheca Hispana vetus*, 1784; D. Clemencin, *Elogio de la Reyna Catalica*, 1821; and W. H. Prescott, *History of Ferdinand and Isabella*, i., 1842.

**Palencia**: 1. Prov. of central Spain, bounded by the provs. of Santander, Burgos, Valladolid, and Leon. It is fertile and well watered by the Carrion and other grain, as well as wine, honey, and fibres and woollens are extensively manufactured and exported. Area 3093 sq. m. Pop. 226,600. 2. Episcopal city and the cap. of the above prov., 27 m. N. by E. of Valladolid. It is an anct. walled city, with a fine cathedral, founded in the fourteenth century. In the twelfth century

P. became the seat of the Cortes and of the Castilian kings. It has important manufs. of blankets, balze, leather, cotton, porcelain, soap, etc., and possesses hospitals, barracks, and a bull-ring. Pop. 20,000.

Palenque, vil. of Chiapas, Mexico. It is celebrated for its ruins of anct. temples, the finest of which is called the Great Palace. There are ten detached buildings in all, amongst which are the Temple of the Cross, the Temple of Inscriptions, and the Temple of Beau Relief. See W. H. Holmes, *Ancient Cities of Mexico*, 1895.

Paléologue, Georges Maurice (1859-1944), Fr. author and diplomat, b. in Paris, of an old Byzantine family (see PALAEOLOGUS). Educated at Lycée Henri IV., he held diplomatic posts in Tangier, Rome, Germany, China, Korea, and Bulgaria, was ambas. to Russia, 1914-17, and secretary-general of the Ministry of Foreign Affairs, 1920-21. Works include *L'Art chinois* (1888); *Vauvenargues* (1890) and *Rome, impressions d'histoire et d'art* (1902), both crowned by the Academy; *La Russie des tsars pendant la Grande Guerre* (1921-22); *Le Roman tragique de l'Empereur Alexandre II* (1923); *Cavour* (1926); *Les Entretiens de l'impératrice Eugénie* (1928); *Un Grand Tournant de la politique mondiale, 1904-5* (1934); *Guillaume II. et Nicolas II.* (1935), and *Alexandre Ier* (1936). In 1928 he was elected to the Academy.

Palermo: 1. Prov. of N.W. Sicily, Italy, covering an area of 1927 sq. m. All along the coast-line are extensive bays and bold promontories, and a branch of the Neptuman Mts. traverses the interior from E. to W. Sulphur, marble, olives, figs, and wine are the chief products. Pop. 998,900. 2. Cap. of the above prov., on a bay of the same name, in the N.W. corner, and 120 m. W. of Messina. It is the sec of an archbishop, and has a magnificent Gothic cathedral commenced in 1180, containing the tombs of two emperors and an archbishop. There are also a royal palace and a univ., founded at the end of the fourteenth century. P. has a good harbour and a fine promenade, the Marina, about 80 yds. wide, stretching for a mile along the bay. The prin. products are wines, oranges, lemons, sulphur, essences, etc. The fisheries are productive, and the industries include boat-building, glove-making, and iron and marble work. P. is a tn. of early Grecian origin, and was a stronghold of the Carthaginians until their defeat by Rome in the Punic Wars. In A.D. 1071 it became the Norman cap., and afterwards that of the Angevins and their Sp. successors. Garibaldi, finally liberated the city from the Bourbon kings of Naples in 1860, when it was annexed to Sardinia. P. was taken by Gen. Patton, commanding the Amer. Seventh Army, on July 23, 1943. Much damage was done to the city during the allied invasion of Sicily in 1943; but all the famous Norman buildings, with their twelfth-century mosaics, are, almost without exception, intact, and the cathedral escaped damage. Pop. 465,300. See C. Diehl, *Palermo et Syracuse*, 1907.

Palestine, city and the cap. of Anderson co., Texas, U.S.A., 151 m. N. of Houston. It has a cotton compress and iron foundries. Pop. 12,100.

Palestine, anct. and biblicl country lying at the extreme E. end of the Mediterranean, to the S. of Syria. It forms a N.W. strip of Arabia balancing the S.E., El Yemen. The commonest term for it in the Heb. Bible is 'the Land of Canaan' (*Eretz Kena'an*). It is also known as the Holy Land, as the Land of Israel (*Eretz Yisrael*), and, in part, as Judaea. The term P., a Gk. word (*Παλαιστίνη*), which means 'Philistine-land,' is used for the whole country first by Herodotus (fifth century B.C.). Originally, however, the term P. (*Heb. Palsheh*) was applied to the mere strip of coast lying between Joppa (mod. Jafa) and Gaza (see Exod. xv. 14), but, like the term Canaan and other geographical terms, it gradually was employed to denote the whole country.

BOUNDARIES.—P. is a historical-geographical expression rather than a political entity. The area contained within its boundaries varied from time to time. The natural and historic boundaries of P. run on the S. from the gulf of Aqabah across the desert of Sinai to the Mediterranean coast. Desert country borders its E. frontier also. Its W. limit is the Mediterranean Sea. The N. limits are difficult to determine; it may be said, however, that they run from the desert on the E., along the slopes of Mt. Hermon over to the Lítani R. and where the Lebanon and Anti-Lebanon first break into a series of elevated plateaus, and thence over to the Mediterranean coast. P. is about 150 m. in length from N. to S., with a width of about 35 m. at the N. and about 110 m. at the S., its area being about 13,000 sq. m. (approximately that of the Netherlands). Under the Brit. mandate P. was bounded on the N. by the Fr. mandated terr. of Syria and Lebanon, on the W. by the Mediterranean, on the S. by Egyptian and Hejaz terr., and on the E. by Transjordan, though this was also included in the Brit. mandate. The N. boundary was settled by an Anglo-Fr. convention of 1920, and ran from the Mediterranean, between Tyre and Acre, across the Upper Jordan valley to Banias, and thence again S. to the N.E. shore of Lake Tiberias and to Samakh.

HISTORICAL-GEOGRAPHICAL SETTING.—Though the country was small, its situation was and still is one of very great strategic importance. P. forms a bridge between Asia and Africa, and in anct. times it formed the main communication between the great empires of Babylon and Assyria, important centres of civilisation on the Tigris and Euphrates, and Egypt, which through many centuries was one of the great world powers. P. was the bridge over which flowed all the traffic between these great commercial powers. Another stream of traffic, less considerable, crossed the country in another direction, from S. Arabia to Phœnicia. Culturally, also, P. drew continuously from Egypt and the valley of Euphrates, and as nearly all important elements of anct. culture

originated in one or the other of these two centres, P. became acquainted with all significant developments of anct. E. civilisation. But not all the traffic that passed over the bridge was peaceful. The rivalry between Egypt and the Mesopotamian powers was inveterate. Whenever their armies advanced to attack one another the route led necessarily through P.; therefore P. became an international battleground and a pawn in the game of war. It is this position, with its fundamental significance, also in its later hist., which renders P. unique. P. has, besides, always been the 'refuge of the drifting populations of Arabia.' Never sought for itself alone, except by the Hebs. and the crusaders, P. has been overrun constantly by invaders from the N. seeking Egypt, or

Galilee and Samaria, and falls away steadily and broadly as the Négob or S. country. N. of Esdraelon this range runs up to the mts. of Lebanon, of which indeed it is the S. extension. In the N. of Galilee its peaks reach a height of about 4000 ft. The main divs. are based on the geological formation; limestone rocks form two folds with a great synclinal valley between the valley of the Jordan; the cretaceous limestone of the Central Range passes under the calcareous sandstone of the Shephelah, which is overlaid by the raised beaches and sea-beds of the Maritime Plain. The Jordan valley forms a deep fault in the earth's crust. From the small lake Huleh or Waters of Merom, just above sea level, the lt. Jordan runs in a narrow valley, dipping so

by the return attack. Thus the Hittites, Egyptians, Assyrians, Babylonians, Persians, Gks., Syrians, Arabs, and Seljuk Turks in turn devastated it. Alexander passed through to Egypt in 331 B.C.; the wars of the Seleucides and Ptolemies passed over it; Pompey in 63 B.C. brought it under Rom. rule; the crusaders estab. themselves there from 1099 to 1187; Napoleon in 1799 abandoned his first ambition on its soil. Yet its destiny was typified by the Arab conquest in A.D. 640; there is everything to attract the desert tribes, but nothing for others except the religious sentiment of Christians and Jews, which later, linked with national consciousness, has given the latest impetus to the hist. of P. (see *Modern History*).

**PHYSICAL FEATURES.**—The land divides simply into the Maritime Plain (subdivided into the fertile plain of Sharon, from Mt. Carmel to Joppa, and the sandy plain of Philistia, to the S.) along the coast, the Shephelah, or low hills, the Central Range, the Jordan valley, and the E. Range; the Central Range is further broken by the plain of Esdraelon between

steeply that on reaching the sea of Galilee it is almost 700 ft. below sea level. The descent continues, but not so steeply; the riv., however, contrives in its wanderings to travel about three times the actual distance (which is about 65 m.) between the sea of Galilee and the Dead Sea (Arabian *Bahr lûb*). The latter is 1292 ft. below sea level. S. of the Dead Sea, in which the riv. loses itself, the valley (known as Wadi 'Arabah (Arabian *Ghôr*)) continues through the desert and gradually rises to the head of the gulf of Aqabah. There are hot springs in the bed of the Dead Sea, and the strata are bituminous; in addition there is no outlet, and evaporation leaves the water both dense and bitter. Its banks are largely of marl fringed with clean gravel. Within the Ghôr and about the Dead Sea were the 'five cities,' Sodom, Gomorrah, Admah, Zebolim, Zoar. The Ghôr has a tropical heat and rank vegetation, thorn bush and broom, and jungle of cane and oleander; it abounds in marsh with its accompanying malaria. Jericho has been its only tn. Beyond these main natural divs., again, the land is cut up into distinct and separated

parts well reflected in the anct. tribal divs., and giving an independent character productive of internal unrest.

*East Palestine*, from Hermon to the S. end of the Dead Sea, has three rivs., the Arnon, Jabbok, and Yarmuk, flowing due W. into the Jordan. Hauran, corresponding to the anct. Trachonitis and Auranitis, a volcanic region covered with a basaltic lava, and showing characteristic denudation, lies N. of the Yarmuk and is partly (in the N.) barren. The tableland rises steeply to 2000 ft., the W. wall sloping more gradually to between 800 and 1500 ft. of the Central Range. To the E. there is the Hauran mt. range, now the home of the Druses. Gaulan, to the W., corresponds to the Gk. Gaulanitis. The S. part of the Hauran is well watered, and probably coincides with the dist. known in the Bible as Bashan and later as Batanea. This was regarded by the Hebs. as an especially fertile area. Between the Yarmuk and the Jabbok (Zerqa) are forested high ridges, the Gilead of the Bible, the Galaaditis of the Gks., while S. again lies the treeless plateau of Moab, with Ammon to the N.E. This whole dist., called by the Arabs El Belka, was known in Rom. times as Perea; then it was Jewish, while the ter. N. of the Yarmuk was mainly pagan.

**HYDROGRAPHY AND VEGETATION.** The hydrography of P. is typical of limestone country, with the addition of summer drought. The streams are plentiful and full in the hills in the rainy season, but soon become dry; in the Maritime Plain surface water is scarce, but is readily obtained by digging. Judaea has few springs, and water is stored in wells from the winter rains. As a consequence of this irregularity the soil and vegetation are similarly varied, from the tropical vegetation of the Jordan valley to the barren moorland and desert. W. of Jordan the land is park stoppe tending towards scrub. Trees include the oak, terebinth, carob, box, pine, cypress, plane, walnut, sycamore, palm, acacia, and shittim-wood. Much of the woodland consists of dwarf trees, the wild olive, vine, arbutus, myrtle, juniper, and thorn. Of fruit there is plenty: the apricot, fig, orange, date, citron, pomegranate, mulberry, pistachio, almond and walnut, olive and grape. Wheat, barley, millet, maize, beans, pulse, lentils, tomatoes, onions, cucumbers, pumpkins, and melons are cultivated, but pasture is wild, short-lived, and sparse, though of excellent quality.

**CLIMATE.** There is every range of climate from the sub-tropical of the lower Jordan to the sub-alpine of the upper. On the Maritime Plain one is in Egypt; in the Shephelah in Italy; Judaea resembles inland Italy, and Moab inland Algeria. However, even in the winter the temp. only exceptionally falls below freezing-point. There are two seasons; the winter rains, commencing about Oct. and lasting till April, with typical desert fringe thunderstorms and hail, and snow on the mts.; and the summer drought, with occasional morning mists, and regular heavy dews at night, while the heat of the

day is sultry. The rains are brought by S.W. and W. winds, the drier N.W. blowing in the summer, and with an approach to land and sea breeze conditions. In spring the Sherkiyeh (sirocco), the hot desert wind, is common. The temp. tends to extremes and sudden changes, but in Judaea is more equable; here the mean ann. temp. varies from 62° to 68°; 90° in summer, 46° in Feb. Throughout the land the climate is healthy, bracing, regular enough to induce steady labour, variable enough to produce anxiety and care. The lower Jordan valley, cut off from the sea breezes, is intensely hot. This heat causes rapid evaporation from the sea of Galilee and, especially the Dead Sea, and explains the fact that despite the millions of tons of water which the latter receives daily from the Jordan, its level does not rise.

**ARCHAEOLOGY.**—Archæology and hist. in P., as elsewhere, are complementary and interdependent studies. Various museums in Europe, America, and Asia preserve Palestinian antiquities; the most important of them is the P. Museum of Jerusalem, built with a gift of \$2,000,000 from John D. Rockefeller, junior.

P. has always been a lure to the archæologist, especially for those who have worked to establish the historical accuracy of the Scriptures. Sober appraisal should be made of the nature, extent, and limits of the actual contribution which archæology makes to our better understanding and true appreciation of the Bible. The great spiritual experiences deposited in the Bible cannot be tested by any material, historical, or literary evidences. On the other hand, the brilliant achievements of the last decades in the field of Palestinian archæology have greatly added to our knowledge of the world in which Israel was set. Archæology fills many gaps in the Bible, explains and illustrates many passages which otherwise would remain obscure.

Scientific surface exploration of P. may be said to have begun in 1838. In that year the Amer. theologian Edward Robinson, prof. at the Union Theological Seminary of New York city, started his extensive observations, which he continued until 1852. In 1865 the P. Exploration Fund (q.v.) was estab., and its first representative, Charles Warren, a Brit. ordnance officer, made a series of sketch-maps of the country, and (in 1867) carried out excavations on the Temple hill of Jerusalem. In the years 1872 to 1878 the P.E.F. made a thorough survey of W. P. under the leadership of C. R. Conder and H. H. Kitchener (Lord Kitchener). The Amer. P. Exploration Society, in 1870, and, in 1898, the Deutsche Orient-Gesellschaft, as well as various other European and Palestinian societies, were founded on the model of the Brit. organisation. W. M. Flinders Petrie, who in 1890 excavated the mound (or tell) of Tell el-Hesi, in S.W. P., may be considered as the father of modern archæology of P. There was considerable archæological activity in P. in the years following the First World War; from 1921 to 1936 no

year passed without sev. excavations. The lead was then taken by Brit. organisations (P.E.F., Brit. School of Archaeology, Wellcome Archaeological Expedition, etc.), often in co-operation with Amer. organisations (Amer. School of Oriental Research, Univ. of Chicago, etc.) or the Heb. Univ. of Jerusalem.

Among the most notable excavations carried out recently are those by the Univ. of Pennsylvania Museum at Bethshan (1921-33), by the P.E.F. and the Brit. School of Archaeology on the Ophel hill in Jerusalem (1923-28), by the Univ. of Chicago at Megiddo (1925-39), by Prof. Harstang at Jericho (1929-36), by the Amer. Schools of Oriental Research in Jerusalem, directed by Prof. W. F. Albright, at Tell en-Nasbeh (1926-35), at Tell Beit Mirsim (1926-32), by Prof. Elihu Grant at Beth Shemesh (1928-33), by the Brit. School of Archaeology in Jerusalem and the Amer. School of Prehistoric Research at Mt. Carmel (1928-34), by Flinders Petrie at Tell el-Ajjul (anc. Gaza) (1930-34), Tell Jemmeh, and Tell el-Far'ah, by the joint Brit.-Amer.-Heb. Univ. expedition at Samaria (1931-1935), by the Wellcome-Marston Expedition at Lachish (Tell ed-Duweir) (1932-1938), where the famous 'Lachish Letters' were found, and numerous shorter excavations. Recent excavations are those of the Jewish P. Exploration Society at Beith Shearim (modern Sheikh Abreik) (1936-40) and Khirbet Kerak (=anc. Beith Yerah) (1944 onwards). The most important discovery which has ever been made in regard to biblical MSS. was in the summer of 1947, when a number of MSS. were found in an anc. cave in the cliffs above the Dead Sea. It will take the scholars many years of study to exhaust all the implications of this remarkable find. See SCROLLS OF THE LAW.

PREHISTORY.—Our historical information concerning P. before the time of the Hebs. is very limited. Indeed the hist. of P. in the ordinary sense does not go back further than the second millennium B.C. Such information as can be gathered about the earlier times is derived almost exclusively from the discovery of excavators and the research work of geologists and archaeologists (see preceding section). It seems that in the Tertiary Age P. rose above the sea, and after much oscillation attained what were roughly its present boundaries; and less than 2,000,000 years ago the tectonic movements in the earth's crust culminated in the great 'left' which is known in its modified form of to-day as the Jordan valley; at the same time upheavals of rock deposits created the hill country of W. P.

P. appears to have been inhabited at a very remote period. The earliest inhab. belonged to the Early Palaeolithic period; they lived in caves in which they left traces of their occupation. The oldest cave deposits are assigned to the Acheulian phase (perhaps 180,000 years ago). On Mt. Carmel, in a Middle Palaeolithic cave deposit (belonging perhaps to 150,000 years ago), a dozen human skeletons were found, and sev.

more were discovered in a cave S. of Nazareth. The Carmel man seems to represent a mixed race, intermediate between Palaeanthropic man (*Homo neanderthalensis*) and Neanthropic man (*Homo sapiens*). There followed various Late Palaeolithic and Mesolithic phases, each one lasting many thousands of years.

Of Neolithic men in P. (perhaps 6000-4500 or 1000 B.C.) much more is known. They left behind them numerous monuments of stone such as menhirs (q.v.), dolmens (q.v.), and cromlechs (q.v.), perhaps the biblical *gilgal*. Perhaps about 4500 B.C. copper made its first appearance in P.; gradually it became more abundant, and partly replaced stone as a material for tools. This period is known as Chalcolithic, i.e. 'copper (or bronze)—(and) stone'; it was the transitional period between the Neolithic and Bronze Ages. Whatever may be the case with the Palaeolithic inhab. of P., according to Prof. Albright, the leading Amer. orientalist, Hamito-Semitic tribes already appear during the Mesolithic period, nearly 10,000 years ago, and (although later there were many movements of non-Semitic peoples across P.) the Semitic element remained primary in the ethnic make-up of P. ever since. The true hist. of P. begins with the invasion of the Israelites in the thirteenth century B.C. (after their exodus from Egypt), and with the invasion of the 'Sea Peoples' in the early twelfth century B.C. (see next section, *Ancient History*).

ANCIENT HISTORY.—(For the traditional hist. of the Israelites see under ISRAEL.) By 1100 B.C. the Israelites had occupied most of the hill country in P. and they were already distinguished from the Phœnician people of the coast and the Semites of the desert beyond the Jordan by their peculiar religion. Hostile pressure, especially from the Philistines, led to the setting up of a monarchy; and under David (c. 1000-970 B.C.) and Solomon (c. 970-930 B.C.) the Israelites were effectively united, the Philistines and other enemies defeated, and the power of the new kingdom was extended over all P. But on Solomon's death a decline set in. The coastal people regained their independence; the N. tribes established a separate kingdom of Israel centred on Samaria, often at war with the kingdom of Judah, in which, principally because Solomon's temple in Jerusalem was the visible symbol of the Heb. faith, the tradition of Heb. culture was thenceforth mainly concentrated. This 'partition' of P. rendered easier its subjection to whichever should become the stronger of the neighbouring empires, Egypt or Assyria. The two Israelite kingdoms and the coast tns., however, succeeded in keeping a precarious independence for two centuries, but in 721 the first blow fell. The N. kingdom became merged in the Assyrian Empire, Samaria was destroyed, and the wealthier sections of the people were deported to other lands. By 587-586 B.C. Judah suffered a like fate. Jerusalem was sacked and deprived of its defences

and equipment and a great part of the pop. removed to Babylon. The 'captivity,' however, did not last long, for in 538 B.C. Cyrus allowed the Judean exiles to return to their country and some 40,000 returned to their homeland, rebuilt the temple, and reconstituted their life in a small inland state. Our evidence for the hist. of P. during the Persian period (538-330 B.C.) is both confusing and scanty. It seems, however, that there was a semi-autonomous state called Yehud (Judaea). After the conquest of P. by the Seleucid rulers of Syria came the earliest persecution of the Jewish faith, but under the lead of Hasmonaeans or Maccabees the Jews revolted, and from 142 B.C. recovered the long lost independence of Judaea and even extended their rule almost to the old limits of David and Solomon. Then in 63 B.C. Pompey stormed Jerusalem and never afterwards was P. independent. The Jews, however, were determined not to yield without a struggle, and in A.D. 66-70 Titus concluded a long and difficult campaign by sacking Jerusalem and destroying the temple. After crushing a further revolt in A.D. 132-35 the Romans ploughed the site of Jerusalem and drove many of its pop. into slavery. From that time onwards P. steadily declined into obscurity and its reduced pop. diminished still further. While the Jews, who had scattered themselves over much of the rest of the world, increased and multiplied, soon only a few thousand of them were left in their old homeland of P. Thus ended the hist. of ant. Jewish P.

**MEDIEVAL HISTORY.**—For over 500 years P. remained under Rom. or Byzantine rule and then, in the seventh century, the Arabs, inspired by the rise of Islam, in their great Mediterranean conquests included Syria, which also embraced P. But whatever the achievements of the golden age of Arab rule, P. played no great part, and the only outstanding work of art which has survived from the age of Arab independence is the Dome of the Rock, erected at the end of the seventh century. But in one respect Jerusalem attained a higher place in the Arab world than Bagdad, Granada, or Cairo: Mohammed placed the scene of his ascent to heaven on the site of the Jewish temple in Jerusalem. In the course of the next 400 years the Arab empire disintegrated, and from A.D. 1099 P. was exposed to the series of invasions known as the crusades, which maintained a precarious kingdom of Jerusalem until the late twelfth century, after which the whole of P. reverted to Muslim rule. In 1517 P. was conquered by the Ottoman Turks and under the rule of the Ottoman sultans at Constantinople it remained, except for a few months of Napoleon's invasion and the few years of Mohammed Ali's occupation, until the First World War.

**MODERN COLONISATION.**—Prior to the First World War the Gers. made sev. attempts at colonisation, notably at Haifa and Jaffa, and many Jewish colonies were estab. at Poth Tliqah, Rishon-le-

Ziyon, Gadera (settlements for wine and orange cultivation), Lower Galilee (between the years 1901 and 1907), and mixed farming settlements under the Zionist organisation at Daganla, Tel Hal, Kinnereth, and elsewhere; Circassian colonies existed (and still exist) at Jerash, Amman, Kaysariyah, and elsewhere in Transjordan (q.r.). These colonies made a beginning towards the restoration of the land to its former flourishing condition. There was also an appreciable increase in philanthropical, educational, missionary, and monastic settlements. The Jordan valley S. of the sea of Galilee became the private property of the sultan, and some improvement took place there. After 1921 there was a wide extension of the colonisation of the Zionist organisation to large connected areas, especially in the vale of Esdraelon.

**MODERN HISTORY.**—*Palestine under British Mandate:* P. was taken from the Turks in 1917 by Gen. Allenby (q.r.). At noon on Dec. 9 a Turkish *parlementaire* conveyed the surrender of Jerusalem to Allenby, who made his official entry two days later (see PALESTINE, OPERATIONS IN). The Brit. conquest paved the way for the Balfour Declaration (q.r.), and this historic declaration, far-reaching in its consequences and repercussions, was endorsed by the allied powers in the treaty of Sevres, 1920, which provided that the country should be entrusted to a mandatory power under the League of Nations. At San Remo, in 1920, the Allied Powers' Supreme Council entrusted the mandate to Great Britain. A body, then styled the Zionist Commission, and consisting of representatives of the constituent federations of the World Zionist organisation, was set up to act as a link between the Brit. administration and Zionist interests. This body was known as the P. Zionist Executive. It was financed by Jews all over the world and did valuable work in the interests of Jewish education, agriculture, and colonisation in P. The Brit. military administration (1917-20) conferred many benefits on P., including sanitation, public gardens, and chambers of commerce. Large sums were spent on road improvements, bridges were rebuilt, and a steel bridge was thrown across the Jordan. There were occasional minor disturbances early in 1920 in various parts of P. Again, in 1921, there was rioting in Jaffa, which developed into racial strife, but no serious outbreak occurred until Aug. 23, 1929, when grave disorders broke out in Jerusalem over the Walling Wall (q.r.). Similar disorders were especially grave in Hebron, but also spread to other parts of the country, order being restored, however, by the end of the month, after troops had been sent from Malta and Egypt. A commission was set up by the Brit. Gov., under the chairmanship of Sir Walter Shaw, to inquire into the causes of the outbreak, and to make recommendations as to the steps necessary to avoid a recurrence. (Report, Cmd. 3530.)

From then until the outbreak of the Second World War the administration of P. was chequered by Muslim-Jewish

hostilities, which presented formidable difficulties to the mandatory. At times the Brit. Gov. seemed to lean in favour of the Jews, and at other times to discourage the Jews in favour of the Arabs. This was especially remarked in the White Paper of 1930, which seemed to be a rebuff to the too rapid development of the Zionist experiment, but which merely reaffirmed Brit. policy in the matter of carrying out the Balfour Declaration. This famous declaration was dual in its purpose, and called for the exercise of the finest sense of justice and equity towards the indigenous pop., while not losing sight of the fundamental purpose of the pledge given to the Jews.

The immigration of Jews has always been regarded with the greatest hostility, overt or otherwise, by the Arabs. From 1929 there was a marked decline in emigration, with only a slight decline in the immigration, of Jews. In 1932 immigration rose to 8553, the first of four consecutive leaps which were to transform the situation by the beginning of 1936. With the growth of immigration went a corresponding growth in the amount of capital invested in the national home, especially by Amer. Jews, and in its agric. and industrial production. Meantime, however, the economic position of the Arabs continued to improve. But the Arabs began to claim that they had been displaced from lands owing to Jewish purchase, especially from absentee Arab landowners, and ordinances were passed to check this tendency, which might eventually have created a large landless Arab proletariat. There was relative tranquillity in P. between 1930 and 1933, but under the quiet surface was smouldering a fierce Arab antagonism to the whole conception of the national home. In 1933 Jews fleeing from Germany under the Nazi regime sought asylum in P. and in that year immigration jumped to 30,327, 5392 coming from Germany and 13,125 from Poland, and the national home benefited in every way materially. It is true that the Jewish money which came in all-spelt prosperity for the Arabs, but that did not appease the latter, and the first open manifestation of the rising Arab temper was the pub. by the Arab Executive Committee in 1933 of a manifesto to the 'Arab nation' which, in effect, demanded the expulsion of all foreigners. Finally in Oct. 1933 the Arab Executive announced a general strike at Jerusalem, and the trouble soon spread to other parts of P. The difference between this outbreak and its predecessors was that previously the Arabs attacked the Jews, but now they attacked the gov. on the plea that they were allies of the Jews and enemies of the Arabs. Yet in this disturbed atmosphere the national home continued to grow. In 1934 there were no fewer than 42,359 'authorised' Jewish immigrants, and in 1935 61,854. The principle of 'economic absorptive capacity,' laid down over ten years previously, was almost stultified, for the Jews now claimed that this enhanced immigration in itself actually increased that capacity and the

Arabs naturally supposed that at no great distance of time they might find themselves outnumbered. It became evident that the longer the mandate operated the stronger and more bitter became Arab opposition. The various Arab political parties jointly demanded the estab. of a democratic gov., the prohibition of land transfer to Jews, and the cessation of Jewish immigration. The two latter demands were precluded by the mandate, unless it could be shown that land purchase and immigration were definitely injuring the rights and position of the Arabs; while as to the first demand, the gov. temporised by bringing forward a proposal (the second since the mandate) for the estab. of a legislative council. The Arabs, in a spirit of perversity, accepted the proposal only because the Jews were opposed to it, for it was clearly far removed from the Arab ideal of independence. It was, however, rejected by the Brit. House of Commons. This was unfortunate in its effect on Arab opinion, which assumed that the Commons were dominated by Jewish influence, though it is but fair to point out that, even if the Commons had accepted the P. Gov.'s proposal, it would not long have satisfied the Arabs. In 1935-36 the political developments in Egypt (q.v.) and in Syria (q.v.) stimulated the Arab nationalist agitation in P.

In such circumstances it is not surprising that in 1936 the disturbances broke out which occasioned the appointment of the Peel Commission (Aug. 7, 1936). In the course of 1936 Arab work and trade were virtually at a standstill, and Arab shops were closed. An Arab 'Higher Committee' was formed which became a kind of *imperium in imperio*, and by June of that year the strike hardened throughout the country. Violence and sabotage increased. Roads were barricaded and trains derailed. Armed bands appeared in the hills, including volunteers from Syria and Iraq. Military reinforcements came from Malta and Egypt for the defence of key-points. By Aug. these bands were strengthened in numbers and arms and were joined by trained guerilla leaders from outside P. In September extensive military operations were set on foot by the Brit. Gov. with a view to rounding up the bands, and over 20,000 Brit. troops were now in P. and martial law was authorised. Then came appeals from the Arab kings of Saudi Arabia, Transjordan, and Iraq to the Arab Higher Committee and the disturbances as an organised national movement ceased. It was then that the Peel Commission went out to P. The main recommendation of this commission, which reported in July 1937, was the partition of P. an independent Jewish state to be formed out of the predominantly Jewish-settled dists. along the coast and in the N., while the rest of P. was to become an independent Arab state. Jerusalem and Haifa were to remain under Brit. administration and the Arabs were to get a corridor to the sea near Jaffa. The scheme was rejected by both Arabs and Jews and received such severe criticism

in the House of Commons that it was in effect put back for further consideration, despite the fact that its major recommendation had already been accepted by the gov. Another commission, known as the Palestine Partition Commission, went out soon afterwards, and on their report against the practicability of partition, the Brit. Gov. came to the conclusion that the political, administrative, and financial difficulties involved in the Peel Commission's proposal to create independent states were so great that that solution of the problem was impracticable and it was dropped. Then came the Palestine Conference in London (Feb.-

was cut short by the outbreak of the Second World War, during which Arabs and, especially, Jews seemed to lay aside their grievances in their willingness to support Britain in the fight. For the proposals of the Anglo-Amer. committee of 1916, and of the United Nations committee of 1947, see BALFOUR DECLARATION.

*Government and Constitution.*—Under Turkish rule, part of P. was in the vilayet of Beirut and part in the independent sanjak of Jerusalem. After it was conquered in 1917-18 by Gen. Allenby, the country was placed under Brit. military administration until July 1920, when Sir Herbert Samuel was appointed

THE POST OFFICE, JERUSALEM

*American Colony Photo Dept*

March 1939); but as the Jewish and Arab delegations would neither meet nor agree on any compromise, the Brit. Gov. issued its own statement of policy in a White Paper pub. in May 1939. In this the gov. declared that it was no part of their policy that P. should become a Jewish state and that in their view the MacMahon-Hussein correspondence (exchanged in 1915 between Sir Henry McMahon, high commissioner in Egypt, and the sheriff of Mecca, on the terms on which the sheriff was prepared to co-operate with Great Britain against the Turks) in no way supported the Arab claim for an independent Arab state; and that the gov.'s objective was ultimately an 'independent Palestinian state,' the two peoples sharing authority 'in such a way that the essential interests of each were secured.' Jewish immigration was to be restricted; the Peel Commission's partition scheme was rejected. But further discussion of policy

High Commissioner and a civil administration was estab. by the treaty of Lausanne (q.v.), 1923. Turkey renounced all right over P. The mandate given by the League of Nations to Great Britain came into force on Sept. 29, 1923, and under its terms Great Britain was responsible for carrying into effect the terms of the famous Balfour Declaration (q.v.) of Nov. 22, 1917. Under that declaration the Brit. Gov. projected the estab. in P. of a national home for the Jewish people, it being understood that nothing should thereby be done to prejudice the civil and religious rights of existing non-Jewish communities in P., or the right and political status enjoyed by Jews in any other country. A new constitution was promulgated on Sept. 1, 1922. It provided for the appointment of a High Commissioner and Commander-in-Chief, an Executive Council, and a Legislative Council. But no Legislative Council

was (or ever has been) elected owing to the persistent refusal of the Arabs to take part in the elections. To meet this emergency the High Commissioner, under an Order in Council of 1923, formed an Advisory Council composed of a number of the chief officials, to enact the necessary laws. Under the constitution Eng., Arabic, and Heb. were the official languages of P. The country was divided into six dists., Jerusalem, Lydda, Haifa, Galilee and Acre, Samaria, and Gaza, administered by dist. commissioners. In 1927 regulations were made for the organisation of the Jewish pop. as a religious community, with autonomy for its internal affairs, religious, cultural, and communal. This community had a Chief Rabbinate, an Elected Assembly, and a General Council (*Va'ad Leumi*) elected by the Assembly to represent the community in its dealings with the gov. The Brit. Gov. and the P. administration recognised the Jewish Agency as representing the Jewish people in all matters appertaining to the building up of the Jewish national home. The Muslim Supreme Council was constituted by the High Commissioner in 1921 to control Muslim affairs in P. This Council consisted of a president (*Rais-ul-Ulama*) and four elected members. It controlled the appointments of officers for the Sharia courts and for the *Waqfs* (Muslim religious endowments). There were (1943) twenty-four municipalities. Election to municipal councils was regulated by an ordinance of 1934. Much was done by the municipal corporations in tn.-planning, street construction, and drainage. In rural areas local affairs were administered by local councils. Law courts were either civil or religious, the former exercising jurisdiction in all save questions of personal status or charitable endowments, which were dealt with, amongst similar matters, by the Jewish, Muslim, and the sev. Christian courts. The Supreme Court consisted of a Brit. Chief Justice with three Brit. and four Palestinian judges. In 1937 the Ottoman code was replaced by a criminal code based on Eng. law.

**Education.**—Under the mandate there was a dual system of gov. schools for Arabs and Jewish schools administered by the council of the Jewish community.

**Production and Industries.**—P. is, generally, fertile: cereals, olives, melons, citrons, and other fruits, olives and wine are produced. Oranges are grown chiefly in the Jaffa dist. Sheep and goats do well, both in the lowlands and on the mts. Olives are second in importance only to citrus: considerable areas, especially in the hills, are also planted with vines and figs; apples, pears, and plums are also grown. Vegetables and fruit, particularly bananas and sub-tropical fruits, are grown in the Jordan valley. Tobacco is cultivated in the Acre-Galilee dists. The minerals found include limestone (most parts of the country), gypsum at Mt. Gipsia (Galilee), sandstone in the coastal area; rock-salt in the Jordan valley and the Dead Sea shore; sulphur, sodium, and magnesium chloride, and chloride of potash. Petroleum and

bitumen exudations occur around the S. part of the Dead Sea. A concession for the exploitation of Dead Sea salts was granted to Palestine Potash Ltd. in 1930. Medicinal hot springs occur at Tiberias and elsewhere in the Jordan valley. The industries of chief importance for the export trade are wine-making, soap-boiling, olive oil, tanning, cement, and some textiles, the prin. manufacturing centres being Tel Aviv, Nablus, Acre, and Haifa. Durra, sesame, lentils, and edible oils are also exported. Citrus exports fell off during the Second World War, when more attention was given to concentrated juices and essential oils. The imports include chiefly rice, sesame, flour, sugar, petroleum, textiles, building materials, automobiles, and machinery. There are a number of nurseries for the raising of forest trees and fruit stock. A proportion of the uncultivated land has been declared as 'forest reserves.' There are, besides, tobacco factories and a cigarette factory. In 1941 thirteen factories produced about 1000 tons of cigarettes, tobacco, tobaccac, heishah, snuff, and cigars. Other products include artificial teeth and chemicals. Exports in 1938 and 1939 were valued at £5,000,000; in 1940, £2,114,000; 1941, £1,362,000; imports averaged £12,000,000 for the four years.

**Shipping and Communications.**—The chief ports are Haifa and Jaffa. Acre and Gaza are also ports of entry for sailing vessels. At Jaffa and Tel Aviv large vessels anchor at open roadstead. In 1939 steamers aggregating over 4,370,000 tons called at P. ports. An aerodrome has been estab. at Gaza, for passenger and mails, and there was normally a flying boat service to Cyprus. Under war conditions, the only civil airports were at Lydda, Haifa, and Kallia. There was also an overland and desert mail service with Iraq and Persia. All the prin. tns. are linked up by telegraph and telephone, and there was direct telegraphic communication with Egypt and Syria. The total length of the railways on P. ter. is 336 m. of standard gauge, 274 m. of narrow gauge, and 16 m. which is of mixed gauge. The Hejaz Railway is a 3 ft. 6 in.-gauge railway, and the Kantara-Haifa section is 4 ft. 8½ in.-gauge. There was through communication with Egypt, and trains connected at Kantara W. with Cairo, Alexandria, Port Said, and Suez. E. of Haifa the P. Railways system terminated at El Ilamme. The main junction of the gov. railways was at Lydda. There are over 500 m. of metalled roads which are much used by motor transport.

**Population.**—The pop. of P. was estimated in 1942 as 1,605,800 (988,000 Muslims, 478,500 Jews, 120,300 Christians, 7000 Druses (*q.v.*), the remainder being Samaritans, Bahais, etc.). These figures are exclusive of Bedouins, who numbered about 100,000. From the 1922 census (752,000) the estimated increase in pop. was over 833,400, the increase among Jews being 390,000, among Muslims 384,000, and among Christians 54,000. Four-fifths of the increase in Jewish pop. was from immigration. The increase in

the Arab pop. was largely due to natural increase resulting from high birth rate and lower infant mortality through improved hygiene. Pop. according to the census of Nov. 8, 1948, in terr. occupied by Israel only, was Jews, 713,000; Arabs and others, 89,000. The estimated pop. of the cap., Jerusalem, on Dec. 31, 1948, was 164,440 (99,320 Jews). The estimated pop. (1946) of the other prin. tns. was: Tel-Aviv, 183,200 (almost all Jews); Haifa, 145,430 (74,230 Jews); Jaffa, 101,580 (30,820 Jews); Gaza, 37,820; Hebron, 26,390; Nablus, 24,660; Lydda, 18,250; Petah-Tiqvah, 18,160 (almost all Jews); Ramle, 16,380; Nazareth, 15,540; Tiberias, 11,810 (8030 Jews); Rehovot, 10,350 (all Jews); and Bethlehem, 9140.

*British Mandatory Regime ended.*—The General Assembly of the United Nations on Nov. 29, 1947, approved the partition of P. by 33 votes to 13, a decision that was expected since the alternative Arab plan for a unitary state had been decisively rejected by the Assembly's Palestine committee. This was a modified scheme of partition to be implemented by a commission of five members unsupported by any police or military forces. This plan was accepted in principle by the majority of the Jews, but the Arabs announced their intention of resisting it by all means and were promised full support from all the Arab countries, a promise which, in the sequel, proved more or less illusory. While this plan was still being discussed, the Brit. Gov. announced its intention to withdraw all Brit. forces from P. by Aug. 1, 1948, a development which might well have been expected since the gov.'s firm decision to assume no responsibility for imposing by force any plan which was not acceptable both to Jews and Arabs. Such a task indeed would have been difficult, for 84,000 Brit. troops had proved insufficient to maintain law and order, and since the war 338 Brit. subjects had been killed in P. while the Brit. military forces there had cost Britain \$100,000,000. It was obvious that, in the absence of agreement and because of the irreconcilable nature of the interests involved, not only was the mandate unworkable, but also no trusteeship agreement could be made to cover the period until P. achieved independence. The Brit. view was that, in order that their withdrawal might be conducted in an orderly manner and with the least disruption of the ordinary life of the country, it was essential that they should retain control of the country until evacuation was well under way. The mandate would, therefore, be terminated some time in advance of the completion of withdrawal and the date chosen by the gov. was May 15, 1948. When it became evident that the United Nations Commission entrusted with the duty of partitioning P. could not itself arrange for the transfer of the functions exercised by the central gov., steps were taken to hand over these functions as far as possible to the local authorities. Provision was made in the Palestine Bill (Feb. 1948) for ending Brit. responsibilities in P. and in a memor-

andum to the United Nations P. Commission, the Brit. Gov. stated that 'after May 15 the United Nations Commission would be the government of Palestine'—with the somewhat strange addition that 'it did not seem very material whether it was considered to be a *de facto* or *de jure* government' and in any case its title would rest on a resolution of the General Assembly of the United Nations. As might have been expected the country was soon to be the scene of the most violent disorder. At least thirty Brit. soldiers were killed and more injured (Feb. 29) when the Cairo to Haifa train was mined N. of Rehovoth. On March 11 some twelve persons were killed and eighty-nine injured in an explosion which shattered the Jerusalem headquarters of the Jewish Agency. In the debate in the Commons (March 10) on the second reading of the Palestine Bill critics complained that the Bill made no provision for Jewish and Arab states, or for the orderly transfer of power. The gov.'s reply was that the Bill did not impede the creation of these states, which was a matter for the United Nations and not for Britain, and that the orderly transfer of power could not be secured by Act of Parliament.

*The New State of Israel.*—Some hours before the ending of the Brit. mandate the Jewish National Council in Tel Aviv proclaimed a new state. The National Council was to act as a provisional gov., and Mr. Ben Gurion was appointed Prime Minister. Later President Truman announced the *de facto* recognition of the provisional gov. by the U.S.A., while from Cairo Nokrashy Pasha, the Egyptian Premier, announced that Egyptian armed forces had been ordered to enter P. The General Assembly of the United Nations endorsed an Amer. resolution appointing a mediator for P. between the warring Jews and Arabs. On May 20 the Arab forces sent by the Transjordan Gov. to invade P. reached the Damascus Gate of the old city of Jerusalem, while in the S. Egyptian troops entered Heersheba. It was clear to the United Nations truce commission sent to Jerusalem that the only way to end the fighting in P. was by exerting strong pressure on all the parties concerned. The Arab forces, increasing their attacks on the old city of Jerusalem, broke through a number of Jewish defense lines and the city was isolated from the rest of P. The Security Council of the United Nations then called for a general cease-fire in P. by May 24 and the Jews accepted the proposal. The Arabs refused to comply with the request, but agreed to resume truce discussions in Jerusalem and to study any prompt suggestions by the council for a solution to the P. problem; in short the Arabs played for time, hoping to keep the door open for negotiations. Indeed they had now lost in their struggle to prevent the estab. of a Jewish state, and the fears they expressed when the Jewish national home was first set up under the Brit. mandate were now fully realised and the state of Israel now existed, recognised by the U.S.A., Russia, and sev. other countries.

**The Armistice.**—When United Nations officers and truce observers arrived in June 1948, there appeared to be a spontaneous desire on the part of almost everybody to help in finding the basis of a peaceful and just settlement. Count Folke Bernadotte, nephew of King Gustav V. of Sweden and a noted Red Cross worker, who was appointed mediator for the United Nations, arrived at Haifa on June 3 and there was a truce soon after his arrival. But the official and public Israeli attitude changed when the Security Council failed to arrive at a solution before the end of the first truce or to extend the latter for a fixed period. However, the truce was maintained up to the earlier days of Oct. and the armies of the Arab states and of Israel were halted and the leaders brought before the supreme tribunal.

The delicate balance between the Israeli wish for immediate settlement of the P. problem and for recognition, on the one hand, and Arab dissension and military weakness on the other, was rudely disturbed by an Egyptian attack on a Jewish convoy in the Negev in Oct. This was used as the signal for the launching of a full-scale campaign by the Jewish forces, with the object of conquering the Negev. With dramatic swiftness the whole Arab position was brought to the verge of collapse. By Nov. the military situation was entirely dominated by the Jewish forces, who could, if they wished, have taken over the whole country. Threatened with encirclement the Egyptian Army evacuated Beersheba and Majdal and fell back southwards. The coastal strip between Tel Aviv to within 10 m. of Gaza was now in Jewish hands. In Galilee sporadic diversionary attacks on Jewish settlements by the Arab national liberation army unleashed a brisk retaliatory offensive by the Israeli forces, and in three days this Arab force practically ceased to exist and its scattered remnants were driven across the Lebanese border. The whole situation in P. proved the necessity for some kind of armed force to carry out the decisions of the United Nations and its officers in the field. The destruction, for example, of the important Latrun pumping station when it was actually under the supervision of those officers, but with insufficient guards to protect it, may well have encouraged the Stern gang to assassinate Count Bernadotte. In Jerusalem the truce was being violated daily because there was no armed force there to safeguard the Holy City. If the small Jewish army now dominated the situation in P. it was due as much to the weakness of the United Nations and the incapacity of the Arabs as to its own undoubted valour and fanaticism, and the arms which were still reaching it.

Before the United Nations Assembly in Paris Moshe Shertok, Israeli foreign minister, now claimed Galilee by right of conquest and the Negev by the terms of the Assembly's own resolution and he rejected the Bernadotte report altogether. This was not the limit of Jewish aspiration, for Mr. Ben Gurion, Israeli Prime Minister, at the same time claimed permanent posses-

sion of modern or Jewish Jerusalem (the new city) and of a corridor connecting it with the main body of Israel, while refusing unconditional Arab rights in the port of Haifa or Lydda airport. The political committee of the General Assembly discussed the Bernadotte report in Paris (Nov. 1948), when Shertok declared that his gov. could not consider the report even as a basis for discussion and contended that the resolution (Nov. 29, 1947) of the United Nations General Assembly for partition was the only valid basis for territorial settlement; and he also asked that Israel be admitted to the United Nations, to put her on an equal footing with the five states, all members of the United Nations, who were waging war upon Israel. The Brit. Gov., however, introduced a resolution calling on the Assembly to accept and take steps to apply the conclusions of the Bernadotte report and recommending that, once the frontiers had been estab., the Security Council should consider any attempt to alter them by force as an act of aggression.

In Dec. King Abdullah announced that he had been invited to unite Arab P. with Transjordan under his rule, and his forces came to agreement with the Israelis. This came as a severe blow to the Arab League. It immobilised the Iraqi Army and paralysed what little initiative remained with the Lebanese and Syrian forces. Egypt was now the sole target of Israeli pressure and on Dec. 22 the Israelis launched what was evidently meant to be the *coup de grâce* and entered Egyptian ter. However, a truce was finally arranged to take effect on Jan. 7, 1949. The Egyptians observed it, but the Israelis were soon on the march again and invaded Egyptian Sinai, where they remained until Jan. 10. On Jan. 13 Egyptian and Israeli representatives met at Rhodes in the presence of Dr. Bunche, the United Nations mediator, to arrange a permanent armistice as a preliminary to peace. The conclusion of this armistice placed before the other Arab states the choice of making similar arrangements or fighting on at a serious disadvantage. Thus, after thirteen months' conflict, the armed Arab struggle to defeat partition in P. had apparently come to an end.

After six weeks of negotiation a general armistice was signed in Rhodes on Feb. 24, 1949. This, the first agreement to have been signed by official Arab and Jewish representatives since the Weizmann-Feisal pact concerning Syria soon after the First World War, was an historic event raising strong hopes of an eventual peace settlement. The armistice pledged each country to refrain from aggressive action against the other and then dealt in detail with the positions which the two forces might take up, Egypt retaining, until the settlement, the Gaza-Rafah coastal area, Beersheba remaining in Israeli hands; but the political rights and claims on both sides were reserved. The armistice did not mean that most Arabs, whether in Egypt or elsewhere, were prepared to recognise Israel, but rather that they

sought a breathing-space. The fact remained, however, that agreement came mainly because neither side wished to go on fighting. If the task of achieving an enduring peace settlement remained, the work of Dr. Bunche or the P. Conciliation Commission to that end was greatly facilitated by the armistice, even though the Israeli Army now controlled half of the Negev from the N. to the gulf of Aqabah, while, assuming agreement were also reached with Transjordan, the other half would probably also be included in the Jewish state. There was every likelihood of agreement between Israel and Transjordan, for the two countries had every confidence in each other's pledges, respected each other's forces, and were natural economic partners. The chances of laying a foundation for good relations between Israel and the Arab world through King Abdullah were enhanced by the fact that the king spoke also for the sister Hashimite state, Iraq. With regard to Jerusalem (q.v.), it would seem to be agreed that a partition plan is the only practical solution.

**Arab Refugees Problem.**—A serious question for P. is the Arab refugee problem, which is not only a matter of relief, but, as time goes on, one which is further complicated by political considerations. The Israeli Gov. defined its attitude to the refugees in a memorandum to the Beirut conference of Arab States (April 1949), expressing its determination to allow only limited categories of Arabs to return to their homes in Jewish ter. The number of refugees at this time was 700,000, and more continued to swell the total day by day. The original Arab pop. of the new Jewish areas has been estimated at 740,000, of whom perhaps 90,000 have remained. This leaves 650,000 for whom new homes have not yet been found. See also ISRAEL.

Röhrich's *Bibliotheca Geographica Palaestinae*, Berlin, 1896, is a catalogue raisonné of the descriptions, MS. and printed, of the Holy Land written between the years 333 and 1878. Dr. P. Thompson's *Die Palaestina-Literatur* (of which 4 vols. have been pub. in Leipzig) is a complete bibliography of all works on P. from 1895 onwards.

**Palestine Exploration Fund**, founded in 1865 as a scientific (not religious) society. Its first important work was a complete and accurate survey, both topographical and geological, of the country. Much has been done in excavation, e.g. at Gezer, 1902-9; at Ascalon, 1920-21; Mareshab, 1921; Samaria, 1931-35, etc. The pubs. of the society include the *Excavations at Jerusalem*, 1894-97; *Hygiene and Diseases in Palestine in Modern and Biblical Times*; *Early Heights and Measures*; *The Latin Kingdom of Jerusalem*; *Samaria-Sebastia* (3 vols.); maps, plans, models, casts, photographs, and slides. A quarterly jour. is also pub. There are many branch associations in the colonies, U.S.A., and Palestine.

**Palestine, Operations in First World War.** Owing to the evacuation of Gallipoli and the surrender of the Brit. force under Gen. Townshend at Kut (q.v.), Brit. prestige in the Near E. had declined. But the success of the O. in P. in 1917 was a material factor in restoring confidence. Brit. troops under Sir Archibald Murray began the offensive by advancing from N. Egypt and driving the Turks before them over the Sinai Desert. A halt then ensued in order to give time for the construction of a military railway from Kantara to Rafa on the S.W. border of P., from which the advance was resumed northward along the coast. But at this point the advancing force was held up by the Turkish resistance at Gaza, the chief battle for the tn. being on March 26, 1917. This check, however, marked the limit of Turkish success; Gen. Murray was replaced by Gen. (later F.M.) Allenby (q.v.), who had greatly distinguished himself on the W. front. Gen. Allenby at once proceeded to re-equip his forces and to reorganise them

for a determined effort. The offensive was resumed in Oct., the moment being favourable because a considerable Turkish force was occupied, E. of the Dead Sea, against the Arabs of the Hedjaz. Allenby took Beersheba in a surprise attack and then fought the second battle of Gaza on Dec. 6, the tn. falling on the following day. This success heralded the beginning of his victorious advance through P., for Jerusalem was captured after the battles fought Dec. 7-9, 1917, three weeks after the Brit. had taken Jaffa, the latter tn. falling after the cutting of the Jaffa-Jerusalem railway at Ludd. Jerusalem was encircled from nearly all quarters, all the Turkish outer positions being taken by storm, and the city itself was surrendered without standing a siege. The following year Jericho was taken in the fighting of Feb. 19-21, and thereafter followed a long halt in the operations, the Brit. hold on the country being in the meantime consolidated. The culminating battle in the P. operations was that of Megiddo (Sept. 19-25, 1918), which followed a brilliant outflanking operation by the cavalry under Sir Philip Chetwode. Allenby's P. campaign is a tale of almost uninterrupted success and of efficient management, and much of the success was due to his magnetic personality. He was especially successful in welding together the very various components of his force, regulars, yeomanry, and New Army, the mounted troops of Australasia, and the Indian contingent, a great part of which contained elements previously untested in war. The Arab effort, too, under T. E. Lawrence (q.v.), was of considerable value, and it was not the least of Allenby's achievements that he should have made the best of such difficult allies. On the broader question of the value of the campaign, a prolific source of contention between the 'E.' and 'W.' schools of military thought, it may be asserted that the P. operations could never have been a decisive factor in the issue of the war. But they were valuable in diverting the strength of the Turks, and to some extent even of the Gers., from more vulnerable points of the allied fronts, and still more in their moral effect, an effect which would have been evident much sooner but for the fact that the military exigencies on the W. front deprived Allenby of many of his best troops. The campaign has a special interest in the brilliant and, no doubt, spectacular work of the cavalry, an effort which marked the last great campaign of mounted troops in modern warfare. See T. E. Lawrence, *Revolt in the Desert*, 1927, and Sir G. McMunn and C. Falls, *Military Operations, Egypt and Palestine, 1917-1918*, 1928.

**Palestrina**, Giovanni Pierluigi da (1525-1594), It. musical composer, b. in the tn. of Palestrina (whence his name), but who passed his life almost entirely at Rome, where in 1540-41 he studied with Firmin Le Bel. In 1551 he was appointed choir-master at the Vatican, with which his name was associated until his death, except for a period of sixteen years (from

1555) when he was engaged at other Rom. churches, e.g. the Lateran and Santa Maria Maggiore. His works, which are pub. in thirty-three vols. by Breitkopf, consist almost wholly of church music—over 90 masses, 250 motets (out of 500, pub. originally in seven books, 1563-84), and numbers of hymns, magnificates, litanies, etc. P. represents the finest achievements of his period in the domain of polyphonic writing. His music is strongly devotional in spirit. See lives by E. Schmitz, 1914; K. G. Fellerer, 1930; and H. Coates (Master Musicians), 1938.

**Palestrina**, or **Præneste**, tn. in the prov. of Rome, Italy. It occupies the site of the anct. city of Præneste, and is situated on a spur of the Apennines 1476 ft. above sea level, and commanding a magnificent view of the Alban Hills, Rome, and Soraceto. In 499 B.C. the city made an alliance with Rome, separating from the Lat. League to which it had previously belonged, but during the Lat. war (340-338) it fought against Rome and lost part of its ter. Down to the time of the Social war it remained an allied city, and it then received the Rom. franchise (about 90 B.C.). During the civil wars of Sulla the tn. was blockaded, and after it fell a military colony settled there. Sulla removed the city from the hillside to the lower ground at Madonna dell' Aquila and enlarged the famous temple of Fortune on the site of the anct. city, making it the largest in all Italy. It was built on five terraces, and contained the famous mosaic with scenes from the Nile now in the Palazzo Barberini. It was also famed for its oracle, which was consulted down to the time of Constantine, who had the temple closed. The city became a favourite resort of the Roms., and Hadrian and Marcus Aurelius had villas there. In 1297 the Colonna family owned the city, and during a revolt against the pope it was taken and destroyed. It was rebuilt, but in 1437 the new city shared the same fate. Stefano Colonna rebuilt it in 1418 and fortified it, and it remained in the possession of the family until purchased by the Barberini family in 1630. Only a few ruins of the anct. city remain; but excavations have brought many interesting relics to light, among them an anct. calendar which had been used in the rebuilding, and the famous Florentine casket found in 1738 and preserved in the Kircherian Museum in Rome. Here was found the earliest Lat. inscription. In the fighting of 1914 the temple of Fortuna was damaged, the capital of one column being broken and the cornice displaced. The Nile mosaic in the Barberini Palace was removed to Rome. The tombs were unharmed but the cathedral was wrecked internally. Pop. 9100.

**Pale**, The, or **The English Pale**, name applied to that part of Ireland in which Eng. law was acknowledged. The dominion of England was for some centuries after the conquest of Ireland by Henry II. restricted to the P. the boundaries of which varied, but which included Kildare, Louth, Meath, and Dublin. The P. as an entity disappeared when Ireland was com-

pletely occupied in Elizabethan times. See E. Curtis, *A History of Ireland*, 1936.

**Paley, William** (1743-1805), Eng. divine, b. at Peterborough; was educated at Christ's College, Cambridge, and was senior wrangler in 1763. He entered the Church, and, after holding sev. livings, was appointed prebendary (1780) and then archdeacon (1782) of Carlisle. He pub. *The Principles of Moral and Political Philosophy* (1785); *Horæ Paulinæ* (1790); *A View of the Evidences of Christianity* (1794); and many other works. The *Evidences of Christianity* brought him into great prominence as a theological writer and was long accepted as a standard work. See life by G. W. Meadley, 1809; also L. Wainwright, *A Vindication of Dr. Paley's Theory of Morals*, 1830.

**Palghat**, tn. in the dist. of Malabar, Madras, India, situated at the P. Pass on the Nilgiri Hills. Among its educational buildings is the Victoria Jubilee College. Pop. 55,100.

**Palgrave, Sir Francis** (1788-1861), Brit. historian, b. in London of Jewish parentage, but was converted to Christianity in 1823. Called to the Bar in 1827, from 1838 till his death he was deputy keeper of the records, in which capacity he arranged a great mass of hitherto inaccessible documents and ed. many of them for the Record Commission. Among the most important of these are *Parliamentary Writs* (1827-31). Among his works are *History of England* (only vol. 1. pub.), *Anglo-Saxon Period* (1831); *The Rise and Progress of the British Commonwealth* (1832); *The History of Normandy and of England* (4 vols., 1851-64). His works are of great value in throwing light upon the hist. and condition of medieval England.

**Palgrave, Francis Turner** (1824-97), Eng. poet, b. at Great Yarmouth, Norfolk, son of Sir Francis P., the historian, was, in 1846, private secretary to Gladstone, and two years later entered the Education Office, in which he rose to be assistant-secretary. He retired from the service at the age of sixty. He was prof. of poetry at Oxford from 1885 until 1895. He was the author of many vols. of poetry and essays, but he is best remembered for his anthology, *The Golden Treasury of Songs and Lyrics* (1861). This is still regarded as one of the best, if not the best, of the works of this kind, and to its compilation P. brought a wide knowledge of literature and a fine judgment. See life by G. F. Palgrave, 1899.

**Palgrave, Sir Robert Harry Inglis** (1827-1919), Eng. economist, b. at Westminster, son of Sir Francis P. He ed. the *Economist* newspaper 1877-83, was knighted 1909, and received the hon. freedom of Great Yarmouth 1910. His pub. include *The Local Taxation of Great Britain and Ireland* (1871); *Notes on Banking* (1873); *Analysis of the Transactions of the Bank of England, 1844-73* (1874); and *Enquiry into the Economic Condition of the Country* (1904). He ed. the *Dictionary of Political Economy* (1894-1906)—Appendix (1908).

**Pali**, tn. of Jodhpur, India, 40 mi. S.S.E. of Jodhpur, is a trade centre. It is on the railway between Jodhpur and Marwar.

**Pali**. The term P. means actually the 'text,' the text *par excellence*, the text of the Hinayāna Buddhist scriptures, but it indicates also the language in which the sacred scriptures of Buddhism are recorded, and the script in which these are written. The P. Scriptures contain a literature about double the size of the Bible, but if its repetitions were excised it would be somewhat smaller than the Bible. It consists of three Pitakas (called also Tripiṭaka), baskets, or collections. They are supposed to be the teachings of Buddha, which were being handed down orally; they were committed to writing probably at the end of the first century B.C. (traditionally in 80 B.C.). The first Pitaka is the Vinaya, dealing with discipline, but including the Mahavagga, a hist. of the founding of the order of Buddhism, and the exposition of monastic rules. The second is the Sutta (Sūtra) Pitaka, or collection of teachings. It consists mainly of dialogues between the Buddha and various interlocutors, and it contains books of meditation and devotion, sayings by the Master, poems, fairy tales, and fables, stories about Buddhist saints, and so on. The third collection, the Abhidhamma, or dogmatic statement of the psychological and philosophic discriminations, contains speculations and discussions on various subjects. There are some other treatises in the P. literature. The most important historical work written in this language is the *Mahāvaṃsa*; other P. works are the *Dhammapadam* and the *Sutta-nipāta*, lofty and artistic ethical and religious verse; the highly literary Jātaka book of 547 stories of Buddha's prior incarnations in various animal and human forms; the beautiful poetic compositions of the *Thera-gāthā* and *Theri-gāthā*, or 'Songs of the Monks' and 'Songs of the Nuns'; the *Mūlinda-pāṇṇa*, or dialogues of the Buddhist monk Nāgasena with the Gk. king Menander, etc.

The language P. should be termed *pāṭibhāṣā* or *saṃtibhāṣā* rather than P. It is an anc. Prakrit, i.e. a 'natural uncultivated' local Middle Indian dialect, probably originated in N.W. India. The great Gautama Sakya牟尼 Buddha (see BUDDHA), anxious to make his spiritual teachings accessible to the common people, refused to confine them to Sanskrit (q.v.), the language of the small privileged class. His teachings became, thus, a potent cause of the development of the language of the people. It is uncertain, however, which of the local dialects became the P. language. According to some scholars it was a prototype of Māgadhī, according to others it should be traced to anc. W. Hindi. It is also uncertain whether the oldest works of Buddhism were actually written in what is now known as P. P. is nowadays used in Ceylon, S. A., and Burma as liturgical language of Buddhism, although it had to give way before the native tongues, in which the later Buddhist literature was composed.

The P. script developed from the archaic Brāhmī, and in the last centuries B.C.

became the writing of the Buddhist scriptures; it was carried by the Buddhists to Ceylon, where it gave rise to the early Sinhalese writing. The cultural expansion of India into Burma, Cambodia, Cochin China, and Siam was also mainly due to Buddhism. The scripts of the Buddhist monks became the vehicle of their culture and their outward organisation: Buddhism played in S.E. Asia a part similar to that of Rom. Christianity in W. and Central Europe in the Middle Ages. P. Buddhism, i.e. the particular form of Buddhism based on the sacred P. books, was brought over from Ceylon in the eleventh-twelfth century A.D. In Burma, the 'square' P. script developed into a capricious, highly calligraphic character, generally employed for writing the religious Buddhist books. The letters are painted with a broad brush (generally in dark brown lacquer, and sometimes on a plate of gilded metal) and are correspondingly very thick. The Buddhist Burmese script was adopted by various peoples (the Karons, the Tangthas, the Yaks, and others), but the Siamese and the various Shan scripts, the Javanese, and other Indonesian scripts, and so forth, which are still considered by some scholars as belonging to the P. branch, may be better termed the Further-Indian branch of scripts, because they do not descend from the P. script, but from another script of Indian origin.

**Palikao**, Comede, see COUSIN-MONTAUBAN.

**Palilicium**, see ALDEBARAN.

**Palimpsest** (παλιψηστός, scraped again), name given to a MS. on parchment, from which the original writing has been erased or washed out, and another text written over it. This practice was due to the scarcity and high cost of parchment, and is mentioned by Cicero. *Ad Fam.* vii., Plutarch, and other classical writers. It was most common between the seventh and ninth centuries, but continued even down to the sixteenth. The old writing was scraped off with a razor or with pumice, and a mixture of cheese, milk, and lime was used to soften the vellum. However, the ink of the old writing had penetrated so deeply into the parchment that even most severe scraping could not remove all traces of the text. If the MS. is soaked in certain chemicals, the blue or red outlines of the old writing come again to the surface. Unfortunately after this treatment—primarily acid obtained from oak gall was used for restoring the P.—the MS. becomes so dim that it is impossible to read it. More recently, in place of tannic acid, other substances have been used, which bring out the old writing for a short time. While the text is thus visible, photographs are taken, and then the acids are washed out. Nowadays photographs of the old writing can be taken without any chemical treatment, only by using ultra-violet rays or fluorescence. Many valuable MSS., which were lost, have thus been restored. There are even Ps. in which there appear three successive writings. Sometimes the Ps. are bilingual, the old writing being Gk.

and the new writing being Lat., or Syriac and Arabic, or Heb. and Lat., and so forth. Many Ps. are written in capitals or uncials, in Gk. or Lat. A Sinaitic Syriac P. turned out to be one of the earliest trans. of the N.T. The idea of using P. MSS. for the discovery of fragments of lost works was first taken up about the eighteenth century. Dr. Bruno ed. his fragments of Livy (1773), Niebuhr's ed. appeared in 1820. Cicero's *Republic* and the *Institutiones* of Gaius were thus recovered. Mal pub. the *Codex Ambrosianus* of Plautus, 1814-15. Tischen-dorf discovered biblical P., including the *Codex Ephraemi*, 1843-45. See E. Chate-lain, *Les Palimpsestes latins*, 1907.

**Palindrome** (Gk. *παλιν*, again, and *δρόμος*, a course) is a form of verse found in Lat. which reads the same either backwards or forwards, e.g. 'Roma tibi subito motibus ibit amor.' An example in Eng. is, 'Able was I ere I saw Elba,' supposed to have been said by Napoleon when asked whether he could have invaded England; and in Gk., *Νίψον ἀνομήματα μὴ μόνον ἄνῃ* ('Wash my sin, and not my face only'), frequently inscribed on Eng. fonts, e.g. St. Mary's, Nottingham, is famous. 'Dog a devil defiled, defiled lived a god' is supposed to be the longest P. in Eng. The 'Sator-Arepe formula':

SATOR  
AREPO  
TENET  
OPERA  
ROTAS

is, besides being a P., a quadrate, i.e. it can be read as a square. This magician's formula can be traced back to the fourth century A.D. and appears to have originated in Asia Minor. The term is freely used at any rate by acrosticists, etc., for a single word like 'ere.'

**Palinurus** (παλιούρος), in classical legend, pilot or helmsman of Aeneas, who was drowned off the W. coast of Italy (Luccania) during the voyage from Troy, having fallen overboard while asleep. Palinuro Punta (or Spartimento, above the gulf of Policastro) was called after him. See Virgil, *Aen.*, vi., 337; Strabo, vi.

**Palisander Wood**, see ROSEWOOD.

**Palissy**, Bernard (c. 1510-89), Fr. potter and enameller, b. near Agen. For years he laboured in the direst poverty to discover how to make fine enamels, having chanced to see a beautiful enamel cup (c. 1541). By 1557 his work won recognition, and he had succeeded in producing the distinctive ware called by his name, pottery decorated in high relief with rustic figurines (plants, fruits, shells, fishes, etc.), in colours true to nature. The Comte de Montmorency became his patron and employed him on the Château d'Ecouen. Though a Huguenot, P. was protected by the king and nobles. He was exempted by Catherine de' Medici from the massacre of St. Bartholomew, and gave courses of lectures on natural hist. and physics (1575). He was imprisoned in the Bastille (c. 1588), and died there. Anatole France pub. his *Oeuvres complètes* (1880). See lives by

H. Morley, 1852; A. B. Hanschmann, 1903; and D. Leroux, 1928.

**Palitana**, state and tn. of Kathiawar peninsula, Bombay, India, 73 m. N.E. of Diu. The Satrunjaya Hill above the city (W.) is the most sacred of the hills of the Jains (c. 1977 ft.). It is covered with temples and shrines, some dating from the eleventh century. The larger ones are in 'taks' or separate enclosures. Horse-breeding is largely carried on. Pop. 76,000; (tn.) 16,700. See J. Hurgess, *Notes of a Visit to Satrunjaya Hill*, 1869.

**Paliurus**, genus of deciduous flowering shrubs (family Rhamnaceae), with slender branches bearing spiny stipules and clusters of small green and yellow flowers, followed by dry, hemispherical fruits. *P. australis* (Jew's thorn), which is hardy in Britain, is a native of S. Europe and W. Asia, and is believed to be the plant from which the crown of thorns was made.

**Palk's Bay** and Strait, gulf and channel of the Indian Ocean, between India and N. Ceylon, N. of the shoals called 'Adam's Bridge.' The Dutch named it after Governor Palk. At the narrowest part it measures 40 m. across.

**Pall**, see **PALLKUM**

**Palladian**, see **PALLADIO**, ANDREA.

**Palladio**, Andrea (1518-80), It. architect, b. at Vicenza. He studied in his native city and at Rome, and assisted in the building of St. Peter's, under Paul III. He was one of the greatest It. architects of the late Renaissance, and the style which he used has received the name of Palladian. It was an attempt to revive the severity and dignity of the Rom. architecture, and was learnt from Vitruvius and from a study of the Rom. monuments that remained. Its best exponent in England was Inigo Jones. P. greatly influenced the architecture of his day by his work, *I quattro libri dell' Architettura* (1570), which was immediately trans. into most European languages. See C. Gurlitt, *Geschichte der Barockstile in Italien*, 1887, and *Geschichte der Kunst*, 1902; and Sir H. Fletcher, *A. Palladio: His Life and Works*, 1902.

**Palladium** (Gk. παλλάδιον), in classical legend, an image of Pallas (usually identified with Athene), upon the preservation of which in its sanctuary the safety and welfare of the state depended. The most famous was the anct. wooden image (εἰκαστήρ) supposed to have fallen from heaven as a gift from Zeus to the founder of Ilium, and guarded in the citadel of Troy. Odysseus and Diomedes stole it during the Trojan war, thus procuring victory for the Gks. Different versions of the story represented the P. as carried to Greece, or brought by Aeneas to Italy and kept in Vesta's temple at Rome. In general use P. has come to mean a 'protecting institution,' or that which assures possession.

**Palladium**, chemical element, symbol Pd, atomic number 46, atomic weight 106.7; one of the 'platinum metals' found in the platinum ore which occurs in small grains and rare nuggets in alluvial deposits and riv. sand principally in Brazil, California, and the Urala. It is a lustrous white metal (melting-point about 1500° C.

and sp. gr. 11.8) which is not acted on by the air at ordinary temps. P. forms the exception in the platinum group of metals by dissolving in hot nitric acid. The oxides Pd<sub>2</sub>O, PdO, and PdO<sub>2</sub> are known, and the metal forms palladous salts corresponding to the monoxide as well as a palladic chloride, PdCl<sub>4</sub>. The metal has the special property of occluding large volumes of hydrogen to form a substance of metallic appearance which is not a true compound, though it approximates to the composition PdH. Absorption takes place most rapidly at 100° C., and with finely divided metal, about 900 volumes of hydrogen being absorbed by 1 volume of metal. P. is used in dentistry, jewellery, scientific instruments, aeroplanes, etc.

**Palladius**, Rutilius Taurus Aemilianus, Rom. author of the fourth century A.D., who lived about the time of Valentinian or Theodosius. His *De re rustica* was mainly compiled from Columella and earlier writers. A Middle English verse trans. from an Eng. M.S. (c. 1420) was pub. for the Early English Text Society under the title, *Palladius on Husbandrie*. See Schmitt's Ger. ed., 1898, and J. G. Schneider, *Scriptores Rei Rusticae*, iii., 1795.

**Pallanza**, tn. and winter resort in the prov. of Novara, Italy, on an arm of Lake Maggiore, opposite the Borromean Is. It commands a fine view of the Alps. Silk and cotton are manufactured. Pop. 5300.

**Pallas**, Peter Simon (1741-1811), Ger. traveller and naturalist, b. at Berlin. He studied medicine and natural hist. at the univs. of Berlin, Göttingen, and Leyden. In 1766 P. pub. *Elenchus Zoophytorum* and *Miscellanea Zoologica*. With these works he gained high reputation, and in 1768 he was appointed naturalist to a scientific expedition bound for Siberia, there to observe the transit of Venus. P. returned to St. Petersburg in 1774 with extraordinary specimens in natural hist., which formed the nucleus of the museum of the Academy of St. Petersburg. His other works include *Reisen durch verschiedene Provinzen des russischen Reichs* (3 vols., 1771-76; supplement, 1779-1801); *Sammlungen historischer Nachrichten über die mongolischen Völkerschaften* (2 vols., 1776-1802); *Flora Rossica*; and *Icones insectorum, praesertim Rossiae Siberiaeque peculiarium* (1781-1806).

**Pallas**, one of the planetoids or asteroids, second in order of discovery (Ceres being the first) and furthest from the sun, revolving between the orbits of Mars and Jupiter. It was discovered by Olbers at Bremen (1802). Its magnitude remains uncertain, while its period of revolution has been reckoned at about 1.61 years.

**Pallas**, hamlet of Longford co., Ire. 2 m. S.E. of Ballymahon. Oliver Goldsmith was b. here (1738).

**Pallas**: 1. Appellation of the Gk. goddess Athene or Athena (q.v.), perhaps derived from παλας, virgin. 2. Favourite freedman of the Emperor Claudius (c. 10 B.C.-A.D. 63). P. and Narcissus together administered the affairs of the

empire under Claudius. Urged by P. Claudius married Agrippina (A.D. 49) and agreed to adopt her son, i. D. Ahenobarbus (later the emperor Nero), by a former husband, as his successor. P. then became Agrippina's accomplice in poisoning Claudius (54), but was dismissed from office by Nero (56), who had him poisoned. See Suetonius, *Claudius*; Tacitus, *Annales*, xi. 29, xii. 2, 25, 65, xiii. 23; Juv. i. 107.

Pallavicino, Pietro Sforza (1607-67), It. historian and cardinal, son of Alessandro P. of Parma, b. at Rome. P. took priest's orders and held important eccles. appointments during the pontificate of Urban VIII. He entered the Society of Jesus in 1637, and was created cardinal by Pope Alexander VII. in 1657. P. was the author of many fine works, but the best known is his *Istoria del Concilio de Trento* (1656-57), intended as a reply to the still more celebrated work of Paul Sarpi. His collected works were pub. 1814-18.

Pallio, La, see ROCHELLE, La.

Palliser, Sir Hugh (1723-98). Eng. admiral, son of Hugh P., an army officer, b. in Yorkshire. In 1759, in his ship *Shrewsbury*, in which he had fought under Anson off Ushant and captured many prizes, he took part in the operations in the St. Lawrence leading up to the capture of Quebec. In 1764 he was governor and commander-in-chief of Newfoundland. In 1778 he was promoted to be vice-admiral of the blue. After the action off Ushant in July 1778, in which the Fr. fleet escaped, a court-martial on Keppel, P.'s superior officer, pronounced the charges malicious and ill-founded. P., whose supporters, or adversaries of Keppel, had instigated the inquiry, consequently resigned and applied for a court-martial on himself, the result being that he was censured for his conduct in the action. It seems probable that a fair and independent court would have reached a very different conclusion. P. was a brave and capable officer, though his conduct in the action remains a mystery, the more difficult to solve because his character was differently estimated by the factions of the day. In the year after the court-martial he was appointed governor of Greenwich Hospital and became an admiral in 1787. See Southey's *Life of Nelson*, 1813.

Palliser, John (1817-87), Canadian geographer and explorer, b. in Ireland, brother of Sir Wm. P. (q.v.). He travelled over N. America in the then uncharted regions of the far W., between 1847 and 1861. He made a topographical delimitation of the boundary between Canada and the U.S.A. from Lake Superior to the Pacific coast.

Palliser, Sir William (1830-82), Brit. soldier b. in Dublin, entered the army as a cavalry officer. He invented the method of drilled shot that bears his name and the method of converting smooth bore into rifled guns (1862-63).

Pallium, or Pall, vestment worn by the pope and by archbishops about the neck, breast, and shoulders. It consists of a narrow circular strip of cloth, about 2 in.

wide, with two pendants about 12 in. in length, which hang down, one over the breast, the other at the back of the wearer. These strips are weighted with small pieces of lead enclosed in black silk. The rest of the P. is made of white wool, wholly or in part taken from two lambs provided by the Lateran Canons of St. John and blessed by the pope on the feast of St. Agnes. The pope may wear the P. on all occasions, but the times of its use by archbishops are strictly regulated. The P. is granted only by the pope, and each newly consecrated metropolitan must apply to him for

PALLIUM

it within a year after consecration. The P. symbolises the supreme pastoral power. It is known to have been in use at least from the fifth century.

'Pall Mall Gazette,' penny daily evening newspaper founded in 1865 partly to supply the want of an evening paper in the journalism of the day, and partly to adapt the principle of the review to the current newspaper press. The first proprietor was Thackeray's publisher, and the editor was Thackeray's assistant in the conduct of the *Cornhill Magazine*, facts which, taken with the earlier style of the paper, have often suggested that it was pub. upon the lines of Thackeray's jour. (also called the *P. M. G.*), written 'by gentlemen for gentlemen.' It was an almost instant success, the more especially because in politics it took up an independent line, a policy that it pursued down to 1880, when it became, under John Morley's (later Lord) editorship, a Radical paper. It was for long as strongly Conservative as before it was Radical. It came to an end in 1923, being incorporated in the *Evening Standard*.

Pall-mall, Pell-mell or Mell, see MALL, THE.

Palm (Gk. *πάλμης*; Lat. *palma*), measure of length, corresponding either to the breadth of the palm of the hand (3-4 in.) or to the whole length of the hand from wrist to finger-tips (7-9 in., Rom. measure 8 in.).

Palma di Cesnola, Count Luigi, see CESNOLA.

**Palma Giovine** ('The Younger': Jacopo (Giacomo) (c. 1544-1628), It. painter. He was the grand-nephew of 'Il Vecchio.' He imitated Titian, Tintoretto, and Paolo Veronese, and studied the antique at Rome (1569-67). He is held by some to combine the best features of the Rom. and Venetian schools. The architect A. Vittorino became his patron and obtained innumerable commissions for him. Among his works are 'St. Catherine rescued from the Wheel,' 'Madonna with Saints,' 'The Brazen Serpent,' 'Resurrection of Lazarus.' See C. A. Rosenberg, *Kunst und Künstler Italiens*, vol. III, 1879; G. Morelli, *Italian Masters in the German Galleries*, 1883; and P. Locatelli, *Notizie intorno a G. Palma*, 1890.

**Palma Vecchio** ('The Elder': Jacopo (Giacomo) d'Antonio de Negreti) (c. 1480-c.1528), It. painter of the Venetian school, b. at Serinalta, near Bergamo. He studied under Bellini and others. He was much influenced by Giorgione, Titian, Cima, and Carpaccio, but employed harder colour. Among his best works were 'Santa Barbara' (Venice); 'A Holy Conversation' (Naples and St. Petersburg); 'St. Jerome,' 'The Virgin Enthroned' (Vicenza); 'Adoration of the Magi,' and various portraits. See J. A. Crowe and G. B. Cavalcaselle, *History of Painting in North Italy*, 1871; M. von Boehn, *Giorgione und Palma Vecchio*, 1908; G. Vasari, *Lives of the most eminent painters, sculptors, and architects*, 1912 13; and life by A. Spahn, 1932.

**Palma**: 1. Fort. tn. on the S.W. coast of Majorca Is., Spain, cap. of the Balearic Is., 130 m. S.E. of Barcelona. The bay of P. has a fine harbour, and new docks were completed there in 1910. P. contains a fourteenth-century cathedral (completed in 1610) generally regarded as one of the six finest Gothic edifices in the world, a fifteenth-century Gothic bourse, a sixteenth-century tn. hall, and other fine buildings. It has a trade in fruits (oranges and almonds), silk, liqueurs, and chocolate are manufactured. The thirteenth-century castle of Jaymo, king of Aragon and Majorca, is 2½ m. S.W. Pop. 136,000. See R. A. Cram, *The Cathedral of Palma de Mallorca*, 1932. 2. La P., tn. of Huelva prov., Spain, 24 m. E.N.E. of Huelva. Pop. 8000.

**Palma di Montechiaro**, tn. in the prov. of Girgenti, Sicily. Its chief exports are fruit, sulphur, and soda, and it is noted for its almonds. Pop. 18,200.

**Palma** (San Miguel de la Palma), one of the Sp. group of Canary Is., Atlantic Ocean, 15 m. W.N.W. of Tenerife. It is mountainous with deep gorges, Pico de la Cruz rising to about 7440 ft. Wine, fruits, honey, sugar, wax, and silk are produced. The chief tn. is Santa Cruz on the E. coast. With Tenerife, Gomera, and Hierro, it has formed since 1927, the Sp. prov. of Santa Cruz de Tenerife. Pop. 60,600.

**Palmas**, Cape, headland of Liberia, W. Africa. There is an Amer. mission station here.

**Palmas**, Las, see LAS PALMAS.  
**Palma Beach**, vil. of Florida, U.S.A.,

situated on a narrow piece of land between Lake Worth and the Atlantic Ocean, 65 m. N. of Miami. It is a fashionable resort. Its nearest railway station is W. P. B., on the opposite side of Lake Worth and connected with it by a bridge and ferry. P. B. and W. P. B. are fashionable winter resorts. W. P. B. has a deep harbour and is a port of call and trading centre for the local fisheries, and timber products. Pop. (P. B.) 3700; (W. P. B.) 33,600.

**Palmer, John** (1742-1818), projector of mail-coaches in England and proprietor of the Bath theatre from about 1778, b. at Bath. He suggested to Pitt in 1782 his scheme for running mail-coaches, and the first started from Bristol in 1784. The idea was promptly caught up, and service multiplied rapidly throughout the country. P. became comptroller-general of the post office in 1786, but was dismissed (c. 1792) because of his frequent quarrels with Lord Walsingham, the postmaster-general. He was granted £50,000 as compensation in 1813. See H. S. Penley, *Bath Stage*, 1892, and H. Joyce, *History of the Post Offices to 1830*, 1893.

**Palmer, Sir Roundell**, see SELBORNE, EARL OF.

**Palmer, Samuel** (1805-81), Eng. landscape painter and etcher, son of a small bookseller at Newington, Surrey. He was sent to the Merchant Taylors' School; he discovered his powers there, and as early as 1819 showed three pictures at the Royal Academy, a remarkable record for a boy of fourteen. At this same exhibition he was deeply impressed by Turner's 'Orange Merchantman.' He became a member of the Etching Club in 1833. Many of his best pictures are on subjects from Milton. There is a trans. of Virgil's *Ecliques* by him, pub. after his death, which took place at Reigate. The plates in this work were designed and, in part, executed by himself. His best works show a genuine, if limited, imagination, and express a personal and emotional vision of nature. See G. Grigson, *Samuel Palmer: the Visionary Years*, 1947.

**Palmer, William Waldegrave**, see SELBORNE, EARL OF.

**Palmer**, tn. of Hampden co., Massachusetts, U.S.A., on the Chicopee R. It manufs. straw goods. Pop. 9100.

**Palmer** (medieval Lat. *palmarius*, from *palma*, a palm), one who, having made a pilgrimage to the Holy Land, was now returning therefrom, carrying a palm-leaf as a sign of his accomplished journey. The title was later applied to those itinerant religious men who spent their whole time in such pilgrimages subsisting on charity. It is also frequently used merely as an equivalent to 'pilgrim.'

**Palmerston**, Henry John Temple, third Viscount (1761-1865), Eng. statesman, b. at Broadlands, near Romsey, Hampshire; succeeded in 1802 to the Irish peerage, and five years later entered the House of Commons. Within twelve months he became lord of the admiralty under the duke of Portland, and in 1809 accepted the secretaryship of war, which, under

various Prime Ministers, he held until 1828. He became foreign minister under Grey (1830), and remained in that office (except during Peel's brief administration) until 1841. In this great position he maintained and even increased the great prestige of England, which was never higher in the nineteenth century than when he was at the Foreign Office. In opposition until 1846, in that year he became foreign secretary under Russell, and in 1850 made his famous *civis Romanus* speech, in which he estab. his reputation as an orator and won the hearts of his countrymen. It was in that year that Queen Victoria, exasperated by P.'s highly independent methods of organising foreign policy, sent him a memorandum through her Prime Minister. This memorandum declared that the queen 'requires, first, that Lord Palmerston will distinctly state what he proposes in a given case, in order that the queen may know as distinctly to what she is giving her royal sanction; secondly, having once given her sanction to a measure, that it be not arbitrarily altered or modified by the minister. Such an act she must consider as falling in sincerity towards the Crown, and justly to be visited by the exercise of her constitutional right of dismissing that minister.' The queen was in the right, from a strictly constitutional view, but the future was to confirm the practical withdrawal of the Crown from direct control of policy. The memorandum had little effect on P. When in 1851 he expressed his approval of Napoleon's *coup d'état*, without having consulted the queen or his colleagues, he was, at the demand of her majesty, dismissed from office by Lord John Russell. Shortly after he had his 'tit-for-tat with Johnnie' (as he expressed it), and overthrew the gov. He became home secretary under Aberdeen in 1852, and strongly advocated a firm attitude against Russia. The Crimean war broke out in 1854, mismanagement was rampant, and Aberdeen (q.v.) resigned in the following year. Almost by general consent, P. became Prime Minister, and his vigorous action soon brought about a more satisfactory condition of affairs. He was defeated in 1857 on the China war question, whereupon he dissolved Parliament and appealed to the nation, and was promptly returned to power. He was defeated again the following year on the Conspiracy to Murder Bill, when it was thought that he, of all men, had trucked to a foreign power. In the meantime, however, he had suppressed the Indian mutiny, 1857-58. In 1859 he again formed a gov., and so strongly was he supported that it was said that he was 'Prime Minister for life,' his following being almost entirely personal. Gladstone was chancellor of the exchequer in this administration, but he and his chief could not see eye to eye, and once P. was moved to write to the queen that it would be 'better to lose Mr. Gladstone than to run the risk of losing Portsmouth.' In this, his second administration, he furthered the cause of free trade, but made the mistake of allowing the *Alabama* (q.v.) to leave Birkenhead.

Though like many of the leading statesmen of the period (1837-70) P. gave no sustained attention to the overseas empire, believing that the colonies would eventually become independent, he was no separatist. He showed, both in 1856 and in 1861, that he had not the slightest intention of allowing Brit. N. America to be seized by the U.S.A. He died in office on Oct. 18, 1865, in his eighty-first year, and was buried near Pitt in Westminster Abbey. P. was an ideal Eng. minister, firm, tactful, humorous, and blessed with great common sense that enabled him to extricate the country and himself from awkward places. He was the most popular Prime Minister of the day, and, except in connection with the Conspiracy to Murder Bill, could always rely upon being supported. In character and policy he expressed the self-confidence of the ruling classes of his era. Though often taking a high-handed attitude towards the powers of Europe, his foreign policy was based on sound principles, and he was able to carry out his plans without resort to force. Only towards the close of his career did he find himself checked by Bismarck, the organiser of Prussian power). See A. E. M. Ashley, *The Life and Correspondence of Henry John Temple, Viscount Palmerston*, 1879; P. Guedalla (ed.), *The Palmerston Papers: Gladstone and Palmerston*, 1928; and H. C. F. Bell, *Lord Palmerston*, 1936.

Palmerston, Australia, see DARWIN, PORT.

Palmerston North, city in Manawatu dist., Wellington Prov., N. Island, New Zealand, 87 m. N. of Wellington. The centre of a thriving dairy and sheep-raising country, it was proclaimed a city in Aug. 1930. There is an agric. college. Pop. of bor. and surrounding area, 30,100.

Palmerton, tn. of Carbon co., Pennsylvania, U.S.A., on the Lehigh R. It is the commercial centre of a farming dist. and also has zinc and silk factories. Pop. 7400.

Palmetto Leaves, leaves of *Sabal Palmella*, a fan palm, native of Central America, which are used in making hats and mats.

'Palmetto State,' see SOUTH CAROLINA.

Palmgren, Selim (b. 1878), Finnish pianist, conductor, and composer, b. at Björneborg. He studied at the Helsingfors conservatoire, where Wegelius was among his masters, and later with Ansgoro in Germany and Busoni in Italy. On his return he became conductor of the Finnish Students' Choral Society and later of the Musical Society at Aabo. He also frequently appeared as a pianist, being a brilliant executant. P. married the singer Malkki Järnefelt, toured Europe and U.S.A. with her, and in 1923 settled as prof. of composition at the Eastman School of Music at Rochester, New York. His works, at times reminiscent of Grieg, include operas, *Daniel Hjort* and *Peter Schlemihl* (after Chamisso); incidental music to Kyösti's *Tukhimo* (*Cinderella*); choral works; two pianoforte concertos, *Metamorphoses* and *The River*; and numerous pianoforte pieces, etc.

**Palmiet**, see PALMITE RUSH.

**Palmira**, tn. of Colombia, S. America, in the dept. of Valle. It is situated on the Llanos de Malajana at an altitude of 3000 ft. Grows tobacco, coffee, cacao, sugar, and rice. It is reached by rail from Buenaventura (144 m.). Pop. 45,000.

**Palmistry**, or **Cheiromanancy** (Gk. *χείρ*, the hand; *μαντική*, divination, or *μαντεία*, prophecy), the art of reading a person's character and the chief events of his life from the general contours of his hand, and, in particular, from the lines upon the palm. Though in modern times it has fallen into disrepute through being exploited for gain by more or less ignorant 'fortune-tellers,' it was in early times highly esteemed, and is mentioned with respect by Pliny, Aristotle, and other

ancient writers. Aristotle declared that 'the lines are not written without cause in the hand of man, but come from celestial influence and the peculiar human individuality'; and more recent authorities seem to agree that there is a close connection between the sciences of P. and astrology, and assert that the study of a person's nativity invariably corroborates the deductions drawn from his hand by a reliable palmist. The different parts of the hand are named after the planets, the thumb belonging to Venus (♀), the first finger to Jupiter (♃), the second to Saturn (♄), the third to Apollo or the Sun (☉), and the fourth to Mercury (☿), while there are also the 'mounts' of the Moon (☾) and of Mars (♂). The chief lines are those of heart, head, and life (1, 2, and 3 in diagram), but all small markings, crosses, etc., must be taken into consideration, the rules upon which an adequate judgment is based being extremely complex. It is claimed that the lines are continually altering in accordance with the development of a person's tastes and character; also that markings signifying particular events appear temporarily and vanish when the event has taken place. With regard to the general significance of shape and lines, a study of drawings of typical hands in any reputable book on the subject will be found suggestive and interesting. See S. D'Arpentigny, *La*

*Chirognomie*, 1843; A. Desbarrolles, *Les Mystères de la main*, 1859; H. Beamish, *The Psychonomy of the Hand*, 1865; A. Raphael, *Cheiroscopy*, 1901; Cheiro, *The Language of the Hand*, 1911; and W. G. Benham, *The Laws of Scientific Hand Reading*, 1901, and *How to Choose Vocations from the Hands*.

**Palmite Rush**, or **Palmiet** (*Prionium palmita*), evergreen perennial plant (family Juncaceae), native of S. Africa, with broad, linear leaves, which are deeply channelled and finely serrated, and small greenish-golden flowers. The leaves are used in thatching, and the fibre in the leaf sheaths is sometimes employed in brush-making.

**Palmitic Acid** ( $C_{15}H_{31}O_2$ ) =  $CH_3 \cdot (CH_2)_{13} \cdot COOH$  occurs in combination with glycerol in many oils, fats, and waxes. Beef and mutton tallow, and lard, contain the glyceride of P. A. This glyceride is known as palmitin, a white solid. Palmitin is also the chief constituent of palm oil. When a piece of tallow is shaken up in caustic potash solution, the solution becomes milky and forms a lather; thus a soapy solution is obtained, and the fat is said to be saponified by caustic potash. If a soft fat is treated with caustic soda until it is dissolved and the clear liquid poured off, addition of hydrochloric acid to this liquid gives an immediate precipitate of a fatty substance. This substance is termed P. A. It is a colourless, fatty body, melting at  $62^\circ C$ . It is insoluble in water, but soluble in alcohol and solutions of alkalis. The acid combines with the bases to form soap, this being manufactured by treating fat and oil with the caustic alkalis. These soaps are soluble in soft water, but not in hard. Palmitin and stearin, which are very similar in properties, mostly occur together, and may be separated from fats as a mixture of palmitin and stearic acids by superheated stearin. P. A. is oxidised by potassium permanganate to a mixture of acids—oxalic, succinic, adipic, acetic, etc. P. A. is best made from Jap. wax by hydrolysis with KOH followed by the action of hydrochloric acid and purification *in vacuo*.

**Palm Oil**, fat extracted, by boiling and skinning, from the pulp of the fruit of various palms. It has a butter-like consistency, a dark orange colour, and, when fresh, a pleasant odour. It mixes with turpentine and ether, and melts at  $27^\circ C$ . Both P. O. and palm kernels are derived from the fruit of the oil-palm. A fibrous pericarp contains the oil and covers the shell, which is cracked to obtain the kernel of commerce. In W. Africa the edible pericarp oil is extracted by crude methods and the nuts are cracked by women and children. Kernels are not used by the Africans, but are exported to Europe for crushing, and the oil is used largely in the manuf. of margarine and soap, and also candles as railway grease. Brit. W. Africa is the largest producer in the world and, except for a few European plantations, production is in the hands of Africans. Nigeria has exported as much as 380,000 tons annually, and the old name, 'Oil Rivs.', was once applied to

the Nile delta because, in the early hist. of the country, P. O. and kernels were brought down the waterways for trading at the ports. In 1922 the W. African trade began to encounter keen competition from the Dutch E. Indies and Malaya, which exported an oil superior in quality and with a lower percentage of free fatty acid. The Nigerian Gov. has taken steps to improve the existing palm groves and to induce the natives to use hand-presses; but progress is slow because it is difficult to persuade the natives to give up old methods. In the Gold Coast oil palm products were the staple agric. export before the development of cacao. The oil palm is also grown in Sierra Leone and there is a large consumption of P. O. for food purposes; but the fruit of the indigenous palm of that colony yields relatively little oil and breeding is confined to imported varieties. In Fr. Togoland the oil palm is an important source of revenue, and in parts of the Belgian Congo the oil palm has always been important in native economy as a source of food and other products, but large areas have been planted at different times and then abandoned.

**Palms, Palmaeae, or Palmae**, large and exceedingly important family of monocotyledons, represented by only a single species in Europe, *Chamaerops humilis*, a pretty little fan-palm, which, though comparatively hardy and much grown as a room plant, and also outdoors in mild dists., is not a native of Britain. A few others, especially *Areca baueri* and *spida*, *Chamaerops excelsa*, *Erythea armata* and *edulis*, *Coros australis*, *campestris*, and *yalay*, *Jubaea spectabilis*, *Kentia canterburyana*, *Livistona australis*, *Nannorops richiana*, *Phoenix canariensis*, *dactylifera*, and *senequensis*, *Rhapiz strobiliformis* and *humilis*, and *Washingtonia filifera*, are sufficiently hardy to live permanently outdoors in the warmest parts of Britain. All other members of the family are tropical or subtropical. All are perennial, and are either arborescent (some of them rising to a height of 100 to 200 ft.), or have no apparent stem, the plant rising from a short or prostrate rhizome. With the exception of the doom palm (*Hyphene thebaica*), all are unbranched and grow by the terminal bud, where in many cases leaves form an immense crown. These are usually of the fan-shaped and radiate or pinnelved types, or intermediate between them, and in many cases are each many feet in length. The flowers are borne upon a spadix, sometimes of great size, and enclosed, at least at first, in a large spathe, which, though often hard and woody, is similar to that of arums. Each flower is sessile on the spadix, and consists of a six-leaved or six-parted perianth, greenish or yellowish in colour; there are usually six stamens and a pistil, commonly with three carpels, but occasionally with fewer. The fruit varies greatly in size and structure; it may be drupaceous or nut-like or berried. The absence of a taproot, characteristic of all monocotyledons, is compensated for in some species

by the lengthening of the cotyledon downwards to a considerable depth, which thus gives stability to the tall-growing stem. The family consists of over a thousand species, which are divided into six tribes, the prin. species of which are dealt with under their own headings. The uses of many of the species are numerous and very varied, their least value being as timber. An exception is *Sabal Palmetto* of Central America, the timber of which is very durable; the wood of many other palm-trees is utilised, but is not of great importance. Among the more important fruit products are the coco-nut (*Cocos nucifera*), date (*Phoenix dactylifera*), coquilla nut, vegetable ivory from the seeds of *Phytolophas macrocarpa*, palm oil from the fruits of the oil palm, and the betel-nut. Sago and other similar foods are obtained from the soft pithy centres of the stem of the sugar-palm, the wine-palm, and other trees. The huge leaves are put to many uses. From Elche, Spain, large quantities of them are exported for ritual and decoration on Palm Sunday (the so-called 'palm' carried on this day in Britain is, however, the willow). The leaves of the Palmyra palm are used by natives instead of paper or parchment for records. Those of most P. are much used for thatching and similar purposes, and many are employed in making 'straw' hats. From some fibre is extracted and put to many uses. The leaves of *Copernicia cerifera* are covered with a wax utilised in candle-making. Incredible though it may sound, the midribs of the leaves of *Melrocyon*, the sago palm, are split to provide flooring and panelling boards. Malacca cane is obtained from species of *Calamus*. Most of the P. suitable for culture in Britain are propagated from seeds, which are sown thickly in pans containing good fibrous loam and silver sand. The seeds germinate very slowly, and are hastened by affording bottom heat from a hot-bed or pipes under a bench. Early spring is the best time for sowing; the seeds are lightly covered and not allowed to become dry. After the first leaf is formed, the young plants are potted singly and repotted as necessary. Decorative P. need shading from the sun and liberal watering. The leaves should be sponged occasionally with tepid water and a little soap. Most P. that are cultivated in Britain require a temp. of about 55° in winter and 70° in summer. Careful hardening off is desirable before the plants are removed to dwelling-rooms. A rich dark green colour of the foliage is encouraged by occasional applications of liquid manure and soot water. See B. Seeman, *History of the Palms*, 1856; A. B. Rendle, *Classification of the Flowering Plants*, 1925; and E. Blatter, *The Palms of British India and Ceylon*, 1926.

**Palm Sunday**, last Sunday in Lent and therefore the Sunday before Easter (g.v.). As is well known this day obtains its name from Christ's triumphal entry into Jerusalem with the children waving and spreading branches of palms before Him. The only remnants of special ceremonies

in a large section of the Eng. Church consist in the decoration of the altar and church with palms, but in Rom. Catholic and E. churches an elaborate ceremonial, including a procession of palms, takes place on this day.

**Palmyra**, anct. city standing in an oasis of the Syrian desert, 150 m. N.E. of Damascus. It is now a mere collection of Arab huts, but wonderful ruins exist. It is called by the Arabs Tadmor, and is supposed by some to have been built by Solomon (2 Chron. viii. 4). This can scarcely be the case, P. having been a flourishing city some considerable time before that given for Solomon's birth. It formed a halting-place for the caravans between Syria and Mesopotamia, and hence grew into a rich, commercial city. The bulk of the pop. was of Arab blood. The city reached its greatest period of wealth and splendour under Hadrian and the Antonines. (For the revolt of the Palmyrenes against the Romans, see ZENO-BIA, the famous queen of P.). The city was destroyed by Aurelian, A.D. 273, and the ruins massacred. It never recovered its former glory. Remains include a temple of the sun, walls, and a colonnaded street with a triumphal arch. See A. Masil, *Palmyrena*, 1928, and M. Rostoutzeff, *Caravan Cities*, 1932.

**Palni Hills**, ranges of mts. in the W. of the Madura dist., Madras, India, consisting of an E. and W. range, and reaching a height of 7000 ft.

**Palo Alto**: 1. Banking tn. of Santa Clara co., California, U.S.A., 30 m. S.E. of San Francisco. It is in the centre of an agric. and fruit-growing dist., with fine views of the coast range. The Leland Stanford Univ. (opened 1891) is 1 m. away, and there is a Rom. Catholic theological seminary. Pop. (1940) 16,700. 2. Battle-field of Cameron co., S. Texas, U.S.A., between Point Isabel and Matamoros. The Amers., under Taylor, defeated the Mexicans here (1846).

**Palolo Worm**, annelid which is widely distributed around the S. Pacific Is. It makes its appearance once a year at the full Oct. moon on the surface of the seas around Samoa and the Fiji Is. It occurs in vast numbers, and the natives value it highly as a food, eaten raw.

**Palomar**, mt in California, U.S.A., 35 m. inland from the coast, and 66 m. N. of San Diego, a peak of the Santa Anna Mts. There is an observatory with a 200-in. reflector, the largest in the world (see MOUNT PALOMAR OBSERVATORY).

**Palomides**, Sir, see PALMIDES.

**Palomino de Castro y Velasco**, Don Aciselo Antonio (1613-1726). Sp. painter and writer on art, sometimes called the 'Sp. Vasari', b. at Bujalance, Cordova. He assisted Coello with the frescoes of the queen's gallery in the Alcazar (1686), and was appointed court painter to Charles II. (1688). On his wife's death in 1725 he took priest's orders. His oil-paintings were better than his frescoes, but he is chiefly remembered for his *El Museo pictorico y escala optica* (1715-24), of which the third part, with the sub-title, *El Parnaso español pintoresco laureado*,

contained biographies of Sp. painters. Abridgments appeared in Eng. (1739), Sp. (1742, 1744), Fr. (1749), and Ger. (1781), and a reprint of the whole work in Spain in 1797. See J. A. Cean-Berindez, *Diccionario de los mas ilustres profesores de las bellas artes en España*, 1800; and Sir W. Stirling-Maxwell, *Annals of the Artists of Spain*, 1848.

**Palsy**, see PARALYSIS.

**Paludan-Müller, Frederik** (1809-76), Dan. poet, third son of Jens P.-M., sometime bishop of Aarhus, b. at Korteininde. On his father removing to Odense in 1819 Frederik attended the Lat. school of the city, eventually entering Copenhagen Univ. to study law, but he never practised. Whilst there he pub. four little romances, and inspired by his study of Shakespeare and Gozzi produced the romantic drama *Love at Court* in 1831, and gained thereby his passport into the society of belles-lettres of the cap. His successful *Dandserinden*, which shows traces of Byron's influence, appeared in 1832. *Amor and Psyche*, probably his most finished work, was pub. in 1834. He settled down to a quiet and studious life in a cottage on the royal estate at Fredensborg. *Zuleima's Flight and Beatrice* were written in 1835-1838, *Venus* in 1841. During 1841-48 he was engaged upon his greatest work, which has become a Dan. classic, *Adam Homo*. This was followed in 1844 by the three graceful idylls, *The Dryad's Wedding*, *Tithon*, and *The Death of Abel*. Excepting the drama of *Kalanus* in 1854, P. afterwards produced nothing of particular merit for some years, until he composed with all his former charm and power what was to prove his 'swan-song,' the beautiful poem *Adonia* (1874). See lives by F. Lange, 1899, and V. Andersen, 1910.

**Paludrine**,  $C_{10}H_{10}N_2Cl$ , antimalarial drug first synthesised in 1944. Up to that time the chief drug used to fight malaria was quinine, but this does not function until some time after the disease has entered the body and then often fails to produce radical cures. P. not only destroys the malaria parasites in the blood but when administered at the correct time prevents the infection from developing. It is well tolerated in man; doses up to 1.5 grams a day have been given, while as little as 10 milligrams a day gives an action in the clinical phase of malaria.

**Palwal**, tn. in Gurgaon, E. Punjab, India, 37 m. S. of Delhi. It is a very anct. city. Pop. 13,600.

**Pamaquin**, synthetic drug used against malaria. It occurs as a granular, pale-yellow powder, and may be used either alone or with mepracrine or cinchue.

**Pamfilii, Giovanni Battista**, see INNOCENT (popes), Innocent X.

**Pamiers**, tn. and episcopal see of Ariège dept., France, on the Ariège, 35 m. S.E. of Toulouse. There are iron works and mills, and numerous gardens and vineyards in the dist. Pop. 12,000.

**Pamirs**, mountainous region forming the nucleus of the central Asiatic highland system. They connect the highlands of the Hindu Kush and Himalayas with those of the Tian Shan, whilst the depressions

of the Amu and of E. Turkestan border the region. The Hindu Kush and the Himalayas from the S.E., the Kuenlun from the N.E., and the Tian Shan Mts. from the N.E., meet here. The region is termed by the dwellers there the 'Roof of the World' (*Hami-Dunya*), the word *pamir* (meaning an upland plain or valley) being a name there applied to the riv. valleys. On three sides the plateau is bordered by high mts., as stated above; on the S.W. there is no such mt. wall, but an abrupt descent to the valley of the Panj. The length of the P. is about 240 m., and breadth from 120 to 150 m., the area being about 30,000 sq. m.

The chief peaks in the N. are the Kizil-agva (21,700 ft.) and the Kaufmann (23,000 ft.); in the E., Mt. Charkum (22,500 ft.) and the Mustag-ata (c. 26,000 ft.). Across the plateau ridges run in various directions, principally from E. to W., enclosing the P. or flat, broad riv. plains. The chief rivs. of the P. are the Wakhan Daria (afterwards the Panj) and the Murgab R., both rising in Lake Oikul, and descending to the Aralo-Caspian depression. The ridges running across the P. are crossed in places by passes, of which may be mentioned the Andamin Pass (15,500 ft.), from the Great to the Little P., and the Khargosh Pass (14,550 ft.), from the Great Pamir to the Tarek Pamir. Various lakes are found on the P., of which the chief are the Great Karakul in the N.; Rang-Kul in the middle; Yashil-Kul, Zorkul, and Oikul in the S.E. Of the P. proper the prin. are the Khargoshi Pamir, round Great Karakul Lake, Rang-Kul, and Alichur; the Great Pamir, round Lake Oikul; and the Taghdumbash Pamir. The theory of Younghusband is that these elevated plains were originally deep riv. gorges, which have gradually been filled up because the debris falling from the mts. on either side has accumulated too rapidly to be washed away by the streams. The culminating point of the Pamir region is reached in the Kung-ling or Onion Mts., and between the Mustag-ata and the Tein Shan the mean altitude is about 20,000 ft., whilst the average height of the P. as a whole is over 12,000 ft. The climate is colder in the centre of the plateau, and the snowfall not so great there as in the other parts; the whole region is destitute of trees or shrubs; along the banks of the streams very fine pasture is found, to which the Kara-Kirghiz nomads bring their flocks in the summer season. These are practically the only inhab. of the P., though the peripheral dists. of Darvaz, Roshan, and Shughan are inhabited by Tajiks. The Russian surveys of Grombchevsky, Bogdanov, Featschenko, Muschketov, and Sezerov, and the journeys of Mr. and Mrs. Littledale, M. Dauvergne, Dr. G. Capus, Sir Francis Younghusband, Sven Hedin, etc., have much increased the knowledge of the geography of the region. The Russian and Brit. boundaries were settled by the Pamir Boundary Commission of 1895. The P. are for the most part in the Tajik S.S.R. See Lord Dunmore, *The Pamirs*, 1893; *Report of the Boundary*

*Commission*, 1897; and Sven Hedin, *Through Asia*, 1898.

**Pampa, La**, see LA PAMPA.

**Pampas** (*Quichuo*, plains) are wide treeless plains found in the Argentine Republic, stretching from Rio Colorado N. to Gran Chaco, and from the foothills of the Andes E. to Parana and the Atlantic coast. They rise gradually from the ocean, and the E. portion is covered with grass, and supports large herds of cattle, sheep, and horses, whilst the W. is more sterile. The soil of the P. consists of sands and clays, and is possibly the bed of an anct. sea, or the remains of former Andean glaciers, or of granite or other primitive rocks. The characteristic vegetation is the 'pampas' grass (*q.v.*), which grows to a height of 8 or 9 ft. Birds are more numerous than other species of fauna. Area about 250,000 sq. m. The name P. is also applied to other similar plains on the Atlantic coast.

**Pampas Grass** (*Gynertium argenteum*), genus of beautiful and almost hardy Amer. grasses. *Cortaderia argentea* (which is an alternative name for the genus) is the best-known species in gardens, and on light, deeply worked soils and in sheltered positions it will survive sev. degrees of frost. The large, upright, plume-like, white or silvery panicles of flowers appear in Sept. and Oct. *C. rubata*, a less hardy species, bears taller rose-coloured panicles.

**Pampas Hare**, see VISACACHA.

**Pampean Language**, see under SOUTH AMERICAN NATIVE LANGUAGES, *Southern Grasslands and Forests*.

**Pampeluna**, see PAMPLONA.

**Pamphlets**. Origin of the word is unknown. Among the various conjectured sources two of the most probable are the O.F. *paume-feuille* (hand leaf, i.e. leaf of paper held in the hand) and the Fr. *par un fil* (by a thread), but both these are more fanciful than convincing. The term pamphlet in a general sense signifies a small treatise occupying fewer pages than a book, on some question or subject of current or temporary importance of a social, personal, political, or eccles. nature, controversial or otherwise, in which the writer endeavours to appeal to the public. Speaking technically it implies eight or more pages of printed matter, not exceeding five sheets, stitched together, with or without a thin paper cover. It is first found in the Lat. form *pamphletos* in Richard de Bury's *Philobiblon* (1344), and early made its appearance in Eng. literature; Occleve making use of 'though that this pamphlet' in *De Regimine Principum* (1412). Ludgate relates in *Minor Poems*, 'which in a pamphlet I redde' (1430), and in Chaucer's 1490 ed. of *Eneydos* we find 'diverse pamphlettis and bookys.' An immense impetus was given to pamphlet writing by the Marprelate controversy in 1590, as instanced by the writings of Nashe, Thomas Cooper, the Harveys, and others. The various witch controversies of the period, especially in the case of the Lancashire trials of 1612 recorded by Thomas Potter, helped to increase the output. Richard Greene likewise caused diversion by his social P., exposing the rogues of

Elizabethan London, the most famous being *A Notable Discovery of Coosnage* (1591) and *A Defence of Coney-Catching* (1592). Contemporary with these are those quaint literary productions, the tobacco P., and political P. and news-sheets (the germ of the modern newspaper) began to appear. Political P. were to multiply quickly during the Caroline reign, helped by the intervening period of rabid Puritanism, culminating in Anne's time in what Dr. Johnson designated the age of P., enlisting such able pens as those of Addison, Steele, and Swift. To touch on all the subjects of the pamphlet writers would be to recapitulate the prin. events of modern hist.; but in England such matters as the Corn Laws, Home Rule, S. African war, Imperial Federation, and the Dreyfus case in France, may be cited as having brought forth their full share of this class of literature. A series of well-informed P. was issued during the Second World War by the Oxford Univ. Press, entitled 'Oxford Pamphlets on World Affairs,' and dealing with the foreign policies of different countries, the economics of the war, racial questions and special problems, such as the Jewish question, encirclement, living spaces, the Danubian basin, colonial raw materials, etc.

**Pamphylia**, anct. country on the S. coast of Asia Minor, bounded by Lycia and Cilicia. The chief twn. were Aspendus, Perga, Attalia, and Olbia. This country formed at first part of the Persian Empire, but afterwards passed successively to Macedonia, Syria, and Rome.

**Pamplona**, or **Pampeluna**: 1. (Basque *Iruña*), cap. of the prov. of Navarre, Spain, in the Pyrenes Mts., 195 m. N.N.E. of Madrid. It is also a strong fortress and possesses a fourteenth-century cathedral. Pop. 70,900. 2. Tn. of Colombia, in the dept. of Santander del Norte, 210 m. N.E. of Bogota, at an altitude of 7000 ft. It is connected by rail with Cucuta and Enconcordes. It is an episcopal see, and is in the vicinity of abandoned gold and silver mines. Other minerals, including iron, coal, lead, and copper, are found in the neighbourhood. Its chief products include dyewoods, gums, coffee, cacao, coal, and gold. There are breweries and distilleries, and also textile factories. Pop. 22,000.

**Pan**, great god of flocks and shepherds among the Gks., usually called a son of Hermes, was originally an Arcadian god, and Arcadia was always the prin. seat of his worship. From that country his name and worship afterwards spread over other parts of Greece, but at Athens his cult was not introduced till the time of the battle of Marathon. He is described as wandering among the mts. and valleys of Arcadia, either amusing himself with the chase, or leading the dances of the nymphs. He loved music, and invented the syrinx or shepherd's flute. P., like other gods who dwell in forests, was dreaded by travellers, to whom he sometimes appeared, and whom he startled with sudden terror. Hence sudden fright without any visible cause was ascribed to P., and was called

a *Panic* fear. The Romans identified their god Faunus with P. In works of art P. is represented as a sensual being, with horns, puck-nose, and goat's feet, sometimes in the act of dancing and sometimes playing on the syrinx. For the celebrated story told by Plutarch, 'Great Pan is Dead,' see Habels, chap. xxviii., and J. O. Lawson, *Modern Greek Folklore and Ancient Greek Religion*, 1910.

**Panama**: 1. Republic of S. America, which, prior to 1903, when it asserted its independence, was a dept. of Colombia. Its area is 28,576 sq. m., its length 480 m.; coastline, 426 m. on the Atlantic and 767 m. on the Pacific; breadth from 37 to 110 m. It is a strip of land branching out westward from Colombia and co-extensive with the isthmus of P. The U.S.A. recognised its independence in 1903 and, shortly afterwards, the remaining powers did so. (For the terms of the treaty with the U.S.A. relative to the P. Canal zone see PANAMA CANAL ZONE.) But it was not until 1914 that Colombia agreed, under the treaty of Bogota, to recognise the independent status of P. This treaty was ratified by the two govts. in 1921, and in 1924 a protocol was signed by the plenipotentiaries of P. and Colombia establishing diplomatic relations between their respective countries. The W. or Costa Rican boundary was determined in 1910, but, after ratification, the question of the true demarcation was referred to the chief justice of the U.S.A., whose award, delivered in 1914, was rejected by P. The U.S. Gov. insisted on the award being upheld, with the result that the ter. in question was occupied by Costa Rica. On March 2, 1936, a new treaty between P. and the U.S.A., ratified by the U.S. Senate on July 25, 1939, annulled the former provision by which the U.S.A. 'guaranteed the independence of P.' but permitted the U.S.A., in the event of war, to defend the canal in any way necessary. The U.S. Gov. paid P. \$10,000,000 for the canal zone rights and, from 1913, \$250,000 yearly. A later treaty, ratified by P. in 1936, and by the U.S.A. in 1939, increased the ann. payment to P. to 430,000 balboas. A disadvantage to P. is that the city of P. is left practically without a seaport, inasmuch as the anchorage at Balboa and Flamenco ls. lie within the delimited zone. In Sept. 1939 the president of the U.S.A. placed the canal and the zone under the control of the U.S. Army, and in Jan. 1942 he estab. Amer. naval control over the gulf of P. and the maritime approaches to Cristobal.

**Provinces and Population**.—There are eight provs., with pops. for 1940 (caps. in brackets): Bocas del Toro (Bocas del Toro), 10,000; Chiriqui (David), 92,000; Cocle (Penonome), 57,800; Colon (Colon), 57,300; Los Santos (Las Tablas), 49,700; P. (P. city) 172,000; Herrera (Chitre), 38,100; Veraguasa (Santiago), 83,500. The pop. of P. city in 1940 was 111,800, and of Colon, 44,000. The total pop. of P. (excluding the canal zone) in 1940 was 622,600, including about 69,000 white; 83,000 Negroes; 56,000 native Indians (living in tribes); and over 400,000

mestizos or mixed. There are about 23,000 Brit. subjects on the isthmus, chiefly coloured people from the W. Indies. The estimated pop. in 1918 was 680,500. Under the constitution the immigration of the following is prohibited: Negroes whose original language was not Sp., yellow races and original races of India, Asia Minor, or N. Africa. The official language is Sp. Some 93 per cent of the pop. is Catholic and 6 per cent Protestant.

**Constitution and Justice.**—The new constitution promulgated in 1946 continues the pre-existing provisions for a National Assembly of thirty-two members. Deputies are elected for four years. The assembly meets biennially on Jan. 2. The term of the president of the republic, elected by direct vote, is also four years, and he is not eligible for a second term. The supreme court consists of five justices appointed by the executive.

**Education** is obligatory for all children between seven and fifteen years of age and co-education has been adopted. The gov. maintains 115 primary schools (sixteen for native Indians), attended by 91,000 children in 1948, and seventeen post-primary schools, with 5000 students. There is a univ. and a school of arts and crafts; but a number of students are sent at the gov.'s expense to the U.S.A. and Europe for their education. The Bolivarian univ., founded at P. city in 1926, is supported by a number of other S. Amer. republics as a pledge of pan-Amer. solidarity. A new normal school, opened at Santiago in 1938, is attended by 1160 students of both sexes. There is also a professional school for young women.

**Production.**—The soil is very fertile but not by any means fully cultivated. The chief exports are bananas (3,500,000 stems in 1947, mostly to the U.S.A.), coconuts, hides, abaca fibre, tortoise-shell, and rubber. Coffee is cultivated in Chiriquí prov. near the Costa Rican border, while timber, sugar, copaiba, sarsaparilla, ipecacuanha, and rice are also produced. Caoutchouc is grown near the coast by European planters, but rubber exports have been small in the past two or three decades. Beer production is a national monopoly, and in 1947 the quantity produced was over 21,000,000 litres. Whisky, gin, and rum are also produced. Tobacco is exported; cattle are reared and hides exported to some extent; pearls from the Pearl Is. and Coiba Is. and turtle-shell are also exported. P. has nearly every valuable mineral except coal, but the mines are not much exploited. The republic, possessing few industries, subsists largely on the P. Canal (in services to its employees) and on tourist and transit traffic. Exports are far below imports, the approximate figures for the five years before the Second World War being between 3,500,000 and 4,250,000 balboas for exports and between 18,000,000 and 23,000,000 balboas for imports; between 1940 and 1945 exports ranged between 2,000,000 and 4,500,000 balboas and im-

ports between 24,000,000 and 40,000,000 balboas. In 1947 exports were 8,500,000 balboas and imports 75,700,000. This heavy adverse balance is met by invisible exports such as the expenditure of canal zone employees, U.S. Army and Navy personnel, and tourists. The greater part of the country's trade is with the U.S.A., with the United Kingdom in the second place, chiefly in imports from the latter.

**Communications, etc.**—The P. railroad, the shares of which are held by the U.S. Gov., is 162 m. long and links P. city with Colon. It passes through the canal zone and the bulk of the goods consigned to P. passes over it, there being no road over the isthmus. Most ships unload at Cristobal at the entrance to the canal. There is a narrow-gauge railway between Pedregal and David and a line between David and Concepción. There is at present a road from P. city westward as far as David. Work on its extension to the Costa Rican border was expedited by Amer. engineers as a war measure so as to complete the Panamanian link in the highway from the U.S.A. to the P. Canal. Commercial aviation has developed rapidly in P. Daily air services, in both directions, connect P. city and David. Daily air mail and passenger services operate between P. and New York. There are telegraph cables from P. to N. and S. Amer. ports, from Colon to the U.S.A. and Europe. The Pacific ports are Puerto Mulas, Pedregal, Dulce, Montijo, and Puerto Armuelles; the Atlantic ports are Puerto Bello, Bocas del Toro, and Colon.

**Defence.**—P. supports no army or navy, but during the Second World War a militia force was formed with the assistance of U.S. officers. In 1941 P. granted air and anti-aircraft bases to the U.S.A. for the defence of the canal zone.

See W. R. Scott, *The Americans in Panama*, 1912; A. Edwards, *Panama: the Canal, the Country, and the People* (revised ed.), 1914; A. H. Verrill, *Panama Past and Present*, 1921; C. H. Forbes-Lindsay, *Panama and the Canal To-day*, 1926; H. G. Miller, *The Isthmian Highway: a Review of the Problems of the Caribbean*, 1929, and W. D. McCann, *The United States and the Republic of Panama*, 1937.

2. P. city, cap. of the republic of P. The original tn. was founded by the Spaniard, Pedro Arias de Avila, who in 1514 amalgamated the sev. Sp. colonies in Central America under the name of Tierra Firme and about five years later founded P. city. This city was sacked and burnt by the famous Eng. buccaner, Henry Morgan (q.v.), in 1671 and rebuilt in 1673 during the governorship of Fernandez de Cordova on a site 4 m. W.S.W. of the previous site. According to Esquemeling the original P. was a city of wealth and luxury of 30,000 inhab., with some 5000 stone houses and thousands of large houses of cedar. P. city stands on a rocky peninsula at the foot of an extinct volcano known as Ancon Hill and is on the S. side of the isthmus at the head of the Gulf or bay of P. Since the republic gained her independence the cap. has undergone many improvements, and the \$10,000,000

paid by America for the lease of the canal has enabled the Panamanian Gov. to erect a number of handsome buildings, which have much altered the aspect of the old city. The main thoroughfare is the Avenida Central, which is traversed by electric cars. The weather-worn cathedral (founded in 1760) took nearly ninety years to complete. It was erected at the expense of a Negro, who from lowly origin rose to be bishop of P. Its chief features are the twin towers, the domes of which are encased in mother-of-pearl, said to have been brought from the pearl fisheries of Margarita. Among the other churches are San Felipe Neri, with an arch built 1688, and San Francisco, dated in 1740. Facing the cathedral are the episcopal palace and old Gov. Palace. Among the new buildings one of the most noteworthy is the handsome Palacio Municipal or city hall. At the lower end of the Avenida is the group of gov. buildings, at the back of which is the handsome National Theatre, one of the finest buildings of the kind in this part of the world. The Malecon, or sea wall, is a popular promenade; to the W. of it is another sea wall, that of Las Bovedas, under which are the old prisons. At the foot of Ave. N. 1411 is the Instituto Nacional, P.'s univ., which was opened in 1911. The houses of P. city are built of stone and roofed with red tiles and rarely exceed two or three storeys in height, and their overhanging balconies accentuate the narrowness of the streets, which are remarkably picturesque. Pop. 111,800. See J. Esquemeling, *Bucaniers of America*, trans. from the Dutch by Wm. Crooke (London), 1684 (Esquemeling or Oexmalin was a buccaner with Morgan and his book is the only first-hand source of all the facts pub. in the Calendar State Papers and used by biographers since); A. H. Verrill, *Panama Past and Present*, 1921; and P. James, *Latin America*, 1942.

Panama Canal, designed in 1879 by Ferdinand de Lesseps (q.v.), who constructed the Suez Canal as a tide-level canal. Gomera (1510-60) advocated a canal; in the sixteenth century the Panama, Nicaragua, and Tehuantepec routes were discussed. A Colombian concession granted to Lt. Wyse was sold to the Panama Canal Company, and work of survey, etc., was commenced in 1881. The estimate of cost was about \$33,000,000, reduced by de Lesseps to \$24,000,000, and the work was to be completed in 1888. With less than one-quarter the work done and \$74,000,000 estimated debt, the company was forced into liquidation in 1889. In 1892-93 occurred the Panama scandals in France, leading to the imprisonment of de Lesseps, his son Charles, and others; mismanagement, bribery, corruption, and fever had ruined the scheme. Up to 1902 \$60,000,000 had been expended, only \$12,000,000 effectively. The chiefs of the Fr. Canal Company, convinced that they were unable to complete the work, commenced negotiations with the U.S. and Colombian Govs. The U.S. offer of \$8,000,000 for the company's rights and

assets was accepted by the Herran-Hay Treaty (1902). This treaty was strongly opposed by Colombia, and its ultimate rejection led to Panama proclaiming her independence in 1903, and signing the Canal Treaty in Nov. of the same year (see PANAMA CANAL ZONE) under which the work progressed. The necessity of the work was brought home to the U.S.A. by the voyage of the S.S. *Oregon* from San Francisco to Cuba in the Sp.-Amer. war, the ship having to sail round Cape Horn. When the U.S.A. eventually made arrangements to dig the canal, it paid the republic of Panama a bonus of \$10,000,000, the Fr. canal company \$40,000,000. In 1925, mainly to obtain the goodwill of the S. Amer. republics, it paid Colombia \$25,000,000. Work on the canal was finally started by the Amers. in 1905, and in 1920 President Wilson declared it formally completed. The digging of the canal was made possible by the work of Wm. C. Gorgas, then a surgeon in the U.S. Army, who, with 2000 assistants, removed the sources of yellow fever and malaria, and made the canal zone as healthy as any place in the U.S.A. The engineering work was entrusted to George W. Goethals (q.v.), then a colonel in the engineering corps of the U.S. Army. Actual excavation work was begun in 1906, with a force of 45,000 men. The clerks, foremen, and officials were Amers., but the manual labour was mainly performed by Spaniards, Ita., and Negroes. Huge steam shovels were employed, the soil being hauled off by about 800 trains of twenty-three cars each. A total of 240,000,000 cub. yds. of earth was removed. The canal cost \$366,650,000, exclusive of appropriations for its defence.

It lies between the 8th and 10th parallels of N. lat. and the 79th and 80th meridians W. long. It connects the Caribbean Sea with the Pacific Ocean. It runs from N.W. to S.E. almost at right angles to the axis of the Isthmus. The canal zone, which belongs to the U.S.A., includes all land extending 5 m. on both sides of the centre line of the canal channels. By the terms of the treaty the city of Colon on the Atlantic side and Panama on the Pacific are retained by the republic of Panama, but the U.S.A. makes itself responsible for their hygienic condition. The total area of the canal zone is approximately 551 sq. m., including Gatun Lake, with 106-40 sq. m., and Miraflores Lake, with 1-90 sq. m. In passing through the canal from the Atlantic to the Pacific a vessel goes through a dredged channel 500 ft. wide, 40 ft. deep at mean low water, and 5-77 m. long, leading to the Gatun locks, the first of a series of three locks. The Gatun locks, which consist of three flights of chambers, raise the vessel from sea level to Gatun Lake, a lift of 85 ft. The locks are double, being 1-04 m. long and 110 ft. wide. Each chamber is 1-90 ft. long, with intermediary gates which can shorten the length for smaller vessels and thus conserve water. All lift operations are controlled from a central station. The ship

is attached to electrically operated mules which run on tracks on both sides, pulling the ship through and keeping it in position, so that it will not damage itself or the mechanism of the locks. Once out of the locks the vessel proceeds under its own steam through a fixed channel in Gatun Lake. This varies from 500 to 1000 ft. wide and from 45 to 85 ft. deep. It does not follow a straight line through the lake, but goes through the former valley of the Chagres R., whose waters were used to form the lake. Once out of the lake the vessel enters Culebra Cut (now Gaillard Cut), a distance of 20-55 m. from Gatun locks. This cut is 300 ft. wide, 45 ft. deep, and 6-97 m. long. At the Pacific end of this cut the ship passes through San Pedro Miguel locks, a single flight of double chambers. This flight of locks is 0-75 m. long with a drop of 31 ft. to the level of Miraflores Lake. Passing through this lake is a fixed channel 500 ft. wide, 45 ft. deep, and 0-86 m. long. The ship then enters Miraflores locks, consisting of two flights of double locks 0-91 m. long with a drop of 54 ft., more or less, depending on the state of the tide, and thus reaches the level of the Pacific Ocean. The channel from Miraflores locks to the Pacific is 500 ft. wide, 35 ft. deep, and 6-99 m. long. In 1940 construction was begun on a new set of locks located approximately parallel to those at Gatun, Pedro Miguel, and Miraflores. A concrete dam, 974 ft. long and 223 ft. high, across the Chagres R. at Alajuela, was completed in 1933, creating Madden Lake, thus providing a reserve of 22 milliard cub. ft. of water for maintaining the level of Gatun Lake in dry seasons. The average time of passage through the canal is from 7 to 8 hrs.; the record passage is 4 hrs. 10 min. The total length of the canal from entrance to entrance is 43-85 nautical m. The ports of entry for the canal zone are Cristobal on the Atlantic side and Balboa on the Pacific. The maximum traffic capacity of the canal is estimated at 48 ships of usual size in a day or about 17,000 in a year. The gross capital investment for the construction, operation, and upkeep of the canal to June 30, 1948, totalled \$724,872,211, and the net investment, minus depreciation, was \$669,019,945. The net revenues (excluding interest charges on investments) have totalled \$273,500,000 since 1920. Net revenues from tolls and other sources during the year ending June 30, 1948, were over \$2,500,000. The total tonnages for the fiscal year ending June 30, 1948, were 24,117,000, comprising over 8,000,000 tons from Atlantic to Pacific, and over 15,000,000 tons from Pacific to Atlantic. Of a total of 4878 vessels, 2035 were Amer., 1041 Brit., 324 Norwegian, 180 Panamanian, 178 Honduran, 147 Swedish, 141 Dutch, 119 Dan., 99 Fr., 80 Colombian, and 69 Chilean. All ships passing through the canal have to pay the tolls except the gov. ships of the republics of U.S.A., Panama, and Colombia. See P. Bunau-Varilla, *Panama: its Creation, Destruction, and Resurrection*, 1913, and *The Great Adventure of Panama*, 1920;

F. J. Haskin, *The Panama Canal*, 1914; D. H. Smith, *The Panama Canal*, 1927; D. C. Miner, *The Fight for the Panama Route: the Story of the Spooner Act and the Hay-Herrán Treaty*, 1940; N. J. Padelford, *The Panama Canal in Peace and War*, 1942; and G. Mark, *The Land Divided: a History of the Panama Canal*, 1944.

**Panama Canal Zone**, strip of land some 5 m. wide, on both sides of the centre line of the Panama Canal, granted to the U.S.A. by the treaty of Nov. 18, 1903, with Panama. In the treaty Panama granted to the U.S.A. the use in perpetuity of the zone and, within its ambit, the exclusive control for police, judicial, and sanitary purposes. A new treaty, ratified by Panama in 1936, and by the U.S.A. in 1938, increased the ann. payment to Panama to 430,000 balboas. The zone is 554 sq. m. in area and of this area 106-40 sq. m. are occupied by Gatun Lake. The zone also includes about 20 sq. m. in the Chagres R. valley above Alajuela, assigned to the U.S.A. in 1924, with the view of constructing a dam at Alajuela. The pop. of the zone is 47,500, of whom 22,800 are Amers. There is no privately owned land in the zone, the zone being gov. property, dedicated to the purpose of protecting, operating, and maintaining the canal; but steamship companies may obtain building sites on licence, and agric. land can be licensed in limited tracts. The cities of Panama and Colon remain within the jurisdiction of Panama, but the U.S. Gov. is, by the treaty, given the control over both cities and over their harbours in matters relating to sanitation and quarantine. The status of the zone is that of a military reservation under the governor of the Panama Canal, who is appointed by the U.S. Gov. In Sept. 1939 the President of the U.S.A. placed the canal and zone under the control of the U.S. Army, and in January 1942 he estab. Amer. naval control over the gulf of Panama and the approaches to Cristobal.

**Panama**, Gulf of, inlet of the Pacific Ocean, formed by a curve of the isthmus, contains the Pearl Is. with their fisheries. Width 120 m., from Point Caracoles on E. to Point Mala on W.

**Panama**, Isthmus of, joins N. and S. America. Lat. 9° N., long. 79° 30' W.; length, 480 m.; breadth, 37 to 110 m. Its E. end separates the gulf of P. (Pacific) and Darien (Atlantic.)

**Pan-American Conference or Congress**. The first P.-A. C. was convened at Panama in 1826 by Simon Bolivar, the Venezuelan patriot, representatives from Colombia, Peru, Mexico, and Guatemala attending. An attempt was made to effect a treaty of federation, but the congress failed to do so, though it had far-reaching results in the direction of fusing Lat.-Amer. aspirations for their own corporate protection. This aim was definitely stated at the congress in 1856, when Peru, Chile, and Ecuador signed a continental treaty. The movement was hostile to the U.S.A., and in 1889 the U.S. Gov. invited Lat.-Amer. republics to a conference to discuss such questions as peace, customs,

and communications. All the republics attended, and recommendations regarding port duties, sanitation, freedom of rivers, common weights and measures standards, extradition of criminals, and intercontinental railways were considered. At further conferences in 1901, when President MacKinley attended, and 1906 and 1910, agreement was reached on arbitration in disputes, adherence to The Hague Convention of 1899 was agreed to, money claims adjusted, and the formal dedication of the Pan-Amer. Union (*q.v.*) was made. At the conference in 1923 Peru, Bolivia, and Mexico refused to attend. Three conventions were adopted, as follows: international disputes were to be examined by a commission, trademarks were protected, and customs documents were to be pub. The sixth congress, held in 1928, was attended by President Coolidge, when public and private international law was coded, and the subject of aerial navigation reviewed. Various Pan-Amer. scientific congresses have taken place. In 1915 President Wilson attended one, when discussions took place respecting improvement of cable services, telegraph and railway co-ordination. The seventh conference, held at Monte Video in 1933, was attended by all the Amer. republics except the Argentine, and the U.S.A. and nine other states sent their foreign ministers. This important conference gave Franklin Roosevelt's administration its first opportunity to expound the 'good neighbour policy' (see further under MONROE DOCTRINE). A declaration that 'no state has the right to intervene in the internal or external affairs of another' was strongly supported by Mr. Cordell Hull (*q.v.*) and unanimously adopted. This conference adopted over 100 recommendations for the promotion of inter-Amer. amity. Noteworthy too was a resolution for the removal of trade barriers, including high tariffs, a welcome reaction from the scandal of the Hawley-Smoot tariffs. President Roosevelt followed up this conference by proposing a special conference on the maintenance of peace, which met in Buenos Aires at the close of 1936, the opening session being addressed by him in person. Its most important result was a convention for the maintenance, preservation, and re-establishment of peace, which provided for general inter-Amer. consultation if any threat of war touched the New World, whether with an Old World nation or war between two Amer. nations. A treaty on the prevention of controversies set up a number of mixed commissions between Amer. states to devise means of avoiding future conflicts and a new protocol raised still higher the barrier against intervention by any one of the signatories 'for whatever reason in the internal or external affairs of any of the other parties.' The Amer. Senate ratified the peace convention or consultative pact. The eighth conference, held in Lima in 1938, met under the shadow of a second world war. Mr. Hull, apprehensive of Ger. penetration of S. America, wished to form a united front against

international aggressors; but Argentina was opposed to drastic action, and late in the war was the one Amer. republic to maintain an equivocal attitude towards the belligerents, even after Brazil, Mexico, and others had actually declared war on the Axis. However, the Declaration of Lima, adopted unanimously, affirmed the faith of the twenty-one Amer. republics in democracy and pledged them to consultation and, at least, to a measure of common action if any were menaced. Thus, under the impulse of common danger, Pan-America did at length achieve something for concord and security in the W. hemisphere, besides fostering closer commercial and cultural relations. In accordance with the declaration of Lima the foreign ministers of all the republics met for consultation at Panama city soon after the Second World War began. They adopted a statement of co-operative neutrality, defining their rights and privileges in a world at war. The Declaration of Panama asserted, though rather unrealistically, their inherent right to keep the waters used for normal inter-Amer. maritime communications 'free from the commission of any hostile act by any non-Amer. belligerent,' and to that end they adopted a neutrality zone (*q.v.*) which, however, never came into effect. The collapse of France led to a new meeting at Havana in July 1940, which resulted in the Act of Havana, an act which went far towards extending the Monroe Doctrine. This was an effort to safeguard Brit., Fr., and Dutch possessions in the W. hemisphere from Ger. seizure. The delegates also adopted a declaration to the effect that any attempt by a non-European state against the integrity of the ter. or political independence of an Amer. state should be considered an act of aggression against all the New World republics. In fact the Monroe Doctrine had now become a multilateral doctrine. After the Jap. had attacked the Amer. fleet at Pearl Harbour it is obvious that all the S. Amer. republics should have given practical expression to this joint declaration by breaking with the Axis and, but for the resistance of Argentina, this step would never have been delayed. The foreign ministers of all the republics again met, this time at Rio de Janeiro in Jan. 1942, and a declaration recommending severance of diplomatic relations was adopted, with Argentine and Chilean reservations; indeed Argentina's ambiguity was the great obstacle to a united Pan-Amer. front. Soon after this conference Brazil, Bolivia, Ecuador, Paraguay, Peru, and Uruguay broke off relations with the Axis. Mexico had done so before the conference, at the end of 1941. See also PAN-AMERICANISM. See *The International Conferences of American States, 1889-1928* (New York), 1931, and *First Supplement, 1933-40* (Washington), 1940; also O. H. Haring *South America looks at the United States*, 1928, and M. Margaret Hall, *The Problem of Inter-American Organisation*, 1941.

Pan-American Highway, planned in 1924 to connect N. America with the

Central and S. Amer. republics. Sections completed include those from the Mexican border to Panama and Ecuador to Peru. Lack of funds prevented great progress in 1947-48.

Acme Photo. U.S. Information Service: American Embassy

**THE PAN-AMERICAN HIGHWAY IN MEXICO**  
From this point the road begins to climb to an elevation of almost 9000 feet.

**Pan-Americanism**, movement intended to bring the Amer. republics into closer association for the promotion of trade, cultural interests, peace, and security. Its fundamental object has no necessary connection with the Monroe Doctrine, but in effect the decisions reached at various Pan-Amer. conferences involve the application of that doctrine in its wider, modern interpretation (see further **MONROE DOCTRINE**). In more recent years U.S. leaders have favoured the inclusion of Canada in the Pan-Amer. system, and the formation during the Second World War of the Canadian-Amer. Defence Board marks the inevitable development of this tendency. The ideal of P.-A. has its origin in the time of Henry Clay (q.v.), but for a number of reasons it made only very slow progress. A serious obstacle is or was the fact that Lat.-America (q.v.) has always had much stronger ties, cultural, moral, and economic, with continental Europe, especially with Spain and Portugal, than with the U.S.A. Secondly the S. Amer. republics for long regarded U.S. foreign policy with deep suspicion. Thirdly there is, even to-day, a difference

in governmental ideals; for, whereas the people of the U.S.A. abhor dictatorships, many S. Amer. states have found them apparently well suited to their stage of political progress. Hence in most Pan-Amer. conferences it has been difficult to discuss political aims from a common standpoint. Fourthly there is a radical difference between the outlook and temperament of the Lat.-Amers. and the Eng.-speaking Amers.; the latter seem to regard the former as indolent, changeable, and unprogressive, while the former, especially the Argentines and Chileans, are prone to regard the N. Amers. as aggressive, materialistic, and irreligious (Allan Nevins, *America in World Affairs*, 1941). It would seem not unlikely that each and all these obstacles have lost much of their force through the common danger to all Amer. states presented by Fascist aggression. See J. B. Lockley, *Pan-Americanism: its Beginnings*, 1920, and *Essays in Pan-Americanism*, 1939, S. G. Inman, *Problems in Pan-Americanism*, 1921; and bibliography of **PAN-AMERICAN CONFERENCES**.

**Pan-American Union**. In 1890 an International Union of Amer. Republics was convened to organise the pub. of comprehensive commercial data in a bulletin issued monthly in the four languages of England, Spain, Portugal, and France. From this beginning there grew the P.-A. U. in 1911 at a congress in Buenos Aires. The stated objects of the union are to develop inter-republic commercial and diplomatic relations and to organise co-operation in communications, customs, etc. A library was estab. called the Columbus Memorial Library, which contains 70,000 vols. The widening scope of the work of P.-A. U., and the creation of specialised inter-Amer. agencies, made it clear that greater integration was required, and accordingly the ninth international conference of Amer. states, held in 1948, adopted a charter of the organisation of Amer. states. Membership comprises the twenty-one Amer. republics on a basis of equality, and its aims are accomplished by sev. bodies, as follows. An inter-Amer. conference meets every five years. The ministers of foreign affairs meet to consider urgent or common problems, assisted by an advisory defence committee. The council of the organisation, with one representative of ambassadorial rank, supervises progress either directly or through technical organs, i.e. the Inter-Amer. Economic and Social Council, the Inter-Amer. Council of Jurists, and the Inter-Amer. Cultural Council. The permanent and central organ of the organisation, housed in Washington, is the P.-A. U., which acts as a permanent secretariat and as a clearing-house for information. Specialised conferences deal with technical matters or specific questions of co-operation, and specialised organisations are estab. to fulfil specific functions in their particular fields of action.

**Pan-Arabic Movement**, or the movement for an Arab union or federation. Arabia proper forms only a small part of

the Arab world, and not even the most comprehensive programme for an Arab union or federation could look to the political unification of this whole area as a practical proposition (see also ISLAM). Moreover the Arabic-speaking countries in N. Africa to the W. of Egypt (Libya, Tunisia, Algeria, and Morocco), down to 1944 held aloof from the current movement for union. But within the E. half of the Arab world, a smaller but more compact group of ters., the peoples of which are not exclusively or even predominantly of Arab origin, have in the course of centuries become thoroughly Arabised, speak Arabic, and consider themselves Arabs. Yet hitherto they have been kept apart by mutual jealousies and suspicions and by the centrifugal force which the geographical peculiarities of the Arabian peninsula have always exerted. Hence the Nejd has never been the nucleus of an Arab state extending beyond the limits of Arabia proper, and only the Umayyad caliphs of Damascus (661-750) succeeded in holding the Arab countries together during the period of their sway, and from 868 their successors had to submit to the existence of virtually independent dynasties in Syria and Egypt. In Arabian hist. it was exceptional for the majority of the Arab countries, which owed formal allegiance to the caliph of Bagdad to be united under a single ruler. Egypt and Syria formed a unit of this kind for some centuries, and the Ottoman Turks, early in the sixteenth century, once more united this region into a single state, though one of Turkish character with its cap. at Constantinople. The scheme of Mehmet Ali (q.v.) to rival the Ottoman caliph was thwarted by the great powers, but, in any case, there existed then no Arab nationalist consciousness such as exists to-day. The origin of the Arab union movement of recent years may be traced back to about 1906, in the growing aversion of the Arabs from Turkish hegemony. Although the positive side of this movement was vague, the existence of a common national feeling in the Arab provs. of the Ottoman Empire was an undoubted fact by 1913, and it had been influenced by the increasing tempo of European nationalism. The experiences of the Arabs during the First World War contributed greatly to strengthening the bonds between them while the Brit. Gov.'s pledge of 1918 to give the Arabs full opportunities of becoming a nation again should have operated in the same direction, but in the result only Syria and Iraq really aspired to unity and in the Arabian peninsula there can, even to-day, be no question of nationalism in the W. sense, while, again, Egypt's independence was founded on local patriotism. The great differences in the standards of civilisation and in economic resources, as well as among the various classes of society in each, formed and still form the main obstacle to union. At the Paris Peace Conference after the First World War the idea of an Arab union was voiced by the Hejaz delegation, against a Syrian movement for local independence. The

settlement of the Arab question after 1918 resulted eventually in the independence of Arabia proper (Saudi Arabia) and the Yemen) and, later, of Iraq and Egypt and, in principle, of Syria and the Lebanon. But many years passed before superficial disagreements, both inside and outside the Arab peninsula, were overcome, or even before the mutual estab. of diplomatic relations. King Faisal (q.v.) of Iraq fostered union between Iraq and Syria, and, since his regime, the desire for Arab unity has been strong in Iraq. The Syrian National party in 1936 embodied in their national pact the same aspiration, to be achieved by a federation of the Arab states. Arab solidarity was also manifested by the joint move of the kings of Saudi Arabia and Iraq, the imam of Yemen, and the amir of Transjordan, in co-operation with the Brit. Gov., to settle the Palestine revolt of 1936. On the eve of the Second World War it seemed as if the first steps towards an Arab union would be the political co-ordination of Syria and Iraq. Egypt, however, joined Iraq as champion of the cause of Arab unity, and took the leading role, for which indeed the country was qualified by reason of its position in the modern Arab literary and cultural revival. This policy was formally approved by Mi. Eden on behalf of the Brit. Gov., and preliminary discussions were held in Cairo. The discussions seemed to point to a strong sentiment in favour of union among the four main protagonists Syria, Egypt, Iraq, and Transjordan. Ibn Saud's attitude remained one of cautious approval as might be expected in view of the special character of his empire, which includes the holy cities of Islam. But the differences of political organisation and status of the various Arab countries seem to preclude any solution more intimate than a loose federation. In the words of Nuri Pasha, Prime Minister of Iraq, an Arab union can become a reality only if the W. powers renounce their privileged position. The new Arab renaissance seems, however, destined to provide a sound cultural basis for future political development. A general Arab conference was held in Alexandria in 1944, attended by gov. representatives of Egypt, Iraq, Lebanon, Saudi Arabia, Syria, Transjordan, and Yemen, and a representative of the Palestinian Arabs. From this resulted the Alexandria Protocol which suggested an Arab league, a covenant establishing this body being signed in March 1945. The object of the league is the co-operation of its members in political, economic, social, and cultural matters, and its organisation comprises a council, sev. special committees, and a permanent secretariat. Provision is made for the evolution of the league into a closer form of union, and for the inclusion of other Arab countries as these achieve independence. It has to be admitted, however, that the solidarity of the League did not stand the strain of the war in Palestine which resulted in Israeli independence. There was much vocal encouragement of the Arabs of Palestine but military aid was restricted to the

Transjordan Frontier Force and to Egyptian troops; whilst little, if any, co-operation was shown in solving the serious problem of absorbing the great number of Palestinian Arab refugees. (See under **PALESTINE**.) See C. Hourani, 'The Arab League in Perspective' in *Middle East Journal*, vol. 1, 1947; M. V. Seton Williams, *Britain and the Arab States: a Survey of Anglo-Arab Relations, 1920-1948*, 1948; and G. K. Kirk, *A Short History of the Middle East*, 1948.

**Panars**, see under **JAINTIA HILLS**.

**Panathenaea** (*Παναθηναία*), most famous of Athenian festivals, was celebrated in honour of Athena, the patron deity of Athens, and is said to have been originally named only *Athenaea*, and to have first received the name of P. at the time when Theseus united all the inhab. of Attica into one body. Claiming to have been founded by Erechtheus as a religious ceremony, it afterwards included horse races, chariot races, and gymnastic sports, as well as torch races and musical contests (introduced by Porcides), and consisted of two feasts, the lesser P. and the greater P., the former of which was celebrated every year and the latter every fourth year. The great P. was the festival and occupied some days, the culminating point being the twenty-eighth day of the month, the birthday of the goddess, when the grand procession carried through the city the costly embroidered peplos or stato robe of Athena. This procession is vividly represented in the well-known frieze of the Parthenon.

**Panax**, genus of shrubs and trees (family *Araliaceae*) with ornamental pinnate or digitate leaves, and umbels of cream, green, or white flowers. See **GINSENG**.

**Panay**, is. of the Philippines, bounded on the W. by Mindoro Sea and on the E. by Iloilo Strait. It has an area of 4446 sq. m., and is mountainous and well watered. The chief industry is agriculture, sugar, rice, and copra being the staple crops, but cotton, corn, chocolate, pepper, bananas, mangoes, pineapples, coffee, and tobacco are also grown in large quantities. Jap. forces occupied P. from May 1942 until March 1945. Iloilo (pop. 46,000) is the largest tn. Pop. 301,700.

**Pancha Tantra**, or **Panchatantra**, see **BIDPAI**.

**Panchayat**, elective committee among the Parsees which manages secular affairs. In Madras the Ps. are vil. committees whose chief duty it is to attend to sanitation.

**Panch Mahals**, dist. of India in the N. div. of Bombay, with an area of 1606 sq. m. Timber is exported, and rice and pulses grown. Chief tn., Godhra. Pop. 330,000.

**Panaras**, St., Thyrigian Christian who was martyred in Rome at the age of fourteen. The date of his martyrdom is uncertain. He was buried in the cemetery of Calepodius in Rome, and his head is preserved in the Lateran Basilica. His cultus was very widespread in Europe in the Middle Ages. Pope St. Vitalian in the

seventh century sent relics of the saint to one of the A.-S. kings, and thenceforward St. P. became very popular in England. His feast is kept on May 12.

**Panchromatic Photography**, see under **PHOTOGRAPHY**.

**Pancreas**, long, narrow, racemose gland composed of two kinds of tissue. In man the P. lies behind the stomach, the larger end lying within the bend of the duodenum, and the narrow end in contact with the spleen. The cells of one kind of tissue are similar to those of the parotid gland and secrete the pancreatic juice containing trypsin, which converts proteids into peptones, some of which it breaks up into leucine and tyrosine; a ferment amyllopsin, similar to ptyalin, which converts starch into sugar, chiefly maltose, but partly dextrose (glucose); and another ferment, lipase, saponifies and emulsifies the fats. These digestive juices are poured into the duodenum at the middle bend, together with the bile; they are viscid and alkaline, due to the presence of sodium carbonate. The cells of the second kind of tissue form the is. of Langerhans, and their secretion contains insulin (from Lat. *insula*, an is.), which is important in carbohydrate metabolism. If the P. be removed, the amount of sugar in the blood increases and some is excreted in the urine, as in diabetes mellitus, a disease in which the carbohydrate metabolism is disturbed. If the pancreatic duct be severed from the duodenum and exposed so that pancreatic juice is liberated external to the body, carbohydrate metabolism remains normal. This is evidence of the control of this metabolism by an internal secretion of the P. which thus functions as an endocrine organ as well as a digestive gland. The function of the cells of the is. of Langerhans may be impaired or even destroyed by lesions, fibrosis, and degeneration, but in some cases of diabetes mellitus no visible change in these cells takes place (see **DIABETES; GLAND; INSULIN**).

**Pancreatitis**.—Inflammation of the P. usually proceeds from the ducts, and is sometimes associated with catarrh of the stomach, bile ducts, and duodenum, and with the formation of gall stones. The chronic form is accompanied by fever, loss of weight, anaemia, abdominal pains, jaundice, large pale stools, sugar in the urine, and the pancreatic reaction. It is characterised by glandular atrophy and growth of connective tissue, and yields to rest, diet as prescribed for diabetes, regulation of the bowels, and internal antiseptic treatment by calomel, butter-milk, etc., in early stages. In later stages surgical operation is resorted to, the gall being drained either into the large intestine or, by means of a drainage tube, outside, thus lessening the catarrh of the duodenum. Acute pancreatitis shows much more violent symptoms; with collapse, nausea, and vomiting, sudden acute colic in the upper abdomen, and a tense and swollen condition of that part, and fever. Death supervenes on the third or fourth day, unless operation and drainage are resorted to. It is of three types: (1)

hemorrhagic, (2) gangrenous, (3) suppurative, with abscess formation; fat necrosis is observed in the substance and surface of the gland. The gangrenous form is regarded as an advanced stage of the hemorrhagic form and results from the infection of the P. by bacteria which disintegrate the tissues.

**Panda**, or **Bear-cat** (*Ailurus fulgens*), mammal of the raccoon family (*Procyonidae*) and almost exclusively vegetarian. It is found only at a height of about 10,000 ft. in the S.E. Himalayas. Its total length is about 30 in. The thick fur is rich chestnut or rusty red on the upper parts and black on the limbs and under part. The face has white markings, and the long bushy tail bears a series of indistinct reddish-brown rings. The feet have large semi-retractile claws, and the animal applies nearly the whole of the sole of the foot to the ground in progression. The Giant P. (*Ailuropus melanoleucus*, is allied to the bears; it is a rare animal of E. Tibet, where it was discovered by Père David. Five Giant Ps. brought to England from W. China by Mr. Floyd Smith in 1938 were the first Ps. ever to reach England alive. One went to the Continent, another to New York, and three to the London Zoo. Ming, the sole survivor in 1944 of the five, *d.* in the London Zoo on Dec. 25, 1944. Valued at £2000, she was the rarest and most valuable animal in the gardens. Little is known about the giant P. in its natural state, beyond the fact that bamboo leaves are its natural food.

PANDA

**Pandanus**, genus of evergreen tropical shrubs and trees, with simple, narrow, strap-like leaves which are often variegated, and dicious flowers, followed by globular or oblong fruits. The flowers of *P. odoratissimus* are said to yield attar of roses. Numerous species, especially those of dwarf habit, are grown in the stovehouse.

**Pandean Pipes**, or **Syrinx**, early form of musical instrument, consisting of a series of reeds or pipes of graduated length fastened together, which when blown

across produced the different notes of the scale. It still survives in some countries, but is of no artistic value in composition, the nearest approach being Mozart's use of an instrument of the type playing five notes from G to D in *The Magic Flute*.

PANDEAN PIPES

**Pandects**, see **JUSTINIANUS, FLAVIUS ANICIUS**.

**Pandemic**, see under **EPIDEMIC**.

**Pandharpur**, tn. of Bombay Prov., India, on the Bhima, 38 m. from Sholapur. It is a popular pilgrims' resort, containing a famous temple to Vishnu. Pop. 30,000.

**Pando**, dept. of Bolivia, adjoining Brazil, in the N.W., is a low-lying area. Cobijsa is the cap. Area 32,405 sq. m. Pop. 18,600.

**Pandora**, in Gk. mythology, name of the first woman. Zeus, out of revenge against Prometheus, who had stolen fire from heaven, caused a woman to be made, who, by her charms and beauty, should bring misery upon the human race. The gods endowed her with powers, and called her P. or 'All-gifted'. She brought from heaven a box containing every human ill, upon opening which they all escaped and spread over the earth. Hope alone remaining. Later the box is said to have contained blessings for the preservation of the human race, but when opened these blessings escaped. See Hesiod, *Works and Days*, lxxxi. seq.

**Pandulf** (d. 1226), bishop of Norwich, b. in Rome. He was sent as papal legate to England in 1211 and 1213 to negotiate with King John, and was also present at the conference of Runnymede in 1215. He received the see of Norwich in 1218, and until his retirement in 1221 exercised much power as legate.

**Panetas**, see under **BANIAS** and **CÆSAREA**.

**Panegyric** (Lat. *panegyricus*), writing or public oration in praise of some person or achievement. Hence the word has come to be applied to anything said or written in a highly laudatory manner of someone or something.

**Panel Beating**, process used in sheet-metal work, to shape the sheet metal for duct work and trunking. Accuracy is essential, especially in the assembly processes such as welding, when heat tends to distort the lines. Machine fabrication is rapidly taking the place of hand-work.

**Panel Heating**, system of low-temp. heating in which small pipes are placed below the surface of walls and ceilings, or beneath flooring, and hot water circulates through them at a temp. of from 70° to 130° F. For complete safety, P. H. should be thermostatically controlled.

**Panel Walls**, walls which fill the spaces between the vertical and horizontal framing members of a structure. They are constructed of a fire-resisting material such as bricks or concrete, and usually comprise two skins or walls. The outer one must be impervious, to keep out moisture, and the inner one pervious to absorb the moisture given off by the occupants of the room.

**Panelling**, covering of a surface in a building, such as a door, ceiling, or wall, with panels, i.e. sunken or raised compartments, usually framed at the edges. They may be of stone, plaster, or wood. Ceiling plaster panels often most ornately moulded, were a common form of interior decoration from the sixteenth to the nineteenth century, while Wren popularised for a time the use of stone and marble P., much favoured by It. Renaissance craftsmen. Wood has been a favourite material for P. since the late Middle Ages. As a type of mural decoration, wood-P. was first used in England in the fifteenth century, solid wood being used. The joiner working in solid wood had always to allow for the limitations placed upon his work by his material. Both the design and construction of Ps. were determined by the nature of the wood. In Tudor times panels were small and unjointed, set in a close framework of stiles and rails, which were all grooved. The panels were set in dry, in expectation of the inevitable shrinkage. In the seventeenth century, when soft woods and scantlings appeared, the design changed to allow for the introduction of large panels, developing into the long Palladian oblong, bolder and simpler mouldings replacing the elaborate detail of earlier times. The influence of Robert Adams reduced the eighteenth century P. to more modest proportions: plain white or cream paint became the chief decoration on Ps., and the moulding was even simpler. But, throughout, the method of construction remained essentially the same: that of a framework grooved and rabbeted to conceal the unavoidable movement in the panels, so that, at worst, it was only necessary to paint or polish the margin that shrinkage would expose along the arris on the stile or rail framing the panel. In modern times, however, the commercialisation of plywood (q.v.) has led to entirely new methods of construction, and, because of its lower costs, to a much wider use of P. Plywood boards in Gaboon mahogany are now mass-produced at a size of 65 in. by 183 in., so that very large plywood panels are frequently used. The shrinkage in plywood is negligible, and mostly confined to end grain shrinkage: the modern designer's chief concern is therefore the concealment of butt and heading joints, since the minutest crack produced by such joints would otherwise be visible on the polished surface given by modern veneering (q.v.), which is the most popular form of panel finishing to-day.

**Pangani**, tn., dist., and riv. of E. Africa, in Tanganyika Ter. The Indian Ocean borders the dist. in the E. The tn., 32 m. S. of Tanga, is on the riv. (which is called

Ruvu near the mouth); much of its former importance has been lost. Sisal, coconuts, and sugar are grown in the dist. In 1933 work was begun for a hydro-electric station at the P. Falls. Pop. of tn. 3000.

**Pange Lingua**, opening words, used as the name, of two famous hymns. The earlier, *Pange lingua gloriosi praelium certaminis*, treats of the Passion of Christ, and is ascribed to Venantius Fortunatus, and by some to Claudian Mamertus (fifth century). It is in the accented unrhymed verse of the period. The other and more popular hymn, *Pange lingua gloriosi corporis mysterium*, treats of the Eucharist and was written by Thomas Aquinas (thirteenth century). It is in rhymed verse and is notable for the theological precision of Aquinas as well as its triumphant swing, imitated from the earlier hymn. There are also lesser known hymns beginning P. L.

**Pangeism**, see under HEREDITY.

**Pangermanism** (Ger. *Pangermanismus*), movement which developed in Germany during the latter half of the nineteenth century, with the intention of encouraging a greater economic and political unity between the Ger.-speaking peoples and those countries under Ger. influence, i.e. Austria-Hungary, Holland, Luxembourg, Flen., Belgium, and Switzerland. An impetus to P. was given by the success of Ger. arms in the Franco-Prussian war of 1870, and from this derived two movements called *Einiges Deutschland* and *Grossdeutschland*. Later these were welded into one society, the *Alldescher Verband* (1890). The political aspect of the First World War was an emphatic expression of P. The alliance with Turkey was the outcome of pangermanist theories, having for its ideal the extension of *Mittleuropa* to include Constantinople. The so-called Flen. movement during the Ger. occupation of Belgium, which aimed at dissociating Flen. Belgium from the remainder and bringing it under closer Ger. influence, was also in accordance with P. So too was the Ger. policy in Poland: it was proposed to give that country autonomy, but only under Ger. supervision. With Germany's defeat in the war and the dissolution of the empire into federated states, the scheme of *Mittleuropa* collapsed and the disintegration of the Austro-Hungarian Empire seemed to have given P. its death-blow. But it was revived in all its worst features under Hitler, who was brought up in the atmosphere of Austrian P. and permanently influenced by It. Bismarck, though a protagonist of P., advocates the political integrity of Austria and the 'little German' solution of the national question in Germany. Hitler, however, discarded the limitations on P., and, from one annexation after another, proceeded to engulf most of Europe. See also NEW ORDER.

**Pangin**, alternative name of Nova-Gôa cap. of Jôa (q.v.).

**Pangkor**, or Pankur, see under DINDINGS. Pangolin, or Scaly Ant-eater (*Manis*), genus of edentate (toothless) mammals, found in Africa, India, Ceylon, Java,

Borneo, China, and Formosa. There are about seven species. They are lizard-like in appearance, and, with the exception of the muzzle, sides of the head, throat, chest, and belly, are covered with scales. They vary in length, according to species, from 1 to 3 ft., exclusive of the prehensile tail, which is about twice as long as the body. The head is small with a tapering muzzle. The lower gums of the mouth form two thickened horny ridges separated by a groove along which the cylindrical worm-like tongue slips in and out. The feet are strongly clawed, especially on the third toe of the fore foot, which is used in burrowing and in climbing. The extreme tip of the tail is free from scales and padded with thick skin. The protection afforded these animals by their scales is

PANGOLIN

supplemented by a powerful stench emitted by the entire surface of the skin. The single genus (*Manis*), which contains all the *Ps.*, may be divided into two groups, distinguished both by geographical distribution and certain convenient but not very important external characteristics. In the first or Asiatic group are three species *M. javanica*, ranging from Burma through Java to Borneo; *M. asiatica*, found in China, Formosa, and Nepal; and the *M. pentadactyla* or the common Indian *P.* found over the whole of India and Ceylon. In the African group are the long-tailed *P.* (*M. macrura*), which has a tail nearly as long as its body, the white-bellied *P.* (*M. tricuspis*), the short-tailed *P.* (*M. temminckii*), and the giant *P.* (*M. gigantea*)—both the last two species have their tails covered entirely with scales. Two specimens of Temminck's (named from Konrad Jacob Temminck, 1778-1857, one-time keeper of the Leyden museum of natural hist.) *P.*, which is confined to the savannah regions of E. Africa, were received by the Zoological Gardens in July 1949. Temminck's *P.* is a terrestrial species, as is also the giant *P.*, unlike the two W. African species *M. macrura* and *M. tricuspis*, which are arboreal. It grows

about as big as a medium-sized pig and has a much broader and shorter tail than the other species. With its bony overlapping scales, which protect it against carnivorous animals, the *P.* is probably quite safe from them when it rolls up into a ball. Its natural food consists of ants and termites; but the terrestrial species is much easier to feed than is the arboreal, which seem almost impossible to keep in captivity. The young *Ps.* are carried about on the mother's tail.

'Panhandle State,' see WEST VIRGINIA.

**Panicum**, genus of grasses which includes two Brit. species and a large number of tropical ones, the most important of which is *P. miliaceum*, millet (*q.v.*).

**Panipat**, decayed tn. in the Karnal dist. of the E. Punjab, India, on the Grand Trunk Road, some 50 m. N. of Delhi. It is celebrated in legend and hist. as the scene of many great battles and is said to have been one of the pledges demanded from Duryodhana by Yudishtira as the price of peace in the war which forms the theme of the national epic, the *Mahabharata*. In modern times the plains of *P.* have thrice been the scene of battles, which have settled the fate of Upper India: in 1526, when the greatest though not the last of the Muslim invaders of India, Baber, the son of Mongolian descendant of Timurlane, came through the passes from Kabul at the invitation of the Muslim governor of the Punjab in rebellion against Delhi and with only 10,000 men defeated the immense army of Ibrahim Lodi, and by securing the mastery of the N. plain confirmed the Muslims in possession of the Mogul Empire, in 1556, when Baber's grandson Akbar, on the same battlefield, reassured the claims of his family by defeating Hemu, the Hindu general of the Afghan Sher Shah, who had driven the heirs of Baber from the throne of the Mogul Empire for a brief period; and finally on Jan. 7, 1761, when Ahmad Shah Durani, ruler of Afghanistan, having taken and plundered Delhi (1754), met a great Maratha (or Mahratta) army and routed it with such overwhelming slaughter (the death-roll of combatants and camp-followers is said to have been reckoned at nearly 200,000) that the power of the Marathas was completely broken for at least a generation. The site was once used as a manoeuvring ground for Brit. camps of instruction. The tn has manu- of cotton cloth, metal ware, and glass. Pop. 37,800.

**Pan-Islamism** is a term applied to organized Muslim hostility to the threat of Christian domination of the Muslim world. With some of its protagonists, Islamic Brotherhood, *El Ukhwa el Islamiya*, always a fundamental doctrine of the Muslim faith, has been used to promote the idle political dream of an All-Islamic federation. *P.-I.* has been assisted in its activities by the institution of the 'Hajj' or the pilgrimage to Mecca and by the caliphate, and perhaps of the two the Hajj was the more potent. Every year 100,000 pilgrims meet at Mecca, constituting virtually an annual Pan-Islam congress, and the leaders of

the militant bodies have here discussed plans for Islam's defence and propaganda. Manifestations of the hostile spirit of Mohammedanism to the Christian, and indeed to all other religious communities, occurred in Algeria with the Kabyle insurrection of 1871, the Mahdist rising in the Egyptian Sudan ending with Kitchener's capture of Khartoum at the end of the nineteenth century, while echoes reverberated in Central Asia, Afghanistan, the Dutch E. Indies, and India. The most active centre of activity was that of the Senussi order focused in Jowf, in the heart of the Libyan Sahara. Its influence was general throughout Arabia and N. Africa. The Senussi, however, although powerful, are not bellicose, and attached more importance to establishing unity among the Muslim world first, by development of oases, the building of better houses along caravan routes, promotion of trade, etc. Their power, however, was utterly broken after the First World War by Gen. Graziani after he had conquered Libya for the It. Fascists. During the First World War P.-I. necessarily curtailed its programmes, but the Turkish sultan, as holder of the now defunct caliphate (an institution which implied the political communion of all Muslims under one head) declared a  *Jihad*  (Holy War) on the Allies, a declaration which utterly failed of its purpose, for, in that war, Islamic Arabs and Indians fought against Islamic Turks. When Atatürk (q.v.) abolished the caliphate the centre of P.-I. passed to the Arabs of the Arabian Peninsula. When peace had been declared strenuous efforts were made to quicken the advance of P.-I. Outbreaks in Iraq required strong military measures by the Brit. Gov., and in Persia a similar threat of widespread action by Muslims of that country was only checked by the energetic nature of Gen. Dunsterville's campaign. With a view to restoring the caliphate a caliphate congress was held in Cairo and an All-Muslim congress in Mecca, in 1926, and the names of King Hussein of the Hejaz and Ibn Sa'ud were put forward for the post, but no practical decision was reached. There has in fact been no united Pan-Islamic empire since the early days of the caliphate, and the obstacles to its restoration to-day are far greater than those which stand in the path of the Pan-Arabic (q.v.) movement. Apart from the very natural economic programme of recovery of land, mines, forests, railways, etc., conceded to foreign powers, P.-I. to-day is really nothing more than a useful spiritual weapon in the Islamic people's struggle for national freedom. See also under ISLAM. For its development in the First World War see Sir V. Chirol, *India in Travail*, 1918; H. M. Hyndman, *The Awakening of Asia*, 1919; and L. Stoddard, *The New World of Islam*, 1921.

**Panizzi**, Sir Anthony (Antonio) (1797-1879), prin. librarian of the Brit. Museum, b. at Brescello, Italy. In 1822, having conspired against the gov., he fled to England. Here he made many acquaintances,

including Brougham, who secured him, in 1831, an assistant-librarianship at the Brit. Museum. He became keeper of printed books in 1837 and prin. librarian in 1857. He was in the first place responsible for the catalogue of books, and was the originator of the great domed reading-room. He was created K.O.B. in 1869. The services he rendered to students in connection with the organisation of the library have been universally recognised. The library, however, was not his only interest, for he was a keen politician, and used all his influence to further the cause of the liberation of Italy. See C. Brooks, *Antonio Panizzi, Scholar and Patriot*, 1931.

**Panji**, see OXUS.

**Pankhurst**, Emmeline (1858-1928), Eng. feminist leader, b. in Manchester, daughter of Robert Goulden, calico-printer and early advocate of woman-suffrage. At thirteen she went to school in Paris, and made friends with the daughter of Henri Rochfort. In 1879 she married Richard Marsden P., lawyer, and they served on the committee that promoted the Married Women's Property Act. Five years a Manchester Poor Law Guardian, in 1892 she left the Liberals and joined the Independent Labour party. Widowed in 1898, she became registrar of births and deaths at Chorlton-on-Medlock, forming the Women's Social and Political Union in 1903. From 1906, as a 'militant', she was frequently arrested, and in 1913 sentenced, in connection with the blowing-up of Lloyd George's house at Walton, to three years' penal servitude. When the First World War broke out Mrs. P. went recruiting in the U.S.A. and visited Russia in 1917. She joined the Conservative party in 1918. Her statue was erected in Victoria Tower Gardens, London. She pub. *My Own Story* (1914). See Sylvia Pankhurst, *The Life of Emmeline Pankhurst*, 1935.

Her daughter Sylvia Estelle P. (b. 1882) was also a member of the suffrage movement, and in 1921 received six months' imprisonment for seditious pubs. She also worked for Abyssinian independence. Her works include *The Suffragette Movement* (1931) and a life of her mother (1935). Another daughter, Christabel (b. 1880), was a worker in her mother's cause, after 1918 devoting herself to a religious movement; in 1936 she was created D.B.E. Panna, important tn. in the Bundelkhand dist., Central India, 105 m. N.E. of Jabalpur, is built of stone quarried from the neighbourhood. Pop. 12,000.

Pannonia, prov. of the anc. Rom. Empire, bounded on the N. and E. by the Danube, on the W. by the mts. of Noricum, and on the S. reaching a little way across the Save. It received its name from the Pannonians, a race of doubtful origin. The Rom. arms were first turned against them by Augustus in 35 B.C. An insurrection took place in 12 B.C., which Tiberius crushed after a long struggle; and a much more formidable one of the Dalmatians and Pannonians together in A.D. 6 was suppressed by Tiberius and Germanicus, but not till A.D. 8. Here-

upon the Pannonians settled in the more N. countries, which received their name. The country was now formed into a Rom. prov., which was secured against the inroads of the Marcomanni and Quadi by the Danube, and on its other frontiers had a line of fortresses. Military roads were constructed by the conquerors, who also planted many colonies in the country. Great numbers of the Pannonian youth were drafted into the Rom. legions, and proved, when disciplined, among the bravest and most effective soldiers of the imperial army. P. was subsequently divided into Upper and Lower P. Upper P. was the scene of the Marcomannic war in the second century. In the fifth century it was transferred from the W. to the E. empire, being afterwards given up to the Huns. After Attila's death, in 453, the Ostrogoths obtained possession of it. The Longobards under Alboin made themselves masters of it in 567, and relinquished it to the Avars upon commencing their expedition to Italy. Charlemagne brought it under his sceptre. In the reigns of his successors, the Slavonians spread northward, and the country became a part of the great Moravian kingdom till the Magyars or Hungarians took it at the end of the ninth century.

Panompeng, or Panompenh, see P'ANOM-PENII.

Panorama, originally constructed by Robert Barker, an Irish artist (1739-1806) living in Edinburgh, who exhibited a water-colour picture of Edinburgh (1788) on a cylindrical canvas 25 ft. in diameter. The name applies to such pictures and to those revolving on cylinders. The *diorama* is a variation invented by Daguerro and Bontou, viewed by direct and reflected light, and giving a more glowing effect. Barker showed a P. of 90 ft. in diameter in a specially built room in London (1793). Robert Fulton in 1797 carried the idea to Paris, and Ps. became popular on the Continent. Prévost painted 'Tilsit,' viewed at Montmartre by Napoleon (1810). Battle pictures by Langlois of 'Navarino,' 'Moscow,' 'Pyramids,' and 'Malakoff' were exhibited at the Champs Elysées. The 'Siege of Paris' and Ps. of the Franco-Ger. war were shown in the two countries. Scenes from the civil war in the U.S.A., Niagara (1890), and Jerusalem (1891) were exhibited in London.

Panormus, see PALERMO.

Panslavism, movement for the union in polity and culture of all the Slav races, in which Russia has naturally taken the lead as the great political representative of these races. The movement began about 1830, and the spread of the national spirit in Europe at this time considerably strengthened it. A congress was held at Prague in 1848, to which most of the Slav races sent representatives. In the sixties Russia used P. as an instrument of tsarist imperialism, for strengthening the Russian hold on Poland and the Ukraine, and for furthering Russian aspiration in the Balkans and in the Austrian empire. The congress held at Moscow in 1867 was, however, less successful than the Prague

Congress, for, not unnaturally, the fear had grown that the movement was becoming no more than an instrument for the aggrandisement of Russia. In the old tsarist days Russia's pan-Slavist policy was directed mainly against the Habsburg monarchy. The Czechs were chief adherents of P. among the W. Slavs, while the Poles, oppressed by tsardom, were its prin. opponents. The movement also affected the Russo-Turkish war of 1877 and the Balkan war of 1912-13. The chief value of the movement was in the revival of interest in folk-literature, stimulated by Jan Kollar, who was the representative writer of P., his essays on Slavonic reciprocity appearing in 1836. Tolstoy came to regard the Slav folk-lore as the purest form of literature, although he never actually joined the Slavophil group of writers. These latter believed it right for the Slav people to leave 'the task of governing to its rulers, while retaining its intellectual freedom to disapprove of what was done amiss.' This justification of the existing order was obviously out of sympathy with the increasing revolutionary theories, and, with the downfall of the tsarist regime and the triumph of the revolution, P. for a time ceased to be a practical force. Mutual inter-Slav sympathies have frequently been invoked since then, but in practice they have been of little avail in face of dissensions among the Slav peoples, such as the Polish-Russian and Serbo-Bulgarian conflicts. To day the traditional pattern of P. reasserts itself, and schemes for E. and central European federations are regarded in Moscow merely as a new version of the Habsburg monarchy, with its centre of gravity in Warsaw instead of Vienna. Following the Second World War Russian foreign policy was concentrated on a deepening *cordon sanitaire* of sovietised states on her W. border as a counterpoise to the 'Western democratic bloc.' In effect this policy was nothing less than P. used as an instrument of Soviet aggrandisement and imperialism. See R. W. Seton-Watson, *The Southern Slav Question and the Hapsburg Monarchy*, 1911; A. Fischel, *Der Panslavismus bis zum Weltkrieg*, 1919; D. J. Oallin, *Russia and Post-war Europe*, 1943; and J. R. Deane, *The Strange Alliance*, 1947.

Pansy, or Heart's-ease (*Viola tricolor*), dainty Brit. plant, common on arable land, and wholly or in part the origin of the numerous and beautiful garden varieties which have all been introduced since the beginning of the nineteenth century. Violets or tufted Ps. are partly derived from *V. cornuta* of the Pyrenees. The production of flowers is encouraged by removing faded flower heads. Propagation is usually by cuttings or division of plants.

Pantagraph, see PANTOGRAPH.

Pantagruel, see RABELAIS.

Pantaleon, Jacques, see URBAN (popes), Urban IV.

Pantellaria (anot. Kossyra), volcanic is. situated in the Mediterranean to the S.W. of Sicily. The vine, olives, and sub-tropical fruits are grown, and the mt.

slopes are covered with forests. Sheep are reared in the valleys. Pop (1939) about 9000. Cap., P., which has a convict prison. Though strongly fortified P. did not long hold out against allied attacks delivered in 1943 simultaneously with the final conquest of Tunisia. Initial attacks were by forces of fighters and light and medium bombers (May). On June 7 Wellingtons and Flying Fortresses reinforced a daylight assault and a naval blockade. Cruisers and destroyers bombarded the Is. sev. times between May 30 and June 8. Though isolated by that time, the exhausted garrison refused to surrender. Air attack was then redoubled, and on June 10 there were over 1500 sorties of planes which dropped the same number of tons of bombs. Next day a powerful force of cruisers and destroyers began a bombardment, quickly followed by another great air raid, while at mid-day the troops put off in assault craft towards the shore. The Lt. commander then surrendered. Under the 1947 peace treaty P. is to be demilitarised.

**Panthalops.** see CHUR.

**Pantheism** (Gk. *pán*, all, and *theós*, God), name given to that system of speculation which, in its spiritual form, identifies the universe with God, and therefore may be called *akosmism*, and, in its more material form, God with the universe. It is only the latter kind of P. that is logically open to the accusation of atheism; the former has often been the expression of a profound and mystic religion. The antiquity of P. is undoubtedly great, for it is prevalent in the Hindu civilisation, the oldest known in the world. Yet it is a later development of thought than Polytheism, the natural instinctive creed of primitive races; and most probably it originated in the attempt to divest the popular system of its grosser features, and to give it a form that would satisfy the requirements of philosophical speculation. Hindu P. as *akosmism* is taught especially by the Upanishads, by the Vedānta and Yoga philosophies, and by those poetical works which embody the doctrines of these systems, for instance, the Bhagavad Gītā, which follows the Yoga doctrine. Hindu P. is purely spiritual in its character; matter and (finite) mind are both alike absorbed in the fathomless abyss of illimitable and absolute being. Gk. P. originated in the same way as that of India. The philosophy of Anaximander the Milesian (611-c. 547 B.C.) may be described as a system of atheistic physics or of materialistic P. Its leading idea is, that from the infinite or indeterminate, which is 'one yet all,' proceed the entire phenomena of the universe, and to it they return. Xenophanes of Colophon (b. sixth century B.C.) is the first classical thinker who promulgated the higher or idealistic form of P.—'casting his eyes wistfully upon the whole heaven, he pronounced that unity to be God.' It is often extremely difficult, if not impossible, to draw or to see the distinction between the P. of the earlier Gk. philosophers and sheer atheism. But the most decided and the most spiritual representatives of this

philosophy were the 'Alexandrian' Neoplatonists, in whom we see clearly, for the first time, the influence of the E. upon Gk. thought. The doctrines of Emanation, of Eo-tasy, expounded by Plotinus (A.D. 204-70) and Proclus (410-85), no less than the fantastic Demonism of Iamblichus (d. c. 330), point to Persia and India as their bp. During the Middle Ages speculation was held in with tight reins by the Church, and we hear little of P. The scholastic system, culminating in the synthetisms of Aquinas, necessarily excluded P. as repugnant to the simplicity and transcendence of God. Almost the only philosopher of this period who tended towards pantheistic views is John Scotus Erigena (c. 817-c. 877), who is regarded as the only link between auct. and modern P. Modern P. first shows itself in Giordano Bruno, burned at Rome for his opinions in 1600. The universe in his eyes is, properly speaking, not a creation, but only an emanation of the infinite mind. Spinoza comes next among pantheists; his system is based, like the geometry of Euclid, on certain definitions and axioms, and he claims to have given it as conclusive and mathematical a demonstration as the latter. The prin. result at which, after a long, firm-linked chain of reasoning, Spinoza arrives is that there is but one substance, infinite, self-existent, eternal, necessary, simple, and indivisible, of which all elements are but modes. This substance is the self-existent God. In Germany, with the exception of Kant, the three greatest philosophers of recent times—Fichte, Schelling, and Hegel—have all promulgated systems of a thoroughly pantheistic and ideal character. Neither England, France, nor America has produced a single great pantheistic philosopher, but there is an immense amount of vague pantheistic sentiment in the poetry, criticism, theology, and even in the speculative thinking, in these and all European countries in the present age. This is attributable to the ravages made by biblical criticism, and the impact of the physical sciences on religious beliefs. See also METAPHYSICS; MOVISM. See G. Weissenborn, *Vorlesung über Pantheismus und Theismus*, 1859; C. E. Plummer, *The History of Pantheism*, 1878; F. Paulsen, *Der moderne Pantheismus und die christliche Weltanschauung*, 1906; and J. A. Peaton, *Pantheism*, 1914.

**Pantheon** (from Gk. *πανθεον*, temple to all the gods), temple erected at Rome in A.D. 123 by Hadrian to replace the previous P. of M. Vipsanius Agrippa (erected 27 B.C.), which had been destroyed by lightning. It is the best preserved and most noble specimen of Rom. architecture (q.v.). It is now used as a Christian church.

**Panther**, see LEOPARD and PUMA.

**Panther-cat**, see OCELOT.

**Panticapœum**, see KERCH.

**Pantin**, tn. on the Canal d'Ouroq in the dept. of Seine, France. It is a suburb of Paris, and has extensive dye works, glass works, tobacco and chemical factories, and sugar refineries. Pop. 37,700.

**Pantograph**, instrument used for making exact copies of a plan or drawing on a larger or smaller scale. The commonest form is made as follows. Four rods are joined together as in figure at points A, B, C, and D, so that ABCD forms a parallelogram, and so that OD = DC and OB = BP. The instrument is pivoted at O, there is a tracing point at P, and a

PANTOGRAPH

pencil at C. The tracing point is then moved over the drawing to be copied, and by the pencil at C a smaller reproduction of the drawing is made at the same time. If the drawing is to be enlarged, the tracing point is placed at O and the pencil at P. Since the points D and B can be moved up and down the rods at pleasure, all positions can be arranged for.

**Pantomime**, among the ancients, denoted not a spectacle but a person. The *Ps* were a class of actors who acted their parts only in dumb show. The date of their first appearance in Rome cannot be ascertained; probably the *histriones* brought from Etruria to Rome in 364 B.C. were *Ps*, but the name does not once occur during the republic, though it is common enough from the very dawn of the empire. Augustus showed great favour to this class of performers, and is consequently supposed by some writers to have been himself the inventor of the art of dumb acting. The class soon spread over all Italy and the provinces, and became so popular with the Roman nobles and knights that Tiberius reckoned it necessary to administer a check to their vanity by issuing a decree forbidding the aristocracy to frequent their houses, or to be seen walking with them in the streets. Under Caligula they were again received into the imperial favour, and Nero himself acted as a *P*. From this period they enjoyed uninterrupted popularity as long as paganism held sway in the empire. As the *Ps* wore masks no facial mimicry was possible, everything depended on the movements of the body, and it was the hands and fingers chiefly that spoke. The subjects thus represented in dumb show were always mythological, and consequently fairly well known to the spectators. The dress of the actors was made to reveal, and not to conceal, the beauties of their person, and as, after the second century, women began to appear in public as *Ps*, the effect of the æsthetic costume was conducive to immorality; sometimes these pantomimic actresses

appeared quite naked before an audience. It was quite natural, therefore, that pantomimic exhibitions should have been denounced by the early Christian writers, as they were even by pagan moralists like Juvenal.

In modern usage *P* denotes not the performer but the piece performed, the character of which nowadays is described under **HARLEQUINADE**. The Christmas *P*, or harlequinade has now become an essentially British entertainment. It was first introduced in this country by a dancing-master of Shrewsbury named Weaver in 1702. One of his *Ps*, entitled *The Loves of Mars and Venus*, met with great success. The arrival in London, in the year 1717, of a troupe of French pantomimists with performing dogs gave an impetus to this kind of drama, which was further developed in 1758 by the arrival of the Grimaldi family, the head of which was a posture-master and dentist. Joseph Grimaldi, the son of the dentist, was clever at inventing tricks and devising machinery, and *Mother Goose* and others of his harlequinades had an extended run. At that time the wit of the clown was the great feature, but now the chief reliance of the manager is on scenic effects. See also RICH, JOHN. See R. J. Broadbent, *A History of Pantomime* 1901, C. W. Beaumont, *History of Harlequin*, 1926, and A. E. Wilson, *Christmas Pantomime*, 1934, and *The Story of Pantomime*, 1944.

**Papacy** (Medieval Lat. *Papatus* from Lat. *papa*), position of the pope or bishop of Rome, with reference to its claim to be the head and centre of unity of the whole Christian Church. W. Christendom is broadly divided into two sections, of which one admits the claims of the *P*, while the other emphatically denies them. According to the Roman Catholic belief the *P* owes its origin to Christ Himself, who gave to St. Peter the primacy of the Church (see especially Matthew xvi 18, 19, Luke xxii. 31, 32), and it is claimed that at the Council of Jerusalem he occupied this position (Acts xv). St. Peter ultimately came to Rome, where he lived and died as bishop of the Church in this place. His powers and office as primate of the Church were handed on to his successor, and so the office has been handed down to the present day. It is however, important to notice that the powers are attached to the office itself. The bishop of Rome is elected, and the peculiar papal powers are his in virtue of his being the successor of St. Peter in the case of Rome. By the end of the fourth century the papal supremacy was generally recognised, in a theological but not in a political sense, and Leo I. (440-461) may be considered as the first of the popes to exercise his jurisdiction on a large scale. The acceptance of his famous *Letter or Tome* at the Council of Chalcedon (451) was in itself a great step. Gregory the Great (590-604) shows the

political and economic side of the Rom. administration. He was responsible for sending Augustine and forty monks to convert the A.-S. (597) and for the planning of two archiepiscopal sees in England, viz. Canterbury and York. He kept in close touch with the Frankish kings, whose help was continuously sought, in the centuries that followed, as a defence against the Lombards. The temporal sovereignty of the Rom. see estab. itself gradually as the Rom. emperor's authority, represented at this period by an Exarch living in Ravenna, grew weaker and weaker, and civil administration at Rome devolved more and more on the bishop. The grant of the papal states was made by Pepin in 753 to Pope Stephen II., Pepin having himself conquered them from the Lombards. A fresh epoch in the hist. of the P. is marked by the coronation of Charlemagne as emperor by Leo III. (800), when the imperial name was revived. During the ninth and tenth centuries the conditions of things at Rome deteriorated. The pope became the mere puppet of conflicting political parties, and the papal prestige reached its lowest point. Reform, largely urged on by the great monastic orders, began in the eleventh century under Leo IX., acting under the guidance of Hildebrand. Hildebrand himself came to the papal throne as Gregory VII. (1073-85), and his vigorous campaign on behalf of the freedom of the Church was eminently successful, accompanied as it was by a moral reformation. The only Englishman to become pope, Nicholas Breakspear, reigned as Adrian IV. (1154-59). For a time the papal power continued to increase and expand until it reached its culminating point in the pontificate of Innocent III. (1198-1216), whose actions and success against King John of England is alone sufficient to demonstrate this. After this comes a decline. The conflict between Pope Boniface VIII. (1294-1303) and Philip IV. of France as to the power of the state to tax the Church ended in the victory of the Fr. monarch. About this period the popes lived relatively little in their own city, but travelled much in their states. The influence of the Fr. king was seen in the election of a Frenchman as Pope Clement V. in 1305. Partly owing to this influence and the disturbed state of Italy, he took up his residence in the little state of Avignon. Here he and his successors who were Frenchmen were subject to the strong influence of the Fr. king, and as this period lasted over seventy years (1309-76) it has come to be known as the 'Babylonian captivity.' It did much to lower the prestige of the P. in N. Europe, and as the P. also fell heavily into debt through the extravagance of Peter Roger, Clement VI., subsequent papal policy was marked by heavy and correspondingly unpopular taxation. In 1377 Gregory XI. returned to Rome at the entreaty of Catherine of Siena, and on his death an It., Urban VI., was elected. His harshness led to a revolt of the cardinals who proceeded to elect Robert of Geneva, who took the

title Clement VII. So occurred the great schism, as each party continued to elect a successor when their claimant died. Europe had the spectacle of two or more popes reciprocally fulminating anathemas. During this period the spirit of nationalism which assisted in the Reformation largely increased. The great schism was healed by the Council of Constance (q.v.) (1414-1418). The result of all this was that the General Council became stronger than the popes, and the fifteenth century is marked by struggles between the two authorities. The Reformation led to an internal reform of the P., which was roused to grapple with the situation. The outstanding papal reformer was the Dominican, Pope Pius V. (1569-72). The Council of Trent (q.v.) (1545-63) is the great monument of the reform movement that arose in the Rom. Church. The seventeenth century saw the growth and expression of the principles of Gallicanism (q.v.), and the eighteenth century was also one of severity to the P., owing to irreligion and atheism especially rife in France. At the end of the century Pius VI. was deported from Rome by the revolutionaries, and a little later Pius VII. was forcibly removed to France by Napoleon. The latter by introducing the Code Napoleon into the papal states, worked a change which proved irrevocable, and the following years were marked by constant revolutionary and anticlerical activity. The latter half of the nineteenth century, during the pontificate of Pius IX., saw a revival of papal influence in every country in Europe. The period is also one of great importance in the internal hist. of the P., for at the Vatican Council of 1870 the dogma of papal infallibility was promulgated (see INFALLIBILITY), simultaneously with the end of the temporal power of the popes, consequent on the occupation of the city of Rome by Victor Emmanuel. From that date until 1929 the pope remained a prisoner in the Vatican and the state of hostility between the new rulers of Italy and the pope over the confiscated papal states was known as 'the Roman Question.' The period of the pontificates of Pius IX. (1846-78) and Leo XIII. (1878-1903) is one of the greatest in the hist. of the P.

The P. is considered by Rom. Catholics to be part of the divine ordinance for the government of the Church, and those Christians who do not submit to the jurisdiction of the pope are regarded as outside the communion of the Catholic Church. The pope, as head of the Church, occupies the position which Christ would occupy were He still on earth, and is, therefore, the vicar of Christ, from whom immediately he derives his jurisdiction. The Vatican Council defined that 'when the Roman pontiff speaks *ex cathedra*, that is, when he, using his office as pastor and teacher of all Christians, in virtue of his apostolic office, defines a doctrine of faith or morals to be held by the whole Church, he, by the divine assistance promised to him in the person of blessed Peter, possesses that infallibility with which the Divine Redeemer was pleased to invest

his Church in the definition of doctrine on faith or morals, and that, therefore, such definitions of the Roman pontiff are irrefragable in their own nature and not because of the consent of the Church.' Moreover it defines that the pope has supreme disciplinary power over the whole Church, a power that is 'ordinary and immediate over all and each of the pastors and of the faithful.' Rom. Catholics are careful to point out the numerous limitations which form part of each of these decisions. In the first case the infallibility does not include the pope's expressions of opinion on matters of science, or on the morality of any specific act, or his private opinions even on matters of faith. Again the pope's immediate authority over each of the faithful is not allowed to diminish episcopal jurisdiction.

During the present century the political situation in Italy has given rise to frequent divergence of opinion between the P. and the state. During the First World War Pope Benedict XV. (q.v.) issued an unsuccessful encyclical calling upon the warring nations to come to terms of peace, but refrained from condemning either side. The advent of Fascism in 1922 brought an altogether new approach to the position of the Church in Italy. Civil measures imposed by the ruthless methods of Mussolini brought the two parties often into open hostility, and Benedict's successor, Pius XI., was by no means prepared to submit to Fascist measures, which were calculated to weaken the position of the Church in Italy. After prolonged negotiation, characterised at first by stubborn refusal by both sides to give way, the Lateran Treaty and Concordat was agreed between the pope and Mussolini in 1929. By this treaty the pope resigned all claim to the papal states, except the Vatican area, in return for a recognition of his sovereign status, certain privileges, and compensation.

Before 1939 when the political situation in Europe became overclouded the pope issued appeals for peace, and throughout the war reiterated appeals were broadcast by the Vatican radio. In 1940 Pope Pius XII. condemned the brutal treatment of the Polish people by the Gers. and the Nazi persecution of religion in Poland, denounced the total war launched by Germany as 'a pitiless war of extermination conducted in defiance of the laws of war,' condemned the Ger. invasion of the Low Countries, and attacked the Nazi doctrine of racialism as opposed to man's equality in the eyes of Christianity. In June 1940 the pope came to an agreement with the It. Gov. on the Vatican's status in wartime, and later he instructed all apostolic nuncios and other papal diplomats abroad, most of whom were It. nationals, to take out Vatican citizenship so as to acquire greater freedom of action during the war. In a broadcast to France in March 1941, the pope strongly condemned the Nazi repudiation of Christianity and at the end of that year, in a Christmas broadcast, laid down the

principles for a lasting peace. In the autumn of 1943 when the allied armies were advancing on Rome the Gers. purported to take the Vatican 'under German protection.' Since the war a conflict between the Vatican and the U.S.S.R. has been waged by propaganda and open hostility in the countries of Europe dominated by the Soviet, notably in Poland, Hungary, and Czechoslovakia. The highest point of this campaign was reached in the imprisonment of Cardinal Mindszenty, primate of Hungary, in March 1949.

*The Election of the Pope.*—The pope is elected by the Sacred College of Cardinals (see CARDINAL). After the pope's death the cardinals enter a conclave, holding no communication with the outside world until a new pontiff is elected. The usual means is by secret ballot, two-thirds majority being required, but unanimous acclamation is recognised as well as delegated election by a committee of three, five, or seven cardinals. The power of veto, once exercised by Christian princes, especially the emperor, has been totally abolished. The secrecy of all transactions in the conclave is secured by oath and severe penalties. The new pope may be of any nationality. If not already a bishop he is consecrated, and afterwards crowned, from which ceremony he dates his pontificate. The insignia of the pope are the pallium and the tiara or triple crown.

Papatoetoe, tn. of New Zealand, 12 m. from Auckland. It is now a rapidly expanding residential area, a feature being 30 ac. of improved playing areas. The first local authority was a highway dist. formed in 1862, followed by a tn. dist. in 1919, with a pop. of 1171. The dist. was formed into a bor. in 1946, when the pop. had grown to 3800. The pop. in Feb. 1949 was 4440.

**Papaver**, the poppy, genus of ann. or perennial plants (family Papaveraceae), a number of which are valuable garden plants. The Shirley Ps. are selected varieties of the common corn or red P. (*P. rhæas*). *P. orientale* includes some very showy varieties, varying in colour from white to scarlet. *P. somniferum*, the opium poppy, bears large white flowers with a purple stain at the base of each petal. There are many handsome garden varieties.

**Papaveraceae**, family of herbaceous plants or shrubs, most of which have a milky narcotic juice. There are usually two concave petals which are early deciduous. The petals are commonly in multiples of four. The fruit is globose, capsular, opening by pores, or pod like, opening by valves. The genera include *Meconopsis*, *Lschscholtzia*, *Glaucium*, and *Chelidonium*.

**Papaw Tree** (*Carica papaya*), small tree (family Papayaceae), with a branchless stem bearing green flowers followed by a large, oblong, orange yellow fruit, which is cooked and eaten by the natives before it is ripe. The juice of the ripe fruit is made into sauce, and is said to have the property of making tough meat tender on account of the presence of papain. It is found in Queensland, in sev. is. of the Pacific, the Malabar coast of India, Ceylon, Burma, and the Malay States.

**Papeete**, or **Papeiti** ('little water'), cap. of the is. of Tahiti, on the N.W. coast, at the mouth of the R. P. It is the chief port and trading centre of the is., and is situated on a beautiful harbour protected by a reef. It has a cathedral. Pop. 3500 (of whom about half are Fr.).

**Papen**, Franz von (b. 1879), Ger. politician: b. at Well, Westphalia. In 1914 he was Ger. military attaché in the U.S.A., but had to leave the country on account of his complicity in plots to blow up Amer. munitions factories. He later became chief of the general staff to the Turkish Army in Palestine. In 1921 he entered the Prussian Landtag as a member of the Catholic Centre party. He organised an aristocratic group, known as the *Hervordklub*, in Berlin, which in 1932 prevailed on Hindenburg to appoint an authoritarian gov. of noblemen under P. as chancellor of the Reich, acting, at the same time, as commissary for Prussia. P. helped Hitler to power by organising a conference at the house of Schroeder, a Cologne banker, at which strong political and economic groups of the right agreed to support a National Socialist gov. By 1933 P. was vice-chancellor under Hitler, but in 1934 he began to oppose him. Hitler's answer was to shoot P.'s closest collaborators in the 'blood bath' of June 30, 1934, but P. was not molested. He continued to serve Hitler, and was sent on various diplomatic missions, and as minister to Austria he prepared the notorious *Anschluss*. During the Second World War he was minister to Turkey. Indicted as a war criminal at the Nuremberg trial (q.v.), he was one of three to be acquitted but was arrested by a Ger. court and sentenced under the denazification laws to eight years' detention in a

labour camp, with confiscation of property and loss of rights. An appeal secured his release and loss of rights.

**Paper**. The making of P., as we know it, is quite a modern development, little less than 150 years having elapsed since the invention of a machine for making P. in bulk was given to the world by a Frenchman, Nicolas Robert. In early times written communications and records were inscribed on clay tablets, leaves, and waxed surfaces of wood or metal. The next stage was reached when the Egyptians used their ingenuity and skill in the manuf. of papyrus by unrolling and flattening out the thin layers forming the stem of the papyrus reed. The skins of animals were next pressed into service, and used in the form of vellum or parchment, but this being of necessity a costly and limited production, it occurred to a Chinese named Tsai-Lun in the year A.D. 105 that it would be possible to produce a writing surface from vegetable fibres beaten to a pulp and made into sheets by a felting or interlocking of fibres. This early production, it is said, was made from bark, tow, and old nets. Before this a P. had been made from silk pulp by pounding small waste pieces of silk, this being of course an expensive method, and wood was also used at about the same period. The Arabs in the eighth century learned the craft from Chinese prisoners, carrying on what they were shown. Thus the Chinese were making very good quality, thin, hard-sized writing Ps. (even dyed various colours) in the third and fourth centuries, whereas the Arabs, and later the Egyptians, were making only very poor quality brown Ps., and no fine writing Ps., such as the Chinese had made, even in the tenth century. The Moors, who at one time had sev. P.-mills in Fez (Morocco), during their occupation of Spain introduced the art into Europe, making P. in Valencia and Toledo in the eleventh century. At the same time it was also introduced into Fabriano, in Italy, by people returning from the crusades. Fabriano has continued to be a great P.-making centre, and the mills there are to-day among the leading mills in the world. Water-marking was first invented there. In 1390 a P.-mill was set up by Strumer in Nuremberg, and, in order to safeguard his methods of production, he compelled his men to take an oath under penalty of death that they would keep secret his processes. No record of Eng. manuf. is met with until we come across, in Wynkyu de Worde's *De Proprietatibus Rerum*, printed in 1495 at Caxton's Press, mention of a P.-mill at Stevenage in Hertfordshire, kept by one John Tate. Caxton used Tate's P., with a seven-star wheel type of water-mark, in 1495. In 1588 a ten years' licence was issued by Queen Elizabeth to Spielman to make P. at Dartford in Kent, from which time until the present day some of the finest P. has been made in that co., one of the most famous mills being that of James Whatman, started at Maidstone in 1769. The method of manuf. in these early mills was practically the same

as that in use in the making of 'hand made' P (i.e. P such as is used for bank notes, good account books, drawing Ps, etc.) at the present day. The rags were carefully cleansed, boiled, beaten into pulp, and mixed with water to the consistency of cream. A finely woven wire mould or sieve, sufficiently open to permit the water to fall through but leave the pulp fibres on its surface, was dipped into the vat of creamy liquid and sufficient pulp taken up to make one sheet. In order to fill or interlock the fibres a peculiar horizontal joggling motion was given to the mould while the water was draining away. The resulting sheet or 'water leaf' was placed between sheets of woollen material. After being subjected to great pressure the sheets were hung up

Baliford Paper Mills  
PAPER MAKING BEATERS

to dry, and then sized with animal size (made from pieces of skin gristle and sometimes bones) and finally dried and surfaced by pressure rollers. The only difference made in these processes at the present day is one of better implements and better finishing apparatus.

A new departure was made in 1799, and the first machine for producing P in bulk more rapidly and cheaply in England was set up in a small mill at Boxmoor in Hertfordshire early in the nineteenth century by Fourdrinier. The development was fairly rapid, and by 1850 at least 150 of Fourdrinier machines were in use. Until about 1860 little addition to the varieties of P of chalk or fibre was made, but the repeal of the P duty in that year caused such an increased demand for printing surfaces that new material other than woven stuffs had to be found. A fine fibre was found by Routledge's experiments with esparto grass which grown in Spain and N. Africa, could be easily shipped to this country, and after passing through the boiling, beating and bleaching processes gives fibre of about 50 per cent of its weight. Many other vegetable fibres have been adapted to the use of the P maker during the last seventy years, among them, recently, bamboo which has been very closely investigated, and though

there are certain difficulties in regard to its conversion to pulp it is of such rapid growth and is so widely cultivated that it is likely to be a P making fibre of the future. The largest consumption is that of wood pulp. There are two kinds of pulp produced from wood viz mechanical pulp the result of a tearing and grinding of the logs and the production of a coarse fibre suitable for use in the manufacture of newspaper and chemical pulp which is produced by the melting out, by use of acids and sodas of all but the necessary fibre the resulting material being used in the manufacture of various types of printing Ps. Nowadays Ps are usually made not merely of one fibre but of combinations of rag esparto and wood the proportions varying according to the quality wanted in the result. The introduction of machines for making the P besides creating demands for fresh fibres and pulps, of necessity revolutionised all the old processes which had been sufficient when each sheet was made by hand. The pulp after beating and mixing with water is turned on to a wire mould but in this instance the mould or sieve becomes an endless band of wire gauze kept moving by rollers and joggled from side to side by special arrangements to effect the felting or matting of the fibres. Rubber 'duck' strap at the sides hold the pulp in the gauze. Finally a 'dandy roll' is used which is a copper wire cylinder used for the purpose of impressing into the P what is known as a water mark. After this it is led on blanketing round a succession of drying cylinders heated by steam and finally reaches the finishing or glazing rolls and is then (unless it is required in reels) chopped into sheets. These machines must have been small affairs at first but necessity in the guise of rotary printing machines has caused them to grow in strength, size and number to feed the capacious maw of a modern newspaper printing press. There are many machines in existence turning out huge rolls 240 in wide and carrying a continuous web of P at the rate of nearly 12 m of P approximating 6 tons in weight per hr. The necessity for the cheap provision of a fine printing surface for use with the 'half tone' process block has resulted in the production of a variety of so called 'art Ps' which depend for their surface on a certain amount of china clay and other minerals. Imitation art Ps loaded with china clay in their manufacture are also used for half tone work. In their best form they certainly lighten the printer's work and so cheapen the cost of production but they are anything but conducive to long life or permanence for the beautiful work which is being done at the present time. It is quite possible to do without them and to use a pure P, highly calendered which will it is known, last for centuries but the cost being about twice as much permanence has to be sacrificed to cheapness. There is a cylinder coated P, which is used quite extensively for magazine work but, unlike the art P the coating is applied by means

of rollers or cylinders on the same machine on which the P. is made; this considerably reduces the production cost. An enormous variety of Ps has been called into being by the demands of the modern printer, publisher and other consumers. The demand for lightness and great bulk has encouraged the manufacture of a soft fluffy P. known as 'feather weight', and made to produce a fat looking book which contains only a comparatively small number of pages. The wavy 'deckle edge', natural to hand made Ps, can be artificially produced on machine made Ps. A committee of world experts drawn from librarians and P manufacturers has put on record the P 'furnish' required for books which have permanent value. One of the chief causes of the use of inferior P is

In the U S A there is a similar (though different) range of standard sizes known by area measurement but not by name. World output of P. is enormous—over 20,000,000 tons a year—of which quite half is turned out by the U S A. Canada is the next biggest producer.

See C. F. Cross and E. J. Bevan, *Text Book of Papermaking*, 1900. J. Beveridge, *Paper Makers' Pocket Book*, 1901, 1911; R. W. Sindall, *An Elementary Manual of Paper Technology*, 1906. E. Sutermeister, *Modern Pulp and Paper Making*, 1921; E. A. Dawe, *Paper and its Uses*, 1929; R. H. Clapperton and W. Henderson, *Modern Paper Making* 1939, and D. Hunter, *Papermaking* 1948.

the necessity for providing the printer with a material which he can immediately put on the machine without the old time-consuming preparation of dampening, etc., necessitated by the sizing of the P. Nowadays what sizing there is done is with resinous compounds, mixed with the pulp in the beating engines, but high grade book and bond Ps are 'tub sized', a process of sizing which is employed after the P. is made, the webs of P. actually running through a tub of size and gaining strength and durability. P. is sold in reams of 480 to 516 sheets in Great Britain and 500 sheets in the U S A. The more important standard sizes in Great Britain are.

Size	Writings and Drawings		Printings and Cartridges	
Imperial	30	× 22	30	× 22
Royal	24	× 19	25	× 20

and multiples of these.

Kingdom and elsewhere. The gold sovereign disappeared from circulation in the First World War and although the gold standard was restored in 1925 there was no restoration of the gold coinage, nor of the right to exchange the individual note for gold at the Bank of England. By Sept 1939 Great Britain had abandoned the gold standard and the gold from the issue dept. of the Bank of England had been transferred to the Exchange Equalisation Account. Thus the £ note, although legal tender, no longer enjoys a gold backing and has become inconvertible currency. Although the Bank of England note is not subject to the limitation in number which gold imposes, the importance of limitation is now fully appreciated and the issue of notes is placed strictly under the control of Parliament. It was not always so. Ricardo wrote in 1817 (*Principles of Political Economy and Taxation*). 'There is no point more important in issuing paper money than to be fully impressed with the effects which follow from the principle of limitation of quantity. It will scarcely be believed fifty years hence that bank directors and ministers gravely contended in our times, both in Parliament and before committees of Parliament, that the issues of notes by

the Bank of England, unchecked by any power in the holders of such notes to demand in exchange either specie or bullion, had not, nor could have, any effect on the prices of commodities, bullion, or foreign exchanges.

Reference to BANKS AND BANKING will show the beginnings of the bank-note. The goldsmith's receipt for coin left in his charge became the earliest bank-note in England (see BANK OF ENGLAND). During the eighteenth century a large number of small private country bankers grew up who issued their own bank-notes, 'promises to pay' which were duly met so long as the bank remained solvent. Many of them failed. The Bank of England note was of a different order. Already accepted in payment of taxes, by 1833 it had been made legal tender; but not before suspending payment of its notes in coin, albeit with the express support of Parliament, for some twenty-four years (1797-1821). The Bank Charter Act of 1844 forbade any further issue of bank-notes not backed 100 per cent by gold and made issues a monopoly of the Bank of England. Apart from three crisis 'suspensions' the bank continued to honour its legal tender 'promises to pay' in gold, right up to 1914. Bank of England notes not backed by gold were known as the fiduciary issue and amounted to £14,000,000 in 1844 and £19,750,000 in 1920, the difference representing two-thirds of lapsed issues of country banks as provided for in the Act. Meantime in the First World War currency notes with no gold backing had been issued in large numbers by the Treasury. These were taken over by the Bank in Nov. 1928, when the fiduciary issue was fixed at £260,000,000. By 1938 Bank of England notes totalled upwards of £500,000,000. In 1939 the transfer of gold from the Issue Dept. made the whole note issue fiduciary. In 1947 this fiduciary issue had risen to £1,450,000,000, falling to £1,300,000,000 in the following year. These large increases in the note issue over the period covered by the two world wars were greatly exceeded in other countries, where inflation proceeded so far as to make the currency unit practically worthless. In Germany between the world wars the almost worthless mark was replaced by the *Reichsmark*. The Fr. franc did not go to such extremes, but in 1949 the £ bought over 1000 francs as against 25 in 1914. Years before in France the gov. of the Revolution had made an unsuccessful experiment in P. M. based on land, i.e. *assignats* (q.v.), representing land which might be assigned to the holder of the note, and later, *mandats* (q.v.). See also BANK OF ENGLAND; BANKS AND BANKING; CURRENCY; ECONOMICS; MONEY; and the bibliographies to these articles.

**Paper Nautilus**, or **Paper Sailor** (*Argonauta argo*), genus of cephalopod molluscs which, in the case of females, hold the shell to the body by two dilated specially adapted arms; it is not attached as in other molluscs by a special muscle. The male is much smaller than the female and is shell-less. The female retains her eggs

and hatches them in the shell, which may therefore be taken to have been elaborated for this purpose; it is indeed the only dibranchiate mollusc which secretes an external calcareous covering. The animal swims by ejecting water from its funnel, not by elevating two of its arms as sails in the manner represented by anct. fable. It can also creep on the sea bottom.

**Paper Office**, see RECORD OFFICE.

**Paphlagonia**, anct. dist. of Asia Minor, bordering on Bithynia on the W. and washed on the N. by the Euxine. It is a rough mountainous country, but contained some fertile plains in the N. which were rich in olive plantations. It was celebrated for its horses, mules, and antelopes, and the forests in the S. furnished abundance of timber, the boxes of Mt. Corymbus being famous. The inhab. were probably of Syrian origin, and are mentioned by Herodotus among the races conquered by Croesus. Later they came under Rom. rule. See R. Leonhard, *Paphlagonien; Reisen und Forschungen im nordlichen Kleinasien*, 1915.

**Paphos**, name of two tns. on the S.W. extremity of the coast of Cyprus, Old P. and New P. The former, now Kukia, was situated on an eminence about 1½ m. from the sea, and was the chief seat of the worship of Aphrodite, remains of whose temple are still extant. The latter, now Baffo, about 7½ m. from Old P., was on the sea and had a good harbour. It was also celebrated for its worship of Venus, and was the administrative cap. of the is. and a flourishing commercial city, famous for its oil and its 'diamonds' of medicinal power.

**Papias**, bishop of Hierapolis in Phrygia, is known to us from references and extracts made by Irenaeus, Eusebius, and others. Irenaeus says of him that he was 'a hearer of John and a companion of Polycarp,' but Eusebius counters the former part of this statement with a quotation from P. himself. P. is chiefly important for three statements made in the fragments that have been preserved of his *λογισμὸς ἀποστολικῆς ἐκκλησίας*, statements which form the basis of all studies on the synoptic problem. In one of these he speaks thus of Mark: 'Mark, having become the interpreter of Peter, wrote down accurately whatsoever he remembered, but without recording in order what was said or done by Christ.' The second reference is to Matthew (see LOGIA). The third is his reference to 'John the Presbyter' presumed to differ from the beloved disciple P. lived in the latter half of the second century, and is usually counted among the Apostolic Fathers.

**Papier-mâché**, substance produced by pasting together many sheets of thin paper which has been used for many purposes w. a lightness and strength were needed. The practice of making P. is of E. origin. Boxes, trays, bowls, and many other articles were at one time made in this way in great variety, and finished by lacquering and gilding and painting. One of the uses to which it is put in

printing is in the production of the 'fong' or mould, made by pasting sheets of blotting-paper, with a mixture of alum, flour, and starch, on to a backing of brown paper, and finishing the surface with two or three sheets of tissue-paper. An impression is taken by beating, or by hydraulic pressure, from the forme of type by a printer. He then may cast from a stereotype reproduction of his matter. Its flexibility enables him also to bend it to the necessary form for casting the curved plates used on the printing cylinders of the modern rotary presses.

**Papilionaceæ**, the only one of the three sub-orders of Leguminosæ which is represented by Brit. species. The flowers are monosymmetric and papilionaceous or butterfly shaped, as for instance in the sweet pea.

**Papillon**, breed of toy dog which derives its name from the large, erect, spreading ears of the prick-eared variety. It is a smart breed, with small, arched skull, pointed muzzle, and dark eyes. The ears are erect or drooping, according to the variety, the chest is deep, and the back rather long. The coat is long and silky, usually white with black, black and tan, or red markings, but it is sometimes red, brown, or yellow. The tail is long and carried over the back. The maximum height is 12 in. at the shoulder, and the maximum weight is 12 lb. It has become very popular, owing to its intelligence and alertness, and it is comparatively easy to rear.

**Papin, Denis (1647-1714)**, Fr. physicist, b. at Blois, studied medicine in Paris, where he practised for some time as a physician. He became acquainted with Huyghens, and devoted himself to physical sciences. Before P.'s time the intense force which can be generated in water, air, etc., under the action of heat was well known, but he was one of the first to indicate the prin. features of a machine by which this property could be made of practical utility. He became a member of the Royal Society in 1681. While in England, P. and Boyle together repeated their experiments on the properties of air, etc. To P. undoubtedly belongs the distinction of having first applied steam to produce motion by raising a piston; he is also the inventor of the 'safety-valve,' an essential part of his 'Digester.' By this latter machine P. showed that liquids in a vacuum can be put in a state of ebullition at a much lower temp. than when freely exposed to the air. He discovered the principle of action of the siphon, and improved the pneumatic machine of Otto de Guericke. Unfortunately for science P.'s numerous writings have not yet been collected, but many of them will be found in the *Philosophical Transactions*, *Acta eruditorum*, and the *Recueil de diverses pièces*. See life by E. Expouf (4th ed.), 1888.

**Papineau, Louis Joseph (1786-1871)**, Canadian politician and leader of the Fr.-Canadians in the struggle against the Château clique or Eng.-speaking merchant class (so-named from the Château St. Louis, one-time residence of the governors

in Quebec). B. in Montreal, he was a squire of good family, handsome, and eloquent. His father had helped to defend Quebec during the Amer. invasion of 1775; he himself had been an officer in the war of 1812, and as late as 1820 he had pursued the advantages enjoyed by Fr.-Canadians under Brit. rule. After 1822, however, he became convinced that the Fr. in Canada were threatened with the loss of their rights. In 1809 he was elected to the Legislative Assembly of Lower Canada, and from 1815 to 1837 he was Speaker of the House of Assembly for Lower Canada. P. led a mission to England to protest against the proposed union of Upper and Lower Canada, and led the Fr.-Canadian demand for financial reform and an elected prov. council. The chief weapon of P. and his followers was the power of the assembly to vote taxes, for though the governor had a few sources of revenue like land-granting which were not controlled by the assembly, they were not sufficient for the purposes of government. P. therefore led the Legislative Assembly of Lower Canada in withholding supplies from the governor, and secured the co-operation of Wm. Lyon Mackenzie's revolutionary party of Upper Canada (1835). P. attended a meeting of delegates at St. Charles that decided on rebellion. His complaints were not all justified; in 1834 he and his followers had drawn up an extraordinary document, known as *Ninety-two Resolutions*; some of its protests were fully justified, but generally speaking the document was bitter and unreasonable, and its approving references to the Amer. revolution were unwise. P. lost the sympathy of moderate Fr.-Canadians, and especially of the leaders of the Church, who had no wish to foment rebellion. A warrant was issued against him for high treason. He escaped to Paris, but after a general amnesty returned in 1847 to sit in the United Canadian Legislature till 1851.

**Papini, Giovanni (b. 1881)**, It. author (pseudonym, Gianfaleo), b. in Florence, and largely self-taught. His father was an old It. Liberal and, therefore, atheist and Garibaldian. Among his vols. of essays and criticism are *Il Crepuscolo dei Filosofi* (1906); *La Paga del Sabato* (1915); *L'Uomo (arducci)* (1918); *Le Più Belle Pagine di A. Manzoni* (1923); *Dante vivo* (1931); *Italia mia* (1939); *Figure umane* (1940). His poetry includes *Cento Pagine di Poesia* (1915); *Opera Prima* (1917); *Pane Fino* (1926). Novels: *Parole e sangue* (1912); *Un Uomo finito* (1912, autobiography; Eng. trans. 1924). Formerly a sceptic, specially famous through his *Stornature* (1916), he accepted the Catholic faith while writing his *Storia di Cristo* (1921), which has been trans. into many tongues (Eng. trans. 1923). See studies by B. Palmieri, 1927; A. Viviani, 1931; and M. Apollonio, 1944.

**Papinianus, Æmilius Paulus**, most celebrated of Rom. jurists, was b. towards the middle of the second century, and during the reign of the Emperor Severus he held the office of Libellorum Magister, and afterwards that of Præfectus Præ-

torio. After the death of Severus, Caracalla dismissed P. from office and caused him to be put to death. P.'s works consist of thirty-seven books of *Questiones*, nineteen of *Responsa*, two of *Definitiones*, and two works, *De Adulteriis* and a Gk. fragment. His high reputation as a jurist was much enhanced by strong moral feeling.

**Papinius Statius**, see **STATIUS**.

**Papirius Carbo**, see **CARBO**.

**Pappus, Alexandrinus**, eminent mathematician of Alexandria who flourished about the end of the fourth century. A.D. He was the author of commentaries on the *Elements* of Euclid of which fragments have been preserved by Proclus and others, and of which the section on book 10 has survived in Arabic; also on Ptolemy's *Syntaxis*, of which books 5 and 6 survive (ed. A. Rome, *Biblioteca Apostolica Vaticana*, 1931), and on the *Planisphaerium* of Ptolemy and the *Analemma* of Diodorus. P.'s greatest work, however, is the *Synagoge*, an invaluable collection of mathematical writings and commentaries. This has come down to us complete (ed. F. O. Hultsch, 1876-78).

**Pappus**, see **COMPOSITE**.

**Papua**, or **Brits' New Guinea**, is the S.E. part of the Is. of New Guinea with the d'Eutchesteaux Is., Louisiade Archipelago, and the small Is. between 8° and 12° S. lat. and 141° and 155° E. long. Area 90,540 sq. m. P. lies wholly within the tropics, and has a very irregular and indented coast-line. The S.E. rises to a series of mt. ranges, the highest point of which, Mt. Victoria, attains 13,120 ft. Viewed from the air P. presents a panorama of scores of miles of abrupt hills, gloomy gorges, and sheer escarpments, all shrouded in thick scrub, a monotonous expanse of sombre green darkening to black in the ravines and steep valleys, with very few native vils. and still rarer white settlements. The chief rvs. are the Fly, Turama, and Banno. The rainfall is heavy and evenly distributed except in one belt of land which has a dry season and produces tobacco and cotton. The wetter parts produce a variety of crops, sugar-cane, coco-nuts, sago palm, bread fruit, dyewoods, spices, ginger, and bananas and other fruits. Many minerals occur, gold, copper, tin, lead, zinc, and cinchabar, also brown coal and petroleum; gold, silver, and osmium are the only minerals exported. Topaz and beryl are the only precious stones. P. imports mainly foodstuffs, tobacco, drapery, and hardware. There are wireless telegraph stations at Port Moresby and Samarai. The races vary in colour, mode of living, and language, and most of the coastal people are not of Papuan origin but are descended from races of more distant parts of the Pacific. They had a reputation for bloodthirstiness among the pioneer settlers, and not without reason. But the tales of cannibalism and murder have undoubtedly been distorted to suit the natural and impressive setting. Gold prospectors blazed the trail and most of the earlier gold-hunters have left their bones to whiten on the slopes of Mt. Scratchley and

the Wharton range, having fallen to attacks by the natives. Raiding by head-hunters, retaliatory blood feuds, and, particularly, sorcery (the convenient term used to include the various forms of magic and necromancy in Papua) have hindered native administration. Many white men have been murdered in past years. In 1901 occurred the massacre of the Rev. James Chalmers and his party by the Goaribari tribe, followed by the Le Hunte punitive expedition, which burned down dozens of *dubes* or native vils. But tribes have in large areas settled down to peaceful habits, while hundreds of the natives are being taught by the many missionary bodies in P.

In order to prevent that portion of New Guinea not claimed by the Dutch from passing into Ger. hands, the Queensland Gov. annexed it in 1883, a step not sanctioned by the imperial gov. In 1884, however, a Brit. protectorate was proclaimed over the S. portion of the E. half of New Guinea, and in 1887 Queensland, New S. Wales, and Victoria agreed to share the cost of administration. The ter. was annexed to the Crown the following year. The Federal Gov. of Australia assumed the control in 1901; the political transfer was completed by the Papua Act of 1905, passed by the Federal Gov., and in 1906 a proclamation declared that New Guinea would be known as the ter. of P. Government is by the usual colonial machinery of executive and legislative councils under an administrator. Jap. forces invaded P. in Dec. 1941. By the capture of Buna by the Allies on Dec. 14, 1942, the invaders were driven out of the country. Pop. (1940): Europeans 1800; Papuans (estimated) 337,000. See also **MELANESIA**. See A. F. H. Wollaston, *Papuans and Papuans*, 1912; Sir H. Murray, *Papua of To-day*, 1925; I. F. Champion, *Across New Guinea from the Fly to the Sepik*, 1932; E. Cheesman, *The Two Roads of Papua*, 1935; J. G. Hides, *Through Wilder Papua*, 1935; and L. Lelt, *The Papuan Achievement*, 1942. See also **MELANESIA**.

**Papules**, see **PIMPLES**.

**Papworth Village Settlement**, vil. settlement situated on the Huntingdon-Royston road near Cambridge for the rehabilitation of tuberculous victims, the largest of its kind in the world. Began in 1917 on a nucleus of a few shelters and an old house, it is now a community of some 2000 people who have been helped to health and enabled to support themselves by their own efforts. In addition to two sanatoria, five hostels, and nurses' homes, there are now some 200 houses and five large modern factories employing 700 men and women making for home and export prefabricated buildings, coach-building and joinery products, cabinet furniture, travel goods, printing, book-binding, and upholstery goods. The founder of the settlement was Sir Pendrill Varrier Jones, together with Sir Clifford Allbutt, Sir George Woodhead, Mr. Robert Morant, and others. Much valuable work was done by Sir Frederick Milner, who was the first chairman.

Although the hospital section of the settlement has been absorbed into the new national health scheme, the hostels, factories, and vil. still retain their individual identity and still require the generous help of the public if its special needs and further development are to be realised.

**Papyrology**, in the widest sense, is that branch of learning which seeks to decipher and determine the date and place of anything written on papyrus. The oldest books known are written on rolls of papyrus, and the earliest preserved written papyri go back to the fifth Egyptian dynasty (about 2750-2625 B.C.); they are couched in Egyptian language and hieratic writing (see under **HIEROGLYPHIC**, **HIERATIC**, AND **DEMOTIC WRITINGS**). Other papyri are written in Egyptian demotic or Coptic scripts, in Aramaic, in Gk., Lat., Persian, or Arabic. The use of papyrus lasted through Gk. and Rom. times down to the early Middle Ages. The middle of the tenth century seems to be the period when its manual (in Egypt) ceased, but already since the fourth century A.D. in S. Europe, under Christian, Rom., and Byzantine influence, papyrus was gradually displaced for writing books by parchment and vellum.

In the strictest sense of the term, P. indicates Gk. P., and particularly deals with the period in which Egypt was more or less completely under Hellenic influence and Gk. was one of its main languages. The upper limit of this period may be fixed at 332 B.C., corresponding with the conquest of Egypt by Alexander the Great, and the lower limit about two centuries after the Arabic conquest of A.D. 641 when Arabic had definitely triumphed. The reason of this restricted use of the term P. lies in the following facts: (1) The manus. of papyrus was confined to Egypt, and it is most probable that the estab. of the great Alexandrian library led to improvements in its manus., and stimulated production. (2) Although, in the countries bordering on the Mediterranean, papyrus was until the fourth century A.D. the most common writing material, on account of climatic circumstances and because of the damp soil, no papyrus could long survive except beneath the splendid protective covering of the sands of Upper Egypt (some charred papyri have been found in Lower Egypt and in Herculaneum Italy; a few fragments have been discovered in Palestine and in Dura Europos in N. Mesopotamia). (3) The number of the preserved Gk. papyri is estimated at about 30,000. Thanks to them we have at our disposal so many data of so great a variety that there is no region in antiquity of which we know the legal, social, religious, cultural, economic, and domestic life so well as Graeco-Rom. Egypt.

P. is a new branch of knowledge; although the first papyrus brought in modern times from Egypt to Europe (the 'Papyrus Schow' or *charta Borgiana*, now in Naples) reached Europe in 1778, and in the nineteenth century considerable finds were made in various places of the

Fayûm, only in the last decade of that century systematic excavations and research for papyri were organised (W. M. Flinders Petrie on behalf of the Egyptian Exploration Fund, 1890; B. P. Grenfell and A. S. Hunt, of Oxford, 1896). P. is of paramount importance for the study of the Gk. civilisation of Egypt in the following fields: writing, language, public and administrative law, social, economic, and religious life.

See L. Mitteis and U. Wilcken, *Grundzüge und Chrestomathie der Papyrskunde*, 1912; W. Schubart, *Einführung in die Papyrskunde*, 1918; W. M. Flinders Petrie, *Ten Years' Digging in Egypt*, 1923; P. Collomp, *La Papyrologie*, 1927; F. G. Keaton, *Fifty Years of Papyrology*, *Actes du I<sup>er</sup> Congr. intern. de papyrol.*, 1938; A. Calderini, *Manuale di papirologia antica greca e moderna*, 1938; W. Perennans and J. Vergote, *Papyrologisch Handboek*, 1942; and M. David and B. A. van Groningen, *Papyrologisch Primer*, 1946.

**Papyrus**, whence Eng. 'paper', (Gk. *πάπυρος*, (also *βύβλος*, *βύβλος*, hence Bible). The term P. is of Egyptian origin, meaning 'the growth of the River (Nile)'. It is a straight, stout, tall, reed-like, aquatic plant, called in Lat. *P. antiquorum* or *Cyperus papyrus* (q.v.), which in ancient times grew in profusion in Egypt on the R. Nile. It also grew, but in small quantities, in N. Palestine. Nowadays it only grows in Abyssinia and in Sicily, but it is reared as a curiosity in many botanical gardens (also in England, where, however, it needs to be removed under cover in the autumn). Its leafless stem rises from four to fifteen feet above the water, and has an umbrella-like top of delicate green rays. The anc. Egyptians used the stems of this plant to make reeds, mats, sandals, framework of light rowing boats, and for other purposes, but the prin. importance, at least in modern eyes, was the use of P. as writing material. A detailed account of the way in which the P. was treated in the Egyptian 'paper factories' is given by Pliny the Elder (*Naturalis historia*, xiii. 74 ff.), the great Rom. naturalist (A.D. 23-79). A section from the lower part of the stem, the pith, was cut vertically into thin strips; these were laid some vertically and others transversely, pressed together, and dried in the sun. Uneven patches were smoothed or pressed away, and the surface was polished more or less carefully according to the quality to be produced. The sheets were then glued together into a roll. The length of the rolls varied; some were 30 or 40 ft. long, but we are told of some that were 150 ft. long, and would contain the whole *Iliad* or *Odyssey*.

The oldest books known are written on rolls of P., and the earliest preserved written papyri go back to the first half of the third millennium B.C. P. was not only employed for literary purposes. In Egypt, Greece, Rome, Syria, etc., it was for many centuries the chief material used for writing for all ordinary purposes, such as legal documents, receipts, petitions, notices of birth, and official and private

letters. Its employment for these purposes continued until the middle eleventh century, while as writing material for books it was gradually displaced by parchment or vellum, which had superseded it in the fourth century A.D. See PAPER; PAPHYROLOGY; PARCHEMENT; VELLUM.

**Par**, or **Par**, see SALMON.

**Pará**, original name for the R. Amazon, S. America. The name is now applied to the estuary in the P. state of Brazil, popularly described as a mouth of the Amazon. It really belongs to the Tocantins and Anapu R., and is only connected with the Amazon by a tidal 'furo.'

**Pará**, or **Grão Pará**, maritime state of N.E. Brazil, bounded on the N. by the Guianas and on the N.E. by the Atlantic. Area 464,780 sq. m. It lies almost entirely in the Amazon basin, and is copiously watered by the Amazon, P., Tocantins, Xingó, Tapajós, and smaller rivers. The higher ground is almost desert. The greater part is still dense forest, but settlements have been made along the rivers, and cacao, sugar, cotton, caoutchouc, Brazil nuts, plantains, rice, manioc, millet, vanilla, etc., are produced. P. produces some of the world's finest rubber, but production has greatly declined. Pop. 1,074,000 for its cap. P., see BELEM.

**Parable** was originally the name given by the Gk. rhetoricians to an illustration avowedly introduced as such. In Hellenistic and N.T. Gk. it came to signify an independent fictitious narrative, employed for the illustration of a moral rule or principle. This kind of illustration is of E. origin, and admirable examples are to be found in the O.T. and N.T., particularly in the discourses of our Lord. Much of Christ's parabolic imagery is to be found in the writings of Hillel, Shammai, and other great rabbis, as, for example, the Ps. of the Pearl of Great Price, the Labourers, the Lost Piece of Money, the Wise and Foolish Virgins, etc. Among modern writers, the Ger. divine Krummacker greatly distinguished himself in this species of composition. The P. differs from the fable in the probability or verisimilitude of the story itself, and agrees with it in the essential requisites of simplicity and brevity. An excellent work on the Ps. of the N.T. is that by Archbishop Trench.

**Parabola**, locus of a point P whose distance from a fixed point S, the focus, is equal to its distance from a fixed line ZZ', the directrix (see figure where SP = PM). The figure also shows a simple method of construction; SPQ is a string attached at S and Q and equal to MQ; the T square MQ is moved along the ruler ZZ', while a pencil keeping the string tight and against the T square traces the curve. A line XX' through S perpendicular to the directrix ZZ' is called the axis; it meets ZZ' at the foot of the directrix. The curve is symmetrical to the axis, which cuts it at the vertex V, and extends to infinity, always receding from the axis. The latus rectum or focal width is the chord of curve through the focus S and perpendicular to the axis. The angle SPV is bisected by

the tangent at P, hence the parallel beams from the light in the focus of a parabolic reflector. The curve is a conic section made by a plane cutting a cone in a direction parallel to the generating line and is a special case of the conics governed by the relation  $SP = ePM$ ,  $e$  being called the eccentricity of the curve. For the P.,  $e = 1$ . The path of a projectile when not truly vertical is a parabola except for interference of air and other irregularities, the recognition of which fact has been of enormous utility in military matters. In co-ordinate (Cartesian) geometry the equation for a P. in the simplest form, taking the origin at the vertex, is  $y^2 = 4px$ .

PARABOLA

All curves of the form  $ym = pxm$  are classed as Ps.:  $y^2 = px$  is the cubical P.,  $y^3 = px^2$  is the semi-cubical P.—the evolute of the P. of the second degree.

**Paraboloid**, figure traced by a parabola moving with its vertex always on another parabola, the planes of the two being constantly at right angles to each other. The elliptic parabola is traced when the concavities are kept in the same direction; its plane sections are either parabolas or ellipses. The hyperbolic parabola is traced when the concavities are kept in opposite directions; its plane sections are parabolas or hyperbolas.

**Paracatu**, tn. of Brazil, in the state of Minas Geraes, 300 m. W. of Ouro Preto. Pop. 12,000.

**Paracelsus**, or **Philippus Aureolus Theophrastus Bombastus von Hohenheim** (1493-1511), Swiss physician. b. at Einsiedeln, son of a physician. His education was very irregular. He studied for a time at Basle Univ., and learnt alchemy and chem. from Trithemius, bishop of Wurzburg, and m. surgery and mineralogy at the Tyrol mines, and gained a great deal of information by travelling. He gained some fame as a physician in Basle, and was made tn. physician and a lecturer at the univ.; but many of his opinions, to which

he held with great obstinacy and arrogance, were in opposition to the best contemporary opinion. He was driven from Basle in 1528 through a dispute, and d. at Salzburg. His numerous works were ed. in Gor. in 1589-91 (J. Huser), 1603-5, 1618, 1926-32 (B. Aschmann), and 1944 ff. (J. Strobel); and in Lat. in 1603-5 and 1638. See studies by M. B. Lessing, 1839; F. Marx, 1842; F. Mook, 1876; E. Hartmann, 1887; G. Kahlbaum, 1891; F. Strunz, 1921, 1937; B. S. von Waltershausen, 1936; and I. Bettschart, 1941; also F. Oesterle, *Die Anthropologie des Paracelsus*, 1937, and C. G. Jung, *Paracelsus*, 1942.

**Paracentric Motion**, term used by Leibniz to express the motion which, together with harmonic circulation, made up the entire motion of a planet. It is sometimes inaccurately applied to simple motion about a centre.

**Parachor**, in chem., a function used by Sugden and others in the investigation of the constitution of various compounds. The P. of a liquid is given by the expression

$P = \frac{M}{D} \gamma$ , where M = molecular weight, D = density, and  $\gamma$  = surface tension of the liquid.

**Parachute** (Fr. *chute*, a fall). A device somewhat resembling a gigantic umbrella about 24 ft. in diameter, intended to break a fall from a height. The origin of Ps. is credited to Leonardo da Vinci (1452-1519), whose rough sketch and theory seems to have suggested the design of Fausto Veranzio in *Machina Nova* (1585). Joseph Montgolfier (or Montgolfière) (q.v.) and Blanchard made experiments (see under BALLOONS) in the latter part of the eighteenth century. Montgolfier descending safely with a P. of the umbrella type from a housetop at Annonay. To André Garnerin falls the distinction of being the first man to descend safely in a P. from a balloon, a feat which he accomplished over Paris on Oct. 22, 1797, being no doubt aided by good luck. In its earlier forms the P. was nothing more than a piece of cloth stretched over a rigid frame, but when, after the lapse of a couple of centuries, interest in it revived, it reappears as a silk parasol with ribs, and is to be found stretched over the top of a balloon open and ready for use. The great problem was oscillation or swaying. Robert Cocking thought oscillation could be cured by the attachment of weights and, with the courage of his convictions, lost his life in 1837 at Lee in Kent in a descent from a balloon in his famous if ludicrous inverted cone. In the following year one John Hampton made a successful descent in an umbrella type of P., 16 ft. in diameter with ribs of whalebone and a canvas covering. One of the most spectacular of parachutists was the celebrated Amer. aeronaut Maj. Thomas Baldwin, who, in the eighties of last century, made a number of successful descents in a simple silk P. carried up under a free balloon. The flexible P. of to-day, in fact, owes its origin to Baldwin. A hole

or vent in the top of the P. was found to be a complete solution to the oscillation problem, and a vent is now made in all Ps. to this day. The First World War provided the first urgent necessity for Ps.

The need for parachuting from aeroplanes brought into being the manually operated P., which is fixed to the man. Since that war America has paid much attention to the subject, and the names of Irvin and Smith are closely associated with the subsequent developments. The first man to make a free drop, or, in other words, to use a manually operated P., was Leslie L. Irvin, at Dayton, Ohio, on April

Central Press Photos Ltd  
PARACHUTE

29, 1919, with a parachute of his own design. This jump not only pioneered the use of Ps. in aircraft, but disproved the belief held up to that time that a human body falling through the air would die as a result. It was subsequently proved by a long delayed free drop and the use of a barograph that the terminal velocity of an average man falling through space was approximately 118 m.p.h.

The modern P. has a small pilot-chute fixed to the apex of the main P., by which it is dragged away from the airman to prevent his falling into it. P. are so constructed that they can, when packed, be fastened on to the back or form a seat for the airman. New types of P. are tested by being cast from an aeroplane diving at over 200 m.p.h., with a 400-lb. weight attached to them. Up to 1939 the ordinary P. contained about 80 yds. of the finest pure silk, but owing to the shortage of silk caused by the Jap. conquests in E. Asia, nylon was introduced and has remained the most useful material.

To the function of Ps. as life-savers was

added that of providing a means of landing troops and supplies in otherwise inaccessible areas (see PARATROOPS). For this purpose an adaptation of the manually operated P. was introduced, the P. being opened by means of a static line, i.e. the rip-cord was not pulled by the parachutist but attached to the inside of the aircraft and the P. was torn open when the weight of the falling body came on the line. Supplies in units weighing up to 8000 lb. could also be dropped by this means.

A recent development is the Irving automatic barometric-controlled P. release, a small device strapped to the P. harness and incorporating a barometric capsule and a clockwork release mechanism. It can be set to open the P. at any height, and is chiefly intended for pilots leaving the aircraft at such high altitudes or high speeds that they would be unconscious during the first part of their descent.

See J. E. Hodgson, *The History of Aeronautics in Great Britain*, 1921.

Parachute Troops, see PARATROOPS AND AIRBORNE TROOPS.

Paraclete (Gk. *παράκλητος*, advocate), name given to St. Holy (ghost which Christ promised his disciples would take his place as their teacher and guide after he left them). Also the name of the monastery founded by Abbot near Nogent-sur-Seine, of which Héloïse was abbess. See also HOLY SPIRIT.

Para-dihydrobenzene, see HYDRO-QUINONE.

Paradise (O.F. *paradis*, Lat. *paradisus*, from Gk. *παράδεισος*, a park or enclosure), word first used in Gk. by Xenophon for a Persian enclosed park or pleasure ground. It occurs sev. times in the O.T., notably in Nehemiah ii. 8, where it is trans. 'forest.' In Christian literature it is used sometimes for the earthly P., the garden of Eden, and sometimes as equivalent to heaven. Sometimes, again, the word is taken, as in Dante's *Purgatorio*, to mean an intermediate state lower than that of heaven, and Luke xxiii. 43 is so interpreted.

Paradise, Bird of, see BIRD OF PARADISE.

Paradise Fish, or *Macropodus viridivirens*, name given to a domesticated variety of a Chinese species of Osphromenidae known as *Polypterus opercularis*. In colour it is bright gold and green.

Paradox (Gk. *παράδοξον*, contrary to opinion), term applied to whatever is contrary to the received belief. It follows that a P. is not necessarily an opinion contrary to truth. There have been Ps. which have overthrown accredited errors, and in the course of time become universally accepted as truths, but this, the highest form of P., which is only another name for originality of thought, is rare. The P. which springs from a passion for distinction, and which despises good sense and the lessons of experience, is far more frequent. It may not be a positive error in thought, but it is so exaggerated in expression that if taken literally it actually does mislead.

Paradoxure (Gk. *παράδοξος*, i.e. adj. 'contrary to received opinion,' + *ουρα*,

'tail'), animal of the genus *Paradoxurus*, family Viverridae, or of an allied genus; so called because of its remarkably long curving tail. Also called palm-cat, -marten, or civet.

Paraffin, white crystalline body found in coal, wood, and organic tars. It can be obtained by distilling cannel coal at as low a temp. as possible. Melting point 45-60° C., sp. gr. 0.87-0.91. When pure it has no smell or taste and is insoluble in water, but dissolves in alcohol and ether. Chemically it is a mixture of hydrocarbons of the methane series. It is mainly obtained from petroleum and natural oils by the process of fractional distillation. P. oil distils over between the temps. of 150 and 300° C. and is used for illuminating and heating processes. At 300° C. the distillate consists partly of solid and partly of liquid. The solid is P. wax, and is separated from the liquid by filter presses. It is used chiefly in the manuf. of candles. From the chemical point of view the term P. has a wider significance than indicated above. It is assigned to an important branch of organic compounds called the methane series, because P. wax consists principally of its higher members. P. wax is not acted upon by strong acids, alkalis, etc., and thus the name P. (from Lat. *parum affinis*, small affinity) was given to it for this reason. The more important members of this series are the following: Methane (CH<sub>4</sub>) boils at -119° C. under 150 atmospheres. This gas is frequently present in decomposing matter and is alternatively known as marsh gas. Ethane (C<sub>2</sub>H<sub>6</sub>) boils at -4° C. under 46 atmospheres; propane (C<sub>3</sub>H<sub>8</sub>) boils at 45° C. under 1 atmosphere; butane (C<sub>4</sub>H<sub>10</sub>) boiling point 17° C. under 1 atmosphere; isobutane (C<sub>4</sub>H<sub>10</sub>) boiling point 17° C. under 1 atmosphere. It will be noticed that there is a constant difference of CH<sub>2</sub> in their composition, while they have similar chemical properties. Such a series is called a *homologous series*, this series having the general formula C<sub>n</sub>H<sub>2n+2</sub>, where *n* stands for any positive integer. The fourth member, butane, presents a peculiarity in that there are two distinct bodies possessing the same composition, while they differ in properties. They are distinguished by the two names given, and are represented constitutionally by CH<sub>3</sub>.CH<sub>2</sub>.CH<sub>2</sub>.CH<sub>3</sub> and (CH<sub>3</sub>)<sub>2</sub>CH.CH<sub>3</sub>. Such compounds are said to be *isomeric* (equal measure), the second being called an *isomer* of the other. The number of isomers rapidly increases with the number of carbon atoms in the compound. There are three main types of Ps. known respectively as Normal, Iso, and Neo (given on p. 312), according to the manner of grouping of the carbon atoms.

The boiling points of the isomers are always lower than that of the unbranched series. The ' ' are found in nature as petroleum in the U.S.A., U.S.S.R., Dutch E. Indies, Burma, etc. Some of the lower Ps. occur as natural gas, e.g., in U.S.A., and some are found in the intestinal gases of animals and in the gases given off during the putrefaction of vegetable and

animal matter. The *cyclo*-Ps. are ring compounds, e.g. *cyclo*-butane is

There are certain fractions in the lubricating oil range of petroleum components which are used for purposes other than lubrication. Liquid P. is one of these. Large quantities of fuming sulphuric acid or oleum, that is, sulphuric acid containing excess of sulphur trioxide, are used in refining liquid P., as it is essential that any tendency to form sludge is removed and that no reactive constituents should remain in the final product. The use of these large quantities of sulphuric acid gives rise to the formation of sulphonic acids, and these are removed by neutralisation with caustic soda solution containing alcohol. After neutralisation the oil is treated with decolorising earth and filtered to produce the water-white, odourless, tasteless liquid P.

**Paragus, see PALAWAN.**

**Paraguari**, tn. of Paraguay, S. America, cap. of the dept. of P., 45 m. by rail from Asunción. It produces tobacco, cotton, and cattle, and there are potteries, tanneries, and distilleries. Pop. 8000.

**Paraguay**, republic of S. America, with no sea-board, bounded N. by Bolivia, N.E. and E. by Brazil, and S. and W. by Argentina. Topographically P. forms part of the great depression known as the basin of Paraná, whose W. edge is formed by the Andes, and on the E. is bounded by the Brazilian highlands. To the N. rises the sheer edge of the Matto Grosso tablelands of Brazil, and to the S.W. is the Gran Chaco, part of whose vast and partly unexplored ter. forms the W. portion of P. P. has been the 'subject of exaggerated descriptions: on the one hand it has been condemned as a pest-ridden and poverty-stricken land of unbearable tropical climate, and on the other lauded as full of great possibilities and pleasing features. In reality it is a country of contrasts, affording compensating circumstances and varied conditions both of nature and people . . . much of the country merits the description of a natural

garden, where flowers and fruit run riot, even around the thatched, mud-walled huts of the squatters. In certain districts' (C. R. Knock). The area of P. proper (i.e. excluding the Chaco or 'occidental section') or 'oriental section' is officially given as 61,600 sq. m. The Chaco formed the subject of a long-standing dispute with Bolivia and led to war in Sept. 1932, which only ended with an armistice on June 12, 1935, followed by a peace treaty signed in July 1938, the boundary being fixed by arbitration (Oct. 1938). The consequent increased area of P.'s occidental section is officially estimated at 88,788 sq. m., making the total area of the republic approximately 149,770 sq. m. Pop. estimated in 1945 at 1,141,300 (including 53,450 in the Chaco, of whom Indians number 8000). The people of P. are of mixed blood, namely Sp., Indian, or Guaraní, and mestizo (mixed European and Indian), the most predominant being the Guaraní. There are practically no Negroes in P. and the admixture of foreign blood is less than in any of the other S. Amer. republics. The white element, as always, forms the governing class, and the official language is Sp., although the common speech is Guaraní. The Paraguayans are a far less energetic people than their neighbours of Argentina, and modern civilisation progresses but slowly.

P. is bisected by the riv. of its own name. The Paraná flows along its E. border, while the Pilcomayo forms its W. boundary till it joins the P. near Asunción. In the angle formed by the Paraná-P. confluence are extensive marshes, one of which, called Neembuco, i.e. 'endless,' is drained by Lake Ypoa, a large lagoon S.E. of Asunción. E. of the Paraná P. the country has always been known as P. proper, while on the W. and S.W. lies the region of El Gran Chaco. The portion lying within the P. ter. (prior to the treaty of 1938) consists largely of swamp, forest, and jungle, inhabited by semi-civilised Indian tribes, among whom the S. Amer. Missionary Society has long been doing good work. This region is also the haunt of the jaguar and numerous reptiles. There are large areas of good grazing ground, which support many cattle. The N. portion of P. is mountainous, but the S. portion is one of the most fertile dists. in S. America, consisting of hills and gentle slopes, richly wooded, and wild savannahs, and rich alluvial plains, some of which, however, are marshy. Much valuable timber is found in the forests, including hard, soft, and dye woods. The rainfall of P. is sufficient for agric. production, and the climate, though sub-tropical, is agreeable and healthy.

**Production.**—The whole area of the oriental section of P. is cultivable, the soil affording facilities for meadows and pastures which are capable of a varying agriculture, such as might render the country the orchard and garden of that part of the S. Amer. continent. Only a small part, however, has as yet been brought under cultivation. Stock-raising

is one of the prin. industries, the country being well adapted to it. About one-third of the whole area is devoted mainly to the raising of horses, cattle, swine, and sheep. The cattle number about 4,500,000, and those not used for home consumption are exported in the form of meat extract, preserved meat, and jerked meat, over 100,000 head of cattle being slaughtered annually for this trade. Herds are to be found in most parts of the country, but it is in Misiones, the area N. of Concepción, and in the Chaco that the greater part exist. Agric. methods are primitive. The inadequacy of labour and the backwardness of communications render scientific agriculture difficult. Tractors, modern ploughs, and agric. implements in general are being introduced upon a large scale. Two botanical schools have been opened by the gov. The country is especially noted for yerba maté (strong flavoured Paraguayan 'tea'), a plantation product as well as a natural product of the forests. The leaves of the shrub (*Ilex Paraguayensis*) are stripped, dried in the sun, packed in sacks, and exported. The cost of production is small and the article is sold at less than the price of tea and coffee. During the war with P. the Brazilian soldiers marched and fought day after day without any other sustenance. It is consumed all over S. America, and the output may be as much as 20,000 metric tons, exports ranging from 4000 to 8000 metric tons. Yerba maté wild trees cover nearly 1,500,000 ac.; the acreage under cultivated trees is less than 30,000. Among other industries are timber cutting, fruit growing (tangerines, grapefruit, etc.), petit-grain essence (an essential oil distilled from the leaves of bitter oranges and used for perfumes and flavourings), and tobacco, while maize, manioc, beans, and various cereals are cultivated. Many rare woods are still largely unknown in foreign markets. Among the more abundant woods are cedar, curupay, and lapacho. Cedars and hardwoods are a valuable article of export, much timber being exported to the Argentine and Uruguay for girders and railway sleepers. In the Chaco the production of quebracho logs is a growing industry. The chief product is quebracho extract (tannin), of which as much as 50,000 metric tons are exported annually. Some 25,000 ac. are under sugar cultivation, mainly for the manuf. of spirit. There are ten sugar-mills, the most important of which are at Tebicuarí and Azucarera Paraguaya. Other products are bananas, rice, and peanuts while another crop which is gaining ground is cotton. Cotton is commonly sold as Argentine cotton, chiefly to the United Kingdom. Cottonseed oil is also a thriving industry. Iron, manganese, copper, and other minerals occur plentifully. Sev. iron-ore mines exist (e.g. Ibicuí), which were exploited in the time of Lopez, whose foundries made cannon, cart-axes, and tyres. The Quilicó manganese mines contain ore deposits estimated at 60,000,000 tons. Copper has been found at San Miguel, Concepción, and Quilicó. Other minerals

include granite, marble, serpentine, and kaolin. Large deposits of lithographic stone of good quality were discovered a few years ago. The few secondary industries of P. produce only for the home market, the exceptions being the meat-canning factories, quebracho-extracting plants, and saw-mills. Cheap quality textiles are made from home-grown cotton which is both ginned and spun in the country. Owing to the civil war, which lasted from March to Aug. 1947, the value of P.'s exports fell from 82.7 million guaraníes in 1946 to 65.7 million in 1947, but imports increased from 66.4 million guaraníes in 1946 to 68.1 million in 1947. The chief exports are quebracho extract, cattle and meat products (in 1945 19,000 tons of canned beef were exported), hides (valued at 5,670,000 guaraníes in 1944), yerba maté (4000 metric tons in 1944, over 8000 tons in 1941), tobacco, oranges, and petit-grain oil. The chief imports are articles of food and drink, cotton goods, tobacco, and vehicles. In 1947 imports from the United Kingdom were valued at £308,534 and exports to the United Kingdom were £1,784,235.

**Government.**—The present constitution was promulgated on July 10, 1940. Under it wider powers are vested in the president than were given by the constitution of 1870. Though basically democratic there are authoritarian and corporative features in the new constitution. The executive power is exercised by the president, who is elected for five years and appoints the Cabinet. The Senate was abolished in 1940 and replaced by a council of state as the legislature. This council is nominated by the Cabinet and is composed of the archbishop, the rector of the univ., together with representatives of commerce, industry, agriculture (two), the army and navy (one each), and the president of the National Bank (opened in 1943). There has been a Chamber of Representatives since April 1948, there being one member for every 25,000 inhab. Elections are held quinquennially. The constitution guarantees private property, but the state has power to regulate economic activities and one of the Cabinet posts is occupied by a minister of national economy.

**Religion, Justice, and Education.**—The estab. religion is Rom. Catholicism, but universal toleration is the rule. P. has its own archbishop whose see is at Asunción. There are bishops at Concepción, the Chaco, and Villarica. The civil ceremony alone renders marriage valid but religious ceremonies are permitted. There are a supreme court, two courts of appeal (civil and commercial, and criminal), ten judges of first instance, and three metropolitan police magistrates. The fiscal-general represents the state both in civil and criminal cases. In the provs the functions of magistrates are exercised by lay justices of the peace, who also act as registrars; but Villarica, Encarnación, Concepción, and Pilar have judges of first instance, civil, commercial, and criminal. Primary education is free and compulsory and is also provided for adults. There are

about 1200 gov. primary schools, with a total attendance of about 180,000 pupils, and over 4000 teachers. There are some secondary schools and special schools and a national univ. with about 1000 students, and there are also a number of special colleges and 100 vocational schools, half of which latter are in the cap.

**Defence.**—There is an army of three divs., each with two regiments; a group of artillery, a group of cavalry, and a battalion of motorised engineers; also two regiments of mechanised 'cavalry' and one mounted regiment. There are three squadrons of aircraft. In war service is compulsory for those aged between 18 and 20 in the active army; between 20 and 29 in the active army reserve; between 29 and 39 in the national guard; and between 39 and 45 in the territorial guard. The navy comprises two armoured gun-boats, two converted merchantmen, and some well-armed riv. craft.

**Communications.**—The P. R. is navigable for 12-ft draft vessels up to Concepción (180 m. N. of Asunción) and for smaller vessels for another 600 m. northward. The Paraná R. is navigable by large boats from Corrientes as far as Puerto Aguirre. Asunción, the chief port, is 950 m. from the sea. There are only 300 m. of public railways, together with 450 m. of private industrial rail lines, and less than 4000 m. of roads, mostly indifferent. The Paraguayan Central Railway, with 274 m. of standard gauge line, is a Brit.-owned railway, running from Asunción to Encarnación. It is one of the oldest S. Amer. railways and had its beginning in 1854. There is now a through train service from Asunción to Buenos Aires. The Ferrocarril del Norte Railway has 33 m. of metre gauge line from Concepción to Horqueta. The other minor railways are forest lines of metre gauge or narrower. Air services are provided by five air lines (domestic and foreign). Contact with the neighbouring republics is by riv., rail, or air. It takes a little over 3 days by water from Buenos Aires to Asunción, 56 hrs. by rail, but only 4 hrs. by air. The air route to Rio de Janeiro takes 6 hrs. The national telegraph connects Asunción with Corrientes and Posadas (2070 m.). Telephone lines cover 5330 m. and the system has been gov.-controlled since the end of the Second World War. There are eight wireless telegraph stations.

**Currency.**—A monetary law of Oct 1943 estab. the guaraní as the unit of currency. It is equal to 100 of the old paper pesos. The guaraní is divided into 100 centimos. It is symbolised by the letter G (crossed). There are no gold or silver coins current, but there are nickel, bronze, and aluminium coins of 1, 2, 5, 10, 25, and 50 centimos. In 1949 the free market rate was 3.73 guaraníes to the U.S. dollar.

**Towns.**—The cap. is Asunción, pop. (urb.) 350,000 (dist.) 350,000. Other prin. tns.: Villarrica, about 31,000; Concepción, 60,000; Coronel Oviedo, 30,000; Jesús e Trinidad, 24,000; Caazapa, 20,000; Caraguatay, 20,000; Encarnación, 16,000; San Pedro, 15,000; Paraguari, 12,000;

Coronel Bogado, 11,000; and Pilar, 10,000.

**History.**—P. was discovered by Sebastian Cabot in 1526, but the first colony there was settled in 1537 by Pedro de Mendoza, who founded the city of Asunción, and estab. the country as a viceroyalty of Peru. The warlike Guaranis long successfully resisted the invaders. In the latter half of the sixteenth century Jesuit missionaries arrived, and their work there is one of the most marvellous in missionary hist. The expulsion of the Jesuits in 1769 was a great blow to S. America. P. was the first republic to obtain its independence, and from 1814 to 1840 it was ruled by the remarkable despot, Dr. Francia. He was succeeded by his nephew, Carlos Antonio López, who, dying in 1862, was succeeded by his son, Francisco López, an ambitious man, who organised a most efficient army, and seems to have aimed at becoming the arbiter of S. America. The other republics recognised the danger, and Brazil, Argentina, and Uruguay engaged in a long and sanguinary war against him, which ended in the defeat and death of López in 1870. The result was the ruin of P., whose pop. dwindled from 1,300,000 to about 200,000. Half a million of the people of P. are said to have been killed in the war with Argentina and Brazil in 1864. In 1912 the revolutions in progress were practically exterminating the male pop., and misery and desolation covered the land. Till recently peace was secured only by the advent or triumph of stronger political adventurers, and the duration of governments was short. Though the country had by no means recovered from these disasters, the pop. had again risen to over 1,600,000 when war broke out (1932-35) with Bolivia over the Gran Chaco (q.v. and see above).

During the Second World War the U.S.A. and Argentina both sought to influence the Paraguayan Gov., the latter being in the stronger position. But in June 1946 pressure from the Paraguayan Army resulted in a modification of the gov., and the removal of all 'Nazi' leaders. President Morínigo remained on the understanding that he would revise his Cabinet, grant a general amnesty, and hold elections. But the delaying of these elections caused a revolt against him in March 1947, which he was able to put down in Ang., with the help of Argentine arms. Its leaders having withdrawn into exile, it was safe for Gen. Morínigo to permit the presidential and parl. elections he had promised and his nominee, Juan Natalicio González, a writer, was elected president (Feb. 1948).

**Paraguay River**, important riv. of S. America, an affluent of the Paraná (q.v.), rises in Mato Grosso in Brazil on a plateau of red sandstone. The P. takes a S.W. course and, after flowing through a level country covered with thick forests, is joined from the W. by the Jauru. It then flows S. through the marsh of Karazes, and winds southwards, forming for a space the boundary between Brazil and Bolivia. It then pursues a S.S.W. course and passes through the republic of P. to join the Paraná a few miles above the tn. of Corrientes. Its chief affluents are the Cayaba, Tacuary, Mondego, and Apa on the left, and the Jauru, Pilcomayo, and Vermejo on the right; its total length is about 1800 m.; it is navigable for steamers to the mouth of the Cayaba, 100 m. above the tn. of Corumbá.

**Paraguay Tea**, see MATÉ TEA.

**Parahyba**, or **Paraíba**, state on the N.E. coast of Brazil, between Pernambuco and Rio Grande do Norte. Cotton-seed, cotton, and tapioca are produced. Cap. João Pessoa. Area 21,730 sq. m. Pop. 1,655,000.

**Parahyba do Sul**, <sup>1</sup> in Brazil, which flows between the Serra da Mantiqueira and the coast range of Rio de Janeiro, and is only partly navigable. Length 530 m.

**Parakeet**, unscientific name for small long-tailed parrots, with a moderate beak and high slender tarsal. Among the best known is the ring-necked P., which is very common in India and Africa, and in some dists. is a serious pest of agriculture. Its gay plumage and hardness make it a popular pet, and large numbers are imported. The crested ground P. or cockatiel is another hardy bird, and breeds readily in confinement. It and the undulated grass P. or budgerigar are natives of Australia; both are extensively kept as pets. A beautiful P. is the king P., which is about the size of a magpie and has a red head and breast and green wings.

**Paraldehyde**, colourless liquid (boiling-point 124° C.), obtained by adding a drop of concentrated sulphuric acid to acetaldehyde (q.v.). It has the formula (C<sub>3</sub>H<sub>8</sub>O)<sub>3</sub>, and is used as a soporific (the so-called 'K.O. drops' of the crime novel).

**Parallax**. The P. of a heavenly body comparatively close to the earth, e.g. any member of the solar system, is the angle between two lines drawn to it, one from the observer on the earth's surface and the other from the earth's centre. Obviously if a body is in the observer's zenith these two lines will coincide, in which case the body has no P., and if it is on the horizon the angle will attain a maximum value and is then known as the *horizontal P.* (H.P.). Between these two extreme values the P. will vary owing to the rotation of the earth, and the effect of P. is to increase a body's zenith distance. The *Nautical Almanac* and other similar pubs. give the positions of the heavenly bodies as if they were viewed from the centre of the earth, thus eliminating the effects of P. Hence any such body observed from the earth's surface will

have a greater zenith distance and less altitude than would be derived by using the data supplied in the *Nautical Almanac*, and corrections must be applied. The moon's P. is the easiest to measure owing to the proximity of our satellite to the earth, and the method adopted is similar to that used by a surveyor who measures a base line and two angles. If *O* and *O'* are two observatories, separated as far as possible, and *M* is the moon, by a method well known to astronomers the angles *MOO'* and *MO'O* can be measured, and as the length of the line *OO'* is known, the distances *OM*, *O'M* are easily found and also the distance *CM*, where *C* is the centre of the earth. When the distance of the moon or any other object in the solar system from the earth's centre is known, the H.P., denoted by *P*, is found from  $\sin P = a/d$ , where *a* is the earth's equatorial radius and *d* the distance of the object from the earth's centre. The same principle is used for finding the distances and hence the H.P. of planets, but owing to their greater distances from the earth the same accuracy is not attainable because small errors in the angles corresponding to *OO'M* and *O'OM* involve relatively great errors in finding the lines corresponding to *OM* and *O'M*. The H.P. of the moon varies because our satellite describes an ellipse in its revolution round the earth and hence its distance *d* varies; the mean H.P. of the moon is about 57' whereas the maxima for Venus and Mars are 31' and 21' respectively, and for those of the other planets (not including all the minor planets) less still. It should be emphasised that no Ps. can be determined directly, that is, they cannot be ascertained by placing one observer on the surface of the earth and another at its centre and measuring the angle subtended by the earth's equatorial radius at the body. The method for finding the moon's P., already explained, is applicable also to the sun and the planets, but great accuracy in such cases is unobtainable, and the procedure for the sun is as follows. Kepler's third law (q.v.) states that the squares of the periodic times of any two planets, that is, of their times of revolving round the sun, vary as the cubes of their mean distances from the sun. The periodic time of a planet can be determined with great accuracy from observation and the minor planet Eros has proved very useful to astronomers for finding the P. of the sun owing to its close approach at times to the earth. Its periodic time is about 1½ years, from which it is easy to compute its mean distance from the sun is 1.45 times the earth's mean distance. From these figures it is possible to derive the distance of Eros from the earth at any particular time in terms of the earth's mean distance from the sun—not in m. Now when Eros makes a close approach to the earth (say about 16,000,000 m.) its distance from the earth is measured in the same way as the moon's distance and expressed in m., and hence the astronomer knows that a certain number of m. corresponds to a certain fraction of the earth's mean distance from the sun.

From this he knows the earth's mean distance from the sun in m. Although the actual determination of the distance of Eros from the earth cannot be carried out with such accuracy as is done in the case of the moon, because Eros even at its nearest approach to the earth is more than fifty times the moon's mean distance, yet this distance is very much less than the distance of the sun, about 400 times the moon's distance. Mr. A. Hinks used this method when Eros made a close approach to the earth in 1900-1 and the astronomer royal, Sir Harold Spencer Jones, also utilised it when Eros made a closer approach in 1931. The following approximate figures will show more clearly how the sun's mean distance from the earth, known as the astronomical unit (A.U.), is derived. Using Kepler's third law, the mean distance of Eros from the sun is 1.45 A.U. and on a certain date its computed mean distance from the earth was 0.17418 A.U. On the same date its distance from the earth, found by the same method that is employed for determining the moon's distance, was 16,200,000 m., and hence 1 A.U. is  $16,200,000 / 0.17418 = 93,005,000$  m. The H.P., derived from  $\sin P = a/d$ , a being 3963.35 m., the earth's equatorial radius, and  $d$  93,005,000 m., gives  $\sin P = 0.000042611$ , or  $P = 8''.79$  nearly. Other methods for determining the distances of the sun and the planets will be found under appropriate headings. See ABERRATION; PERTURBATIONS; VELOCITY OF LIGHT.

**Stellar Parallaxes.**—The earth's radius subtends such a small angle at the distance of the nearest star that it cannot be detected. A much longer base line is necessary and this is provided by the diameter of the earth's orbit, which is about 186,000,000 m. A star is observed at each end of a diameter, an interval of six months intervening, and the principle is practically the same as that used in finding the moon's distance. At each end of the diameter selected, not only is the star photographed, but in addition another faint star in its field is also photographed, the presumption being that the fainter star is very far off—so far that it may be assumed at an infinite distance and hence lines drawn from the earth at each position of its orbit to this faint star are practically parallel. In these circumstances a displacement of the brighter star whose P. is sought, relative to the fainter star, takes place, from which the angle subtended at the former by the diameter of the earth's orbit is easily found. This supplies the necessary data for finding the distance of the star. Many refinements are essential in the method, but the above gives the general principle involved, and when the distance of the star has been determined its P. is supplied with the following implication. The P. of a star is the maximum angle subtended at the star by the earth-sun line; when this line is not at right-angles to the sun-star line, reductions are made so that the P. refers to the maximum angle. An example will show how stellar P.—often referred to as *ann. P.*—can be reduced to

A.U.s. and from this to light years. The P. of Proxima Centauri, the nearest star to us, is  $0''.783$ , and using the formula  $\sin P' = a/d$ , or  $d = a/\sin P$ ,  $a$  and  $d$  in this case denoting 1 A.U. and the distance of the star, respectively,  $d = 1/0.000003796 = 263435$  A.U. Since one A.U. is 93,000,000 m., the distance in m. is 24.5 million million or  $24.5 \times 10^{12}$ . A light year is  $5.88 \times 10^{12}$  m., and hence the distance of the star is about 4.2 light years. Various other methods besides the above trigonometrical method are used for finding the distances of the stars. See under STARS, Cepheid Variables; SPECTRUM AND SPECTROSCOPE.

**Parallax of the Fixed Stars,** see preceding article and STARS.

**Parallelepiped** (*parallelopiped*, wrong spelling), solid figure having six faces, all parallelograms, any two opposite being similar and parallel; the edges equal and parallel on opposite faces, the diagonals meeting in a point. With square faces it becomes a cube. The ordinary rectangular box is another form. The volume is the product of the area of any face as base and the vertical height between it and the opposite face.

**Parallelogram of Forces.** When two forces act in different directions, not opposite, on a point P, the resultant or 'combined' force acting as one can be determined as to direction and magnitude

PARALLELOGRAM OF FORCES

by constructing a parallelogram, with sides PA, PB representing the two forces in direction and magnitude. The diagonal from the point PR gives the resultant. All vector (q.v.) quantities, such as velocity and displacements, are similarly determined.

**Paralysis, or Palsy,** in medicine, denotes the loss of power of movement, but applies also to loss of function; incomplete P. (diminished power) is known as *paresis*. There are three classes: *cerebral*, *spinal*, and *peripheral*. Cerebral P. arises from destruction of motor nerve cells of the surface of the brain, or from interruption in the nerve fibres leading to the spinal cord. 'Hemiplegia' is characterised by unilateral P. of the body in the legs, arms, etc., with aphasia (loss of speech), if on the right side. The facial muscles and tongue are generally affected, the eyelids and mouth drooping. Cerebral P. usually follows ruptured blood-vessels or choking by clots, etc.; tumours, abscesses, fracture of the skull, epileptic fits or hysterical fits may be the cause. Recovery may take place if the paresis results from

pressure only, but such is not common. Spinal P. is due to pressure, interruption, or destruction of the nerve cells or fibres in the spinal cord or those passing to the muscles. Sensory P. is more often found than in the cerebral form, where 'hemianasthesia' is unusual. In 'paraplegia' both sides of the body are affected in certain areas depending on the position of the lesion in the spine; reflex movements may remain unaltered; motor areas on one side and sensory on the other may be affected. Spinal P. in its oncome is seldom marked by convulsions, but it is often characterised by progressive waste of muscles. Peripheral P. arises from affection of the nerves or muscles. Facial P. (Bell's P.) is due to affection of the seventh cranial nerve caused by disease of the ear, or exposure to draught. Lead palsy is characterised by 'wrist drop,' with affection of the muscles of the forearm. 'P. agitans,' the form in old age, is accompanied by tremors, loss of equilibrium, and rigidity. 'Diphtheritic P.' is an affection of the structural protoplasm due to a bacillus and its ptomaines. 'Birth P.' in its various forms, often in the legs and feet, is a frequent occurrence owing to difficult labour and consequent injury to the brain or spinal cord. 'Bulbar P.,' a rapidly fatal form, affects the speech and centres of deglutition; it springs from the *medulla oblongata*. P. is usually accompanied by flaccid muscles, though there may be temporary rigidity; the muscular fibres are replaced by contractile connective tissue, and the limbs become permanently bent and immobile. Traumatism, embolism, hæmorrhage, tumour, and thrombosis are the chief causes, alcoholism and syphilis and other diseases affecting the circulatory system are also among the causes. Infantile paralysis (*q.v.*) (*polio-myelitis*), which affects the motor areas in the grey matter of the spinal cord, is a virus infection which is a further cause of P.

**Treatment.**—If not too advanced and accompanied by debility, gentle exercise and massage may be resorted to, but with care; faradisation is supposed to be of some benefit, but as a rule treatment must consist in attending to all the rules for health which are falling out of use by the patient. The bowels should be kept open, and attention paid to the emptying of the bladder, by catheter if necessary. Bed sores should be guarded against. Fresh air and sunshine and warmth of clothing must be supplied; mental rest is essential, and after a seizure complete rest in bed. See also GENERAL PARALYSIS. See W. R. Brain, *Diseases of the Nervous System* (3rd ed.), 1947.

**Paralysis of the Insane, General see under INSANITY (CLASSIFICATION)**

**Paramaribo**, cap. and chief port of Surinam (Dutch Guiana), on the Surinam R., 12 m. from the sea, and 214 m. from Georgetown, Brit. Guiana. It is the centre of the trade of the colony, and it is a station on the U.S.-Argentine air route. There is a deep-water frontage of a mile. A metre-gauge railway runs to Dam (100 m.). Pop. 74,000.

**Paramatta**, see PARRAMATTA.

**Paramecium**, or **Slipper animalcule**, one of the group of Protozoa formerly known as Infusoria, but now classified as Ciliata. The name *Infusoria* (*q.v.*) was originally applied to these and similar organisms because they were observed in infusions prepared from such organic substances as hay, seeds etc. The group is now limited to those protozoa which have a permanent investing pellicle, a large and one or more small nuclei, and an arrangement of cilia by which they move about. One section of the ciliata includes organisms which are usually ciliated only in the young state and acquire their food from the surrounding medium by suction, these are known

**PARAMECIUM, THE SLIPPER ANIMALCULE**

A, anterior end, C, cilia, CV, contractile vacuule, D, dermis, MA N, macronucleus, MI N, micronucleus, FV, food vacuole, G, gullet, M, mouth, P, posterior end, TR, trichocyst, V, ciliate.

as *suctorica*. The remaining members of the ciliata comprise organisms permanently provided with cilia, and it is to this group that the P. belongs. The P., as its alternative name suggests, is shaped like the sole of a slipper, but is only about 0.01 in. long. The surface is provided with rows of cilia arranged longitudinally. The cell is surrounded by a definite pellicle, and contains within its body food vacuoles formed by the particles of food collecting bubbles of water about them as they pass from the oral cavity into the endoplasm; the food passes in an elliptical path through the endoplasm and becomes gradually digested. There are also two contractile vacuules which function alternately and act as osmotic organs. Water is constantly absorbed by osmosis over the whole pell. and these vacuoles suddenly contract and forcibly expel it. Experiments made to show that the function of these vacuoles is excretory have so far failed. The P. provides itself with food by lashing the water with its cilia. These also serve as an organ of

locomotion, the cell taking a peculiar zigzag path at a constant angle to the general direction of its motion. The food is directed into a funnel-shaped 'mouth,' within which is a thin membrane. This by its movements, aids the direction of the food into the animal. Reproduction is effected by fission and by conjugation. In the former case, first the smaller or micronucleus, then the larger or meganucleus, become constricted and divide into two by oblique division, and the missing organs in either part are quickly regenerated. It is observed that frequent multiplication by fission diminishes the vitality of the organism and is succeeded by conjugation, when two exchange part of the substance of their nuclear apparatus and so obtain a new lease of life. When conditions become unfavourable the animals encyst themselves.

**Paraná:** 1. City of Argentina, cap. of the prov. of Entre Ríos, on the P., facing the tn. of Santa Fé, 400 m. by riv. from Buenos Aires and 365 m. by the Mitre and Urquiza railways. It is the centre of a grain-growing dist. For a few years from 1853 the city was the cap. of the Argentine. The chief objects of interest to visitors are the governor's palace, the cathedral, and the Urquiza Park. P. is a bishop's see and the seat of a univ., and a thriving riv. port. Pop. 75,000. 2. Coastal state of S. Brazil, between Paraguay and the Atlantic. W. of the low-lying coastal strip are the mts. of the Serra do Mar. Timber, cereals, rice, fruit, and cotton are produced, and there are coal deposits. Cap. Curitiba. Area 77,717 sq. m. Pop. 1,438,000. 3. Great riv. of S. America, formed by the confluence of the Rio Grande and the Paranaíba. The Rio Grande rises in the state of Minas Gerais, Brazil, and flows N.W. and W. to the point of confluence. As the P. the two rvs. then flows in a S.W. direction through Brazil, then S., forming the boundary between Brazil and Paraguay. Thence it sweeps W. between Paraguay and Argentina to receive its prin. trib., the Paraguay. It then flows S.W. to Rosario and S.E. to unite with the Uruguay in the Plata estuary. Cataracts and rapids render it unfit for navigation over a large part of its course, but for the last 1000 m. it is always navigable even by large steamers. Its total length is about 2500 m., excluding the Rio Grande, its true headstream.

**Paranáguá,** chief seaport of the state of Paraná, Brazil, 55 m. E. of Curitiba. It is situated on a lagoon-like bay of the same name; its quay is small but modernised. The bar is to be dredged to receive ships of greater draft. Coffee, sugar, spice, and maté are exported, as well as bananas, maize, wood, and other products. The port dates from the colonial period and in the tn. there are some historic churches. The rail journey to São Paulo is 660 m. Pop. 23,000.

**Paranoia,** see under INSANITY (CLASSIFICATION).

**Parapet** (from the It. *parapetto*), low or breast-high wall or fence, to serve as a protection on bridges, terraces, platform-

roofs, etc. In It. architecture Ps. are generally balustrades. In Gothic architecture the P. is merely a continuation of the wall carried up above the edge of the roof and finished by a coping, unless machicolated, in which case it projects and overhangs the walls below. In the Lombardic buildings of Italy, and frequently in the Norman style, there is seldom any P., the eaves of the roof finishing the elevation. In Elizabethan buildings open-work Ps., forming various fantastical devices, are common.

**Paraphrase** (from Gk. *παρά*, beside, and *φράσις*, to speak), name given to a re-statement of a passage in prose or verse, so as to bring out its meaning with greater lucidity, without altering the sense of the original by change, addition, or subtraction. In music a P. is a free adaptation of a piece of music so as to suit it to other instruments. The metrical arrangements of portions of Scripture which are sung with the psalmody in the Scottish Church are called Ps.

**Paraphrenia,** see under INSANITY (CLASSIFICATION).

**Parapsychology,** see PSYCHICAL RESEARCH, and under PSYCHOLOGY.

**Paraselenae,** see MOCK SUNS AND MOONS.

**Parasites** (Gk. *παράσιτος*, one who eats beside, or at the table of another, or at another's expense), living organisms which pass the whole or a part of their existence on or in other living organisms or hosts without conferring any benefit. They do this essentially for the purpose of obtaining nourishment from their hosts, not merely for shelter. In recent years numbers of instances have been observed where one creature is in intimate association with another purely as a commensal (q.v.). For instance, small sea anemones are transported in the claws of two species of crabs, which take any food the anemones cannot completely swallow. The anemones probably gain from the transportation more opportunities of catching prey. Some small fishes shelter themselves beneath the 'umbrella' of large jelly fishes, others in the gullet of large sea anemones, and one in the hind gut of a sea cucumber. But in none of these and other similar cases does one of the commensals live or rear its young at the expense of the other, and hence they are not termed P. These are, however, of considerable interest as indicating how in many cases a parasitic life was entered upon, and one view of symbiosis maintains that it is the perfection of parasitism.

Until parasitology became an estab. science, attempts were made to classify P.: there were Ectozoa, or P. which live on the surface of the host, and Endozoa, which live in the blood or internal parts; but this is artificial, and the only satisfactory classification is along biological lines. (For plant- or phyto-P. see PARASITIC PLANTS.) The gradation of the symbiotic into the ectoparasitic habit is well illustrated by different barnacles. *Balanus* lives almost indifferently as a commensal on various animals such as whales, crabs, and sharks; but *Anelasma*, living on the shark, sends haustoria into

it, and thus establishes itself as an ectoparasite. Having adopted this mode of life, *Anelasma* has apparently to be maintained by sharks or to die, for it is unable to make other animals its hosts as indifferently as *Balanus* makes them commensals. In this way biological species of both plant and animal P. have been estab. From those examples where the prey or host is quickly destroyed, there is every degree of elaboration up to the stage of such perfect and (at any rate in the adult stage) harmless parasitism as those which merge into symbiosis.

The absence of serious injury by a parasite points to a long period of natural selection in which, on the one hand, the

admission to hosts of species other than those to which they have accustomed themselves. There are remarkable instances of this in the case of the microscopic parasite which causes malaria, and which can be conveyed only by the spotted-winged gnat (*Anopheles*); it is destroyed in the system of other gnats. Similarly the ciliated embryo of the liver fluke refuses to enter any small other than *Limnaea trunculata* and also, according to recent work, young specimens of *L. stagnalis*, as an intermediate host. Motor and other organs become atrophied as in the wingless insects (e.g. fleas) which have adopted parasitic life, while in the leech the alimentary tract is considerably simplified, and in the tapeworm the digestive system is completely aborted, as to a large extent are the nervous and sense organs. A large proportion of the so-called Entozoa require more than one host in which to complete their life-history. The host in which the adult reproductive stage is reached is the 'ultimate' or 'definite' host, and that in which the life-history is begun with the entrance of the ova or newly hatched larvae is the 'intermediate' host. For instance, the embryos of the tapeworm, picked up by pigs with their food, become encysted in their muscles, causing 'measly' pork, which if not properly cooked introduces the tapeworm to the intestines of man, where it passes into the adult stage. To counteract the slender chances of the completion of the life-history, which in the case of the liver fluke passes through seven distinct stages, many P. are extraordinarily prolific. A single tapeworm, (see GASTRODA), for example, produces some 75,000,000 young, of which perhaps, on the average, not more than one becomes estab. in its ultimate host. It is doubtful if any vertebrate is a true parasite, though the lamprey-like hagfish (*Myxine*) eats its way into the turbot, cod, and other fish, where it is often found by fishermen; but its stay in the body of its victim is short. The highest P. of importance in the animal kingdom are the various Arachnids, which include the numerous mite species. Among insects P. are numerous, and with them may be mentioned aphides, or plant-lice, the gall-wasps, and gall midges, and many others parasitic on plants.

As an instance of the artificiality of the classification of P. as external and internal, there is the instance of *Acaris megalocephala*, which lives in the intestine of the horse and is usually described as an endoparasite. Since, however, no penetration of cells is involved, it seems better to regard organisms living in the gut as ectoparasites, and those in the cells or blood stream as endoparasites. Among flat worms or Platyhelminths, and round worms, or Nematodes, parasitism is very frequent and gives rise to a number of serious diseases. The Sporozoa—a class of the Protozoa or unicellular animals—include a large variety of parasitic organisms of such importance as those that cause malaria, sleeping sickness, and amebic dysentery. P. are

SOME EXTERNAL PARASITES

parasite has been brought to a high degree of harmlessness, and, on the other hand, the host has become able to tolerate the parasite without being injured or poisoned by it. The most deadly P. are those that have recently acquired the habit and have not had time to become modified, and whose hosts have not acquired a tolerance of their presence. Some avoid killing the host only while their dependence upon it is essential. A caterpillar, for example, in which an ichneumon fly has laid her eggs, does not die until it has passed into the pupal stage, when the grubs of the fly which have fed upon it have become full grown and have also pupated. As parasitism becomes more pronounced, definite structural features are evolved, such as hook-like claws or suckers for secure attachment to the host and cuticles that are adequately protected against the action of digestive juices—to such a high degree indeed of adaptation is evolved this power of tolerating the chemical qualities of the gastric juice, that some P. are poisoned and destroyed if they gain

usually described as degenerate, but the criterion of degeneracy needs first to be clearly established. Viewed structurally P. are usually much simpler than related free-living forms. They have evidently lost the complex structure once possessed, so that if complexity be a criterion, P. are usually highly degenerate. *Sacculina* and *Pelagaster*, for example, are little more than ova-producing structures. If, however, success be a criterion, most P. are better described as highly specialised rather than as degenerate, for they may be regarded as highly successful, and they have elaborate reproductive organs. The Nematodes, well advanced in parasitic habits, are very widely distributed and very numerous. The food of the parasite is often pre-digested by the host; consequently a simple alimentary canal or absorptive area is sufficient for the parasite. It is often transported by the host, and therefore needs no organs of locomotion, unless a free-living phase occurs in its life-history. Even in this case the organs of locomotion are usually ill-developed, since they are little used. Thus degeneracy of structure is correlated with adaptation to the mode of life, and it may be questioned whether adaptation is degenerate. The degeneracy here appears to be an ethical question rather than a biological one.

Although P. are frequently highly successful, their hosts suffer considerably (see PARASITIC DISTURBANCE). Even when the parasite has established some sort of harmony with its host, to the extent that the host continues to live, there is frequently a reduction in size, and a disturbance in metabolism sufficient to effect sex reversal occurs when the crab is parasitised by *Sacculina* or by *Pelagaster*. Parasitism is a highly specialised mode of life favourable to the parasite but, at best, harmless to its host. At its worst, it destroys the host, but this usually indicates the beginning of a parasitic career, or an attempt to parasitise a new host. See also BACTERIOLOGY; CESTODA; PATHOLOGY; SYMBIOSIS, and articles on individual P.

**Parasitic Diseases.** Many parasites cause but little inconvenience or derangement to their hosts, but others give rise to serious disorders, some of which under suitable conditions are fatal. Probably further research will show a considerable proportion of all diseases to be due to parasites, high or low, animal or vegetable. Already a long list can be compiled of diseases due to specific organisms. Among the higher invertebrates, many Arthropoda

cause P. D. of plants and animals. Mange is due to three types of Arachnida, the Sarcopotes, Psoroptes, and the Symptobites. The Sarcopotes burrow into the flesh of domestic animals, causing considerable irritation and shedding of hair, the Psoroptes bite and feed on the exudations, and the Symptobites feed on scurf and debris around the hair. 'Ile of Wight' disease of bees is caused by a mite (*Acorapis woodi*) which infects the breathing tubes. Amongst Insecta, the larvae of warble flies do considerable damage to cattle by burrowing into and eating the flesh, and escaping through the skin so that the hide is punctured. In addition, parasitised cows produce less and poorer milk. Sheep are debilitated by the larvae of the sheep nostril fly, and also suffer from infection with various 'worms.' A tapeworm, *Conurus*, causes the disease variously called 'sturdy,' 'gid,' or 'staggers.' Another tapeworm, *Tenia echinococcus*, causes hydatid disease in man. Amongst Trematoda, *Fasciola hepatica* feeds in the liver of sheep and occasionally of man, and species of *Schistosoma* cause Bilharziasis (q.v.). The Nematodes or round worms have attained a great degree of harmful parasitism, giving rise in man to miners' worm (hook worm), guinea worm, elephantiasis, and trichinosis. *Syngamus* causes gapes in poultry, and *Heletotheca* forms root galls on tomatoes, cucumbers, and other plants. Amoebic dysentery, sleeping sickness, and malaria are due to parasitic Protozoa, and bacteria are responsible for many serious diseases such as tuberculosis, meningitis, and pneumonia. Ringworm and thrush are caused by parasitic fungi. Fungi are also the chief cause of disease in plants. See BACTERIOLOGY; ENTOMOLOGY.

**Parasitic Plants.** A large number of plants, especially fungi, have developed parasitic habits, some of which are the cause of serious loss to cultivated plants and trees. The number of Brit. phanerogamic (flowering) parasites is small; the dodders (*Cuscuta*) are the only ones of serious economic importance, often doing considerable damage to crops of clover and lucerne, into the tissues of which they send suckers. After germination a seedling dodder can live independently for two or three weeks; but if within that time it has not found a suitable host, it perishes, as the entire absence of chlorophyll prevents it from utilising inorganic food. The broomrapes (*Orobanchae*) are so dependent on their hosts that unless in contact with them the seeds cannot germinate. The toothwort (*Lathraea squamaria*) is also destitute of chlorophyll, but is said to supplement the food appropriated from the roots of various broad-leaved trees (e.g. hazel and elm) by animal organisms which get into small cavities in the leaves. In these cavities are glandular cells similar to those of certain insectivorous plants, but there is no conclusive evidence of the function of these cells. The mistletoe, eyebright, yellow rattle, and cow-wheat are partial parasites, for all these plants contain chloro-

phyl and can assimilate carbon dioxide, though dependent upon their hosts for water and salts. Among the fungi, the rusts and smuts do considerable damage to cereal crops; the mildews to hops, grapevines, gooseberry plants, and various fruit trees. *Phytophthora infestans* is the cause of potato blight, which led to the Irish potato famine in 1846-48. Ringworm and other skin diseases of man are caused by parasitic fungi (see ACTINOMYCOSIS; FUNGI). Most extraordinary of the numerous P. P. of the tropics is the huge-flowered *Rafflesia*, which grows on the *Cissus*; the flower, said to measure a yard in diameter, is the largest known. See F. T. Brooks, *Plant Diseases*, 1928.

Parasitology is the scientific study of parasites (q.v.).

Parasitoidine, see TOLUIDINE.

**Paratroops and Airborne Troops.** The first expression is sometimes loosely used to cover the meaning of the second. Airborne troops are of all arms and are specially trained and equipped to arrive at the scene of action by air, usually in ter. held by the enemy. They may be transported in gliders or powered aircraft which land and disembark small units complete in the assembly area, or, as P. proper, they may drop by parachute from aircraft, together with the greater part of their weapons and equipment. All the infantry and a proportion of other arms of a modern airborne div. are trained as P. Training of P. is strenuous, both physically and mentally, and consists in exercises of endurance and agility similar to those performed by commandos, together with jumping from towers, moving vehicles, captive balloons, and finally aircraft.

The employment of parachutists as an integral part of military organisation was first demonstrated by Russia in 1936. Although in the Second World War Russian airborne troops confined themselves to the role of organising and leading partisans in the Ger. back areas, in the W. this war saw a rapid development in the use of airborne troops. Parachutists were extensively employed by both sides for purposes of espionage and sabotage, but airborne troops were first employed on a large scale by the Gers. in the Low Countries in the spring of 1940, notably in the capture of Dutch airfields by parachutists, and of the fortress of Eben Emael on the Albert Canal by gliderborne troops. The invasion of Crete in 1941 may be taken as the culminating point of the Ger. airborne effort. After this, though the number of Ger. parachute divs. rose considerably, they were never used in their proper role, owing to the lack of transport aircraft to land and supply them. Ger. airborne divs. formed part of the Luftwaffe.

Brit. parachute troops began their operations with harassing and reconnaissance operations such as the raids on Lofoten and Bruneval and in support of the Canadian sortie against Dieppe. Parachutists were used in the allied landings in N. Africa in 1942, and airborne troops in gliders flown by sergeant-

pilots of the Glider Pilot Regiment took part in the invasion of Sicily, especially in the fighting round the Gornalunga Bridge, where they came face to face with Ger. parachutists. The Brit. 2nd Parachute Brigade occupied strong points in Catania to prepare the Eighth Army's landing there and the same brigade was used in a sea landing role at Taranto, and operated around Gioia del Colle between there and Bari. It also took part in the Sangro battle line in 1943, but not in an airborne role.

On the W. front the allied landings in Normandy were preceded by heavy droppings of parachutists, especially on the left bank of the bridgehead. In the autumn of 1944 an attempt was made to seize the crossings of the Lower Rhine by

Central Press Photos Ltd.

#### BRITISH PARATROOPS

dropping elements of the Brit. 1st and 6th Parachute Divs. and a Polish parachute brigade at Arnhem and Amer. parachute troops at Nijmegen. Owing to unfavourable weather, the quickness and violence of the Ger. reaction, and the failure of the Brit. Second Army to break through the Ger. troops encircling the Arnhem bridgehead, the Brit. and Polish P. had to be withdrawn. In support of the crossing of the Rhine by the allied 21st Army Group large forces of the 1st Allied Airborne Army were dropped a short distance behind the Ger. defences on the right bank of the riv. This operation may be taken to demonstrate the diminishing margin of profit accruing from the use of airborne troops. They were first employed to achieve surprise and attack in depth. As their use became more frequent so the element of absolute surprise diminished. As the reaction of the defence became more rapid and determined, so the time permissible in which they might effect a junction with their own ground forces was reduced and their range of action, the depth to which they could attack, was shortened. The Arnhem operation showed how short was the

time during which a large airborne force could be supported and supplied from the air except under the most favourable weather conditions. At this stage of the war it may be noted that two Ger. parachute divs. were fighting as ground troops in Italy, and the remaining seven in a similar role on the Lower Rhine. Yet such was the allied air superiority that none of these Luftwaffe troops could be dropped from the air, and the Ardennes offensive of Dec. 1945 was deliberately mounted in weather conditions which it was hoped would preclude air activity. Typical Ger. airborne operations of the second half of the war are the rescue of Mussolini from his prison on the Gran Sasso d'Italia by airborne troops under the Waffen S.S. Maj. Skorzeny in 1943 and the attempt to kidnap Tito at his headquarters in 1944. Both are good examples of the kind of *coup-de-main* to which the airborne arm lends itself.

In the last stages of the It. campaign allied P., including elements of the It. Nembo and Folgore divs., were dropped to secure crossings of the Po and the Adige.

P. in general are armed with ordinary hand weapons as carried by infantry, but some have been modified so as to reduce weight and bulk, as have some infantry support weapons such as the Brit. 3-in. mt. howitzer and six-pounder anti-tank gun. Airborne engineer equipment consists mainly of explosives for demolition, prepared charges of all kinds, and light-weight anti-tank and anti-personnel mines. Special parachutist weapons and equipment include the Ger. *Fallschirmgewehr* (an automatic rifle) and recoilless infantry gun, and the Brit. 'Corgi'-type collapsible motor-cycle. Special types of tank have also been modified for airborne use. See F. O. Miksche, *Paratroops*, 1943, and H. St. George Saunders, *The Red Beret*, 1949.

Paratyphoid Fevers were separated from typhoid fevers by Acharid and Ben-aude in 1896, and are of three types, designated A, B, and C. They are caused by infection with three varieties of *Bacillus paratyphosus*, the infection being carried by water contaminated with sewage, by milk and milk products, by food, or by animal carriers. The diseases are clinically indistinguishable from one another and from typhoid fever, although the latter is fatal in a higher percentage of cases. Microscopic examination of the bacilli reveals differences, and the reactions with sugars and with sera are different.

Before the First World War paratyphoid A was known only in E. Asia, paratyphoid B was confined to Europe, and paratyphoid C was most common in S.W. Europe and in Mesopotamia. During the war paratyphoid A and B became epidemic in the armies on the W. front and in the Near E., and all three types of fever have since been distributed throughout Europe and Asia. Although an attack of one type of paratyphoid fever or of typhoid fever does not immunise against an attack of any other type, it was found that soldiers inoculated

with antityphoid vaccine were to some extent protected against P. F., for the disease was much milder in character than in un inoculated men. For complete immunity inoculation with vaccine containing bacilli of each type is necessary. Treatment is the same as for typhoid fever. (See also BACTERIOLOGY; EPIDEMIOLOGY; TYPHOID FEVER.). See Goodall and Washbourn, *Infectious Diseases* (3rd ed.), 1928, and C. B. Ker, *Manual of Fevers* (4th ed.), 1939.

Paravane is a contrivance developed by Commander Usborn and Lt. (now Sir Dennistoun) Burney during the First World War as a protection for ships from mines. It consists of a cigar-shaped body made of welded steel plate. At its nose-end it carries an eye for a towing-cable, a fixed cutter for cutting the moorings of a mine, and a small steel plane for stability.

PARAVANE

At the tail-end are two rudders actuated by a hydrostatic valve which controls the depth at which the P. is required to run; also small horizontal and vertical fins. A P. is towed on each side of a ship by steel ropes attached to the stem and is adjusted to run submerged at a given depth generally slightly below the level of the keel—about 50 ft. from the ship's side and about 180 ft. from the stern, depending on the length of the vessel. The towing-cable thus forms a wedge which, when it comes in contact with the mine, mooring-wire deflects the latter away from the ship and leads it to the powerful cutter on the P., where it is severed, thus permitting the released mine to rise to the surface, when it can be destroyed. There is no danger of a ship registering a direct hit with its stern on a mine, owing to the cushion of water which a ship's stern pushes in front of her having the effect of deflecting the mine to one side or the other. Another type of P. contained explosives and was developed in 1916 to destroy submarines whose positions were approximately known. It was towed at high speed by the attacking vessel and the charge could be fired by electricity or automatically on the P. striking its target. But, with the development of asides, the P. as an anti-submarine weapon became obsolete and is only used to-day as a protective device.

Paray-le-Monial, tn. of the dept. of Saône-et-Loire, France, 48 m. W.N.W. of Maçon. At the convent of the Visitation

the nun Marie d'Alacoque was reputed to have had visions of the Saviour. The tn. manufs. ceramics and tiles, and has oil refineries. Pop. 7100

**Parcæ**, see MOIRÆ.

**Parcel Post**, see under POST OFFICE.

**Parceners**, see CO PARCENERS

**Parchim**, tn. in Mecklenburg, Germany, 20 m. S.E. of Schwerin. Moltke was born here. Pop. 12,000.

**Parchment**, skin of the sheep, lamb, goat, pig, or calf, prepared for writing upon. When the skin is divested of its hair or wool, it is placed for some time in a lime-pit, and then stretched on a square wooden frame drawn tight by pegs. When in the frame it is first scraped on the flesh side with a blunt iron then wetted with a moist rag, covered with pounded chalk, and rubbed well with pumice stone. After a short pause these operations are repeated, but without chalk. The skin is then turned and scraped on the hair side once only. The flesh side is scraped once more, and again rubbed over with chalk. All this is done by the skinner, who allows the skin to dry in the frame, and then cuts it out and sends it to the parchment-maker, who repeats the operation with a sharper tool, using a sack stuffed with flocks to lay the skin upon instead of stretching it in a frame.

**Parcimony** (Lat. *parcmonia*). The Law of, in logic, the principle that complex powers, principles, or causes are not to be postulated without necessity, but that the simplest hypothesis is to be preferred. The law is enunciated by Wm. of Ockham in the famous phrases—'Entia non sunt multiplicanda præter necessitatem.' Frustra fit per plura quod fieri potest per pauciora. The first maxim is aimed at the hypostatizing of abstractions, an error which he attributes to the Realists. See HYPOSTASIS NOMINATIM.

**Pardo-Bazan**, Countess Emilia (1852-1921), Sp. novelist and critic, b. at Corunna, Galicia, married Don José Quiroga of Orense (1866). Her title was granted by Alfonso XIII, and she was the first woman to be made counsellor of public instruction. She wrote numerous novels, the best dealing with Galicia, books on Fr. and Russian literature and travel, and collections of short stories and essays. Her most outstanding works are *Un Viejo de novios* (1881) and *La Tribuna* (1885), both in the manner of Fr. realism, *Los Paños de Ulloa* (1886), a vivid portrayal of Galician country life, and *La Madre Naturaliza* (1887). See life by E. González López, 1944.

**Pardoe**, Julia (1806-62) Eng. novelist, b. at Beverley, Yorkshire. She visited Portugal and wrote on her return *Traitor Traditions of Portugal* (1833). A visit to Constantinople supplied material for *The City of the Sultan* (1836) and *A Romance of the Harem* (1839), and after going to Hungary she wrote *The City of the Magyar* (1839-40).

**Pardon**. In the United Kingdom the home secretary in the exercise of the royal prerogative (see CROWN) has the right to pardon offenders against the criminal

law. A P. cannot be granted where private interests are mainly concerned in the prosecution of the offender (a principle which explains the obsolete rule that the Crown could not pardon a man 'appealed' of felony). For example, the Crown will not pardon a common nuisance while it remains unabated. Again, under an Act of Charles II., the Crown cannot pardon a person guilty of committing a man to prison out of the realm. It is the better opinion that the king cannot pardon where the effect would be to nullify the effect of a recognisance to keep the peace; nor again is it the practice to pardon a contempt of court to the prejudice of the rights of a subject. A P. may be absolute so as to put the offender in the same position as if he had been innocent all along, or conditional, e.g. when a person sentenced to death is pardoned on condition that he submit to having his sentence commuted to penal servitude. In form a P. is granted by warrant under the great seal (q.v.) or under the sign manual. Under the Act of Settlement no P. under the great seal can be pleaded to an impeachment by the Commons. In the U.S.A. the constitution gives the president the power to pardon offences against the U.S. Gov. except in the case of the impeachment of public officers.

**Paré, Ambrose** (1509-90), Fr. surgeon, b. at Laval in Maine, France. Although his parents were poor he went to study surgery at Paris. He gained a great reputation during the Fr. campaigns in Italy, and was made surgeon in ordinary to Henry II., and he held the same office until his death. P. is considered to be the father of modern surgery.

**Parent and Child**. By Eng. law the complete relation of P. and C. exists only where the child has been born in lawful wedlock or where it has been legitimated by the subsequent marriage of the parents (see LEGITIMATION). There is no obligation on either parent at common law to maintain a legitimate child, though indirectly he or she could be compelled to do so through the old Poor Law Statutes, the Vagrancy Acts, and the Cruelty to Children Acts (see CHILDREN ACTS, 1908, 1933). An illegitimate child, whose parents have not married each other, is primarily maintainable by its mother, though if its paternity be proved an affiliation order can be obtained against the putative father compelling him to pay for the child's maintenance and education a sum not exceeding 20s. a week, until the child is sixteen. No person is required as father of an illegitimate child to give information concerning its birth, and the registrar of births and deaths may not enter in the register the name of any person as father of the child unless at the joint request of both parents. The effect of the Poor Law statutory obligation as reinforced by the National Assistance Act, 1948 (section 42) is that a husband is bound to support all his wife's children, whether legitimate or illegitimate, which she had when she married him, in addition to those he himself may beget by her.

**Legitimate.**—Legitimacy by birth depends on the lawful marriage of the parents and the fact that the child was born in wedlock, though it is immaterial how soon after the marriage the birth takes place. In Scots law the position has for long been that children otherwise illegitimate may be legitimated by the subsequent marriage of their parents. The prin. effect of legitimacy is the right of the child to inherit and take his parents' real estate and personal estate respectively, though there is nothing to prevent the parent from willing away from his own issue the whole of such property as does not form the subject of a settlement. The other results of legitimacy are the right to bear the father's name, and, to the extent indicated above, the right to be maintained, educated, and protected. The parents are the natural guardians of their children, and their control endures in ordinary circumstances until the child reaches twenty-one or marries under that age. But the father is the legally favoured parent, a pre-eminence the principle of which found its strongest expression in the *patria potestas* of the Rom. father of an agnatio family (see *HEIM*). In England the father has the right to the custody and control of the children, not only as against third parties but against the mother, even though the child be at the breast; but this exclusive right of the father has been so far modified by the Divorce Acts and the Infants Custody Act, 1873, that the court will, on the mother's petition, give her either access or complete control where it is clearly for the benefit of the child to do so. Under the Guardianship of Infants Act, 1886, the mother has the right to appoint by deed or will a guardian to act after her death, who will be entitled to act either alone or jointly with any guardian the husband may have appointed. The Adoption of Children Act, 1926, however, provides for the adoption of infants by applicants who must not themselves be under twenty-five years of age nor less than twenty-one years older than the infant they are applying to adopt. Before granting an adoption order the court must be satisfied that every person (and this includes the natural parents) whose consent is necessary to the order both consents to and understands the nature and effect of an adoption order and, in particular, that the effect will be permanently to deprive him (her) of his (her) parental rights; and the court must also be satisfied that the order will be for the welfare of the infant. It is obvious that the only cases likely to arise are those in which the applicant(s) has already been maintaining the infant in his (her) own home. Prior to 1926 the law would not allow parents to enter into an agreement binding themselves to surrender the custody of their children; and if they had, in fact, given up control to third persons, they could at any time resume control subject to any doubt the court might entertain as to whether it would be for the child's benefit that it be taken away from the care of those who had

actually reared it. In any case, if the child has been brought up by another person, or is boarded out by Poor Law or equivalent authorities, the court may make an order on the parents, if it restores the custody to them, to pay such remuneration for the past maintenance as may be just. Where any dispute arises between the parents as to the question of custody, and the child, if a boy, is not less than fourteen years of age, or, if a girl, not less than sixteen, the court may allow the child to exercise a discretion and withdraw itself from the control of one or both its parents. Where the husband and wife have separated and drawn up a deed of separation, providing that the mother have access or full custody, the father will be bound by his agreement. Parents have a legal right to give or withhold consent to an infant child's marriage (see *INFANCY*); such consent must be given honestly and without any view to the parents' own private advantage. It is almost needless to say that the right is of no great value, and that the absence of consent will not invalidate a marriage ceremony which is otherwise good, whatever effect it may have in debarring the disobedient child from succeeding to property or from other material benefits.

Under the former Poor Law Act of 1601 there was mutual obligation of maintenance on children and parents; but though grandparents might be compelled to maintain pauper grandchildren, the converse did not hold good. But under the National Assistance Act of 1948 the only responsibility now is that of parents to children. By the Children Act, 1908, the wilful neglect on the part of a parent to provide his child with adequate food, clothing, medical aid, or lodging, or to take steps to procure the provision of the same from the Poor Law authorities (now the National Assistance Board), is misdemeanour, for which he may be punished either summarily by a fine up to £25, with or without imprisonment up to six months, or on indictment by a fine up to £100, with or without imprisonment up to two years. When an order for maintenance is made against a soldier husband, it must be sent to the War Office, which dept may then order a certain part of his pay to be deducted and appropriated to the support of his children. The absence of any civil obligation to maintain is important in connection with the liability of parents for necessities supplied to their children under twenty-one. A father who gives no authority, *a fortiori* who enters into no contract, is no more liable for goods supplied to his children than would be a mere stranger, though, of course, a jury is not unnaturally disposed, from his moral obligation to provide for his children, to infer an admission of liability in respect of such claims upon his children by tradesmen. But apparently mere knowledge on the part of the father that his child was being maintained by a stranger will not be enough to fix him with the liability to pay for the necessities supplied by the stranger on the ground of tacit

acquiescence; it would be otherwise if he had deserted his child or it was in a destitute state, for in such cases the law always implies a liability to repay a stranger for necessities supplied.

Before the Elementary Education Act, 1876, it was not obligatory on a parent to have his child educated. Under that Act it is his duty to cause it to receive efficient elementary education in reading, writing, and arithmetic, subject to any reasonable excuse for not sending his child to school, e.g. on the score of ill health (*see further under EDUCATION*). Rich and poor fathers are alike in this, that neither is legally bound to do more than cause his child to receive a statutory elementary education. If, however, the child is under the custody of guardians, the latter are bound to educate him in a manner becoming his rank and station in society. Again there is no obligation on a parent to bring up his child in any particular religious creed, or indeed to instil any religious views in him at all. The father, however, has the right to choose in what religion the child is to be educated, *even though it be illegitimate and un-legitimated*, and he cannot release this right nor bind himself conclusively to bring his child up in a particular faith, for the right is to be exercised not for his but for the child's benefit. Apparently a father cannot directly secure in what religion his child shall be brought up *after his death*, but he can accomplish the same object by choosing the right testamentary guardian.

A father acquires no legal interest in any real or personal property that may be given or settled exclusively on his child, whether such property accrues to the child while under age or after majority. In ancient legal systems, like the Roman, children were unable for the most part to hold any property separately from their fathers (*see FIRM*). It seems a moot point whether a father is entitled to the earnings of his child. Much must depend upon the implied terms of any arrangement that may be supposed to have been made between them. If the father, after the child reaches a certain age, sends him out to work but undertakes to continue his board and lodging, it may be assumed that he does so only on the understanding that the child's earnings will be 'pooled' for the common benefit of the family. But there is nothing to prevent a child from making a formal contract with his father as to wages if he enters his father's service, and such contract would be enforceable against the father. Of course, if the father frees the child from his control he has no longer any hold over the child's earnings. A widow, being bound to support any children she may have who are under sixteen, has a similar right to their earnings (as to the law of succession on intestacy as between P. and C., *see under SUCCESSION, INTESTATE*). A child may make a gift to his parent, provided the gift is not tainted by any undue influence on the part of the parent; and conversely a parent's gift to his child gives the latter an exclusive property in the gift as if made over to him for valu-

able consideration. Further a voluntary settlement is binding on the parent, and can, if necessary, be specifically enforced by the children (*see also PORTIONS; LAND LAWS; MORTGAGE*). A child is under no legal obligation to support his parents, even though he may be in receipt of a handsome income and his parents be scarcely able to 'make both ends meet.' Prior to the National Assistance Act of 1948, if a parent became chargeable to the poor rate, his children, if able, could be made to contribute to his or her support; now, however, the responsibility for the maintenance of parents in case of need is upon the National Assistance Board, while the obligation to provide accommodation is upon the local authority.

If a daughter is seduced, her father, or mother, can bring an action for damages against the seducer, not directly for the seduction but for the loss of services consequent upon the daughter's becoming pregnant (if so) or sick. But it is essential for the parent to give some evidence, however slight, that the daughter did perform services for him (or her) of some kind. In regard to torts (actionable wrongs other than breach of contract) committed by children, e.g. libels, assaults, trespasses, negligence, the parent is liable only if he authorised the tortious act, or where it can be reasonably inferred that he must have known of and assented to its commission.

*Illegitimacy*.—As to the status of legitimacy and, inferentially, its converse, illegitimacy, *see LEGITIMACY; LEGITIMATION; BASTARDY*. By the common law an illegitimate child is *filius nullius* (the son of no man), and therefore has no parent on whom he has any claim or from whom he can derive any rights; but under the Legitimacy Act, 1926, an illegitimate child is on the same footing as a legitimate child, provided the parents are subsequently married to each other; but this statutory provision does not avail to legitimate a child whose father or mother was married to a third person at the time of the birth of the child. Even before this change, an illegitimate child was so far the legal child of his parents as to be able to take a bequest to a 'child or issue' if he had in his putative father's lifetime gained the reputation of being, in truth, the son (or daughter) of his father. It is the mother and not the putative father of an illegitimate child who has the care and right of custody of such child during nurture. The mother is bound so long as she remains unmarried or a widow to support her illegitimate children until they reach sixteen years of age. If she marries the husband becomes bound in her stead, though if the wife has separate property and the husband cannot support his family the wife must do so. *See also ADOPTION; BASTARDY; CHILDREN ACTS; CHILDREN, S. JETTES FOR PREVENTION OF CRUELTY to; GUARDIANS; INFANTS; LEGITIMACY; LEGITIMATION; REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES*. *See W. F. Eversley, Law of Domestic Relations* (6th ed.), 1937; G. Lushington, *Law of Affiliation and Bastardy* (6th ed.),

1936; and J. C. Hall, *Law of Adoption and Guardianship of Infants*, 1928.

**Parents' National Educational Union**, founded by Charlotte Mason in 1888, is a non-profit-making society of world-wide membership, offering practical help to parents and others whilst providing a meeting ground for the study and discussion of educational problems. Members receive a monthly copy of the *Parents' Review*, and a leaflet giving reading and occupations for children under six, and may use the lending library. Available to the children of members is the Parents' Union School (conducted by correspondence) which plans a common curriculum in all usual subjects for children aged six to eighteen working in P.N.E.U. schools, classes, and families. The Charlotte Mason College, Ambleside, Westmorland, offers a three-year training in P.N.E.U. methods of teaching. Address: P.N.E.U., 171 Victoria Street, London, S.W.1.

**Parentucelli, Tommaso**, see **NICHOLAS** (popes), *Nicholas V.*

**Paras, Sir Bernard** (1867-1949), Brit. historian and student of Slavonic languages and literature educated at Harrow and Trinity College, Cambridge. He was a univ. extension lecturer at Cambridge and, at various times, at London, Oxford, and Liverpool. He first visited Russia in 1898 and, subsequently in 1906 and often in later years, acquired a wide knowledge of Russian political and social life before the 1917 revolution, his relations with the moderates enabling him to exercise some influence on the development of the Duma, in which he was appointed a gentleman usher. His views on Russian constitutional advance at this period are given in his *Russia and Reform* (1907). Appointed reader in Russian hist. at Liverpool Univ. (1906), he was prof. of Russian hist., language, and literature there from 1908 to 1917. But in the meantime he spent much of his time in Russia and, in 1914, with the consent of the Tsarist Gov., was appointed a Brit. observer with the Russian forces, describing his experiences in *Day by Day with the Russian Army* (1915). K.B.E. in 1919, he was appointed to a chair of Russian in London Univ. in the same year; he developed, and became the first director of, the School of Slavonic and E. European Studies there. In 1925 he pub. his *History of Russia* and, in 1931, *My Russian Memoirs*, which latter served to show how he had tried to inculcate among Russian liberal reformers the Eng. concept of parl. gov. and how fundamental was his divergence from the Bolshevik outlook, a divergence which had long barred him access to the new Communist Russia. His chief work is *The Fall of the Russian Monarchy* (1939), based on a careful examination of documents, memoirs and interviews, and his previous experiences in Russia, and considered the best existing narrative, from the liberal standpoint, of the causes and earlier incidents of the October Revolution. During the Second World War he lectured and broadcast on Russia in America and Canada, and in 1944 pub. a

'Penguin' book on *Russia and the Peace*, which followed a 'Penguin Special' on *Russia*. Other works: *Letters of the Tsar and Tsaritsa* (ed. Eng. trans. 1924), and a trans. of Gribodov's comedy *Gore of Uma*, under the title of *The Misfortune of being Clever* (1925); and *Moscow admits a Critic* (1936).

**Paria**, Gulf of, inlet of the Caribbean Sea, between the is. of Trinidad and the mainland of Venezuela.

**Pariah**, name given to the lowest class of the pop. of India, which, not belonging to any of the castes of the Brahminical system, is shunned even by the lowest Hindu, as touching a P. would render him impure.

**Parian Chronicle**, see under **ARUNDEL MARBLES**.

**Paridae**, see **JACANA**.

**Paris**: 1. Famous pantomime of Domitian's reign, was a native of Egypt. He was a great favourite both with the emperor and the people, but was put to death for intriguing with the emperor's wife, Domitia. 2. Famous pantomime of Nero's reign. He was a great favourite of the emperor, who declared him to be freeborn though originally a slave of Domitia; but when Nero attempted to become a pantomime he caused P. to be put to death, deeming him a dangerous rival. See Tacitus, *Annals*, xli.

**Paris** (also called **Alexander**), second son of Priam and Hecuba. When he was born he was exposed on Mt. Ida, but was brought up by a shepherd; he became a great defender of flocks and shepherds, and received the name of Alexander, or defender of men and flocks. Discovering his origin, he was received by Priam and married Hecuba, but deserted her for Helen. He was called upon by Zeus to decide as to which was the fairest, Hera, Athena, or Aphrodite. Hera offered him the sovereignty of Asia, Athena renown in war, and Aphrodite the fairest woman for his wife. He decided in favour of Aphrodite. She took him to Greece and he was received by Menelaus in his palace at Sparta. He carried off Helen, the wife of Menelaus, and the most beautiful woman in the world. From this arose the Trojan war, and all Helen's former suitors sailed against Troy. P. was defeated by Menelaus, but was carried off by Aphrodite. Having killed Achilles, he was wounded, on the capture of Troy, by Philoctetes with one of the arrows of Hercules. He returned to his wife, Hecuba, but she refused to heal him and he died. Hecuba, remorseful, thereupon ended her life. P. is represented as a beautiful beardless youth with a Phrygian cap.

**Paris, Alexis Paulin** (1800-81), Fr. savant, b. at Avonay (Marne). He pub. in 1824 *Apologie de l'école romantique*. In 1828 he was appointed to the dept. of MSS. in the Bibliothèque Royale. During 1830-36 he completed a Fr. trans. of Byron's works in 13 vols., and from 1836

to 1848 he compiled a valuable catalogue of the *Manuscrits français de la bibliothèque du roi*, which has formed the basis of all subsequent works on early Fr. literature. P. was the first to occupy the chair of medieval literature founded at the College de France in 1853. On his retirement he was made an officer of the Legion of Honour.

**Paris, Gaston Bruno Paulin** (1839-1903), Fr. scholar, son of Alexis Paulin P., b. at Avenay (Marne). He studied at Bonn, at Göttingen, and at the École des Chartes. In 1865 he won his doctor's degree by a thesis on the *Histoire poétique de Charlemagne*. He founded, with P. Meyer, C. Morel, and H. Zotenberg, the *Revue critique* in 1866, and with P. Meyer in 1872 the *Romania*. His connection with these two journals was in great part the cause of the revival of scientific study in France. Among P.'s works may be mentioned *De Pseudo-Turpinio* (1865), the *Vie de Saint-Alexis* (1876), the *Petit Poucet et la grande course* (1876), and the *Littérature française du moyen âge* (1888, 1890). He succeeded his father as prof. of medieval Fr. literature at the Collège de France in 1872, of which he was appointed director in 1895.

**Paris, Louis Philippe Albert, Comte de** (1838-94), son of the Duc d'Orléans, eldest son of King Louis Philippe. On the deposition of Louis Philippe and the proclamation of the republic, the Orléanists were driven into exile, the family finally settling at Claremont, Surrey. The Comte de P. travelled with his brother, the Duc de Chartres, for some time in the E. In 1861 the brothers proceeded to the U.S.A., and joined the staff of Gen. McClellan. They were present at the siege of Yorktown and the fight at Williamsburg, and took an active part in sev. other engagements. Returning to Europe, he married in 1864 the Princess Marie Isabelle, daughter of the Duc de Montpensier, a son and heir being born at York House, Twickenham, the following year. At the declaration of the war in 1870 he was refused service in the Fr. Army. On the fall of Napoleon III. he returned to France, and by the death of the Comte de Chambord in 1883 became head of the house of Bourbon. Through the passing of the law of expulsion by which direct claimants to the throne of France were banished from the country, he was again forced to seek refuge in England, and resided quietly for some years at Richmond, where he died. His *History of the American Civil War* appeared in 8 vols. in 1874-75.

**Paris, Matthew** (c. 1200-59), Eng. historian and monk, entered the monastery of St. Albans in 1217. He succeeded Roger of Wendover as chronicler to the monastery (1236), and carried on the *Chronica Majora*, a hist. from the creation down to 1259, from the summer of 1235. He visited Norway in 1248, but returned to England in 1249. He was the best Lat. chronicler of the thirteenth century, his style being vigorous and bright; and his writing is of historic value, giving as it

does information derived from leading actors in contemporary events. He also wrote *Historia Anglorum*, a summary of the chief events between 1200 and 1280. The standard ed. of the *Chronica Majora*, by Dr. J. Ward, was pub. in the Rolls Series (1872-83).

**Paris**, anc. Lutetia, cap. of France and of the Seine dept., of whose area it occupies over one-sixth. It is built on both banks of the R. Seine, about 100 m. from its mouth, in two unequal parts, with the Ile de la Cité in the centre. On the r. b. it is enclosed by a sweep of low hills known as the Collines de P. On the l. b. are the Butte aux Cailles, Montsouris, Montrouge, and Mont Ste Genevieve. The outer boundary is formed by the plains of Grenelle and Vaugrard. The rising ground in the suburbs was once the site of forts, now dismantled. The area at present occupied by the Bastille and the *hotel de ville*, known as the Marais, was, for a long time, under water. Of numerous islets there now remain only the Ile de la Cité, the Ile aux Vaches, now called St. Louis, and the Ile de la Conférence, on which is built the Auteuil viaduct. Its height above sea level varies from 85 ft. to 110 ft., the highest point being the hill of Montmartre. Geographically it occupies an important position, being situated in a fertile plain, on ground of recent alluvial formation, near the confluence of the Oise, the Marne, and the Yonne with the Seine, and, what must have been of almost equal importance in early days, just at the point where the natural highway from the Mediterranean to the ocean is joined by the route from Aquitaine and Spain. The climate is temperate. The highest recorded temps. were 38° C. in 1874 and 1949; the lowest was -21° C. in 1929. P. has an area of 40 sq. m. It is 240 m. from London by air, Le Bourget-Northolt, and 285 m. by rail and sea, Calais-Dover. Pop. of the city, 2,725,400; of the dept. of Seine, which covers P.'s outer suburbs, 4,775,700.

**Administration.**—The municipal government of P. is under the prefect of the Seine dept. and a municipal council, which is elected and which in turn elects a president. The twenty mayors of the twenty arrons. into which P. is divided, who assist the prefect in certain services, are, however, civil servants, appointed by the Ministry of the Interior. There is a Justice of the peace for each arron. The police are under a separate functionary, the prefect of police, both he and the prefect of the dept. are appointed by the gov. The *Juges de la paix* (justices of the peace) hold their courts at their respective *mairies*. A tribunal of 1<sup>st</sup> inst. sits at the Palais de Justice. The Cour de Cassation, which sifts cases before their actual trial, and the Tribunal de Commerce, also sit at the Palais de Justice. P. is also the seat of the courts of first instance and appeal. It is the seat of the president of the republic, who resides at the Palais d'Elysée. The Chamber of Deputies is housed at the Palais Bourbon and the Senate at the Palais de Luxembourg.

The Conseil L'Etat and the Cour des Comptes also sit in P.

P is the seat of an archbishopric, whose titular, normally a cardinal, is primate of the Ile de France. He has under his jurisdiction ninety four par. churches, the Institut Catholique, nineteen eccles. communities, fifty-four religious houses, and one seminary. There are more than a hundred religious buildings of various other denominations and nationalities. P has thirty eight hospitals, besides a number of foreign charitable institutions and private clinics. The cemeteries include that of Père Lachaise, where the marshals of France are buried, and such

There are also two municipal colleges and more than 2000 primary schools, besides a number of private educational establs. Twenty one national museums are controlled by the Ministry of Education, two by the Institut, and seven by various private bodies. The most important is the Musée de Louvre, one of the finest in the world, and the Musée Carnavalet, which specialises in the hist. of P. Among the 15 libraries and archives of P the most important is the Bibliothèque Nationale. It possesses 5,000,000 printed books, 3,000,000 prints, 200,000 engravings, and 130,000 MSS. The Bibliothèque de l'Arsenal houses the Rondel Collection,

PARIS THE LEFT BANK AND THE QUAI D'ORSAY FROM THE RIVER  
On the left is the Gare d'Orsay, on the right the Sofrino and C. de l'Orsay

famous writers as Balzac, de Musset, and Oscar Wilde. There are a number of prisons, but the famous one of St Lazare has been demolished.

Five official academies form the Institut. Their headquarters are at the Hôtel Quai Conti; formerly the Collège des Quatre Nations. The most famous is the Académie Française, founded by Richelieu in 1635. The others are the Académie des Inscriptions et Belles Lettres, the Académie des Sciences, the Académie des Beaux Arts, and the Académie des Sciences Morales. The Académie de Médecine is at the Faculté de Médecine at the Sorbonne. The unit, governed by a rector, is also at the Sorbonne, together with the various faculties and the Ecole Normale. The minister of education is styled grand master of the university. There are faculties of Protestant theology, law, medicine, letters, and pharmacy. Teaching is supervised by the faculties in sixteen lycées and ten extra-mural lycées.

dealing especially with the theatre, and the Bibliothèque Mazurine possesses a collection of 900 incunabula. There are numerous places of amusement. The national theatres include the Opéra National and the Opéra Comique, the Comédie Française and the Théâtre Populaire.

There are six railway termini in P, including the Gare du Nord, Gare de Lyon, and Gare St Lazare. For internal traffic there are the Métropolitain and the Chemin de Fer de Ceinture besides an extensive motor bus service. There is an air port at Le Bourget linking P with all parts of the world. The principal markets are at the Halles Centrales. The dist. around P supplies it with much of its food, and P. manufactures jam, automobiles, beer, boots and shoes, and refined sugar. There are also luxury manufactures such as jewellery, dresses, furs, clocks, engravings, dress trimmings and ornaments, embroidery, tapestry, porcelain, etc.

**History.**—The Ile de la Cité, largest of the Seine is., was the nucleus of modern P. Before the Rom. conquest of the country, a small tribe of Gauls, known as the Parisii, settled there. The Romans called the is. Lutetia, and built a camp there, and in 52 B.C. the country came under Rom. rule. The settlement began to spread on to the l. b. of the Seine. Caesar placed the tn. and the region under the command of Labienus. A city was erected on this bank, large enough to contain massive arcus (excavated in 1856), but by the end of the third century barbarian invasions forced the inhab. back to the is. St. Denis and his companions, Rusticus and Eleutherius, were the first to introduce Christianity, towards the end of the third century, having been sent by the pope. St. Martin continued their work in the fourth century. P. was the cap. of Constantine Chlorus, who had a palace there. In 410 P. joined the Armorican league. Attila attempted to enter P. in 451, but halted at the prayer of St. Genevieve, who became patron saint of the city. This incident is commemorated by Laudowski's statue of the saint on the Pont de la Tournelle and is illustrated in one of the frescoes in the Panthéon. In the Frankish invasion P. was captured by the Merovingian king (Clovis (481-511), who made P. his cap. in 508, frequently residing there. After his conversion to Christianity he built the basilica of St. Peter and Paul. Chilpine removed his cap. from P. in 567, and for the remainder of Merovingian rule P.'s hist. is sombre, except for the brilliant reign of Dagobert the Great (628-38). Charlemagne (768-814) succeeded the Merovingians. P. had only grown slowly under the Frankish kings, though the civil power of the church had greatly increased, and trade and the guilds were flourishing. Charlemagne made P. a co., and it became a duchy under Charles the Bald. In 845 the Norsemen reached P. by the Seine and laid waste the city, sucking its monasteries and churches. The city stood a forty-five-month siege against them in 885, led by Bishop Gozlin and Count Eudes. In 892 the Norsemen were routed by Eudes, and they never again captured P. Under the Capetians, the line that was to reign until the revolution, commencing with Hugh Capet in 987, P. became the permanent cap. of France. Their palace was in the Cité, where the Palais de Justice now stands, the towers of the Conciergerie being remains of it. Louis the Fat marked out the second line of walls; these included the *faubourgs* of the l. b. In the reign of Henry I. (1031-60) the church of St. Martin des Champs, burned by the Norsemen, was rebuilt. The reign of Louis VI. (1108-37) was marked by a great expansion of P., and the great abbey of St. Victor and a nunnery at Montmartre were among the buildings erected. Between 1180 and 1213 Philip Augustus began the paving of P. and the building of its third wall. The wall was 8 ft. thick, pierced by twenty-four gates, and fortified by about 500 towers. A part remains to-day. Besides this he built the

Louvre, a moated château, parts of two wings of which are incorporated in the present palace, and the remainder may be traced. The Louvre was originally a hunting lodge before the name came to signify any royal residence. Two great warehouses at the old market at Champignons, the origin of Les Halles, were also the work of Philip Augustus. It was in this reign, too (in 1182), that the choir of the cathedral of Notre Dame was completed, the first stone having been laid by Pope Alexander III. twenty years earlier. The whole building, however, was not finished until the end of the thirteenth century.

P. had by this time become the intellectual centre of Europe. In the first

NOTRE DAME

E.N.A.

half of the thirteenth century the various schools organised themselves, thus giving to the univ. its definite character. P. Univ. was soon made famous by Peter Lombard, Abelard, and Sorbon, who gave his name to the Sorbonne. Louis IX., the Saint (1226-70), built the beautiful Sainte Chapelle, famous for the magnificence of its structure and its stained glass. He founded many monasteries and abbeys, as well as the Hôtel Dieu. Philip the Fair estab. the Parlement, the chief legal tribunal of the kingdom, which he housed in his palace of the Cité. In 1302 the Third Estate met with the States-General for the first time, to discuss the question of the temporal supremacy of the pope. In the reign of Philip VI., who succeeded to the throne in 1328, and in the succeeding reigns, France became the scene of Eng. invasion. In 1346 the *faubourgs* were laid waste. Some order was restored at the accession of Charles V. (1364), a great builder and art patron; the fourth wall around P. was built, which included the first buildings on the r. b. As the

Louvre was no longer part of the defences of P., he transformed it into a sumptuous palace; he also founded the first royal library. To him are also due the beautiful chapel of Vincennes and the raising of the Bastille. The minority and reign of Charles VI. (1380-1422) was a period of deep misery for P. The rivalry of the Armagnacs and Burgundians divided P. into two factions, and the Eng. occupied it, being driven out in 1446. P. then enjoyed a period of calm. During the reign of Charles VIII. the Petit Pont and the Pont Notre Dame were rebuilt; the latter replaced the previous wooden bridge in 1499, the houses on the new bridge being the first in P. to be numbered. Francis I. in 1528 began the building of the Louvre des Valois, and founded the Collège de France. Religious wars broke out in France, culminating in the massacre of St. Bartholomew's Eve in Aug. 1572 when, possibly at the instigation of Catherine de' Medici, the Huguenots in P. were murdered by the Rom. Catholics. Only after Henry IV.'s conversion to Rom. Catholicism in 1593 was peace restored, P. having suffered two sieges during the course of the wars. Catherine de' Medici had had erected the Petite Galerie on the S. of the Louvre, and had begun in 1564 the palace of the Tuilleries. Henry elaborated a vast scheme for finishing the Tuilleries, quadrupling the size of the Louvre, and joining the two palaces by continuing the Grande Galerie to the W. He practically completed the *hôtel de ville*, built the N. portion of the Pont Neuf, and incorporated the two islets W. of the Cité with the is. Under Louis XIII. building began on the Île St. Louis. The palace of Luxembourg, built by Marie de' Medici, was begun in 1615. Richelieu commissioned Lemerle in 1624 to complete Henry IV.'s scheme for the enlargement of the Louvre. Lemerle also designed the Hôtel Richelieu, which was later extended by Anne of Austria and renamed the Palais Royal. In 1614 Louis XIII. laid the first stone of the first bridge from the Île St. Louis, to the N. bank. P. again suffered internal dissension, culminating in the wars of the Fronde (1648-52) against Mazarin; but order was eventually restored to the advantage of the royal power. During Louis XIV.'s minority the building now known as the Institut de France was built as the Collège des Quatre-Nations, and also the Hôtel Mazarin, now the Bibliothèque Nationale. Louis XIV. was responsible for many magnificent buildings. During his long reign much of medieval P. was demolished. He finished the N. wing and riv. front of the Louvre. Other buildings completed during his reign were the two domed churches of St. Louis des Invalides and the Val de Grâce. The Porte St. Martin and the Porte St. Denis were transformed into triumphal arches. During this reign the court resided at Versailles and the pop. of P. insensibly lost their loyalty to the person of the king. Under Louis XV. huge buildings arose: the Place Louis XV. (now the Place de la Concorde) and the church which

was later secularised as the Panthéon. But for thirty years of Louis XV.'s reign nothing was done towards the completion of the Louvre, nor was there really much progress in P. during his or his successor's reign. Louis XVI. began the fifth circuit enclosing P. (1786). The revolution started in 1789 with the storming of the Bastille and its destruction. The principal events of the revolution took place in P., Louis XVI. being guillotined there in 1793. Thousands of executions followed, but P. regained a degree of calm under the Directory and the Consulate, and the period of neglect and destruction came to an end. In 1795 Bonaparte opened fire from the steps of the church of St. Roch on the royalists who were marching against the Convention. He soon rose to power, and became emperor of the Fr. in 1804, being crowned at Notre Dame in the presence of Pius VII. Napoleon commenced the modernisation of P. Perreault's colonnade to the Louvre was

ARC DE TRIOMPHE

E.N.A.

restored, the four façades of the quadrangle completed, and the Pont des Arts built. The two triumphal arches in the Place du Carrousel and the Place de l'Etoile were erected by Napoleon, though the latter, the Arc de Triomphe, was not completed until the reign of Louis Philippe. It is notable for its magnificent group sculpture by Rude, 'The Marsillaise.' The quays on the S. bank of the Seine were also built under Napoleon, and he ordered the church of the Madeleine, begun in 1761, to be completed as a Temple of Glory; it was not, however, finished till 1842, when it became a Catholic church. He drove sixty new streets through the city. In 1815 Napoleon was finally defeated. The sixth circuit was begun in 1818. There was a three-day revolution in P. in 1830, when Charles X. was deposed. This was commemorated by the bronze Colonne de Juillet in the Place de la Bataille. Louis Philippe's reign also ended in revolution which led to the estab. of a republic. Between 1815 and 1818 the basilicas of Notre Dame de Lorette and St. Vincent Paul were erected, as well as many bridges, and fifty-five new streets were laid. The

columns on the Place de la Concorde and the Place de la Bastille were raised, but the greatest architectural event of the period was the careful restoration, by Viollet le Duc, of Notre Dame and the Sainte Chapelle. In 1852 Louis Napoleon was proclaimed emperor. The seventh circuit, known as that of Thiers, was begun in 1841 and finished in 1869. In 1857 the N. façade of the Louvre was completed. The great changes which have made the modern P. were effected during the Second Empire under Baron Haussmann, prefect of the Seine from 1853. All remnants of medieval P. were swept away. Over £34,000,000 were spent then on making twenty-two new boulevards and avenues. Haussmann's idea was to raise the height of P. instead of allowing it to continue to spread outwards. P. was besieged by the Gers. during the Franco-Prussian war from Sept. 1870 to Jan. 1871, and the city suffered bombardment, damage, and famine. After the peace a civil war known as the Commune was waged in P., in which the *hôtel de ville* and the Tuilleries were destroyed. The Eiffel Tower was constructed for the exhibition of 1889; that of 1900 marked the extension of P. into the plain of Grenelle. Under the Third Republic the new *hôtel de ville*, the new Sorbonne, the Trocadéro, the Opéra, and the church of the Sacré Cœur were built. In 1937 the Palais de Chaillot replaced the old Trocadéro. During the First World War P. suffered air raids and was threatened with attack in Aug. 1914. A military governor was appointed and the seat of government removed to Bordeaux the following month. The battle of the Marne drove the Gers. away from the cap. Reinforcements were sent to the battlefield from P. in taxicabs. The gov. returned to P. in Dec. 1914. From 1916 to 1918 P. was attacked by 'Big Bertha.' In July 1919 an allied victory march through P. celebrated the signing of the treaty of Versailles, and on Nov. 11, 1920, the body of an unknown soldier was buried under the Arc de Triomphe. Between the two world wars some blocks of luxury flats in the W. of P., and some thirty new churches, products of the Catholic revival of the 1930s, were the prin. new buildings, apart from those already mentioned. Overcrowding has, however, been one of the social and economic effects of the wars.

In June 1940 Ger. troops occupied P., the Fr. having withdrawn to spare it from devastation. In May 1941 a Ger. municipal councillor was appointed commissioner for P. Allied planes made numerous raids on the factory suburbs of P., notably a heavy night attack by R.A.F. bombers on the Renault works at Billancourt in March 1942. In Aug. 1944 Gen. von Choltitz surrendered P. to Gen. Leclerc, after some bitter fighting had occurred between Fr. partisans and Ger. troops (see further under WESTERN FRONT IN SECOND WORLD WAR). P. had suffered little damage during the war, but nevertheless was faced in 1945 with a

severe housing problem, since there had been no building done since 1939. New buildings were commenced both in the centre of P. and in its suburbs, and a number of Metropolitan stations were named after war personalities or incidents, e.g. Franklin D. Roosevelt. P. remains a most beautiful city, with its wide streets, gardens, squares, and impressive buildings, representing the artistic evolution of a whole nation.

*Present-day Paris.*—The whole of P. was once surrounded by fortifications comprising three distinct lines of defence: the inner ramparts were demolished between the world wars. Beyond these there are separate rings of detached forts on the surrounding heights, the outer ring extending for about 75 m. and at about 8 m. from the ramparts, the intermediary forts varying in distance from the outer from 2 to 5 m. The inner line of fortifications confines P. to something roughly resembling a pear in shape, with the stalk towards the W., and the Cite and the Ile de St. Louis, on the bend of 7 m. which the Seine makes in its five hour flow through the city, for core. The riv. flows between broad stone embankments, being spanned by thirty-two bridges in its course. The greater part of the Cite is occupied by five buildings: Notre Dame, the Palais de Justice, to which a new wing was added in 1911-14, the Sainte Chapelle, the Prefecture de Police, and the Tribunal de Commerce. The Ile de St. Louis is known now as one of the most peaceful quarters of P. These is., and across the riv. on either hand the busiest part of P., are found within the circuit of the boulevards, the broad, tree-planted thoroughfares which have replaced the ramparts of Louis XIII. on the N. and of Philip Augustus on the S. Within this boundary and on the N. or r. b. of the riv., the following are among the chief points of interest: the Louvre; to the W. between its N. and S. wings is the Place de Carrousel, with the Arc de Triomphe, and stretching W. again the Jardin des Tuilleries and the Place de la Concorde. Outside the circuit of the boulevards are the Champs d'Elysées, and between the Louvre and the gardens is the site of the Tuilleries. In a straight line with the Champs d'Elysées is the Arc de Triomphe in the Place de l'Etoile, from which sev. avenues radiate. S. of this line, still on the r. b. of the riv., is one of the most fashionable residential areas. To the N. of the Jardin des Tuilleries are the Ministry of Marine, the Ministry of Justice, and the Vendôme Column; to the N. of the Louvre the Palais Royal, the Bibliothèque Nationale, and the Bourse. E. of the Louvre are the Galles Centrales, the Tour St. Jacques, the *hôtel de ville*, the site of the Bastille, and the Bibliothèque de l' Arsenal. N. is the Hôtel de Rohan, the Hôtel Carnavalet, and the Musée Victor Hugo. In the dist. N. of the Seine and beyond the portion already described the prin. points of interest include the following: just beyond the boulevards the Madeleine and the New Opera House. Further N. is the 'artists'

quarter' of Montmartre. About 1 m. beyond the boulevards to the E. is the cemetery of Pere Lachaise, and in the N. suburbs the abbey of St. Denis, containing the royal tombs. In St. Denis and Aubervilliers are the cap.'s worst slums. N. P.'s suburbs are mainly industrial, particularly in the N.E. On the S. bank of the Seine and within the space formerly enclosed within the walls of Louis Philippe is the Quartier Latin in which are to be found the various buildings of the univ. of P., the Institut, the Musée Cluny, the Panthéon, and the churches of St. Severin and St. Étienne du Mont. Between the two world wars a new univ. residential quarter was erected beyond the Porte D'Orléans, known as the Cité Universitaire, with different buildings to house the students of different nationalities: Collège France-Britannique, Collège au Japon, etc. Beyond the old Quartier Latin to the W. are the Ecole Militaire and the Champ de Mars, with the Eiffel Tower facing the Palais de Chaillot on the opposite bank of the riv. A little to the E. of these is the Hôtel des Invalides, and on the riv. bank close to the boundary the Ecole des Beaux Arts; and S. of that the Palais du Luxembourg with its beautiful gardens, and to the E. on the riv. bank the Jardin des Plantes just outside the old ramparts are the Bois de Boulogne on the W. and the Bois de Vincennes on the S.E.

**Paris:** 1. City of Texas, U.S.A., the co. seat of Lamar co., 93 m. N.E. of Dallas. It has cotton-seed oil mills, and a cotton-oil refinery. Pop. 18,700. 2. City, the co. seat of Edgar co., Illinois, 19 m. from Terre Haute. It is in a rich farming region. Manufs. brooms. Pop. 9300. 3. City of Kentucky, co. seat of Bourbon co., 18 m. N.E. of Lexington. Pop. 6700. 4. City of Tennessee, co. seat of Henry co., 95 m. W. of Nashville, situated in a fertile agric. region, in which cotton and tobacco are the chief products. Pop. 4400. 5. Tn. and port of entry of Brant co., Ontario, Canada, 30 m. W. of Hamilton. It has potteries, knitting mills, and oil refineries. Pop. 5000.

**Paris**, genus of herbaceous perennials (family Liliaceae), with a stout rhizome

and erect stem, bearing four whorled net-veined leaves, and a solitary green flower followed by a berry-like fruit. The only Brit. species is the herb P., or truelove knot (*P. quadrifolia*) a rather uncommon plant found in woods. The berry is black. *P. polyphylla* bears yellowish-green flowers, which are succeeded by bright red berries. This is sometimes grown in gardens. Its perianth is normally in eight reflexed petals, four large and lanceolate, and the alternating four small and narrow.

**Paris**, Declaration of, see DECLARATION OF PARIS.

**Parish.** The term par., as used to-day in connection with local government, means no more, according to the Interpretation Act, 1889, than a place for which separate overseers can be appointed or a separate Poor Rate levied; but like all statutory definitions, that of par. is one of convenience only and not instruction. Originally the expression par. was properly of eccles. significance only; and though it has been suggested that the explanation of the origin of urb. pars. is involved in great obscurity, Blackstone's definition that a par. meant primarily 'that circuit of ground in which the souls under the care of one parson or vicar do inhabit' is probably as true of urb. as of rural pars. The difficulties arise from the fact that from quite early times the par. was regarded as being not only an eccles. but also a civil subdivision of the co., and that the legislature has generally dealt with the par. as the unit area, not only for Poor Law purposes but for local administrative purposes generally. In parts of England the par. for local government purposes remains practically coterminous with the old eccles. bounds; but in a great number of urb. dists., and especially the metropolis, many pars. have been grouped into one, or the term has been used to cover other areas which, though not historically pars. have a not dissimilar organisation. The result is that in many cases a particular area may be a par. for civil but not for eccles. purposes, while in other cases a particular area may be a par. for some civil purposes and not for others. Historically a par. denotes a circumscribed ter. varying in extent and pop., but annexed to a single church whose incumbent (q.v.) is entitled to the tithes (or other commuted payment) within that ter. The creation of pars. in England was gradual and not complete till shortly before the Conquest. Most historians concur in the theory that the Eng. parochial divs. arose chiefly from lay foundations, the differences in extent being accounted for by the varying limits appointed for them at their origin. The origin of these lay foundations is to be sought in the early inadequacy of the means of divine worship supplied by the bishoprics and monasteries, when the feudal lords began to build their own demesne churches and oratories for their families and tenants. The bishops consecrated these places and consented to the incumbent residing at the church and receiving the tithes and offerings of the

inhab. to whose use the particular church was limited, as well as any endowment which the founder happened to annex to it. The last concession made to the lay-founder was probably the advowson or right of presenting the clerk to the vacant living—a right which, by the primitive constitution of the church, belonged exclusively to the bishop; and when this concession was obtained, these united tithes differed in no material respect from most modern pars. See LOCAL GOVERNMENT.

Paris, Treaties of, name given to various international peace treaties signed in P.; viz. the treaty signed Feb. 10, 1763, by Britain, France, and Spain at the end of the Seven Years' war; the treaty signed on Sept. 3, 1783, between Britain and the Amer. commissioners, recognising Amer. independence; the treaty of May 30, 1814, between the Allies and France after the abdication of Napoleon; the treaty concluded on Nov. 20, 1815, between the same signatories after the final overthrow of Napoleon; and the treaty of March 30, 1856, signed by Great Britain, France, Turkey, Sardinia, and Russia at the close of the Crimean war. The peace conference after the First World War, which drew up the Versailles peace treaty, was held in P. in 1919-20; and the peace conference held in P. after the Second World War in 1946 drew up the peace treaties between the Allies and Italy, Hungary, Bulgaria, Rumania, and Finland.

Paris University, *see* SORBONNE.

Park, Sir Keith Rodney (b. 1892), airman, b. in New Zealand. In the battle of Britain he commanded No. 11 Fighter Group, which took a major part. He was then promoted to air officer commanding in Egypt (1942); in Malta (1942-1943); air officer commanding in chief in the Middle East (1944-45), and became allied air commander-in-chief, S.E. Asia (1945-46). He reached the rank of air chief marshal.

Park, Mungo (1771-1806), Brit. explorer, b. at Selkirk; he went to Edinburgh Univ., where he studied medicine and surgery, and distinguished himself as a botanist. In 1792 he went to Sumatra and there carried out certain botanical investigations, the result of which brought him into notice. In 1795 the African Association sent him to explore the course of the Niger, and this he did accompanied only by two servants. The journey was full of difficulties and set-backs. At one point he was imprisoned for four months by a hostile chief, and escaped with only his horse and his pocket compass. At last, in July 1796, he found the long-sought Niger, and followed the river downstream from Segu. But he was weak, hungry, and without means, and he had to turn back, finally collapsing with fever at Bamako after having traced the course

of the river for 300 m. Only the nursing of an African, in whose house he remained for seven months, saved his life. On his return in 1799 he pub. his *Travels* (*see* Everyman's Library), which achieved great popularity. He now estab. himself as a surgeon at Peebles, but the love of travel was too strong within him for such a life, and in 1805 he sailed for the Niger. This expedition was a much more ambitious one than the first and consisted of some seventy Europeans, including soldiers, artificers, draughtsmen, as well as native guides and carriers. They started, as before, from Pisanla, in the Gambia, but by the time they had reached the Niger only eleven Europeans were left alive; the rest had succumbed to fever and dysentery. P., however, was undeterred and determined to continue from where he had left off on his first expedition. With the help of the one soldier still capable of work, he built, out of two canoes, a serviceable boat which he called the *Joliba*, the native name for the Niger. Before setting sail in it with the poor remnants of his party he gave letters to a native guide to take back to the Gambia for transmission to England. One of these, addressed to the Colonial Office, ends on a note of high courage, to the effect that though all with him should die he would still persevere and if he could not succeed in the object of his journey he would at least die on the Niger. P. perished in the rapids at Bussa; but not before he and his companions had navigated a thousand m. of the river. The *Joliba* seems to have got into a wrong channel, struck a rock, and remained fast. Hostile tribesmen on the bank attacked with spears and arrows, and, other because they were unable to defend themselves, or because the boat was smashed under them, the occupants were swept into the water and drowned. To-day at Pisanla there stands a monument commemorating this gallant Scotsman. *See* life by L. G. Gibbon, 1931.

Park, large enclosed piece of ground, usually with woodland and pasture, attached to a country house, or an enclosure in a tm. ornamentally laid out for public recreation. In England a bor. or urb. council has the power to purchase land for such a purpose, and there are few tns. that have not one or more public P's. Those presented by private individuals are usually maintained by the bor. or urb. council. The word is also used for a large tract of land kept in its natural state for the public benefit. Among the most famous P.s., public or natural, may be mentioned Hyde P. in London, the Bois de Boulogne in Paris, the Tiergarten in Berlin, the Yellowstone National P. (q.v.) in the state of Wyoming, U.S.A., the Algonquin P. in Ontario, the Yosemite National P. in Central California, the Australian National P. at Port Hacking, the Rocky Mts. and Jasper P.s. in Alberta, and the Parc National Albert in the Belgian Congo, in which is Mt. Karisimbi (14,780 ft. high). But the great national P.s. have nothing in common with a small Brit. public P. and may be more appro-

privately compared with the animal sanctuary at Whipsnade. Ps. like the Kruger National P. in S. Africa and the Buffalo and Wood Buffalo Ps. in Alberta are essentially game reserves, and in the Brit. and Belgian E. and central African dependencies there are many Ps. for the preservation of the fauna and flora of Africa. See also GAME RESERVE, NATIONAL PARKS.

Parker, see THUR AND PARKER

turned to New York and became an organist and choirmaster, and taught at the National Conservatory directed by Dvořák. Later he became organist at Trinity Church, Boston and in 1894 prof. of music at Yale Univ. He visited England sev. times for performances of his work at the festivals and to receive the Mus. D. from Cambridge in 1902. Among his works are (opera) *Mona and*

John H. Stone

CHATSWORTH PARK, DERBYSHIRE

Chatsworth House, a seat of the duke of Devonshire, was built by Sir William Cavendish in 1557, and rebuilt by the first duke between 1687 and 1707.

Parker, Sir Gilbert, first Baronet (1862-1932), Eng. politician and writer, b. at Camden E. near Addington, Ontario, Canada, and educated at Trinity Univ., Toronto. Conservative M.P. for Gravesend 1900-18. In the earlier half of the First World War, in charge of Amor publicity. P.O., 1916. He wrote poems, books of travel, and novels, among which may be mentioned *Round the Compass in Australia* (1892), *A Lover's Diary* (poems, 1894); and *The Land, the People and the State* (1910). Probably the most popular of his novels are *The Seats of the Mighty* (1896, which was dramatised and played at His Majesty's Theatre); *The Lane that had no Turning* (1900); and *A Ladder of Swords* (1904). Later works: *The World in the Crucible* (1915); *Wild Youth* (1919); *No Defence* (1920); *The Power and the Glory* (1925); and *The Promised Land* (1928). His autobiography, *My Story*, appeared in 1927.

Parker, Francis William (1863-1919), Amer. organist and composer, b. at Auburndale, Massachusetts. He studied at Boston and at Munich, where he was a pupil of Rheinberger. In 1884 he re-

turned to New York and became an organist and choirmaster, and taught at the National Conservatory directed by Dvořák. Later he became organist at Trinity Church, Boston and in 1894 prof. of music at Yale Univ. He visited England sev. times for performances of his work at the festivals and to receive the Mus. D. from Cambridge in 1902. Among his works are (opera) *Mona and*

*Fairyland*; (oratorios) *The Legend of Saint Christopher* and *The Dream of Mary*.

Parker, Sir Hyde (1711-1783), Eng. admiral, b. at Tredington, Worcestershire. He commanded the Brit. fleet in the action off the Dogger Bank in 1781, in which three Dutch ships were destroyed and the rest compelled to retreat to harbour. Having been given command of the E. India fleet, P. sailed from Rio de Janeiro Dec. 12, 1782, but neither he nor his ship were again heard of. Nine years later its equipment was found and it was presumed to have been lost with all hands.

Parker, Sir Hyde (1739-1807), second son of above and a more famous admiral. He distinguished himself in the Amer. war, blockaded the Dutch harbours in 1782, and commanded the fleet in the E. Indies in 1795. In 1801 he was in supreme command of the fleet which was sent to the Baltic against the fleets of Russia, Sweden, and Denmark. It will be remembered that it was he whom Nelson disobeyed at the battle of Copenhagen by jocularly using his blind eye to look at the signals (see NELSON). P. compelled Sweden to remain neutral later,

and was ready to sail to Kronstadt when Paul's death put an end to the hostilities.

**Parker, Joseph** (1830-1902), Eng. Congregational minister, son of a stone-mason at Hexham-on-Tyne. About 1845 he became known as a local preacher and temperance lecturer. On entering the ministry in 1852, he became assistant to John Campbell at Whitefield's Tabernacle, London, soon afterwards going as pastor to Banbury, whence he went to Manchester. P. returned to London in 1869 as pastor of the Poultry church, and almost immediately began his great scheme for the erection of the building on Holborn Viaduct known as the City Temple, which was opened in May 1874. There he preached to large congregations and became famous among nonconformists for his powerful oratory. He wrote many books on religious subjects. See his *My Life and Teaching*, 1889, and *A Preacher's Life*, 1899.

**Parker, Louis Napoleon** (1852-1944), Eng. dramatist, composer, and pageant master, b. in Calvados, France, his father being an Amer. lawyer and his mother Eng. His great-grandfather, the Honourable Isaac P., was from 1814 to 1830 chief justice of Massachusetts. P. made rapid progress in the study of music and, at the instance of Sir Wm. Sterndale Bennett, went to Sherborne school as piano master, and stayed in Sherborne for twenty years, teaching languages as well as music. P. later went to London to teach music, but instead became a playwright, improvising his own theatre from a large barn. The list of his works is long and, generally, his plays were more successful in America than in Britain. At one time three New York theatres were crowded by *Joseph, Disraeli*, and *The Paper Chase*, while *Pomander Walk* had a record run on tour in the States. It was in *Drake*, however, produced at His Majesty's Theatre in 1912, and revived in 1914, that P. reached his highest level in spectacular grouping on the stage. Already he had achieved a great reputation outside by his pageants at Sherborne in 1905, Warwick, Bury St. Edmunds, and elsewhere in subsequent years (see on these his reminiscences, *Several of my Lives* (1928)). Besides writing his own plays he was a skilful adapter of the work of others. His *David Copperfield* gave Sir Herbert Tree a great opportunity. His *Beauty and the Barge* was very successful, and *The Man in the Street* and *The Bugle Call* were effective curtain raisers. His trans. of *L'Aiglon*, *Rosmersholm*, *Magda*, etc., were also excellent. Of his later work mention may be made of *The Cardinal*, performed at St. George's Theatre during Canterbury Week of 1930, and *The Lily of France*, a play on Joan of Arc produced at Nancy in 1936.

**Parker, Matthew** (1504-75), archbishop of Canterbury, b. in Norwich. In 1544 he was elected master of Corpus Christi College, Cambridge, and in 1545 vice-chancellor of the univ. in which capacity he manfully opposed the spoliation with which the colleges generally were threatened. In 1555 he was installed dean of Lincoln, but lived in retirement during

Mary's reign, to be promoted on the accession of Elizabeth to the archbishopric of Canterbury. He was a member of the great party, afterwards known as Anglican, which sought to establish a *via media* between Rom. Catholicism and Puritanism. He pub. *The Bishop's Bible* (1563-68); *De antiquitate ecclesie* (1572); and eds. of Gildas, Assor, Elfric, the *Flores historiarum*, Matthew Paris, and other important chroniclers. He presented a valuable collection of books and MSS. to Corpus Christi. See W. T. Hook, *Lives of the Archbishops of Canterbury*, 1872; A. S. Barnes, *Bishop Parker and the Anglican Orders*, 1922; and J. O. Whitebrook, *The Consecration of Matthew Parker*, 1935.

MATTHEW PARKER

**Parker, Sir Peter** (1721-1811), Eng. admiral, b. in Ireland, the son of Rear-Adm. Christopher P. (d. 1765). He served in the Mediterranean in 1743, and in 1775 was in command of a squadron which attacked Charlestown, being repulsed with the loss of three frigates. He took part in the reduction of Long Is. and Rhode Is. the same year; and in 1777, having been promoted to rear-admiral, was appointed commander-in-chief at Jamaica. In 1782 he was created a baronet, and in 1799 promoted to be admiral of the fleet. He was the early patron of Nelson.

**Parker, Theodore** (1810-80), Amer. clergyman, b. at Lexington, Massachusetts. Educated at Harvard College, he settled as Unitarian minister at W. Roxbury in 1837. The rationalistic views which separated him from the more conservative portion of the Unitarians first attracted wide notice in consequence of an ordination sermon, in 1841, on 'The Transient and Permanent in Christianity.' He further developed his theological views in five lectures, delivered in Boston, and pub. (1841) under the title *A Discourse of Matters Pertaining to Religion*, which was

followed by *Sermons on Theism, Atheism, and Popular Theology* (1853).

**Parker, Sir William** (1781-1866), Brit. admiral, the grandson of Sir Thomas P. (c. 1695-1784). He entered the navy in 1793, and served in the Channel fleet under Lord Howe, subsequently coming under Sir Hyde P. (1739-1807). He protected Brit. interests on the Tagus during the civil war of 1834. In 1841 he was appointed commander-in-chief in China, and having captured Amoy, Ningpo, Wosung, and Shanghai, brought the war to a successful conclusion by seizing Chin-kiang-foo. He rose to the rank of admiral in 1863.

**Parkersburg**, city of W. Virginia, U.S.A., and cap. of Wood co., on the Ohio, 195 m. N.E. of Cincinnati. It is a centre of an oil and natural gas region. There are iron works, chemical factories, and lumber mills. Pop. 30,100.

**Parkes, Edmund Alexander** (1819-76), Eng. prof. of hygiene, b. at Bloxham in Oxfordshire. He studied at Univ. College and Hospital. During 1842-45 he was assistant-surgeon in the Indian Army, and in 1849 was made prof. of clinical medicine at Univ. College Hospital. In 1855 he superintended a large civil hospital in the Dardanelles, opened to relieve the pressure upon the hospitals at Scutari during the Crimean war, and in 1860 accepted the chair of hygiene at the Army Medical School. He was the founder of the science of modern hygiene, and famous throughout Europe in the field of military hygiene. His most important work was his *Manual of Practical Hygiene* (4th ed., 1891), which has been trans. into many European languages.

**Parker, Sir Harry Smith** (1828-86), Eng. diplomat, b. at Birchill Hall, Bloxwich, Staffordshire. P. entered King Edward's School, but in 1841 went out to join his sisters, who had been settled some time in China. On his arrival at Macao he applied himself to the study of Chinese, which laid the foundation of his successful career. He was attaché in 1842 to Sir Henry Pottinger's punitive expedition up the Yang-tzekiang, and, though only a lad of fourteen years, P.'s knowledge of the language made him of immense service to the commissariat. In Sept. 1843 he entered the Brit. Consulate at Canton, eventually becoming head of the legation at Canton in 1856. Appointed consul at Shanghai (1861), he left there for diplomatic work in Japan in 1865. Returning to China in 1883, he took over the legation at Peking, carried through a valuable treaty with Korea, and acquired Port Hamilton for a Brit. coaling station in the N. Pacific. Worn out with overwork, he died of fever in Peking. His body was brought to England and buried at Whitchurch.

**Parkes, Sir Henry** (1815-96), Australian statesman, b. at Stoneleigh, Warwickshire. Possessed of very little education, he worked for some time as a labourer, but emigrated to Sydney in 1839, where he found more congenial employment. During his spare time he developed a taste for literature, publishing a small vol. of poems, *Stolen Moments*, in 1812. He

became interested in politics, and in 1849 started the *Empire* newspaper, in which he expressed his views against the transportation of convicts. For some years he represented E. Sydney in the Legislative Assembly. P. came to England in 1861 as a commissioner for promoting emigration. On his return he was made colonial secretary in 1863, and when the Martin ministry resigned, in 1872, became Prime Minister, to which office he was five times re-elected. His financial position was never strong, and he died, a very poor man, at Sydney. P. was instrumental in passing the Public School Acts of 1866, and worked hard in the cause of Australian federation. See life by T. Bavin, 1941.

**Parkes, to.** in Ashburnham co., New S. Wales, Australia, 300 m. W.N.W. of Sydney. There is gold-mining, and fruit and wheat growing. Pop. 8000.

**Parkhurst**, dist. wholly contained within the area of the bor. of Newport. It is a growing residential dist. and includes the Albany Barracks (depot of many well-known regiments), P. Prison (the famous penal institution), the Camp Hill Borstal Institution, St. Mary's Hospital, and the administrative headquarters of the Isle of Wight Hospital Group.

**Parkman, Francis** (1823-93), Amer. historian, b. at Boston in Massachusetts. He was called to the Bar, but he never practised, and devoted himself to the writing of historical works, as a rule taking for his subject the war between England and France in Canada. He was unremitting in his labours, and made careful study of documents and places at first hand, making, amongst others, the famous journey along the Oregon Trail. His books are standard authorities on the hist. of colonial N. America. His prin. works are *The Conspiracy of Pontiac* (1851); *The Pioneer of France in the New World* (1865); *The Jesuits in North America* (1867); and *Montcalm and Wolfe* (1884). See M. Wade, *Francis Parkman: Heroic Historian*, 1912, and (ed.) *The Journals of Francis Parkman*, 1949.

**Parlement**. The Ps. of Fr. hist. were those important tribunals which prior to 1789 were invested with sovereign judicial authority, together with such political and magisterial powers as early rendered them formidable instruments of monarchical tyranny. Historians were long in conflict as to their origin. Some ascribe the Ps. to the great military assemblies called 'champs de Mars,' in which were discussed, during the earliest period of the Fr. monarchy, national affairs generally. Larousse repudiates this suggestion, and most modern Fr. historians concur in drawing a broad distinction between the origin of the P. and that of the *États Généraux*, and deny any analogy between the Fr. P. and the Eng. Parliament on the ground that, while the latter has always had a peculiarly political character, the former always had a peculiarly judicial character. According to Loryseau and Machiavelli, the institution of the Ps. was the vital factor in saving feudal France from such dismemberment as occurred in Italy and Germany, for most

of the Fr. kings developed the powers of these bodies as a weapon against feudality, and gave them, as far as possible, an independent status. This supreme power was soon turned against the monarchy, and Thierry mentions that in the reign of Louis XII. the P. acted as a sort of mediator between the king and the nation. Under Louis XIII. the pretensions of the P. increased, especially after the dissolution of the États Généraux of 1615. It took upon itself to censure the policy of the queen, extravagance of all kinds, and the shackles put upon justice by the court and the nobility. In the ensuing struggle between the P. and the monarchy, the former was completely humiliated by the boldness of Cardinal Richelieu. On the death of Louis XIV. the P. became once more as powerful as before, tore up the will of the late monarch as it had that of his predecessor, and formally took upon itself the name of 'sovereign court.' Constitutionally it appears during the early years of the eighteenth century to have admitted that 'the legislative power belonged to the king,' but claimed to 'verify the royal edicts,' to see that they contained nothing contrary to the fundamental laws of the kingdom. In 1762 the P. acquired tremendous popularity by declaring the abolition of the society of Jesuits, and in despoiling that society of its property. Finally in 1792 the P. was definitively abolished on the ground that the nation had never concurred in the election of its members. From one point of view it is possible to regard the birth of liberty in France as synchronous with the abolition of the P.s., but every Fr. historian and publicist from Laboulaye downwards acknowledges both the services those tribunals did for France and the splendid types of characters they formed from time to time.

Farley, Peter, see GOODRICH, SAMUEL GRISWOLD.

**Parliament. HISTORICAL SKETCH.**—Down to the revolution of 1688 the hist. of the Eng. P. is, in a sense, that of the struggles between the king, the nobility, and the people. After that date it becomes the hist. of the struggle for electoral reform and of the evolution of the doctrine of ministerial responsibility, together with the development of the party system. The landmarks of the pre-revolutionary period are the resistance of the king and the people, in alliance, to the tyranny of the feudal barons, and, later, the alliance of the barons and people against the encroachments of the royal prerogative; the admission to P. of the medieval burgesses ostensibly to be consulted on questions of taxation (the beginning of the development of popular representation); the alternating concentration of power, first in the hands of the monarchs and then in the commonsens, between the end of the thirteenth century and the close of the Tudor period; the struggle, during the Stuart period, between the protagonists of the divine right of kings on the one hand and the supporters of parl. privilege and lawful taxation on the other, compli-

cated by questions of religion; and the limitations of the royal prerogative as embodied in the Bill of Rights. A brief narrative of these phases will now be attempted before dealing shortly with that period which saw the triumph of the democratic idea in the Reform Act of 1832.

According to Stubbs, the term P. was first used in England by Matthew Paris (q.v.) in 1246, and probably introduced through the Normans or through intercourse with the Fr. kingdom (*Constitutional History of England*). It is also used retrospectively by later writers, and Stubbs mentions the fact that in a record of the twenty-eighth year of Henry III. the assembly in which Magna Carta was signed is mentioned as the 'Parlamentum Runnmede.' It is clear that no very precise meaning can be given to the term by reference to the class of persons that at any particular time constituted the national assembly, though many historians seem to differentiate the deliberative assemblies of the Plantagenet monarchs at and after the time of Simon de Montfort's celebrated P., by calling them 'Ps.' as opposed to the 'Magnum Concilium' of the anterior period. One thing emerges clearly from a survey of Eng. institutions, and that is that there has always been, in spite of the pitch of despotic power to which some Eng. monarchs have attained, a national assembly, a fact which distinguishes the hist. of England from that of every other European kingdom. For the Witanagemot becomes metamorphosed into the Great Council, and the latter into the bicameral P. of a later date. But the A.-S. folk-moot, though a popular assembly which declared the law or custom of the countryside, was a localised institution, and as such did not deliberate such great matters as war and peace; nor can the Witenagemot be taken as a really convenient starting-point for a historical sketch, because the balance of opinion seems to be that it was an aristocratic assemblage in the constitutional powers of which the people at large did not participate (see on this point the contrary opinion of E. A. Freeman, *History of the Norman Conquest of England*, 1887-1879, and J. M. Kemble, *The Saxons in England*, 1849). It is probable that the people had some shadow of theoretical right to attend, e.g. when a new king was to be elected, but there is no evidence that they habitually did so; and we may, therefore, regard the Witanagemot or the later Magnum Concilium, or Council of Magnates, as the forerunner of the House of Lords, and perhaps the assembly at Runnymede as the lineal progenitor of the House of Commons, though until the year 1295 there appears, in spite of the frequent summonses of the burgesses to attend, to have been for the most part but one legislative chamber. There can be little doubt that the struggle between the king and the greater feudal barons was the predisposing cause of popular liberties; for the kings, at a time when William the Conqueror's notions of the appropriate relations between the

kingship and the feudal hierarchy of tenants were as yet in the balance, generally found themselves forced to secure the support of the people at large, with the result that some idea of popular liberties slowly emerged, albeit largely in the interest of the land-owning class. The judicial, fiscal, and legislative reforms of Henry II. (as to the fiscal, especially the commutation of knight service for scutage, which made the king independent of the baronage in respect of his fighting force) sealed the doom, not only of the barons, but also of any future monarch who should disregard the type of Eng. government and administration crystallised in those reforms. Thereafter the opposing forces were usually the king and his foreign favourites on the one hand, and on the other those barons who, excluded from power and privilege, sought to acquire both by winning control over the Crown. The Commons were from time to time drawn into alliance with baronial factions, but attempts to introduce continuous control of the Crown broke down in face of the barons' reluctance to undertake such an onerous task. Finance and judicial business were the chief concerns of the representatives, and the king's court estab. a superiority in these matters over local feudal courts. It is essential to bear in mind that P. was (and is) the 'high court.' 'No taxation without representation' has been the peculiar genius of Eng. government at almost all times, and Englishmen were familiar with the idea of representation long before the reign of John; for prior to that time the king's officers (generally circuit judges) used to arrange financial matters with the commoners' representatives in the shape of the recognitors of the grand assize (the progenitors of the modern co. member) and deputies sent by the bor. inhab. (the forerunners of the modern burgess). See **BURGESS**; **ELECTORATE**; **JURY**; **REPRESENTATION**.

The representative principle became further developed in the reigns of John and Henry III., when co. and bor. representatives were occasionally summoned to meet either the king or the barons at some selected tn. to confer about taxation; which conventions very naturally prompted a desire for a national P., though it was not till the reign of Edward I. that a P. was summoned which consisted of representatives of all the estates of the realm (*q.v.*), viz. archbishops, bishops, superior clergy, barons, knights of the shires, and burgesses. Prior to De Montfort's famous P. of 1265 there were only four instances of co. representatives being summoned to the national council, the first being in 1213, the second 1254, the third in 1258 (the 'Mad Parliament'), and the fourth later in 1258. In all these cases the prin. if not the only business was the discussion of financial matters. Strictly the wording of Magna Carta gave the king no option but to consult the people's representatives on the question of taxation; and inasmuch as there already existed a recognised machinery in the shire-moots for the

election of knights to nominate recognitors in civil suits, or, in other words, a working system of co. representation generally, the Crown had still less justification for abstaining from summoning at least the knights of the shires. The burgesses or tn. representatives, however, were shut out until the bold innovation effected by Simon de Montfort, earl of Leicester, who, in spite of the various conflicting opinions as to the novelty of his democratic work, may not unjustly be termed in Pauli's words, 'the creator of the House of Commons.' The writs which De Montfort caused to be issued in 1264 required the sheriffs to return not only two knights from each shire, but also two citizens from each city and two burgesses from each bor. It is tolerably certain that Henry III., though he called the burgesses to the national assembly, had no desire to consult them on matters of state; and indeed Edward I. would appear to have favoured the idea merely because it was an easier mode of raising money than by a purely arbitrary method. But though they were long ignored in the matter of legislation and deliberation generally, the very fact that they were regularly summoned inevitably led to their gradually acquiring a degree of political status. Moreover there were social causes at work which may find analogous expression even at the present day. For whereas at first knights and burgesses deliberated and voted apart, the former soon forgot the fact that the representatives of the thriving and wealthy cities and tns. were socially their inferiors, and began to join with them in presenting petitions for legislation. This alliance was rendered the easier by the fact that younger sons of noble families, being excluded from rank by the heirs, were plain esquires. Finally the knights broke away altogether from the greater barons or hereditary legislators, and sought the House of Commons as their appropriate sphere. By the reign of Edward III. the Commons had become much bolder, and not only successfully asserted a right to veto enactments affecting the people at large, but declared to the king in P. that they 'refused to be bound by any of his statutes or ordinances unless made with their assent.' The Crown interested itself in the composition of the Commons (see **ELECTORATE**).

Since Magna Carta no king could question the right of the co. to send their representatives to P.; but the Crown did not hesitate to dispute the bor. representation, and in consequence sev. Acts were passed to check the Crown's attempts in this direction; which attempts generally took the form of incorrect returns of members by the Crown's nominees, the sheriffs. In Richard II.'s reign an Act was passed fining sheriffs who made false returns, and in the time of Henry IV. the justices were empowered by statute to inquire into the same abuses. After the House of Commons was estab. as a separate legislative body, it began itself to restrict the suffrage (see **ELECTORATE**), e.g. an Act was passed in 1430 to restrict

the co. franchise, formerly possessed by all freeholders, to those whose freeholds were worth forty shillings a year (i.e. £20 in present-day money). Towards the close of the Middle Ages, parl. importance suffered a marked decline, more and more of the general petitions which were a chief function being referred to the executive branch of the gov. This process, analogous to the decline of Ps. in France, Spain, and Germany, was halted only when the Tudors recognised the importance of attaching mass opinion to the benevolent dictatorship which they estab. Under the Tudors P. is at first entirely subject to the king; it is rarely summoned by Henry VII., or during the first part of the reign of Henry VIII. It was not until the latter years of Elizabeth's reign that the Crown lost its ascendancy and initiative. The dangers of civil war lingering on from the Lancastrian-Yorkist factions, and the need for a strong gov. to stamp out the remnants of baronial lawlessness, enabled Henry VII. to maintain with ease the ultimate power of the Crown. To him P. was useful, but it was by no means necessary. Yet its usefulness in canalising popular support gave it some importance, and an effective resistance was later made to Thomas Cromwell's attempts to introduce a standing army and other means of unlimited royal autocracy. In Henry VIII.'s reign P. was establishing a continuity important for the future. The breach with Rome was effected through P. and with parl. approval, since a façade of popular action was thus built up. Yet the very fact that Henry used and consulted P. gave the institution an ever-increasing importance. The Sp. menace, and the fear of Rom. Catholicism, demanded a strong central authority, but after the defeat of the Armada new spirit began to manifest itself, and Elizabeth's latter years were marked by an ever-growing independence of speech and action by P., complicated by the conflict between Puritanism and the Anglican Church. Repeatedly Elizabeth declared that there were topics—such as her marriage, religion, and foreign affairs—which were not to be considered matter for parl. concern, and repeatedly the more progressive elements denied this restriction. The Commons indeed came into collision with Elizabeth on sev. occasions, e.g. on the question of the queen's marriage and the settlement of the succession 1566; on eccles. matters, 1571, and 1593; and on monopolies, 1601. The control which the council had exercised over parl. deliberations began to give way to a new group of Commons leaders. With James I. and Charles I. this process developed with growing speed to the inevitable outcome in civil war. With all the Englishman's Concern for precedent and legality, Crown and Commons appealed to the past. The lawyers became leaders in P., since they could produce justifications for parl. claims which were practically effective if theoretically doubtful; they could draft bills and organise business; and they were supported by the legal knowledge

which almost every Stuart gentleman acquired as part of his education. Sir Edward Coke represents this importance of the lawyers, both in P. and outside, where in his judicial capacity he developed and consolidated the common law against the autocratic claims of his sovereign. The Stuarts took their stand on theory; they claimed a theoretical divine right of kingship which was no less irritating because the Tudors had enjoyed it in practice. The need for authoritarian government had passed, and the politically conscious middle classes were demanding that this be recognised. That the Crown also supported the estab. church added a further source of conflict with those of the commons who had embraced the Puritan beliefs. Once the claim of taxation without parl. approval had been advanced, and material interest reinforced religious and political ideas, compromise became impossible.

During the interregnum a period in which P. undertook executive authority was followed by one in which it lost all authority to Cromwell, whose rule convinced the nation, with a clarity which seems to be now an inherited characteristic, that irresponsible government was not to be borne. The folly of James II. reinforced the lesson, and the peaceful revolution of 1688 marked the beginning of theoretical and practical parl. dominance over the Crown, and of the responsibility of the executive to P.

The clause in Magna Carta against the imposition of arbitrary aids, after the span of close on five centuries, found renewed expression in the wording of the Bill of Rights, making illegal the levying of money for the use of the Crown by pretence of prerogative, without leave of P. The Bill of Rights gave the death-blow to prerogative for all time, and made it true in fact as well as in theory that the king was a monarch with powers limited by those of P. Henceforth the hist. of P. is that of party government: the wielding of the prerogative power by the party in the majority in the House of Commons, or rather by the Cabinet (see on this CROWN; CABINET; PARTY GOVERNMENT). The Crown was reduced to the exercise of personal influence, and even that suffered an irretrievable blow from the alien manners and speech of the first two Georges. But that the victory over prerogative achieved by the revolution of 1688 was a far cry from the ideals of a democratic P. is sufficiently attested by the tremendous struggle for electoral reform and the disfranchisement of the 'rotten bors.' that culminated in the Reform Act of 1832. Whether the hist. of P. subsequent to that date shows a real advance in the democratic principle as conceived by the idea of popular representation is a question which must to a large extent depend upon the view the individual may take of the functions of a private member of the House of Commons, or, in other words, how far it is really for the benefit of the community that the private member should subordinate himself entirely to the rule of the

ministry; and the ascendancy of the Cabinet is as marked to-day as ever. It is not, however, proposed to pursue the sketch of this period of parl. hist. further in this article, as the whole question has been treated both historically and critically in the articles on PARTY GOVERNMENT, CABINET, ELECTORATE, and POLITICS. The hist. of the House of Lords has not been specially adverted to in the above sketch because it is to a great extent that of the Privy Council (*q.v.*), or rather of the Great Council of the Saxon and Norman kings out of which sprang the Privy Council, the Cabinet, the executive dept. of state, and the high court (*see* CABINET;

hereditary right to the privileges of the peerage.) The House of Lords has undergone no essential change in its composition ever since that composition was stereotyped in the Middle Ages, though occasionally life peers sat in the House. Since the decision of the Committee of Privileges in the Wensleydale case (1856) no life peer, except spiritual peers and the lords of appeal in ordinary, has ever been allowed to take a seat in the House of Lords. The more recent hist. of the House of Lords will be found in the article PARLIAMENT ACT, 1911.

MODERN TRENDS.—The Imperial P. no longer legislates for the dominions or the

National Portrait Gallery

## PARLIAMENT

Moving the address to the Crown at the meeting of the first reformed Parliament, 1235

PRIVY COUNCIL; GOVERNMENT). It is important, however, to notice that before Magna Carta a distinction had grown up between the *maiores* and *minores barones*, and that by Article 14 of the charter the former were to receive a special writ and the latter a general writ, calling them to P. In fact the greater barons were those who in their military, fiscal, and legal transactions dealt directly with the king, while the lesser transacted their business with the sheriff. If Simon de Montfort can be said to be the creator of the House of Commons, there is equal justification for Stubbs's dictum that Edward I. created the House of Lords; because even after 1215 the greater barons were by no means a strictly defined class, and it was merely by reason of Edward I.'s consistent exercise of his power to select those whom he chose to be summoned by special writ that the demarcation of the hereditary legislator from those titled persons who were not to be so highly honoured resulted. (*See also* NOBILITY on the principle of the

greater part of the empire, and it ceased to do so long before the Statute of Westminster (*q.v.*). Nor does it now venture to pass bills of attainder or confiscate property or deprive people of life and liberty without due process of law, excepting in very rare cases. Yet theoretically it can do all these things, for there is no legal limit to what P. can enact. By contrast with the Amer. political system of checks and balances, the Eng. is designed, not unsuccessfully, to make it easy to determine what general line of policy shall be followed, and by what individuals it shall be carried out. In America it seems that the people authorise the president to follow some clear-cut policy, while at the same time they give authority to Congress to act differently, and to the supreme court to prevent either president or Congress from acting unconstitutionally. But democracy in England, which reduces the influence of personalities to the few leaders on either side, means the choice of a gov. with almost plenary

powers. Hence it is that 'third' or independent parties fade out of the Eng. parl. scene, because the Eng. voter is averse from throwing away his vote on lost causes. It is no doubt true that among the principles for which Wilkes successfully fought was the right of the electors to choose what candidates they liked for P. Actually, to-day, the average constituency has no choice in the matter, the candidates being nominated by the party machines; while, as regards the Conservative party, none but wealthy candidates have any hope of nomination. In the eyes of an Amer. critic a parl. system whereby complete power is put into the hands of a small group of men, whose exercise of their authority is restrained only by public opinion and tradition, which, however, are strong sanctions in England, seems undemocratic. For in the Amer. political system power is deliberately divided, little or no trust being reposed in the discretion of either the executive or the legislative power, while minorities have ample legal powers to impede the action of majorities. 'Under all the feudal trappings' and elaborate procedure lies the simple assumption that the majority of Parliament represents the majority of the people and, as the people cannot exercise direct power, no more can Parliament, so that the decision what laws are made, altered and repealed, as well as the practical business of administration, is the business of the Cabinet so long as the House of Commons supports it. And the House of Commons is organised on a party basis to secure that such support will be given. It is only in the rarest circumstances that a House of Commons elected to support a government overthrows it' (D. Brogan, *The English People*). Thus it will be appreciated that P. is a more important institution in the Eng. system than Congress is in the Amer. political system, because it does not share its powers with a president or a court over which it has no direct control; yet, by a seeming paradox, members of P. as a class are less important than congressmen, because they, in effect, delegate most of their powers to the ministry. This is not, however, undemocratic, for the Eng. voter at an election is primarily choosing a Prime Minister, so that really the House of Commons is, as it were, a kind of electoral college and national convention combined. But the good party man or unambitious, silent member, who never puts awkward questions to the gov., is not necessarily the best man from the country's point of view or from that of P. as an institution. The restless critical self-advertising type of member is much more likely to keep P. before the press and public as a dynamic institution than a house of party hacks, however able may be the gov. of the day. 'Every instance of a safe Labour seat given for irrelevant services rendered, every case of a Conservative seat sold, every disillusionment of the young and hopeful politician, tells against the efficiency of the basic English political institution, Cabinet Government' (Brogan).

**POWER AND JURISDICTION.**—The 'transcendent and absolute' power of P. for making laws was asserted by Coke, and Blackstone and Dicey use language to the same effect. It is needless to say that the old Amer. colonies, which by winning their independence destroyed the first Brit. empire, did not accept this dictum. But it was enshrined in a Declaratory Act of 1764, which remains on the Statute Book to-day, albeit subject to the limiting effect of section 4 of the Statute of Westminster, 1931 (*q.v.*) (which provides that no Act of P. shall extend to a dominion unless that dominion has requested and consented to its enactment). It may be noted, however, that most authorities accept the interpretation that the imperial P. could, as a matter of abstract law, repeal or disregard that section. The point, however, is purely academic, for no imperial P. would venture to violate the Statute of Westminster, the provisions of which are in themselves only declaratory of long estab. usage. Dr. Ivor Jennings points out that in emphasising the 'transcendent and absolute' authority of P. there is a tendency to overlook the legislative functions of both Houses; for legislation is not the sole, or even the more important, function of the House of Lords, which is an assembly for debate of the less technical and less purely 'political' issues of government; and though the House of Commons carries out the essential business of legislation, often under the greatest pressure of time and urgency, its time is by no means wholly occupied with legislation. It is probably true to say that, omitting financial business, only about two-fifths of the time of the House is occupied in considering Bills. General policy debates occupy much of its time, and much of the discussion on legislative proposals is not of a legislative character. It is the responsibility of the gov. as much to initiate legislation as to conduct administration, and all important Bills, and indeed most others, are produced by the gov. In substance, therefore, P. controls legislation, as it does administration, by debating and ultimately approving the policy of the gov. But even so the element of control is slight, and if the House as a whole is hostile to the gov. it can compel the gov. either to resign or to dissolve P. Naturally this is most unlikely where the gov. possesses a party majority and, normally, the gov. has at its command a stable parl. majority, 'whose support is based on loyalty to the personnel and acceptance of the principles of the party from which the government is drawn, upon dislike of the alternative which would be drawn from the opposition, and upon the threat of dissolution which the government can if need be wield' (Jennings); and though in one sense it may be true that the House controls the gov., in a more practical sense the gov. controls the House. When the gov. has a majority in both Houses, the 'transcendent and absolute' authority of P. is the authority of the gov. But it is not really transcendent and absolute, for behind both gov. and the House of Commons

is public opinion, which, vague though it may sometimes be, can quickly transform the whole parl. scene in times of emergency, as, for example, when in 1840 Neville Chamberlain's Gov. collapsed, and gave way to the Coalition Gov. of Winston Churchill.

While P. can, within the limits of public opinion, decide anything, this does not imply that any member of the Commons can bring forward any motion at any time he thinks fit, for the activity of private members in respect of such functions as asking questions, moving the adjournment of the House, introducing Bills, or moving amendments, is very rigidly limited. The importance of the absolute legal authority of P. is that, there being no constitutional limitation on legislation, there is no topic which the House cannot discuss, though not all matters can be discussed with equal facility, e.g. under a rule over two centuries old, if a Bill involves expenditure it can proceed beyond its second reading only if a minister introduces a financial resolution. In short, the 'transcendent and absolute' power of P. places enormous power in the hands of the gov., but it is not a power which can be seriously abused, for abuse would lead to retribution at the hands of the House of Commons or the electorate. Because it is a democratic system the Brit. parl. system can afford strong gov., and does not require constitutional limitations upon parl. authority (see W. Ivor Jennings, *Parliament*, 1939).

**PRESENT RELATIONS OF THE CROWN AND PARLIAMENT.**—By virtue of the prerogative the Crown is entitled to summon, prorogue (see *PROROGATION*), and dissolve P. On the accession of a new sovereign P. must assemble without delay (see *DEMISE*). The king is not supposed to pay official visits to P. except on stated solemn occasions, viz. at the opening and closing of a parl. session. He can, but does not, personally attend to assent to Bills that have passed the Houses. The formal ceremonial of the speech from the throne at the opening of a session, in so far as it has any real meaning, is intended to indicate the nature of the state's relations with other countries, and generally to outline the gov. programme of legislation. To drag the name of the sovereign into debate in order to influence the opinion of either House is contrary to parl. etiquette, and no member is allowed to speak slightly of the sovereign. The king may dissolve P. when he chooses, but it need hardly be said that his discretion has become the constitutional privilege of the Cabinet (see *CABINET*). The mode of dissolution is by proclamation (*q.v.*), issued technically by the advice of the Privy Council (*q.v.*). Either House may adjourn for any period it likes; and until 1906 the practice was to adjourn for the greater part of the autumn. The Crown has a statutory power to order a resumption of business when both Houses stand adjourned for more than six days. That P. must sit at least once a year is guaranteed by the fact that no demand for taxes would be legal unless

it did (see on this *Dicey's Law of the Constitution*).

**HOUSE OF LORDS: Composition, Officers, and Privileges.**—The upper House is composed of temporal hereditary peers of the United Kingdom, spiritual Eng. peers, Scottish elected peers, Irish peers elected for life, and lords of appeal in ordinary who are appointed for life and sit and vote as barons; all these classes together forming two estates of the realm, the lords spiritual and temporal. At present there are 4 peers of the royal blood, 2 archbishops, 20 dukes, 28 marquesses, 116 earls, 80 viscounts, 7 lords of appeal in ordinary including the lord chancellor, 24 bishops (of whom those of London, Durham, and Winchester always sit, and 21 others are appointed as vacancies occur in order of seniority by consecration), 478 barons, 16 Scottish representative peers, and 13 Irish representative peers. Of lords of P. some hold their seats during tenure of office only, others for life, while the remainder are hereditary peers. A bishop loses his seat on retirement, but a lord of appeal holds his seat for life. The Scottish representative peers are co-opted by all the Scottish peers assembled at Holyrood whenever an election is directed by royal proclamation.

The prin. officers of the House of Lords are (1) The Speaker, who, though usually the lord chancellor, may be a commoner, called the lord keeper. But the Speaker of the House of Lords has not the wide powers of his brother in the lower House; questions of order are determined not by him, but by the House, and in debate the House, and not the Speaker, is addressed. (2) The Chairman of Committees, who holds office during the lifetime of a P. He takes the chair when the House goes into committee, and superintends all matters appertaining to private Bills. In the absence of the lord chancellor he may be authorised to act as Speaker. (3) Gentleman Usher of the Black Rod, who is appointed by letters patent under the great seal, and is a member of the royal household. His duties, which are purely ceremonial, are to assist at the introduction of peers, to desire the attendance of the Commons when necessary, and to execute warrants of commitment. His appellation is derived from the black wand, surmounted by a golden lion, which is used as the mace of the House of Lords. (4) The Serjeant-at-Arms, who carries the mace when the lord chancellor enters and leaves the House. (5) The Clerk of P., who keeps the journals of the House, makes minutes of proceedings, acts as registrar of the House sitting in its judicial capacity, and signifies the royal assent to Bills that have passed both Houses.

The chief privileges of the upper House are as follows: (1) Freedom of speech (but the case of Lord Abingdon establishes the principle that a peer cannot afterwards publish a speech delivered by him in the House so as to make it a vehicle of slander against any one). (2) Freedom from arrest or molestation, which privilege used to, but does not now, extend to the servants of peers. The privilege, which is

limited to civil causes, and in no way fetters the administration of criminal justice, commences forty days before a session and terminates forty days after the session. After a dissolution it is enjoyed for a reasonable and convenient time for returning home. (3) The right to demand audience of the sovereign in order to tender him advice as an hereditary counsellor of the Crown. (4) The right to record a written protest in the journals of the House against a measure disapproved of. (5) The right to decline to attend in court as a witness on subpoena; but this privilege has generally been waived. (6) Exemption from jury service. (7) Right to vote by proxy; a right which has been waived since 1868. (8) The right of the House to commit a member or other person for breach of privilege and for contempt for a definite period. If no

House of Commons stood at 640, but the nominal membership had stood at 658 ever since the Act of Union with Ireland. The Redistribution Act of 1885, by increasing the number of members for Scotland from sixty to seventy-two, brought the nominal total to 670. By the Representation of the People Act, 1918, the number was increased to 707, but the reduction of the number for N. Irish constituencies from 52 to 13 under the Gov. of Ireland Act, 1920, and the cessation of representation for S. Ireland reduced the total number of members of the House of Commons to 615.

By the Representation of the People Act (1915) twenty-five new constituencies were created, making the total of 640, but by the Representation of the People Act (1948) the total membership was lowered to 625, the distribution being as follows:

	England	Wales	Scotland	N. Ireland
Counties .	215	26	39	8
Boroughs .	291	10	32	4
Total .	506	36	71	12

period is fixed the person committed is released on a prorogation or dissolution. (9) The right to try impeachments by the Commons, not only for high crimes and misdemeanours beyond the reach of the municipal law of the state, but for any crime whatever. It is hardly necessary to say that the privilege is obsolescent by reason of the fact that P. has in these days acquired such complete control over the royal prerogative that the Crown is no longer able of its own motion to protect political offenders from justice. (10) The right of the House to try peers and peeresses for treason or felony, and, conversely, the right of the individual peer to be so tried. This right rests on the literal meaning of *parum suorum* in Magna Carta, and has, illogically, become restricted to the barons of P., and then only in cases of felony. Only twice in this century has the House of Lords met in its ancient capacity as a criminal tribunal of first instance, once in 1901, and then not until 1935, when Lord de Clifford was indicted for manslaughter (a motoring case), and acquitted. (11) The right of the House to try disputed peerage claims. Only lay peers may take part in such trials. (12) The right to act as the final court of appeal from all the superior courts of law in Great Britain (see PRIVY COUNCIL). Some members of the gov. must be in the House of Lords, and the conduct of business there must be in the hands of ministers. The effect of the Ministers of the Crown Act, 1937, is that at least three ministerial heads of depts., and at least three other ministers, must sit in the House of Lords.

**HOUSE OF COMMONS: Composition, Officers and Privileges.**—(As to the qualifications for membership, mode of election, and parl. registration, see ELECTIONS). Up to 1885 the actual membership of the

Members of the House of Commons receive ann. salaries of £1000 and travelling facilities over the railways to and from their constituencies. Payment of members was introduced in 1911 by vote on the estimates, and this vote is now a permanent feature of the ann. Appropriation Bill. Thus the cost does not fall on the constituencies, which formerly it did in the days when the hors. used to pay their members. It has been judicially decided that payment does not depend on attendance at the House.

The prin. officers of the House of Commons are: (1) The Speaker, who receives a salary of £5000 a year, is the first commoner in the country, and generally retires with a peerage on a pension of £4000 a year. He is elected by the House at every new P., but the Speaker of the old P. is customarily re-elected provided he has not lost his seat. The Crown has the right to reject the person elected, but never avails itself of this privilege. The Speaker is in an exalted position, and although he never votes save on an equality (see CHAIRMAN), and rarely takes part in debate (except very occasionally in a committee of the whole House), his powers are substantial, especially in respect of rulings as to procedure. The Speaker acts independently of all party considerations, whence it is quite immaterial from which party he may be chosen. His other functions are to maintain order, sign warrants of commitment for contempt, reprimand members when necessary, and sign warrants for by-election writs. The impartiality of the Speaker is of little more than a century's standing. In the days of liability to impeachment, ministers in the plenitude of their power were far from solicitous of their opponents' rights, and, so long as the House

was dominated by bribery and corruption, the conventional rules implicit in a democratic system could not be developed. (2) The Chairman of Ways and Means, a member of the House who has a salary of £2500 a year, takes the chair when the House goes into committee, maintains order in committee, and acts as Deputy Speaker of the House in the unavoidable absence of the Speaker. He is nominated by the gov. and, like the Speaker, holds office until a dissolution. When acting in committee he can apply the closure (*see* CLOSURE). He also has important duties in conjunction with the chairman of committees of the upper House in regard to private Bills. In his absence the Deputy Chairman, also a salaried officer at £1500 a year, acts for him. (3) The Serjeant-at-Arms, who bears the mace when the Speaker enters or leaves the House. He is appointed by letters patent at a salary of £1700, and his prin. duty is to execute the directions of the Speaker relative to the maintenance of order. Hence he has power to arrest strangers who have no lawful business in the House, execute warrants for contempt, and bring persons in custody before the Bar of the House. (4) Clerk of the House of Commons. This officer is also appointed by letters patent and receives a salary of £3500 a year. His prin. functions are to make entries of all that transpires in the House, and from such entries to prepare the hours, or records of the proceedings in the House, and to endorse Bills sent up to the Lords. (5) Whips. There are gov. and opposition Whips. The duties of the recognised whips, which are harassing and often thankless, are to see that their party is duly represented at a div. Hence they must personally know their fellow members in the House by sight, so that when a div. comes on they are in a position to ensure a full vote. They are supposed to keep the party leaders fully informed about the members generally, and also to act as intermediaries between the leaders and the various local party organisations. In more important debates the order of the chief speakers on each side is arranged between the whips and given to the Speaker, who usually adheres to it. The whip is essentially the creation of the party system (*see* PARTY GOVERNMENT). The gov. whip must be ever on the alert to prevent the possibility of a snap vote. If he makes an error in calculating the numbers of his 'flock' that have strayed, or in estimating the probable duration of a debate, he may find himself in an awkward dilemma (but as a rule he can get some members of the gov. to talk against time until he can round up the followers). The gov. whips are, technically, junior ministers. The chief whip is parl. secretary to the treasury. Until recently he was known as 'patronage secretary,' a name which comes from the days when a majority was kept by patronage or influence; and his functions in this respect have not entirely disappeared, for he brings to the attention of the Prime Minister the names

of members who merit honours and whose support will be more effective if honour is accorded them. (6) There are also a number of minor officers such as prin. clerks, assistant and senior clerks, examiners of petitions for private Bills, the editor of the official debates, chaplain, and others.

The privileges of the House may be divided into two classes according as they are or are not claimed by the Speaker at the opening of a new P. But all privileges are of equal validity whether so claimed or not, for all alike rest upon binding legal decisions or statute law. The chief privileges claimed by the Speaker are: (1) Freedom of speech. This important privilege is essential to every free council or legislature, but it was only after a series of historic battles, in which the most prominent names were those of Haxey, Yonge, Strode, Elliot, Hollis, Valentine, and Conway, that the privilege was finally vindicated. This privilege is also to be construed by the light of Creevy's case, Watson's case, Wright's case, and the Act of 1810, so as to give summary protection to persons engaged in the pub. of parl. papers (passed in consequence of the celebrated case of *Stockdale v. Hansard*). The principles deducible from the cases are that a private member is not entitled to claim the privilege when he sends to an editor a correct report of a speech made by him in the House and containing a charge against an individual; but that a fair and faithful report not only of such a speech but of the whole debate is not actionable (whence presumably it would be a breach of the privilege to attack the publisher). By the Act of 1840 proceedings, criminal or civil, against persons for the pub. of papers printed by order of either House of P. will be immediately stayed on the production of a certificate, verified by affidavit, to the effect that such pub. is by order of either House of P. Formerly the House itself looked with no favourable eye on the pub. of its debates, because the Crown thereby became cognisant of what passed within the walls of the House (*see also under* NEWSPAPERS as to the hist. of newspaper reporters in the Gallery). It is to be noted that there are limits to the freedom of debate, which are imposed by the House itself; for any member is liable to censure and punishment by the House if he utters offensive words in P. Such punishment may be a mere admonition, or the offender may be suspended, expelled, or even imprisoned. (2) Freedom from arrest. This privilege is co-extensive with that of the House of Lords. Similarly, when a member of the House of Commons commits a crime, he has no immunity, but is arrested like any other subject, and, if convicted, the judge notifies the Speaker. The papers are then laid before the House at their request, and the question of expulsion is considered. (3) Right of access to the Crown through the Speaker; which right is exercised only when an address is presented to the king by the whole House. Addresses may also be communicated to the sovereign by

any members who have access to him as privy councillors or as members of the royal household. (4) Right of the Commons to transact whatever business they choose without reference to the wishes either of the Crown or its ministers. This very ancient privilege is affirmed at every opening of P. by the formal first reading of a dummy Bill before the king's speech is delivered, a symbolical ceremony which is as meaningless in practice as the privilege, for under the present Standing Orders practically the whole time of the House is at the absolute disposal of the gov.

The privileges not claimed by the Speaker are: (1) The right of the House to regulate its own constitution, as a corollary of which the House is theoretically entitled to settle disputed elections and to pronounce on the legality or otherwise of an election. The House, however, long since transferred to the law courts the right to deal with petitions against the validity of an election (see ELECTIONS). By virtue of this privilege the House can also of its own motion expel and refuse to admit persons, even though elected as members, whom they regard as unworthy of their assembly. (2) The right to control finance, and initiate financial legislation (see especially PARLIAMENTARY ACT, 1911). (3) The right of impeachment. (But see the earlier part of this article and IMPEACHMENT). (4) The right (according to Sir Erskine May, not a right or privilege at all, but merely an expectation that the Crown will exhibit its habitual courtesy in the matter) to have the most favourable interpretation put by the Crown on deliberations of the House. (5) The right to punish both members and strangers for contempt. A person committed by the House is usually given an opportunity of apologising. If not set free at the end of a session, he can demand a writ of habeas corpus. (6) The right to decide, uncontrolled by the law courts, all matters arising within the precincts of the House. Mr. Justice Stephen in the case of *Bradlaugh v. Gossett* (in which the celebrated atheist after being prevented by the Serjeant-at-Arms from entering the House, sued for a declaration that the order of the House was invalid) stated *obiter* that in his opinion there was a limit to the privilege, and that the House could not, although technically a court of record, try a charge of murder committed under its roof. (7) The right to exclude strangers. Formerly any member could directly object to the presence of strangers, but according to the modern practice he must first call the attention of the Speaker to the matter, when the question of objection is determined by vote. The Speaker, however, has power to order strangers to withdraw.

**PROCEDURE IN THE HOUSE OF COMMONS.**—(For the necessary quorum see COURT OF COMMONS). The customary order of business is as follows: (1) Private business. (2) Presentation of public petitions. (3) Motions for leave of absence. (4) Notices of motions. (5) Questions. (6) Motions for adjournment under Standing Order 10

in order to discuss some matter of urgent public importance. (7) Presentation of Bills. (8) Matters taken at the commencement of public business which must relate to the business of the House. (9) Orders of the day and notices of motions as set down on the notice paper for the particular day. *Motions, amendments, questions, and divisions* are to be found as far back as the sixteenth century, and in the seventeenth century their form was in all essentials the same as at the present date.

**Motions.**—An important distinction is to be noted between those which require previous notice and those which may be moved without notice. As a rule motions which relate to matters of substance require to be known beforehand. The principal cases in which notice of motion must be given are: the introduction of a new clause upon the report stage of a Bill (see below); the nomination of members to serve on select committees; (see COMMITTEES, PARLIAMENTARY); the grant of leave of absence to members; the presentation of a Bill without an order of the House; and a motion that the House go into Committee of Supply. Formal or uncontroversial motions do not require to be notified beforehand, e.g. a motion for the first reading of a Bill from the upper House; for the consideration of the Lords' amendments to a Bill on a future date; for the issue of a new writ to fill a vacancy; for the adjournment of the House or a debate; or, in committee, a motion to report progress, or that the chairman vacate the chair. An adjournment motion is very effective if allowed, but an examination of the list of parl. proceedings shows that it is difficult to secure a debate on an urgency motion for the adjournment. There exists a body of precedents as to what is 'urgent,' 'definite,' and 'of public importance' in this context, and they have tended to restrict opportunities for discussion on adjournment motions. 'Urgency' motions are those which may be discussed before the opening of public business. If a motion on the adjournment is accepted by the Speaker, it must either be supported by forty members or by the House itself on a div.; and in practice the whole opposition supports the motion. Another kind of adjournment motion is that which is moved every evening at the close of public business and this short debate on the adjournment is generally used to raise individual grievances. Debates on the adjournment, however, are rarely reported in the press so that the member does not get the publicity which he desires (Jennings).

**Amendments.**—An amendment is really a variety of motion. 'It is a subsidiary motion, i.e. a motion for fundamental or partial change in, or curtailment of, or addition to, a motion already before the House' (Redd.).

**Divisions.**—The lobbies, called div. lobbies, which communicate by a number of doors with the various parts of the House used by members, play an essential part in divisions. When the Speaker's decision as to the result of a vote by voices

has been stated and challenged by at least two members, the Speaker directs all strangers to withdraw (with the exception of those in the gallery). No member is entitled to take part in a div. unless he was actually in the House when the question was put; but in fact grace is given through the medium of the various div. bells, which resound continuously at this critical moment in all the lobbies and rooms of the House. Any member who desires to abstain from voting, by pairing or otherwise, must, while the bells are ringing, withdraw from the House and the div. lobbies; and he has only two minutes in which to do so, which space of time is measured by a sand-glass in charge of clerks seated at a table for the purpose. Members who enter the House during these two minutes may and must vote. When the time has expired the Sergeant-at-Arms, having previously cleared the lobbies at a sign from the Speaker, locks all the doors leading into the House. The question is then put a second time, and the result by voices may again be challenged; but it is almost impossible at this stage to prevent a div. The Speaker then directs the 'Ayes' to his right and the 'Noes' to his left, and the members thereupon pass the gauntlet of the party tellers (two of whom are the whips), who stand at the doors leading from the lobbies, and the members, according as they pass into the gov. or opposition lobby, thereby declare themselves to be 'Ayes' or 'Noes.' The tellers then count the members as they return into the House from the lobbies, and so ascertain which side is in the majority. Every matter is determined upon questions put by the Speaker and resolved in the affirmative or negative, as the case may be, e.g. 'That this Bill be read a second time.'

**Debates.**—The rules for the conduct of debates are as far as possible adapted to the curtailment of unnecessary argument. An opposition, even though but little numerically inferior to the gov., has no just cause of complaint against devices like the 'guillotine' (see CLOSURE); its grievance, if it have one, is not with respect to the rules of debate but rather with the party system generally. In the session of 1919 the power of the chair was made independent of any preliminary motion, and, by a standing order then made, the Speaker (or, in committee, the chairman of ways and means) and the deputy chairman were given power in respect of any motion on any Bill, under consideration either in committee of the whole House or on report, to select the new clauses or amendments to be proposed. Consistently with the theory of the will of the majority, no less than with the conduct of any orderly discussion, many of the rules of debate are designed to prevent the revival of a debate which has already been brought to an end, e.g. all references to previous debates in the House during the current session upon any question not under discussion is forbidden, though debates on the earlier stages of a Bill may be referred to in a debate on a later stage. No member is

allowed to speak against or reflect upon any previous determination of the House during the current session except on a motion for rescinding such determination. Similarly no allusion may be made to debates in the upper House. Again no member is allowed to read his speech, though one may well believe that even the best debaters have carefully prepared their greater efforts beforehand. It need hardly be said that reasonable and seditious words may not be used; nor may members make personal reflections or insult other members. There is indeed a code of rules which 'aim at depriving debates, looked upon as a combat of words between members, of all needless and injurious bitterness,' and for the most part these rules are obeyed.

**The Opposition.**—The leader of the opposition has a task of considerable public importance and, under the Ministers of the Crown Act, 1937, is paid a salary of £2000 a year charged on the Consolidated Fund. Thus the gov. by taxation raises £2000 a year in order to enable its prin. opponent to criticise it, but this is an essential part of democratic government, and promotes effective criticism. Yet although he is paid a salary as leader of 'his majesty's opposition,' the leader of the opposition would appear to have no responsibility to the House as distinct from his responsibility to his constituents. The purpose of parl. opposition is to appeal to the 'floating vote.' The opposition does not expect to be able to turn out the gov. by its vote. It hopes to persuade the floating vote to do so at the next general election and, so long as the gov.'s majority holds, the gov. cannot be defeated otherwise than on a 'snap' vote; and it is the function of the gov. so to shape its policy and marshal its forces that it never courts the risk of defeat. The gov. can always reverse a decision by sending out an urgent whip, and getting together its majority; but it is recognised that a defeat is damaging to a gov.'s prestige in the eyes of the floating vote and it is the purpose of the opposition to show that it could manage the nation's affairs much more competently (Jennings). There is of course less loss of prestige in withdrawing an unpopular proposal than in being outvoted on it. The task of an opposition is not merely to see that such of the gov.'s proposals as are objectionable are opposed by speech and vote, to secure concessions on gov. Bills, to compel the gov. by all the methods of propaganda to modify its general policy, and, finally, to create the necessary public opinion against the gov. ready for the next election—it must take part also in the actual process of parl. government. The opposition parties choose the votes to be put down on supply days. By arrangement with the gov. whips the main subjects to be discussed on the addresses from the throne, the long adjournments, and the Consolidated Fund Bills are determined by the opposition whips acting on behalf of the party meeting or 'shadow Cabinet,' as it has been called.

**Questions.**—Written notice of intention

to ask a question must, unless the Speaker gives special leave to the contrary, be delivered to the clerk of the House. An asterisk is affixed to the notice where an oral answer is required. Where there is no asterisk, or the member or a friend of his is not in the House to put the question, or the question is not reached by 3.45 p.m., the minister who has to answer it has the answer printed and circulated with the votes. Questions may, however, be postponed by the questioner. Opinions must not be asked, and purely legal questions are not allowed. No imputations on private character are permitted, and imputations on official character may only be made with certain reservations; neither is argument nor irony tolerated for a moment. No questions can be put as to matters pending in a committee until the report of that committee is issued. The Speaker is the sole judge of the propriety of a question. Ministers may decline to answer questions on the ground of public policy, and in any case questions to ministers must relate to their respective depts. The foreign minister has great licence allowed him in the matter of answers. Sometimes a question is the only means of securing redress of an individual grievance which a member has already put before the appropriate minister without securing satisfaction. Originally a question was asked in order to get an answer to that particular question; but to-day questions are often merely pegs on which to hang a more insidious 'supplementary.' The answers to questions on the order paper are prepared by civil servants, but a minister must necessarily answer 'supplementaries' on the spur of the moment out of his imagination unless his dept. has been able to anticipate the questions or his parl. private secretary, by liaison work with the departmental officials in the official gallery, can help him. But there is no obligation to answer a 'supplementary' question.

*Discussions of Estimates.*—The discussion of estimates comes on at the conclusion of the debate on the address from the throne (see under COMMITTEES, PARLIAMENTARY). Until recently twenty days were allocated for their discussion, and at the conclusion of that time they were voted on without further discussion. An estimates committee was instituted in 1922 to meet the view of members that the period of twenty days available for the discussion of ever-increasing burdens of expenditure presented by the gov. to the House was altogether inadequate. When the estimates are under discussion members cannot move an increase, but if they desire increased expenditure, they must do so in the form of a motion to reduce the salary of the minister in charge of the particular estimate. The financial year commences on April 1, and the chancellor of the exchequer generally introduces his budget at or about that date. When the budget resolutions have been passed they are embodied in the Finance Act of the year; the allocation of the revenues

in committee of supply are embodied in an Act called the Appropriation Act. Money required by the Treasury in the meantime is obtained on the authorisation of Acts called Consolidated Funds Acts. (As to money Bills, see also PARLIAMENT ACT, 1911.)

*Bills.*—1. *Public Bills* (other than money Bills and Bills dealing with the representation of the people).—The first reading of a Bill is a matter of form only, and nothing more than a bare explanatory statement is given even if the Bill is likely to be opposed. The Bill is then printed and circulated. The second reading is the all-important stage, when the main principles are discussed. The member in charge may mention any day he chooses for the second reading, but if it be not reached that day (as it most assuredly will not be), he may put it down for a subsequent day. But if any one opposes the Bill it can only be read a second time on one of the days fixed for taking opposed Bills. It is for the gov. to arrange the order of business, and consequently the days set apart for private members' Bills are so limited that priority is balloted for. When a second reading is opposed, the opposer moves 'that it be read a second time on that day six months,' and if this motion be carried, nothing further will be heard of the Bill that session. It need hardly be said that the exigencies of party government, as it exists at the present day, give the private member very limited facilities for bringing before the House any question in which his constituency may be specially interested, though, in recent years, there have been some slight changes in the standing orders in the matter of allocating parl. time to private members. The overwhelming control exercised by the ministry over the time of the House to the exclusion of the private member is as marked to-day as ever it was. It may be said that no opposed Bill has the slightest chance of passing into law unless the ministry choose to give it special facilities, and even if a private member's Bill does pass its second reading, it becomes indefinitely shelved. Further, even if the member confines himself to a resolution in order to test the opinion of the House, he will not be able to do so unless the Speaker accepts the closure at the end of the debate, so that a div. can be taken; but, even if the Speaker allows the closure, the gov. itself can put up a spokesman to move a shelving amendment so as to obviate a div. on what it considers an inconvenient resolution. 'Blocking motions,' put down at the last moment, are also a favourite device for burking inconvenient discussions, while the method of raising questions by a motion for the adjournment of the House is fenced round with a veritable wall of restrictions. To continue the statement of the orthodox procedure on a public Bill at the point of digression above: When a Bill has been read a second time it is referred to a standing committee unless the House otherwise orders (see COMMITTEES, PARLIAMENTARY). After all the clauses are disposed of one way or another, the Bill is reported to the House,

and then considered by a committee of the whole House, and is put down for third reading if it passes without amendment; if not it must be set down for consideration on report.

On the report stage it may be amended as in committee, the new clauses being taken first in order. After being considered on report, it is ready for third reading, when only verbal amendments may be moved, though the Bill, as a whole, can be opposed. It is then sent to the House of Lords, where the procedure is not dissimilar. If the Commons do not assent to the Lords' amendments a committee is appointed to draft reasons. If the Houses cannot ultimately agree the Bill is lost; if otherwise, it receives the royal assent, which is usually signified by commission.

**II. Private Bill Legislation.**—The procedure on private Bills is of a quasi-judicial character, and it requires that full notice should be given in order to give interested parties an opportunity of opposing. When the Bill is referred to a committee, counsel and witnesses are heard on behalf of the contending parties. Proposals for private Bills must be publicly advertised in certain newspapers in Oct. and Nov.; plans, sections, and books of reference must be left with the authorities in the private Bill office; owners and occupiers of land affected by the proposed scheme must be served with notices, and a deposit of money made by the promoters (see PARLIAMENTARY DEPOSITS; PARLIAMENTARY AGENTS). The next step is to deposit the petition for the Bill, or a copy of the Bill itself, in the private Bill office. After the examiners have seen that all standing orders have been complied with, the chairman of ways and means, and in the Lords, of committees, fix in which House the Bill is to be considered first. The procedure which then ensues is of a most intricate nature. Ordinarily when a private Bill has passed its second reading it goes to the committee of selection, who refer it to one of the small committees on private Bills. Generally speaking in every separate stage, private Bills, when they come before either House, are treated as if they were public Bills. They are read as many times, and similar questions are put, unless otherwise directed by the standing orders. A special procedure has been provided for Scottish private Bills by the Private Legislation Procedure (Scotland) Act, 1899.

**Parliament Act, 1911.** Bitter have been the struggles between the two Houses over the control of money Bills, and it is now a historical commonplace that representative government in England, and the very liberties of the people, are due in no small measure to the issue of that struggle in favour of the lower House. But in the years immediately following on the remarkable Liberal triumph at the polls in 1906, a real or apparent change had come over the current Liberal conceptions of theories of taxation. With exceptions of no striking kind, the Finance Acts for a very long period prior to the first decade of the twentieth century had done little more than ring the changes on what had become the stereotyped sources of revenue. But Lloyd George, in 1909, following out the growing demand of the Liberal party for an all-round 'broadening of the basis' of taxation, proposed in his great budget of that year to impose a number of highly novel land taxes (*q.v.*), and to enhance the existing liquor duties. The opposition viewed this budget in the light of a flank attack on landlords and brewers, designed not primarily to raise revenue for current expenditure but in reality to drive in the thin end of the wedge of land nationalisation on the one hand and, on the other, to cripple the resources of an influential body of Conservative supporters, under the pretext of making people sober by Act of Parliament. The budget was, therefore, declared by its opponents to be not a money Bill at all, but a mere 'tacking' measure, and on it becoming clear that the upper House would never pass it, the ministry resigned, and were returned, though with a greatly reduced majority. The budget then became the Finance (1909-10) Act, but it was patent that fundamental Liberal legislative proposals, notwithstanding party majorities, would seldom become Acts if an unwilling assent could only be extorted from the upper House after constant appeals to the electorate. There were moreover at this time certain other legislative proposals mooted which formed the very life-blood of the advanced Radicals: home rule, Welsh disestablishment, plural voting, and so forth, proposals which it was useless to attempt to pass in the House of Lords. Believing, rightly or wrongly, that the House of Lords intended always to thwart Liberal measures, whatever their merits or demerits, the Liberals postponed all other business to the task of

destroying once and for all the unfettered legislative power of the upper chamber. The controversy was the all-absorbing topic in Parliament from Nov. 1910 to Aug. 1911, in which month the P. A. became law. All parties were agreed, though for very different reasons, that the House of Lords stood in need of reform, but whereas a section of the Unionist party late in the day was not averse to a reconstitution of the upper chamber, the Labour and Irish parties demanded its total abolition. Between these extremes a *via media* by consent was sought in vain. In Nov. 1910 Parliament, after the failure of a secret conference of four Liberal ministers and four Unionists, was dissolved on the advice of Asquith and Lord Crewe, who secured a promise from the king to exercise his constitutional power to override the resistance in the House of Lords by a practically unlimited creation of new peers 'in the event of the policy of the government being approved by an adequate majority' in the next House of Commons. Meanwhile the Unionists availed themselves of the time intervening before the dissolution by presenting a belated scheme of reform to Parliament, the prin. proposals of which provided the settlement of lesser differences between the two Houses by joint sittings and of issues of great gravity by the process of a referendum. Lord Rosebery also endeavoured to stem the tide with a resolution declaring that the House of Lords should in future consist only of peers: (a) Chosen by the hereditary peers from within their own ranks; (b) nominated by the Crown; (c) chosen or sitting *virtute officii*, or by reason of specified qualifications. The various counter-moves did not, however, avail to return the Unionists, and in Feb. 1911 the Parliament Bill was introduced into the House of Commons by Asquith, and after some five or six months of debate in Parliament the Bill was accepted by the House of Lords. The House of Lords tried every possible device, in the shape of amendments and counter-proposals, to thwart the passage of the Bill, but the threatened influx of an unlimited number of new peers took the heart out of most of the opposition, with the exception of a somewhat mock-heroic group who were lampooned in the Radical press as the 'Die-hards' (*q.v.*). The ultimate voting in the House of Lords, in spite of the 'Die-hards', was 131 to 111 in favour of the Bill. The provisions of the Act, other than the preamble, are in effect as follows: (1) A money Bill which has been passed by the House of Commons and sent up to the House of Lords at least one month before the end of the session becomes law a month after being so sent up, however the House of Lords may deal with it. A money Bill is defined to mean 'a public Bill which in the opinion of the Speaker of the House of Commons contains only provisions dealing with all or any of the following subjects, namely, the imposition, repeal, remission, alteration, or regulation of taxation; the imposition for the payment of debt, or other financial purposes, of charges on the Consolidated

Fund, or on money provided by Parliament, or the variation or repeal of any such charges; supply; the appropriation receipt, custody, issue, or audit of accounts of public money; the raising or guarantee of any loan or repayment thereof, or subordinate matters incidental to those subjects or any of them.' But the expressions 'taxation,' 'public money,' and 'loan' respectively do not include any taxation, money, or loan raised by local authorities or bodies for local purposes. The Speaker certifies money Bills, and his certificate is conclusive and may not be questioned in any court of law. If a financial measure contains new administrative machinery or administrative powers other than those specifically set out in the above definition, it cannot be certified. It may be noted here that of the twenty-nine Finance Bills between 1913 and the end of 1937 only twelve were certified as money Bills. The common notion that by tacking provisions to a money Bill the Commons could pass extreme legislation in a single sitting without the consent of the House of Lords is untrue. It derives from Unionist propaganda in 1911 and since, and is not justified by the terms of the Act or by the practice. The allegation about tacking is, in fact, an allegation that a Speaker might be found ready to pervert the meaning of the definition in the interests of a 'progressive' government, and all the traditions of the office are against any such method of decision' (Jennings). (2) When a Bill, which is not a money Bill, is passed by the House of Commons in three successive sessions (whether of the same Parliament or not) and is rejected by the House of Lords in each of those sessions, it is to become law (unless the House of Commons direct to the contrary), provided that two years have elapsed between the date of the second reading in the first of those sessions in the House of Commons and the date on which it passed the Commons in the third of those sessions. A Bill is deemed to be 'rejected' by the House of Lords if not passed by them either without amendments or with such amendments only as may be agreed to by both Houses. The need for these separate sessions is not a substantial limitation, because the gov. could by prerogatives reduce the duration of the sessions at pleasure, and could rigidly limit debate by the guillotine. (3) The maximum duration of Parliament is reduced from seven to five years.

In 1917 the Coalition Gov. called a conference of members representing all parties under Lord Bryce to examine the question, but no final agreement was reached. It was tentatively agreed that the hereditary peers should form only a minority of the second chamber and that there should be no property qualifications. But most acute differences arose over the question of the powers of the House, some members favouring the referendum, others the machinery of joint sessions. After the failure of this conference the gov. introduced resolutions into the Commons in 1922 for reconstituting a House of

Lords of 350 members, with statutory limitations on the numbers, respectively, of hereditary, elected, and nominated peers, and also providing that the decision of what constituted a money Bill should be left to a standing joint committee of both Houses. But these resolutions were more remarkable for the questions they left unanswered than those they purported to settle, and it is not surprising that they were defeated. In 1933 the marquess of Salisbury introduced a Bill to reform the Lords, one provision of which was that the peers should elect to the House 150 of their own order while another 100 should be added from outside; but this Bill too was defeated, and since then the enthusiasm of reformers has waned, though it should be noted that the Labour party at its ann. conference in 1934 formally adopted the policy of abolishing the House. So far no mention has been made above of the preamble to the Act, which announces the intention of the legislature to substitute at a future date a second chamber constituted on a popular basis for the present hereditary House of Lords, and then states the expediency of making provision in the Act itself for restricting the existing powers of the upper House. No such substitution has yet taken place.

The P. A. does not apply at all to private Bills, to Bills confirming Provisional Orders, and to Bills containing any provision to extend the maximum duration of Parliament beyond five years. Experience of the operation of section 2 of the P. A. (up to the end of the Second World War) is limited to the period 1912-1914, during which the procedure of the Act was adopted for Bills dealing with the Welsh Church disestablishment and with the government of Ireland, and also for one or two minor Bills. The most controversial of these Bills was that on the government of Ireland, but both that and the Established Church (Wales) Bill were introduced three times. Ultimately a conference was held on the Irish Bill but no agreement was reached, and eventually the deteriorated international situation involved the necessity of postponing the second reading of an amendment Bill, and no further steps were thereafter taken. The Government of Ireland Act, 1914, never came into force and was repealed by the Act of 1920 (see EIRE). The Welsh Church Disestablishment Act, 1914, was brought into force, with many amendments and after long suspension, by the Welsh Church Act, 1919. In the period 1919-44 the House of Lords was in agreement with the gov. except during the brief tenure of office by Labour Govs. in 1924 and 1929-31. The P. A. is evidently ineffective from the standpoint of those who believe that the true function of the upper House is to thwart 'rash experiments' in public control; for it seems obvious that an extremist gov. could introduce a Bill for the abolition of the House of Lords and then, after that House had disappeared under the P. A., appeal to the electorate on a new programme involving drastic experiments in social reform.

*Parliament Bill, 1947.*—This Bill amends the Act of 1911 by reducing from two years to one, and from three sessions to two, the period for which the House of Lords may delay the enactment of any Bill which it opposes and antedates the operation of the measure when it should be placed on the Statute Book. The Bill was given its first second reading in the Commons on Nov. 11, 1947. In the committee stage on Dec. 4 an opposition amendment to defeat the provision making the Bill retrospective was defeated by 271 votes to 150, and a Labour proposal to reduce the peers' delaying power to six months was withdrawn. The Bill, which gave rise to a bitter struggle between the two Houses and the main parties, and to the charge by the opposition that the gov.'s motive for introducing the Bill was to facilitate the early nationalisation of the iron and steel industry, was read a third time on Dec. 10 on the motion of the home secretary (Clement Ede), who said that the measure was one which, if the necessity arose, the gov. intended to use in order to secure the passage of controversial legislation. Herbert Morrison, lord president of the council and leader of the House of Commons, who had moved the second reading, admitted that the Lords was a very good revising chamber, but he did not believe it was any more fitted than the House of Commons to gauge public opinion. A conservative motion for the rejection of the Bill was negatived by 310 votes to 166. The real struggle came in the House of Lords, when the Bill came up in that chamber for second reading on Jan. 27, 1948. Lord Salisbury moved an amendment declining to give a second reading to a Bill which would not modify the basis of the membership of the House of Lords so as to conduce to the more effective performance of its duties. The gov. agreed to an opposition suggestion to adjourn the debate for an all-party conference on the possibility of devising an agreed scheme of House of Lords reform which would embrace the composition as well as the powers of the House of Lords, and Lord Salisbury's motion was accordingly withdrawn. The conference, however, broke down on the question of the powers to be given to a reformed House. Efforts to obtain a basis of agreement failed, although the difference between the negotiators was reduced to a gap of only three months in the period by which the House of Lords might delay legislation, the gov. agreeing to nine months from the third reading in the Commons and the Conservatives insisting on twelve months. The Lords debate on the Bill was therefore resumed on June 8, and the next day a motion for its rejection was carried by 177 votes to 81. The gov., as a consequence, then decided to hold a short session for the reintroduction of the Bill and to resort to the procedure of the Parliament Act (1911) to carry the new Bill into law. On Oct. 31 (1949) the reintroduced Bill was given a second reading in the Commons by 333 votes to 106 and the third reading followed a

fortnight later. It was then submitted to the House of Lords for the third time and again rejected at the end of the month. This ended the long conflict between the two Houses, for under the existing power of the Act of 1911 the gov. was able to present the Bill for the royal assent without the customary 'advice and consent of the Lords Spiritual and Temporal.'

**Parliamentary Agent.** P. As. are the persons who conduct the business of promoting private Bills and prosecuting proceedings upon petitions against such Bills in Parliament. Various duties and responsibilities are imposed on P. As. by orders of both Houses. No person may act as a P. A. until he has subscribed a declaration engaging to observe the rules and practice of Parliament, and to pay all fees in respect of any petition or Bill upon which he appears, and has entered into a bond, in a penalty of £500 with two sureties of £250 each, to observe such declaration. Persons other than solicitors or writers to the signet must apply in writing to the clerk of the private Bill office in order to qualify as a P. A., and in addition must produce a certificate of respectability from a member of Parliament, barrister-at-law, or solicitor. No person is allowed to be registered as a P. A. unless he is actually employed in promoting or opposing some private Bill or petition pending in Parliament. P. As. are personally responsible to the House and the Speaker (or chairman of committees in the House of Lords) for the observance of rules and orders and for the payment of fees, and the Speaker (or chairman) may, on misconduct, prohibit the P. A. from practising. The private Bill register in the private Bill office, containing the names of the tn. and country agents soliciting any particular Bill, may be inspected by the public. The P. A. in fact performs the useful function of examining Bills on behalf of those who are affected but who have neither the skill nor time to study projected legislation themselves and, in practice, various grouped interests have Bills watched in their interests by P. As. Nearly every collective organisation, including such bodies as the Federation of Brit. Industries, the associations of local authorities, the public utility organisations, and associations of employees employ P. As. to watch their interests.

**Parliamentary Commission, see COMMISSION, PARLIAMENTARY.**

**Parliamentary Committees, see COMMITTEES, PARLIAMENTARY.**

**Parliamentary Deposits.** The standing orders of both Houses of Parliament require that the promoters of railway, tramway, subway, or other private Bills in which authorisation is sought to carry out undertakings which may prove abortive shall make a deposit of money on or before Jan. 15 in the year preceding the proposed passing of the Bill as a guarantee of good faith. The deposit is to be returned to the promoters where non-completion of work is due to want of compulsory powers. No deposit is re-

quired where the money needed for works is intended to be raised on the security of rates and no private profit is to be made.

**Parliament, Houses of.** The official title for the building generally known as the H. of P. is the Palace of Westminster. The palace built by Edward the Confessor was a walled unmoated building which, in the fourteenth century, is said to have had an area of 12½ ac. and to have housed as many as 20,000 persons, courtiers, craftsmen, artificers, and cooks. This building was considerably damaged by fire in 1512 and Henry VIII., having acquired Whitehall from Wolsey and built St. James's Palace, no longer required it. In 1547 Edward VI. granted its chapel of St. Stephen to the House of Commons, and there they sat until a fire in 1834 destroyed it and the rest of the palace save Westminster Hall, the crypt, chapel, and the cloisters. The foundation of the succeeding building was laid in 1840, the House of Lords first occupied their chamber in 1847, and the whole building was completed in 1852. It was built from designs by Mr. (afterwards Sir) Charles Barry, assisted by A. W. Pugin. The features of the building are the clock tower, containing 'Big Ben,' the central tower, and the Victoria Tower. The chief apartments are those in which the two Houses meet (that in which the Commons met was irreparably damaged in the 1940 air raids on London) and those for the use of the sovereign on ceremonial occasions, the royal court and the royal gallery. A terrace fronts the R. Thames, Westminster Hall and St. Stephen's Hall, which escaped the fire in 1834, have been incorporated. The stone used for the building is magnesian limestone from Yorkshire, and has proved too little immune to the corroding influence of weather and noxious acids, with the result that much stone has had to be removed from the fabric for the sake of safety and considerable expenditure incurred in repairs. There are over 300 statues in the main façade, representing sovereigns, saluts, and patron saints. In the sunk garden on the W. side is Hanso Thornycroft's statue of Cromwell. The clock tower is some 320 ft. high to the top of the spire. The dials of the clock are 23 ft. in diameter, the figures 2 ft. long, and the minute spaces 2 ft square, while the hour hands are 9 ft. long; the pendulum is 13 ft. long. The first blow on the bell—'Big Ben'—which weighs 13½ tons, indicates the hour. It was called by this name after Sir Benjamin Hall, who was first commissioner of works when the clock, made by Messrs. Dent, was fixed in 1858. The clock is wound by an electric motor and lit at night by electricity. A light is kept burning in the clock tower while the House is sitting.

The public entrance is by a door in Old Palace Yard. At the top of the staircase seen through this door is the Norman Porch, so called because it was once proposed to place there upon the pedestals the statues of Norman kings. Next is the king's robing-room, where the king assumes his robes before going to the

**House of Lords for the opening of Parliament.** The Lords sat here after June 1941. An oak dado adorns the room with eighteen panels of carving portraying stories from the Arthurian legend. The chair of state is surmounted by an oak canopy, carved with the emblematic rose, thistle, and shamrock. From this one passes into the royal gallery, traversed by the king in opening Parliament. Here are Maclise's huge paintings, 'Wellington and Blücher' and 'Nelson,' and Copley's 'Death of Chatham' (whose death however, did not follow his seizure in the

five galleries available for peeresses, ambas, and other distinguished persons, the strangers' gallery is at the N. end, and there is a press gallery over the doorway. At the far end of the chamber is the Bar, at which the Commons attend to hear the speech from the throne and the royal assent to Bills. The frescoes over the throne represent Edward III conferring the Order of the Garter on the Black Prince, the baptism of St. Ethelbert, and Prince Henry acknowledging the authority of Judge Gascoigne. Those behind the strangers' gallery are 'The Spirit of

John H. Stone

THE HOUSES OF PARLIAMENT FROM LAMBETH BRIDGE

House of Lords for many weeks.) Beside the doorways are gilded stone statues of King Alfred, William I, Richard I, Edward III, Henry V, Queen Elizabeth, William III, and Queen Anne.

The next room, the Prince's Chamber, is an ante room to the House of Lords. Its chief features are a massive statue group of Queen Victoria, bas-reliefs of historic events of the Tudor period and a series of Tudor portraits by students of the Royal School of Arts & Kensington. The House of Lords, occupied by the Commons after June 1941, is the most impressive and ornate apartment in the whole palace. The throne is beneath an ornamental canopy divided into three compartments, the central one projecting over the two chairs of state, behind which is some fine heraldic carving. In the centre below the throne is the woolsack (now stuffed with hair), the seat of the lord chancellor as Speaker of the House. There are

Justice (Maclise). The Spirit of Religion, and The Spirit of Chivalry (Maclise). The House of Lords lobby is notable for the fine stone carving and the doors of oak, mounted with brass. The peers' corridor, which is next reached, has paintings of events during the Stuart period; the E. corridor is adorned with frescoes depicting episodes of the Tudor period. Thence one passes to the lower waiting hall and, on the left, a model of the old Palace of Westminster, with a statue of John Bright and Bernini's bust of Cromwell.

Thence, turning left, through a long book-lined corridor, and left again through a portrait gallery, is reached the site of the House of Commons. The gov. side of the House was to the right of the Speaker's chair and the opposition to the left. The seating accommodation was formerly for 368 members below and for eight-two in the galleries. The members' lobby contains statues of Sir Wm. Harcourt and

Joseph Chamberlain. Thence one passes through another corridor with frescoes of historic incidents of the Stuart period, and thence, turning right, enters St. Stephen's Hall. This stands on the site of St. Stephen's Chapel, founded by King Stephen c. 1141, partially destroyed by fire in 1298, rebuilt by Edward III. in the Gothic style, and completed in 1361. The chapel contains a number of statues of old-time debaters, including Selden's monument and statues of Chatham and Pitt. On either side of the doorways are statues

and worked by wood-carvers in London, has been bleached a grey colour. The House of Commons table is to be made of oak from Canada, and the dominions have also given some other wood furniture, including the Speaker's chair and the clerks' chairs. The main contract for the superstructure of the new building was due for completion in April 1950, and by the beginning of 1948 all the steel work was in place. As to the architectural character of the new House of Commons, the object of the design is to blend the new

A general view of the chamber, looking towards the Speaker's chair from the south east corner of the strangers' gallery.

of early kings and queens of England, and at the E. and W. ends are two large mosaic panels relating to the hist. of the chapel. The mosaic at the E. end, symbolising St. Stephen's martyrdom, was unveiled in 1926, that at the W. end, portraying Edward III. with the master-mason of the chapel, in 1926. More recent mural panels of Eng. hist. were unveiled by Mr. (later Earl) Baldwin in 1927.

The new House of Commons, now in process of rebuilding, was designed by Sir Giles Gilbert Scott. Quarries in the Clipsham dist. near Stamford have provided the stone, which was shaped by masons at Cambridge and Peterborough as well as in London. The internal panelling and joinery is of Eng. oak from trees grown within a radius of about 50 m. of Newport, Shropshire. The oak, after being kilned by the most modern process

work with the old and preserve a certain unity, yet at the same time break away to some extent in the ornamental detail of the interior. The new chamber is designed to be almost a replica of the old, except for the galleries at the N. and S. ends, which are enlarged. Two new floors below the chamber will provide rooms for individual members, and also secretarial and conference rooms. For the first time there will be a suite of offices over the chamber. The whole of the construction under the old House of Commons was occupied by the vast ventilating space, 20 ft. deep. Modern methods make it possible to get all the ducts and machinery for ventilating into 6 ft. of depth under the chamber, leaving 20 ft. to spare for two new floors. The National Physical Laboratory advised on acoustic problems, including the treatment of the

ceilings for sound absorption and amplification. See also WESTMINSTER HALL.

**Parma:** 1. N. prov. of Italy, bounded N. by Cremona and S. by Massa e Carrara. The R. Po flows along its N. boundary. Area 1334 sq. m. Pop. 401,800. 2. Cap. of the above prov., built on both banks of the Parma, 76 m. S.E. of Milan. Probably Etruscan in origin, and in 183 B.C. colonised by Rome. P. is of a circular form, and is surrounded by walls and ditches flanked by bastions; the streets are straight and wide and meet at right angles, the chief of them, a part of the Rom. Via Emilia, crossing the city from E. to W. P. is celebrated for its churches, the chief of which are the Duomo or cathedral (consecrated A.D. 1106), built chiefly in the Lombard style, having the interior adorned with magnificent frescoes by Correggio and paintings by other artists, and surmounted by a beautiful dome; the Battisterio, or Baptistery, one of the most splendid in Italy, begun in 1196 and completed in 1251; and the church of the Madonna della Steccata, containing the famous painting of 'Moses breaking the Tables of the Law,' by Parmigianino. P. has also a univ. and an observatory. Silk is manufactured, and there is trade in cheese, cattle, and grain. P. emerged from the Second World War relatively undamaged, apart from the area around the railway station, and all important works of art had been previously stored in safety. Pop. 122,800.

**Parma, Duchy of.** The former duchy of P. was created in 1545, when Pope Paul III. (Alexander Farnese) invested Pier Luigi, his nephew, with the duchy of P. and Piacenza. There were eight dukes of P. of the Farnese line, and, after the line failed, the duchy was chiefly in Sp. hands. It twice came, for a time, under Austrian rule, until its conquest by the Fr. revolutionary armies in 1796. At the Congress of Vienna it was assigned to Maria Louisa, the wife of Napoleon, who was named duchess of P., Piacenza, and Guastallo. Later the duchy fell to the duke of Lucca. Finally, after the battle of Magenta, the Austrians left the duchy, which then became a part of the new kingdom of Italy.

**Parmenides** (Παρμενίδης) (b. c. 540 B.C.), anct. Gk. philosopher, a native of Elea in Italy. He visited Athens, where he made the acquaintance of Socrates. He was much admired both by Plato and Aristotle, and was a follower of Xenophanes, whose successor he was in the Eleatic school. His views, which are contained in a didactic poem *On Nature*, were that sense is delusive, and that only by mental abstraction it is possible to know the only reality, an eternal unchanging being. His great importance in the beginnings of Gk. philosophy lies in his recognition, along with Heraclitus, of the problem of reconciling the seemingly very opposite notions of the one and the many. The conception of the identity and permanence of reality, which in Xenophanes is merely the result of poetic intuition, became, with P., a well-defined doctrine with impressive consequences. Yet of all

philosophical systems, his is the most paradoxical, for it is founded on the absolute denial of change and multiplicity, and their reduction to pure illusion. With P. only the One exists and that One is eternal, immutable, immovable, indivisible, and infinite.

**Parmenion** (Παρμενίων) (d. 330 B.C.), a famous Macedonian general. He was held in high esteem both by Philip and Alexander, the former of whom he served in the siege of Halus in 316 B.C. He also took part in the battles of the Granicus, Issus, and Arbela, and being in command of the left wing of the army greatly distinguished himself. After the conquest of Drangiana his son, Philotas, was accused of plotting against Alexander's life, and the king, believing P. to be involved in the conspiracy, ordered him to be assassinated in Media.

**Parmentiera**, genus of fruit-bearing trees of the order Bignoniaceae, which flourishes in tropical countries. *P. ceroxylon*, which is known as the candle tree, is a typical example.

**Parmigiano, Girolamo Francesco Maria Mazzola** (1503-40). It. painter called Parmigiano or Parmigianino, b. at Parma, an able exponent of the Lombard school, and the most distinguished of those who followed the style of Correggio. In 1523 he went to Rome to follow his studies, and was soon employed by Clement VII. He was in that city when it was stormed by the imperialists under Bourbon in 1527, and, it is said, was calmly at work on his picture of 'The Vision of St. Jerome' (now in the National Gallery, London) when soldiers, bent on pillage, burst into his studio. He was, however, protected by their leader. Having engaged to execute sev. extensive frescoes in the church of S. Maria Steccata, after repeated delays he was thrown into prison for breach of contract, and on being released he fled to Casal Magliore, in the ter. of Cremona, where he died soon afterwards. Vasari attributes his misfortunes and premature death to his passion for alchemy; but this oft-repeated story has been disproved. He executed sev. etchings, and some wood-cuts are attributed to him.

**Parnahyba, or Parnaíba:** 1. Riv. of N.E. Brazil, rising in the N.E. of the state of Goyaz. It forms the boundary between Piahy (or Piauí) and Maranhão, and after a course of 650 m. enters the Atlantic by six mouths. 2. Seaport of Piahy state 175 m. E.S.E. of Maranhão. It is a port of some importance for the export of tropical produce and cattle. Pop. 23,000.

**Parnasse, Le**, name given to a school of Fr. poets who wrote for a review pub. by Alphonse Lemerre and ed. by Louis X. Ricard, called *Parnasse* and devoted entirely to poetry (1852-93). Among the chief poets were Stéphane Mallarmé, Verlaine, Lafenestre, and Théoret. The chief characteristics of the school are beauty of style and plasticity of form, but it was gradually expanded and modified, developing ultimately into the school called Symbolist or Decadent. See M. Souriau, *Histoire du Parnasse*, 1930, and F. Vincent, *Les Parnassiens*, 1933.

**Parnassus**, mt (8070 ft high) of Phocis, anct Greece, overlooking Delphi, the modern Iyakkora. It had two prin peaks, Tithorea and Lycorea, on the latter of which was the Corycian cave. It was regarded as one of the most holy mts of Greece, being one of the chief seats of Apollo and the Muses. It was also sacred to Dionysus.

L. J. Yell

SHILHURDS OF MOUNT PARNASSUS

**Parnell, Charles Stewart** (1846-91) Irish politician. b at Avondale, Wicklow, entered Parliament as a member for Meath in 1875 and soon became a prominent member of the Irish Home Rule party led in the House of Commons by Isaac Butt, who had founded it. He organised a policy of obstruction, which played havoc with the business of the House, and secured the support of the Fenians. He was in 1879 elected president of the National Land League formed with the object of securing the ownership of land in Ireland for the occupiers. Shortly after the death of Butt in 1879 P. was unanimously elected to succeed him in the leadership of the Home Rule party at Westminster and, because of his great influence over his followers, he was called 'the uncrowned king of Ireland'. In the autumn of 1881 he was imprisoned in Kilmainham jail for inciting to violence, but he was released in the following May, when an arrangement concerning Irish affairs, called the 'Kilmainham Treaty,' was arrived at with Gladstone. The murder of Lord Frederick Cavendish and T. N. Burke in Phoenix Park, however, upset all plans, though P. of course not only had no connection with the crime, but denounced it in the House of Commons. In 1886, owing to the Conserva-

tives and Liberals being nearly equal in numerical strength, he threw in his lot with Gladstone, and turned out the Conservative Gov. His price was the introduction of a Home Rule Bill, which was brought in and rejected. An appeal to the country resulted in the return of the Conservatives to power. In 1887 he was charged by *The Times* with having been actively concerned in the crimes perpetrated by the Land League. A special commission was appointed, and it was ultimately proved that the documents upon which *The Times* relied were forgeries by Richard Light who had sold them to the newspaper. P. was completely vindicated by the report of the special commission. Three years later P. was cited as a respondent in a divorce action brought by Capt O'Shea, a member of the Irish party, against his wife, and being found guilty Gladstone publicly stated that it was impossible for P. to remain leader of the Irish party. The majority of the party deserted him and he returned from the leadership. In June 1891 he married Mrs O'Shea. He died in the following Oct. See T. P. O'Brien *The Parnellite Movement* 1889 and lives by R. B. O'Brien 1898, W. O'Brien 1906, St J. Levine 1925 and H. Harris 1941.

**Parnell, Thomas** (1671-18) Irish poet, b. and educated in Dublin took orders in 1700 and was vicar of Finglas and archdeacon of Clougher. He was a friend of Swift and Pope, a contributor to the *Spectator* and aided Pope in his translations of the *Iliad*. He wrote various isolated poems showing a fine descriptive touch, of which the most important are *The Hermit*, *The Night Piece* and *The Hymn to Contentment*. There is an ed. of his collected works by G. A. Aitken (1891) and all his poems are printed in *Minor Poets of the Eighteenth Century* (Everyman's Library) ed. by H. F. A. Aitken. See life by Goldsmith 1770.

**Parnajogi**, see Parnaji.

**Parochial Schools (U.S.A.)** In the main these are institutions maintained by the Roman Catholic Church, although there are also some Lutheran and Episcopalian schools. From the very beginning of the American republic in the larger centres of population there was a considerable Roman Catholic element, the Church hierarchy deemed it necessary to maintain its own schools because in the public schools no religious instruction was given. This position was reinforced in the years following 1848 when there was a heavy migration of German and Irish Catholics to the U.S.A. To-day practically every Catholic parish has its own school maintained not out of public funds like the public schools, but from the resources of the Church itself. In the large towns the schools are housed in as fine and up to date buildings as any in their section. The Roman Catholics maintain over 800 elementary schools with 2,141,000 pupils, 2,100 secondary schools with 167,000 pupils.

**Parody** (Gk *para* 'beside', *opsis* 'view', a song), writing either in prose or verse in which an author's style is copied and his sentiment mimicked in order to

ridicule the original; or in which what is written on one subject is altered and applied to another by way of burlesque. The art is almost as old as literature, as wherever a writer of talent is found, there is also to be found a parodist. The *Gigantomachia* (of Hegemon or Hipponax) and the *Batrachomyomachia* (Battle of Frogs and Mice), which was ascribed to Homer himself, are among the earliest known Ps. The merciless caricature of Euripides' style presented in Aristophanes, particularly in the *Acharnians*, has never been surpassed for subtlety and humour. P. in Rom. literature occupied a subordinate place to satire, in which it sometimes appeared. Ps. of the extravagances of the time are found in Shakespeare, who was himself parodied by Marston. Dryden was very well parodied by Buckingham in his *Rehearsal* (1672), whilst *The Splendid Shilling* by J. Phillips, although somewhat over-rated, set the fashion of employing the sonorous rhythm of Milton for ludicrous subjects. The best collection of Ps. of the eighteenth century was contained in *A Pipe of Tobacco* (1736), in which J. H. Browne mimicked with very good effect Colley Cibber, Ambrose Phillips, J. Thomson, E. Young, and J. Swift; the *Anti-Jacobin* (1797) of J. H. Frere also contains some good Ps. In the following century the *Rejected Addresses* (1818) of J. and H. Smith contained some exceedingly clever imitations of Wordsworth, Byron, Crabbe, Scott, Southey, Moore, and others, moreover their Ps. were marked by no such bitterness, and animosity as was Shelley's *Peter Bell the Third*, a P. of Wordsworth. The *Bon Gaudier Ballads* (1855) of Sir T. Martin and Aytoun, and A. C. Hilton's magazine, *The Light Green* (1872), contain good specimens of Ps. But the palm in this period must be awarded to C. S. Calverley, who, in *Verses and Translations* (1862) and *Fly Leaves* (1872), reached greater heights than any other Eng. parodist; his work is marked by such almost uncanny cleverness of craftsmanship that not only the turns of phrase, but the very turns of thought of his victims seem to have been appropriated. In the last part of the century the *Hephalogia*, or *Seen against Sense* (1880), which was supposed to have been written by Swinburne, Andrew Lang's *Ban and Arrive Ban*, and the *Green Boys* (1893) of 'Q' (Sir A. Quiller-Couch), are worthy of mention; and Owen Seaman, the editor of *Punch*, proved himself in the *Battle of the Boys* (1896) and *Borrowed Plumes* (1902) to be an excellent parodist. In its commonest form, verbal imitation, P. demands no great ingenuity, and it is because that form is so easy that the whole art of P. has fallen into disrepute. A poem like Calverley's *Pillar*, which parodies Lord Tennyson's *The Brook* (1887), is excusable on the plea that in blank verse it preserves in permanent form the spirit and style of Tennyson. Another good example of this, the lowest form of P., is A. C. Hilton's *Heathen Passer*, which parodies Bret Harte's *Heathen Chinee* (1877). The verbal imitation form of P., however, ridiculous style

rather than matter. In its highest form P. aims at the literary merits in some isolated example of the works parodied. It burlesques the salient eccentricities rather than the essential characteristics. As regards prose, *Don Quixote* (1605) parodies most excellently the medieval romance, and some of Thackeray's works, such as *Codlingsby*, are very fair Ps. The *Condensed Novels* (1867) of Bret Harte are still the best examples of prose Ps., though some good work has been done in this direction by Barry Pain, Max Beer-bohm, F. O. Burnand, and Sir Owen Seaman. Of both prose and verse P. Sir J. O. Squire is a master. P. and burlesque are very closely related (for examples of the latter art see BURLESQUE). The best collection of Ps. is Hamilton's *Parodies of the Works of English and American Authors* (6 vols.), 1884-89.

Parole (Fr. from late Lat. *paraula*, Gk. *παράβολα*, story), word formerly in use as the equivalent of verbal or oral, but is now only employed in the legal phrase P. evidence as distinguished from written evidence. In its more common sense it is an abbreviation of the Fr. phrase *parole d'honneur*, or word of honour. This is a military term, denoting a prisoner's promise that he will not attempt to escape, and that if released he will not again take up arms in the war in which he has taken part. It is a rule of international law that prisoners of war may be set at liberty on parole only if the laws of their country authorise it, and that in such case they are bound on their personal honour scrupulously to fulfil the engagements they have contracted, and their own gov. may not require or accept from them any service contrary to the P. given. A prisoner of war cannot be forced to accept his liberty on P.; similarly the hostile gov. is not obliged to assent to the prisoner's request to be set at liberty on P. The punishment for breach of P. is death. (Hague Conference rules, 1907—articles 10 and 11.) The term is also used as an equivalent for password, or used only by officers or inspectors of guard.

Paros, is. of the Grecian archipelago, Cyclades group, in the *Ægean* Sea, 4½ m. W. of Naxos. It is in shape a low pyramid, consisting largely of one huge mt. of marble (Mt. St. Elias, formerly Mt. Marpessa, 2330 ft.). Parian marble was very famous in olden times for sculptural purposes, and is still used, the existing quarries being about 4 m. to the E. of the cap., Paroikia, or P. (pop. 2500). The bay of Naussa, on the N., affords excellent anchorage. The prin. products of the is. are marble, wine, figs, and wool. P. was first colonised by the Ionian Gks., and was conquered by the Persians in 490 B.C. During the fifth century B.C. it became a member of the Athenian confederacy. The is. of Antiparos is 1½ m. to the W. Pop. 8400.

Parotid Gland, one of the salivary glands. It is situated in front of and below the external ear; its duct (Stensen's duct) is about 2 in. long and opens on the buccal surface of the cheek opposite the

second upper molar tooth. The gland secretes saliva containing ptyalin, potassium, sulphocyanide, traces of uric acid, mineral salts, etc.

**Paroxysmal** Haemoglobinuria, see BLACKWATER FEVER.

**Parr**, Catherine (1512-48), sixth queen of Henry VIII., was the daughter of Sir Thomas P. (d. 1517) of Kendal. She married Henry VIII. in 1543, and during her reign tried to diminish religious persecution, and showed great kindness to the

CATHERINE PARR

king's children, Edward, Elizabeth, and Mary. She acted as regent during Henry's expedition in France, 1544. On Henry's death in 1547 she married Sir Thomas Seymour.

**Parr**, Samuel (1747-1825), Eng. pedagogue and author, b. at Harrow-on-the-Hill, son of an apothecary. He was educated at Cambridge, becoming an assistant master at Harrow and headmaster successively at Colchester and Norwich schools. Having taken holy orders, he finally (1785) settled at Hatton, Warwickshire, where he took private pupils. He interested himself in political affairs and became prominent as a pamphleteer. P. was a great Latinist, but left no work to account for the great reputation for ability which he enjoyed in his lifetime. His chief power lay in his literary controversialism, but though he was nicknamed 'the Whig Johnson,' he fell far short of his model. His writings, including correspondence, were pub. in 1828. See W. Field, *Memoirs of the Life, Writings, and Opinions of Samuel Parr*, 1828; H. J. Nicol, in *Great Scholars*, 1880; and P. Colson, *Private Portraits* 1948.

**Parr**, Thomas (c. 1482-1635), 'Old P.', was a native of Albury, near Shrewsbury. He is said to have lived to the age of 168, and his longevity has been celebrated by Taylor the 'Water-poet.'

**Parr**, William, see NORTHAMPTON, MARQUESS OF.

**Parr**, see SALMON.

**Parra**, see JACANA.

**Parrakeet**, see PARAKEET.

**Parral**, see HIDALGO DE PARRAL.

**Parramatta**, tn. of New S. Wales, Australia, on the P., 14 m. W. of Sydney, after which it is the oldest tn. in the colony. It is noted for its orchards and orange-ries. The manufs. are colonial tweeds, P. cloths, soap, etc. Pop. 19,000.

**Parratt**, Sir Walter (1841-1924), Eng. organist, b. at Huddersfield, son of the par. organist, and educated privately. From 1854 to 1861 he was organist at St. Paul's Church in his native tn., and in 1872 was organist of Magdalen College, Oxford. He became organist at St. George's Chapel, Windsor, in 1882, holding office until his death. In 1892 he was knighted and made Master of the King's Music. He was also prof. of music at Oxford (in succession to Sir H. Parry), 1908-18, and from 1916 to 1920 dean of the faculty of music in London Univ. Prof. at the Royal College of Music he conducted choral classes. P. composed music for the production of *Agamemnon* at Oxford, 1880, as well as for the *Tale of Troy* and *The Story of Orestes*, and also odes, anthems, songs, and organ pieces, as well as various compositions on the occasion of royal weddings and other state ceremonies. He had much influence upon the development of organ-playing in England. See life by D. F. Tovey, and G. Parratt, 1942.

**Parrhasius** (Παρρᾱσιος) (fl. 400 B.C.), famous Gk. painter, was the contemporary and rival of Zeuxis. He was a native of Ephesus, but spent most of his time in Athens, and is ranked among the greatest Attic artists; indeed he is said to have done for painting what Phidias did for sculpture. His picture of the Athenian Demos is famous, and his study of Theseus adorned the Capitol in Rome.

**Parricide** (Lat. *parricidium*, from *pater*, father, and *caedere*, to kill), crime of murdering a parent or a near relation. In Rom. times the law against P. was very severe, special punishments being reserved for those who were found guilty. In some countries there may be a tendency even to-day to treat any one guilty of P. with greater severity than other murderers, but the Eng. law makes no distinction.

**Parrot** (Psittaci), group of about 500 birds, most abundant in the warmer parts of Australia and S. America, though numerous in other tropical countries. They include a number of widely divergent forms and details of organisation. The plumage is often gorgeously coloured, but a few are soberly tinted. Most of them are arboreal in habit, but the owl P. or kapo of New Zealand is flightless and lives usually on the ground, though it can still climb trees. Another New Zealand P. differs from the rest of the group in having developed carnivorous habits. The characteristic large and powerful, much-arched bill, with its elongated tip, is well adapted in most Ps. for tearing up fruit and cracking nuts, and in a number of species the tongue is highly specialised for extracting honey by means of a

brushlike tip. Many species are favourite cage-birds. The best talker is the African grey P. (*Psittacus erithacus*), a bird of from 10 to 12 in. long; with the exception of the short, broad tail, which is bright scarlet, the plumage is pearl-grey in colour. The sexes are hard to distinguish, and as males are rarely imported it is almost unknown for it to breed in captivity. Many Amazons are imported; one of the best talkers is the brilliantly coloured blue-fronted Amazon. A P. is taught to talk by repeating words slowly and distinctly over and over again, preferably from a place of concealment. Variety of food is necessary and should include fruit, but little or no meat, if outflashed bone is excepted. Water for drinking is required in spite of a popular idea to the contrary, and many Ps. like bathing water. Grit in the form of clean gravel is also essential for digestive processes. See W. T. Green, *Parrots in Captivity*, 1884.

**Parrot Fishes**, or **Parrot Wrasses** (Scaridae), group of fish in which the teeth of the jaw have coalesced to form extremely hard beaks which are able to bite off pieces of coral; these, as well as seaweed and molluscs, form the prin. food. There are eight genera, with 110 species. They are all brilliantly coloured, and some attain a length of 4 ft. *Scarus cretensis*, a Mediterranean species, was much esteemed by the ancients.

**Parry, Sir Charles Hubert Hastings** (1848-1918), Eng. musical composer, b. at Bournemouth. Educated at Eton and Oxford, after leaving the univ. he studied music under Sterndale Bennett and Macfarren. He was appointed prof. of composition and musical hist. at the Royal College of Music, 1883, and director, on the death of Sir George Grove, in 1894. The five scenes from *Prometheus Unbound* show richness of harmony, and his mastery of choral work appears in *Bliss Pair of Sirens*; *Job* is perhaps his work of greatest strength. This early promise, however, was not wholly fulfilled, due doubtless to the distraction of his office as head of the Royal College of Music. Spontaneity and a sense of constructive purpose are lacking in *War and Peace* and *Voces Clamantium*, though they appear in *Ode on the Nativity* and in the organ works such as the *Wanderer* toccata and fugue and *Ye Boundless Realms*. His literary works include *Studies of Great Composers* (1887); *The Art of Music* (1893); and *Style in Musical Art* (1900, 1911). Among his other compositions are *L'Allegro and Il Penseroso*; *Music to the Birds of Aristophanes*; *Music to the Frogs of Aristophanes*; *Music to the Agamemnon of Aeschylus*; *Judith*; *King Saul*; *Te Deum*; *Invocation to Music*; *A Song of Darkness and Light*; and *The Vision of Life*. Most popular compositions are *Jerusalem* and various sea-songs. See R. A. Streitfeld, *Hubert Parry*, 1913, and C. L. Graves, *Hubert Parry: His Life and Works*, 1926.

**Parry, Sir Edward Abbot** (1863-1943), Eng. judge and author, b. in London. Co. court judge at Manchester, 1894-1911,

then at Lambeth, retiring in 1927; president of the Pensions Appeal Tribunal, 1917-18. His plays include *Kalwampus* (children's play, in collaboration with Louis Calvert, 1895, produced in 1901); *England's Elizabeth* (with Calvert, 1901); *What the Butler Saw* (with Frederick Mouillot, 1905). Other pubes.: *Letters from Dorothy Osborne to Sir William Temple* (1887, 1902); *Pater's Book of Rhymes* (1901); *What the Judge Saw* (1912), and *What the Judge Thought* (1922), both reminiscences; *The Law and the Poor* (1914, intended to promote certain legal reforms); *The Law and the Woman* (1916); *The Drama and the Law* (1924); *The Overbury Mystery* (1925); *The Gospel and the Law* (1928); *Herrington* (1928, a novel); *The Bloody Assize* (1929); *My Own Way: an Autobiography* (1932). P. will be remembered longer as an author than as a lawyer, although he did excellent work in his profession.

**Parry, Sir William Edward** (1790-1855), Eng. sailor and explorer, b. at Bath. He did good service in preparing the way for the eventual discovery of the N. pole. P. commanded sev. successive expeditions to the Arctic, where he reached a lat. beyond the furthest N. of his own day. The charts he made of the N. seas were very valuable to contemporary navigation. He was voted a sum of money by Parliament for his services to science, and was made hydrographer to the Admiralty, and later rear-admiral. P. told the story of his Arctic expeditions in his own journals, and the accounts of his voyages in the *Fury* and the *Hecla* (pub. between 1819 and 1823) form an interesting chapter in the hist. of the conquest of the N. pole. It was due to his skill and resource that the passages of Lancaster Sound and Barrow Strait, Prince Regent's Inlet, and Wellington Channel were discovered. A memoir was pub. by his son, Edward P., in 1857.

**Parry Islands**, group in the Arctic Ocean belonging to Canada, W. of Baffin Bay and N. of Lancaster Sound, Melville Sound, and Barrow Strait. The P. I. include Owen, Bathurst, Melville, Cornwallis, and Prince Patrick Is., are covered with tundra, and are uninhabited. Sir W. E. Parry, after whom they are named, visited them in 1819, and the expeditions searching for Franklin explored them further.

**Parry Sound**, tn. of Ontario, Canada, 221 m. W. of Ottawa, on Georgian Bay (Lake Huron), with lumbering industry. Pop. 4000.

**Parsec**, unit of astronomical distance; the distance of a star of parallax (q.v.) one second, i.e.  $3\frac{1}{3}$  light-years, or 19 million million miles, generally expressed in the form  $19 \times 10^{14}$  in.

**Parsees**, see PARSIS.

**Parsis** (Parsees) are the last remaining branch of the old historic Iranian race. When the Arabs conquered Persia in the seventh century, they fled to India by sea and land rather than give up their ancient religion of Zoroaster, which consisted in the worship of fire, belief in duality of existence, and practice of good thought, good word, and good deed. The P. are

mostly to be found in Bombay, and number barely 100,000 all told. Though the P. have been in India for over 1300 years, they have kept intact their distinct individuality and sturdy independence in habits, customs, and mode of living, which is more W. than E. They are an enterprising race and foremost in the trade, commerce, and industries of India. They were the first to open cotton mills, iron and steel works, and scientific research institutions in India, and from among them came that long line of naval architects who a hundred years ago built ships-of-the-line for the R.N.

The Indian political freedom movement was started by them, and the three members of the Brit. House of Commons have all been P. They were the first to teach non-communalism to Indians by sinking wells and building schools, hospitals, and dispensaries where all had free access without any distinction of caste, colour, or creed.

There is not an uneducated man or woman among them, and their charitable trusts and institutions are of such dimensions that not one Parsi need go without food, clothes, or shelter if he is unable to provide these necessities of life for himself. Purity being the basic principle of their religion, they keep themselves and their homes scrupulously clean and tidy. Altogether they are among the most enlightened and progressive people among the different races and nationalities of India.

Parsiwan, see TAJIK.

Parsley (*Carum petroselinum*), flavouring and garnishing herb. It will grow in almost any soil, but does best in a deep rich moist loam. A single sowing of seed is made in April, and from the seedlings, if kept thin, a supply of plants can be secured for two seasons. P. makes a handsome edging to beds.

Parsnip (*Pseudanum sativum*), native Brit. umbelliferous plant, long valued for its edible tap-roots. It is hardy, and easily grown in deeply dug soil, which need not be rich. The seed, which must be new, should be sown in March, and the seedlings thinned out until the plants are set apart. The roots are ready for use in Oct., but until required may be left in the ground, where their flavour improves.

Parson (Lat. *persona*; *parson* and *person* are the same word, the parson being so called because 'by his *person* the church, which is an invisible body, is represented'—Blackstone), priest of a par. or eccles. corporation; the vicar or incumbent of a par. having the parochial charge or cure of souls. To constitute a P. four requisites are necessary by law, viz. holy orders, presentation, institution, and induction. The P. is in himself a body corporate, in order to protect and defend the rights of the Church by a perpetual succession. During his life a P. has the freehold in himself of the parsonage house, the glebe, the tithes, and other dues. Strictly the rector in holy orders is a P., while the vicar is not. In common usage the term has been widely extended so as to include not only a vicar, and indeed any clergy-

man, but also nonconformist ministers and preachers. In this sense it is used only colloquially, and generally with a somewhat depreciatory significance.

Parsons, Sir Charles Algernon (1854-1931), Eng. inventor and engineer, son of the third earl of Rosse, b. in London, was educated privately and at St. John's College, Cambridge. He is best known in connection with the steam-turbine which bears his name, and which he rendered suitable for the generation of electricity and the propulsion of vessels. The first turbine was produced in 1884; the torpedo boat *Turbinia* was the first to be fitted with turbine engines. He was made a fellow of the Royal Society in 1898. Other inventions of his are an improved variety of gramophone and a non-skid device for motor tyres. K.C.B. 1911, O.M. 1927. He received the Copley medal of Royal Society in 1928. He wrote on the turbine and other engineering matters. In 1926 pub. *The Scientific Papers of William Parsons, third Earl of Rosse*. See life by R. Appleyard, 1933, and R. H. Parsons, *The Steam Turbine*, 1916.

Parsons, or Parsons, Robert (1546-1616), Eng. Jesuit and polemical writer, b. at Nether Stowey in Somersetshire, and entered the Society of Jesus at Rome in 1573, being ordained priest three years later. He and Campion were selected for the work of the Eng. mission, directed chiefly from Douay, and he landed at Dover in 1580; but Campion was arrested and P. had to flee the country. He went back to Rome, whence he continued to direct the Eng. mission, and later went to Spain, where he founded a number of institutions for training Eng. priests. He was a man of great attainments and amazing industry, and notable for his inveterate political intrigues. He played a large part in the policy which eventually led to the dispatch of the Sp. Armada for the invasion of Britain. His great aim was working for foreign intervention on behalf of Eng. Catholics. Among his best-known controversial pamphlets is the *Brief Discourse concerning certain reasons why Catholics refuse to go to Church*. See H. Thurston, *Catholic Writers and Elizabethan Readers*, reprinted from *The Month*, 1894-95.

Parsons, William, see ROSSE, EARL OF. Parsons, city of Kansas, U.S.A., in Labette co., 43 m. W.N.W. from the S.E. corner of the state. It is the centre of a rich farming dist., and there are car and machine works. Pop. 11,300.

Parsonstown, now Birr, (n. of O.) Irel. co., Elre, 61 m. S.W. of Dublin. It has a boot and shoe factory. Pop. 3,400.

Partabgarh: 1. Cap. of state of same name in Rajputana, Indi. 120 m. N.W. of Indore. Manus, a particular kind of enamelled jewellery. Pop. (state) 92,000; (tn.) 11,000. 2. Dist. of United Provs., India, covering an area of 1457 sq. m. Bela is the chief tn. Salt, saltpetre, and limestone are mined, and the prin. crops are rice, barley, wheat, millet, and sugarcane. Sugar and silk are manufactured. Pop. 1,041,000. 3. Auct. fortress of Bombay, India, and a stronghold of

**Sivaji**, founder of the Maratha Empire. It is 8 m. S.W. of Mahabaleshwar in the Satara dist.

**Parthenay**, tn. in the dept. of Deux-Sèvres, France, on the Thouet, 25 m. N.N.E. of Niort. It has interesting old buildings and anot. ramparts. Pop. 7700.

**Parthenius**, **Bartan-su**, or **Bartine**, riv. of Anatolia, Asiatic Turkey, the tn. of Bartan, on its banks, being on the site of the anot. vil. of Parthonia. It was the chief riv. of W. Paphlagonia, and formed part of the boundary between Paphlagonia and Bithynia. It rises on Mt. Olgasys and flows N.W. into the Euxine (Black Sea), 10 m. from Amastria.

**Parthenogenesis**, see under **BIOLOGY**; **FERTILISATION**; **ALTERNATION OF GENERATIONS**.

**Parthenon** (from *Gk. παρθενος*, a virgin). most celebrated Doric temple of anot. Greece, and one of the finest pieces of architecture in the world, receives its name from its dedication to the virgin goddess Athena. It was commenced about 450 B.C., and was dedicated in 438. Its architects were Ictinus and Callicrates, but the whole of the work was carried out under the supervision of the sculptor Phidias, by whom the statue of Athena Parthenos, which stood in the naos, was executed. The temple is situated on the S. side of the Acropolis at Athens. It is octastyle (with eight columns in front) and pseudo-dipteral (it has only one range of columns at the side). The number of columns along the flank is seventeen, counting those at the corners. Behind the corners of the peristyle are six columns, somewhat smaller in size, by which an excellent effect is produced. The most notable feature in the architecture of the P. is the delicacy of the refinements introduced to counteract various optical illusions. These are to be found everywhere, in the curves of the columns, stylobate, cornice, etc. Often they are so slight as to be revealed only on the most careful measurement. The fine sculptures of the metopes, frieze, etc., were mostly removed to the Brit. Museum by Lord Elgin, the P. having been largely destroyed in 1687. The chief dimensions are as follows (outside measurements): length, 228 ft.; width, 101 ft.; height, 64 ft.; length of naos, 98 ft.; width of naos, 63 ft. The worst of the injuries which the P. has suffered from war and pillage was inflicted in the siege of Athens by the Venetians in 1687, when a bomb exploded in the very centre, and threw down much of both the side walls. Some slight damage, chiefly in the shape of scars and splintering, was caused by shell and mortar fire during the Second World War, and from rifle fire in the succeeding disturbances. There is an immense literature on the P. See the official *Guide to the Department of Greek and Roman Antiquities in the British Museum*, which contains plans of the building. The sculptures are dealt with in H. B. Walters's *The Art of the Greeks* (chap. vi., 31st ed.), 1934.

**Parthenope**, see under **NAPLES**.

**Parthenopean Republic**, formed in Naples under the direction of the Fr., in

Jan. 1799. Naples, once called Parthenope, was reoccupied for the Bourbon house by Cardinal Ruffo, the Fr. leaving their protégés to their fate. Nelson then arrived, and, ignoring the armistice concluded between the two sides, sanctioned the execution of sev. republican leaders, including Francesco Caraccioli (q.v.).

**Parthia**, anot. name of a country of W. Asia, situated to the S.E. of the Caspian Sea, and corresponding to the N. portion of the Persian prov. of Khorassan. The country was primarily subject to Persia, and later to the Seleucids. But in 250 B.C. the satrap Pherecles was slain, and Arsaces, leader of the Parthians, a subdivision of the Dahae, was proclaimed first king of P.; such is the official account, but in all probability Pherecles was satrap of Pataurus, to the N.W. of P. The empire thus started grew in importance, until after the time of its greatest power, under Mithridates I. and II., it extended to the Euphrates, Caspian Sea, India, and Indian Ocean. From the first century B.C. onwards P. waged many wars with Rome, and was at one time her ally and at another her vassal. The Parthian cavalry were very famous, and from their method of shooting as they appeared to retreat comes the expression a 'Parthian shot.' In A.D. 226 the country was annexed to the new kingdom of Persia, founded by Artaxerxes. The cap. of the Parthian Empire was Ctesiphon (q.v.) of which some remains exist. The Lat. poets of the Augustan age use the names Parthi, Persae, and Medi indifferently. See N. C. Debevoise, *A Political History of Parthia*, 1938.

**Parting**, in metallurgy, the separation of gold from silver by heating with concentrated nitric acid, in which the silver dissolves while the gold remains unaffected.

**Partinico**, tn. of Sicily, 32 m. S.W. of Palermo by rail. Manuf. silk and woollen goods. Pop. 25,300.

**Partisans**, see **GUERRILLA WARFARE**.

**Partition**, in equity (q.v.), the div. of a joint estate in land into separate parts. P. may be effected either by a deed, by agreement between the joint tenants, by order of the Ministry of Agriculture, or by a P. action in the chancery div.; but in the last case the court must, under the Partition Act, 1868, direct a sale instead of P. if tenants to the extent of one-half require it. See also **JOINT TENANCY**; **COMMON TENANCY** IN.

**Partition Coefficient**. When a substance is shaken up with two immiscible liquids, in both of which it dissolves, it distributes itself between the two liquids in such a way that the ratio of its concentration in them is a constant. This constant is called the P. C. of the substance in these solvents.

**Partnership**. In Eng. law a P. is the relation which subsists between two or more persons carrying on a business in common with a view to profit. It is essential to an understanding of the Eng. law of P., the fundamental principles of which are to be found in the consolidating Partnership Act, 1890, to distinguish Ps. from companies and corporations, not-

withstanding that the law of unincorporated companies consists of 'little else than the law of partnership modified and adapted to the wants of a large fluctuating number of members' (Lindley). And the same is true of companies which are incorporated (see COMPANY). In short, though registered joint-stock companies are P.s., they are P.s. of an exceptional nature, and are expressly excluded from the provisions of the Partnership Act, 1890. The prin. differences between companies and P.s. proper are these: (1) A P. is not a distinct entity from the persons composing it, and hence the personal liability of partners for the P. debts is unlimited, although recourse must first be had by the creditors to the P. assets; but the liability of a joint-stock company is generally limited either to the amount unpaid on the shares or by guarantee, and when its assets are exhausted nothing further remains for the creditors. (2) A registered company (other than a private company) may consist of any number of members not less than seven; but a P. may not contain more than twenty, or, in the case of a banking P., ten members. A 'private company' has limited liability and containing as few as two members is now, however, perfectly lawful (see on this at the end of the article on COMPANY; and also COMMANDITE, SOCIÉTÉ EN). (3) The formation and continuance of a P. depend on the mutual confidence in and personal relationship of the different members to each other, but such a relationship between the shareholders of a company is virtually non-existent. (4) Every partner is entitled, subject to the terms of the P. agreement, to participate in the business; but in the case of companies, the management is delegated to directors, who, in most cases, are in that position mainly by their own appointment, regardless of the wishes of the shareholders. It is not always easy to determine whether a particular transaction constitutes a P. or not; and, in particular, agreements to lend money to a P. must be carefully drawn to avoid the inference that the lender was really a partner. The Act of 1890 is notoriously cryptic on the subject, especially in regard to the inference to be drawn from a profit-sharing agreement. The general effect, according to high opinion, is that sharing profits without more implies a P.; but if there are other facts, these too must be taken into consideration; e.g. if A lent money to B in return for a share of accruing profits, but in no way interfered in or controlled B's business, and had no power to prevent the misuse of the assets, A would probably not be held to be in P. with B. A bona fide loan will not constitute the lender a partner with the borrower; but it must be a loan with a personal liability on the part of the borrower to repay, and the lender must not take an interest in or share of the capital *in specie*, because that of itself would imply a joint interest in or part ownership (i.e. P.) of the capital and profits. In other words, lending on the security of a share in a P. is one thing; contribution towards a joint speculation in return for a propor-

tionate share of profits quite another, and generally conclusive evidence of a P. The Act also provides that the following facts, *inter alia*, do not, taken by themselves, constitute P.: (1) The receipt by a servant of a share of profits by way of remuneration, or by a widow or child of a deceased partner of a portion of the profits by way of annuity. (2) The receipt of a portion of profits by the vendor of the goodwill of the business. (3) The receipt of a debt out of accruing profits.

A written agreement is not essential to the formation of a valid P., and indeed a P. may be inferred from a general course of dealing. But in practice deeds are usually drawn up, and it would be highly imprudent not to guard oneself by some document. Writing, however, is required in the case of a P. which is either intended to last for more than one year, or is only to commence at a future date exceeding a year ahead (see CONTRACT; FRAUDS, STATUTE OF), subject to the effect of part performance. The matters that common prudence demands the settlement of in the agreement are these: (1) The nature of the business. (2) The duration of the P. (3) The firm name. (4) Mode of providing the capital. (5) Banking account and signing of cheques. (6) Management. (7) Accounts. (8) Expenses and profits. (9) Effect of the death of a partner or the dissolution of the firm for any other reason. (10) Provision for the family of a deceased partner. (11) Arbitration. A firm may lawfully carry on business under any name or style, whether those of the partners themselves or not, provided, if they adopt other than their own names, the result is not calculated to deceive the customers of other persons already trading in such name and thereby to deprive another business of profits that would otherwise have accrued to it. It is a moot point whether partners can lawfully carry on a business in their own names if those names are already well known to the public as the style of an existing firm; and all that can be said with certainty is that if the new firm is deliberately trying to pass off its goods or represent its business to be the same as that of the old firm, the latter could get an injunction against the former.

Certain Ps. are unlawful: those against public policy or *contra bonos mores*, e.g. a P. in the profits of a gambling-hell or a bawdy-house; those the membership of which is in excess of the statutory numbers; medical or solicitor Ps. where some of the partners are not properly qualified to practise. A bookmaking P. is not *per se* illegal, but if it was intended to carry it on at a 'place' within the meaning of the Betting Act, 1853, it would be illegal (see GAMING). The prin. legal effect of a P. being unlawful is that the courts will not recognise actions by any of the partners against any of their fellow partners. All the partners in any firm are agents for each other, and each can bind the firm to the extent of his apparent or ostensible authority. Limitations of authority as a rule cannot affect third persons unless they had notice of such limitations, but

only give the firm a remedy against the individual partner or partners who have exceeded those *de facto* limitations. To be within the apparent authority of a partner the act (a) must be done in relation to the P. business; (b) must be incidental to the usual business of the firm: e.g. where the business is not of a commercial nature, or where there is no buying or selling of goods, a partner cannot issue negotiable instruments nor borrow nor pledge the firm property, though he can sign ordinary cheques. The firm would only be liable for an act outside the scope of its business if the partner who did it had express authority to do it, and (c) must be done in the character, not of an individual, but of a partner, or in the firm name or in some other manner indicative of an intention to bind the firm.

Every partner is liable for the P. debts, and the creditor can sue any or all of them; and if he obtains judgment against the firm he may issue execution (q.v.) against the private property of the members if the P. assets prove insufficient. If he chooses to sue one or more partners separately, and obtains judgment, he cannot enforce that judgment against the partners he chose not to sue, nor can he sue such other partners by reason of not obtaining satisfaction against those he did sue. When a partner retires an agreement by the continuing partners to release him from existing firm liabilities will not release him as against those creditors who do not assent to the arrangement. A new partner is only liable for debts incurred by the firm before he became a member by special agreement. Generally only partners can be responsible for firm liabilities; but if any person by his conduct 'holds himself out' as a partner, he will not be allowed afterwards to deny a role upon the assumption of which outside people may have been induced to give credit to the firm. It is only upon the principle of 'holding out' that a retiring partner can be made liable for debts contracted after his retirement, i.e. if he allows himself to appear to remain a member. To escape future liability he should give express notice of his retirement to habitual customers of the firm, and by a general notice in the *London Gazette*. Only actual members of a firm are liable for the torts (i.e. wrongs independent of contract) of a partner; the doctrine of holding out does not apply to torts, and even an actual member cannot be held responsible for the fraud or other tort of a fellow member of a firm unless the act was (a) within the ordinary course of the firm's business, or done with the other partners' authority; or (b) consisted of a misapplication of funds or other property received by the misapplying partner within the scope of his ostensible authority (or received in the first instance by the firm) and misapplied whilst in the custody of the firm. The ordinary rights of partners *inter se* are generally regulated by agreement. Unless modified by agreement the following rights are implied: (1) To take part in the business; (2) to have the busi-

ness carried on according to the terms of the P. agreement; (3) to be indemnified by the firm against personal liabilities incurred by him in the ordinary course of the firm's business; (4) to be paid interest at 5 per cent on advances by him to the firm beyond the capital he has originally agreed to subscribe; (5) to prevent new partners being admitted against his wishes; (6) to have the firm's books kept at the prin. place of business; (7) to share equally in the capital and profits; and (8) to enjoy the confidence of his co-partners.

A P. may come to an end: (1) At the will of any partner where no fixed term has been agreed on; or (2) by fluxion of the term agreed upon if any; or (3) upon the performance of the venture for the accomplishment of which the P. was formed; or (4) by bankruptcy or death of a partner (unless otherwise agreed upon in the P. deed or agreement); or (5) by the desire of the other partners if one member suffers his share of the assets to become charged for his private debts; or (6) by the fraud of one partner on his co-partners; or (7) by the occurrence of some event causing the P. to become unlawful; or (8) by the decree of the court upon the application of one or more of the partners (a) where some partner has become insane, or permanently incapable, or been guilty of such conduct as makes it impracticable for the others to continue in P. with him; (b) when the business can only be carried on at a loss; and (c) whenever the court thinks it 'just and equitable' to order a dissolution.

**Limited Partnerships.**—The Limited Partnerships Act, 1907, provides for limited P. of not more than ten persons in the case of banking or more than twenty in other cases who are 'general partners' and who are liable for all debts and obligations of the firm, and of one or more 'limited partners' who will not be liable for the firm's debts or obligations beyond the amount they have contributed to the P. capital. A limited partner may not take part in the management of the P. business and he has no power to bind the firm. But he may, personally or through his agent, at any time inspect the books of the firm and examine into the state and prospects of the business, and may advise with the other partners in such matters. If he takes part in the management of the business he will be liable for all debts and obligations incurred while he so takes part in the management. Any differences arising as to ordinary matters connected with the business may be decided by a majority of the general partners. A limited partner may, with the consent of the general partners, assign his share in the P. A limited partner cannot dissolve the P. by notice. See N. Lindley, *Law of Partnership, including Limited Partnerships* (16th ed. by A. B. Lindley), 1935; Sir A. Underhill, *Principles of Law of Partnership* (5th ed. by E. M. Holland), 1937; and Sir F. Pollock, *Digest of Law of Partnership* (14th ed. by J. W. C. Turner), 1944.

Partridge, Eric Honeywood (b. 1894), Brit. writer, b. in the Waimata valley,

Gisborne, New Zealand, spent his childhood in New Zealand, and then lived in Australia. He served with the Australian forces in the First World War. In 1921 he went to Oxford as Queensland travelling fellow, since when he has lived in England. After being a univ. lecturer in Eng., he founded the Scholaris Press, a publishing firm. P. began to write in 1931 and now enjoys a high reputation for his books on Eng. in general, Eng. usage, and Eng. slang. During the Second World War he served in the army and in the R.A.F. His book, *Words at War - Words at Peace* (1949), incorporates both his war experience and his views on language in general. In particular it shows the effect of war on vocabulary and the odd uses of words which develop. His other pubs. include *A Dictionary of Slang and Unconventional English* (1937) and *Usage and Abuse: a guide to Good English* (1939).

Partridge, John (1614-1715), Eng. astrologer, b. at St. Sheen, Surrey. He pub. a number of pamphlets and books dealing with astrology, and issued an almanack entitled *Merlinus Liberatus* (1670). He also wrote *Astrology at a Glance* (1679), *Flagellus Mercurius flagellatus* (1697); and a trans. of Myndicht's *Treasury of Physic*. His almanack was ridiculed by Swift.

Partridge. Two Ps. are common in Britain, but it is usually the grey P. (*Perdix cinerea*) that is associated with the name. The other is the Fr. or red-legged P. (*Caccabis rufa*), which was introduced into Britain towards the end of the eighteenth century by the marquis of Hertford. Its sides and flanks are transversely barred, and its flight is more rapid than that of the grey P. In this species the plumage is mainly brown; the breast is bluish-grey, flecked with brown, and with a horseshoe patch of chestnut on a white ground on the lower breast. The sides are barred with chestnut. The wings are rounded and short. Ps. pair very early in the year, the males, like the males of most gallinaceous species, being very pugnacious. The nest is made with a minimum of trouble on the ground in fields or hedge-rows, and contains from ten to sixteen pale greenish-yellow eggs. The hen hatches them, but the male is attentive to her during incubation. The young are fed chiefly on ant. pupae, and other insects when these are not available; these and snails and slugs form a considerable proportion of the food of older birds, but in addition grain and other seeds are consumed in great quantity when obtainable. The young remain with their parents for some months, forming coveys of about twenty birds. In the morning and evening they search the stubble and pastures for food, but during the day they hide in turnip fields, under hedgerows, or wherever else safe cover may be found. See B. Vesey-Fitzgerald, *British Game*, 1948.

Partridge Wood, or Cabbage Wood, is derived from a leguminous evergreen tree, native of S. America.

Parts of Speech, in grammar, are usually

reckoned as being eight in number. This number was fixed by the Gks., and though the classification has been changed since their time, the number has remained permanent. Aristotle, in his philosophical works, speaks of three parts of speech, nouns (*ὀνόματα*), predicates (*ῥήματα*), and connectives (*σύνδεσμοι*). The later Gk. writers fixed the parts of speech as follows: noun, verb, participle, article, pronoun, preposition, adverb, conjunction. The adjective was included under the noun, and here also came certain pronouns and numerals. When the Romans took over this system of classification an alteration was necessary, for the Lat. language contained no article. For this class the interjection was substituted. The Romans also abolished the participle class, but kept the number at eight by giving the adjective a class by itself. The Rom. classification is that now generally adopted. It must not be supposed, however, that either of these arrangements is entirely satisfactory. They are both somewhat arbitrary, and the boundaries that separate one class from the other are very narrow. Words are now almost invariably assigned to their class according to the function that they perform, and this simplifies matters when once a satisfactory definition of each part of speech has been obtained. According to this method a large number of words can each serve at different times as different P. of S. The use of words as nouns which are really adjectives is very common, while the participle, though formally a verb, is more frequently used as an adjective than as a verb. Similarly the verbal noun partakes of the nature of a noun. Adjectives and adverbs have always been more or less interchangeable. The interjection has no function in the sentence, and so should not, strictly speaking, be included in the list. It is the conventionalised form of those early and semi-articulate sounds with which primitive man eked out his gesture language. The other parts of speech were all primarily derived from the verb and the noun. See GRAMMAR, and articles on each of the separate P. of S.

Party and Party Government (Party System). Government by party in one form or another exists in most civilised countries of to-day, and indeed the permanent existence of political parties may be regarded as a corollary of any democracy where the electorate is necessarily large.

The Eng. dual party system was evolved from the historical accident of the div. into Whigs and Tories in the Stuart period, a div. which, long after its causes had been forgotten, had become stereotyped into a tradition that it corresponded to a real divergence of political outlook—the Tories being the representatives of monarchy, Anglicanism, and insularism, the Whigs the aristocratic party of foreign adventure and expansion. By the mid-nineteenth century, however, the two great parties had approached so near to each other that, in Gladstone's words, the only distinction was that one 'was rather more

stationary, the other more movable.' His own great contribution was to convert the old Whigs into the Liberal party, which held the gov. of England in alternation with that Conservative party which was largely Disraeli's refashioning of the old Tories. The salient and remarkable fact about Eng. party government is that in all its implications it is a flat contradiction of the constitutional theory of government by kings, lords, and commons, however much in harmony it may be with the conventions of the *de facto* constitution. In the earliest decades of the twentieth century, whatever the distribution of private wealth and influence among the leading politicians, the Liberal party appeared to be definitely pledged to schemes of social reform and retrenchment, while the Conservative party seemed to be bent on the preservation of vested interests and some scheme of tariff reform. At the present time there are two political parties of numerical consequence in England, the Labour party having now replaced the Liberal party as the natural opponents of the Conservatives. A detailed statement of the growth and policy of the Labour party will be found under LABOUR PARTY, and it will suffice to say here that it is definitely opposed both to Conservatives and Liberals and to the small, if vociferous, Communist party.

The struggle between Commons and Crown was theoretically decided in 1688, and despite the activities of George III. and the personal influence of Victoria, the chief development of the eighteenth and nineteenth centuries was the evolution of Cabinet government based upon coherent and disciplined party majorities.

The Eng. party system is eminently favoured by the fact that the ministry of the day has gradually succeeded in drawing virtually the whole of the legislative as well as the executive power into its own hands. It differs from the group systems of party government in vogue before the Second World War on the Continent in that in the latter there were always, or nearly always, present in the legislative assembly one or more groups of 'irreconcilables,' whose immediate object was to change the existing form of government, sometimes by peaceful, sometimes by violent, means, in the same manner as the Communist party, whilst participating in the Eng. parl. system, ultimately seeks a totalitarian rule.

In more recent times there has been an increasing tendency to refer to royal commissions of experts outside the House of Commons questions which require ability not to be found among statesmen. Also, in times of grave crisis party government has been abandoned in favour of coalition. See PARLIAMENT; POLITICAL PARTIES; REPRESENTATION. See A. L. Lowell, *Governments and Parties in Continental Europe*, 1896, and *The Government of England*, 1908; J. Bryce, *Modern Democracies*, 1921; F. W. Maitland, *The Constitutional History of England*, 1926; W. Jennings, *Parliament*, 1938; H. H. G.

Groaves, *The British Constitution*, 1938; H. J. Laski, *Parliamentary Government in England*, 1938; E. Jenks, *The Ship of State*, 1939; D. Lindsay, *The Modern Democratic State*, 1943; C. Ilolls, *Can Parliament Survive?*, 1940; F. Williams, *Fifty Years' March* (the rise of the Labour party), 1949; and L. B. Namier, *History of the Tory Party*, 1949.

*United States.*—Here the party system has evolved some distinctive features. Beyond influencing public opinion, directing governmental policy, and winning elections, which are common indeed to all party systems, the Amer. party organisations direct two most important measures: they select candidates for office and procure positions for party workers. The same system of party patronage existed in eighteenth-century England, ultimately dying out to be replaced by a politically neutral civil service.

It was during the discussions over the adoption of the Federal Constitution by the various states (1787-91) that the first two parties were formed. The first, which took the name of Republican, and was led by Thomas Jefferson, maintained the independence of individual states in the matters of legislation, administration, and jurisdiction. The other under the name of Federalist was led by Alexander Hamilton, and maintained the supremacy of the central Federal authority and the subordination to it of the various states. In 1830 the Republican party came to be known as the Democratic party. The Federalist party declined in influence and disappeared between 1820 and 1830, but in its place a new party was formed under the name of Whigs. About 1854 the Whig party came to grief by reason of dissensions over the slavery question. Two years later a new party was formed, mainly from the old Whig party and supporting most of that party's traditions, under the name of Republican. Since that time the Democratic and Republican parties have represented the majority of the people of the U.S.A. There have of course been many smaller parties, some temporary to remedy some temporary grievance and some permanent, the chief among the latter being the Socialist organisations.

The Democratic party was the first to form anything like the elaborate machinery of the present day, about the time of President Andrew Jackson. They were followed in this by the Republican party when it was formed from the ruins of the Whig party. The machinery of an Amer. party consists of two bodies, one permanent, one temporary. The first consists of a system of committees, one for each important election area; these committees are subdivided in such a fashion that there is a state committee, a co. committee, a congressional dist. committee, and in some dists. a township committee; at the head of all these is the national committee. Each committee is locally independent, and is concerned with the management of party affairs, the organisation of meetings, the admission of voters, and the superintendence of the poll. The

other branch of the organisation consists of the bodies which nominate party candidates for elective posts. These bodies are meetings of members of the party in each election area. Every four years in the summer preceding the presidential elections, a national convention is assembled consisting of delegates from state conventions, each state sending two members to every federal representative it possesses. After the appointment of a chairman and the formation of a series of committees, a number of resolutions are discussed and adopted. These resolutions form the party 'platform.' The aspirants for the presidential post are then balloted on. The roll of the states is then called alphabetically, and the chairman of each state delegation announces the vote of the state. In Democratic conventions a state delegation, if instructed by the state convention to cast its whole vote for a particular aspirant, must do so; in other conventions this unit rule is not in force. If on the first roll-call one candidate obtains an absolute majority (in Democratic conventions two-thirds majority), the choice is then declared nominated. If no candidate polls the requisite number of votes, the poll is repeated until this is achieved. The candidate for vice-president is then chosen.

It would be very misleading to identify the Democratic with the Brit. Liberal party and the Republican with the Brit. Conservative party. Though generalisations are dangerous, it may be said that on the whole the Republican party is the party which tends to uphold the Federal power and to increase it, while the Democratic party is the party which is pledged to uphold unimpaired the rights of the separate states. Yet notwithstanding this tradition, Roosevelt's Democratic administration probably interfered with states' rights more than any other in the list of America. It is to be noted that as yet there is no Labour party, though there are two powerful and rival labour organisations, the Amer. Federation of Labour and the Congress of Industrial Organisations, and these have never, as happened in Britain, formed a separate political party or put up candidates for Congress. The only place in America where there has ever been a Labour political party is New York, where there has consistently been a Socialist candidate for presidency, and Socialist or Labour candidates for various political offices for many years. Trade unionists and the groups who would in Britain support a Labour party follow a different course; their leaders bargain with the Republican and Democratic candidates and the rival machines, and carry the Labour vote to the side which is ready to offer most support to the claims of organised Labour. Hence though no Socialist candidate has as yet succeeded in obtaining more than a small protest vote, no president can ever be elected if the whole, or a large section, of Labour support goes to his adversary. Again it must not be supposed that the Republicans are the Right and the Democrats the

Left. There are in the Democratic party as hide-bound Tories as any in the world, and in the Republican some of the boldest advocates of social economic experiment. The largest single block of opinion in the Democratic party consists of the reactionary Tory majority in the heavily Democratic S. states. Apart from the Democrats of the S., there are the powerful city Democratic party organisations (of varying integrity), of which Tammany Hall in New York is the best known. Apart from these elements, the Democratic party consists of a large proportion of organised Labour, and of rather more than half Amer.-educated Progressives. It is, at least in the E., the party of all who oppose Wall Street. In the country small farmers normally vote Republican, but they may sometimes be swung *en masse* into the Democratic group. As for the Republicans, they are at the same time the party of big business and finance, especially in New York and Chicago and the other great cities, the party of New England Conservatism, the party of the Middle W. farmers, and the party which represents in various ways the reaction of the W. to the 'money empire' of the E. See C. E. Merriam, *The American Party System: an Introduction to the Study of Political Parties in the United States*, 1940.

'Single-party Government.'—The antithesis to the party system as understood in England or the U.S.A. or any of the Brit. dominions, or to the group system of France, etc., is the single-party form of government of Fascist, Communist, or 'authoritarian' regimes. 'Single-party government' is a misnomer or even a contradiction in terms, for a coherent party system implies the existence and political influence of more than one party. The essential feature of any Fascist or authoritarian system is that it is 'nationalist' in character and intolerant of any political opposition. See further under FASCISM and NATIONAL SOCIALISM; also RUSSIA.

Paruta, Paolo (1540-98), Venetian historian, pub. *Della Perfezione della vita politica* in 1579, and was appointed official historian to the republic. He also wrote a number of political orations, *History of the War of Cyprus*, and *History of Venice from 1513 to 1551*, pub. after his death. See ed. by Apostolo Zeno, 1718.

Pārvatī, see UMA.

Pasadena, city of California, in Los Angeles co., 10 m. N.N.E. of Los Angeles. It is near the base of the Sierra Madre, has an altitude of from 750 to 1000 ft., and has sev. mt. peaks in the immediate vicinity ranging from 3200 to 6000 ft., with two observatories. Its fine climate and picturesque surroundings make it a famous winter health resort, its vicinity to Los Angeles making it a favourite residence of cinema artists. Fruits and flowers and sub-tropical trees and plants grow and bloom all the year round. P. grows fruit for export, particularly oranges and lemons. Cork-oak grows, also eucalyptus, and pepper-growing is an important industry. P. manufactures furniture and has machine shops. The California

Institute of Technology is at P., which also has a Natural Hist. Museum and an Opera House. Pop. 31,900.

**Pasargadæ**, anc. city of Persia, founded by Cyrus the Great, was for a time the cap. of the country, being superseded by Persepolis. It was situated near the R. Polvar, about 55 m. N.E. of Shiraz, and was inhabited by the Pasargadians. The prin. ruins, including the tomb of Cyrus, are situated near the present tn. of Murghat.

**Pascagoula**, riv. of U.S.A., in the S.E. portion of Mississippi. It flows for a course of about 250 m. into a small bay of the same name, on the gulf of Mexico, and is navigable for about 100 m.

**Pascal**, Blaise (1623-62), Fr. mathematician and devotional author, b. of a good family of lawyers at Clermont-Ferrand. As a mathematician, his youthful

BLAISE PASCAL

achievements of discovering by himself *Euclid*, Book I, up to Proposition 32, at the age of twelve, and of writing a book on conic sections which gained the approval of Descartes, and which is the foundation of the modern treatment of the subject, at the age of sixteen, gave promise of extraordinary ability. This promise was amply fulfilled; by following up the experiments of Torricelli, he succeeded in determining the weight of air, and from this he arrived at the means of measuring altitude by reading barometric pressure; he invented the hydrostatic press, and also his calculating machine; and in pure mathematics he investigated the theory of probability and the differential calculus. P. embraced a monastic life in 1654, and came under Jansenist influence at Port Royal. In the same year P. enjoyed the famous mystical experience referred to in the *Memorial*. The following year Antoine Arnauld, the virtual chief of the circle, being threatened with censure by the Sorbonne for his teaching on efficacious grace, called upon P. to defend him. The result was his celebrated *Lettres provin-*

*ciales* (1656-57), regarded by Voltaire as 'witty as Molière and sublime as Bossuet.' The following year his health broke down, and he died four years later. His *Pensées sur la religion* were pub. in 1669; they were ostensibly the jottings for a projected *Apologia*. P. recognised that Christianity is a bond between the greatest and the most degraded, as symbolised particularly at the Crucifixion; he refuted the sceptic and modified the Stoic position accordingly, in his own brilliant style. This may account for the dictum that 'he juggled with God and with the immortality of the soul'; and this in turn for his condemnation by some critics (e.g. Cousin) as a pessimist. Nietzsche called P. 'the one logical Christian.' The Eulogium of P. by Bordas-Demoulin, which won the prize of the Fr. Academy on June 30, 1842, is to be found in many eds. of the *Lettres*. The best eds. of the *Pensées* are those of Antoine Nicolas, Marquis de Condorcet, 1776; J. de Bossut, 1779; A. Molinier, 1877; and G. Michand, 1896. There is a trans. by W. F. Trotter in Everyman's Library. Fagnère's ed. of the *Lettres provinciales* is the most reliable. P.'s complete works were ed. by L. Brunschwig and E. Boutroux in 1908. *See* L. Brunschwig, *La Genie de Pascal*, 1924; C. J. Webb, *Pascal's Philosophy of Religion*, 1929; M. Bishop, *Pascal*, 1938; H. F. Stewart, *The Secret of Pascal*, 1941; and D. Patrick, *Pascal and Kierkegaard*, 1918.

**Pascal**, Jean Louis (1837-1920), Fr. architect, b. in Paris. He obtained the Grand Prix de Rome, 1866, and planned restorations (churches and palaces) in Italy. Returning to France, he took part in many important designs, and in 1875 became architect of the Bibliothèque Nationale, of which he lived to see the completion.

**Paschal**, name of two popes and one antipope: 1. *Paschal I.* (817-24), a Rom., notable chiefly for his relations with the Emperors Louis and Lothair, the latter of whom he crowned in 823. In his pontificate the iconoclastic controversy began. He was canonised. 2. *Paschal II.*, known also as *Rainerius* (1099-1118), reigned while the question of investiture was being disputed, and thus came into conflict with Henry I. of England among others. 3. *Paschal III.* (Guido of Crema), antipope, was set up in 1184 by Frederick Barbarossa, and continued the opposition to Alexander III. At the justification of Frederick he canonised Charlemagne.

**Paschal Lamb**, *see* PASOVER.

**Pasco**, Cerro de, *see* CERRO DE PASCO.

**Pascoli**, Giovanni (1855-1912), It. poet and scholar, b. at San Marco di Romagna, Forlì; lecturer at Bologna Univ., succeeding G. Carducci in the chair of It. literature, 1905. He was earlier prof. of Gk. and Lat. grammar at Modena and Pisa Univs. Among his poems are *Myrica* (1891); *Primi Poemetti* (1897); *Canti di Castelvecchio* (1903); *Poemi conviviali* (one of his best works, 1904); *Odi e Inni* (1906); *Poemi italiani* and *Inno a Torino* (1911). He also wrote poems in Lat. Noble philosophic reflections and social

dreams, perhaps somewhat Utopian, are revealed in these. He also wrote two interesting works on Dante, *Minerva oscura* (1898) and *Salto il relame* (1900). A complete ed. of his works was pub. 1935 ft. See studies by B. Croce, 1920; A. Gandiglio, 1924; and F. Montanari, 1914.

**Pas-de-Calais:** 1. or Strait of Dover (see DOVER). 2. Dept. of N. France, formed in 1796 from most of Artois and the N. maritime portion of Picardy; bounded on the W. by the Strait of Dover and the Eng. Channel. It covers an area of 2806 sq. m. The surface is generally flat, and the soil fertile and watered by sev. rivs. The seaboard is about 80 m. long, and consists chiefly of dunes. The climate is damp and changeable. The prin. crops are cereals, potatoes, sugar-beet, and tobacco. Coal is produced, the chief coal-basin centring on Bethune. Calais and Boulogne are the most important ports of transit. There are iron and glass works, tanneries, potteries, etc., and fishing is an important industry. **Arr.** Arras. There are five arrons.: Arras, Bethune, Boulogne, Montreuil, and St. Omer. In 1914 Ger. flying-bomb sites were constructed in the dept., drawing heavy allied bombing attacks. The dept. was liberated on Sept. 1 and 2 of that year, with the exception of Calais, where the Gers. held out until the end of the month. Arras, Bethune, and other places were much damaged, Boulogne especially so, and the old tn. at Calais was largely destroyed. Pop. 1,168,500.

**Paseng**, see GOVT.

**Pasha, Pacha, or Bashaw**, title derived from the Persian, and applied to commanders of high rank, naval, military, or civil, in the Turkish Empire. At one time it was limited to princes of the blood. Every general or governor of a prov. was *ex officio* a P.

**Pasht**, see under RUSSIA.

**Pasig:** 1. Riv. of Luzon, Philippines Is. It flows W. from the N. end of the Laguna Bay, emptying into Manila Bay at Manila. 2. Cap. of Rizal prov., Luzon, Philippine Is., at entrance of the Marikina R., 9 m. E. of Manila. Pop. 12,000.

**Pasiphaë**, mother of the Minotaur (q.v.).

**Paso del Norte, El**, see CHAD JÓÁREZ.

**Passue Flower** (*Anemone pulsatilla*), beautiful Brit. plant bearing purple flowers which are so called from appearing about Easter time. It is a good rockery plant, but prefers a dry, chalky soil.

**Pasquier, Étienne** (1529-1615), celebrated Fr. advocate and writer, b. in Paris. Early destined by his parents to follow the career of an advocate, he studied law at the Bologna Univ. under Socin, and was admitted to the Bar in 1549. During his earlier days he indulged his literary tastes by publishing *Recherches sur la France* (in encyclopædia form) (1560); *Monophile* (dissertations on love) (1555); and *Pour-parler du prince* (c. 1560). The first named led to his obtaining in the *Parlement* in 1564 a brief for the univ. of Paris, the lawsuit arising out of the Jesuits' attempt to gain admission to that univ. Thenceforth he appeared in numerous *causes célèbres*. In 1588 he became deputy in

the States-General (q.v.). In 1603 he resigned his office of advocate to the king, and devoted the rest of his life to literature. The collected works of P. were pub. in 1723. See life by Margaret J. Moore, 1934.

**Pasquin, or Pasquino**, name of a cobbler of Rome, celebrated for the gibes he hurled at every turn. He lived at the corner of the Palazzo Orsini, and at his death the mutilated statue of a gladiator, which was found under the pavement near his stall, was put up on the same spot and received the name P. It became customary to affix to this statue satirical verses directed against prominent personages, which were hence called *pasquinades*. The satires were for the most part epigrammatic replies to some topical question affixed on the pediment of a statue of Marforio, which stood near by. A celebrated instance is the following:

**Marforio.** E vero, Pasquino, che tutti Francesi sono ladri?

**Pasquino.** Tutti, no, ina buona parte.

('Is it true, Pasquin, that all Frenchmen are thieves?')

'All! no, but the greater part of them.'—

directed against and being a pun upon the name of Napoleon Bonaparte, on the occasion of the Fr. occupation of Rome.

**Passacaglia** (Sp. *pasar*, walk, and *calle*, street), originally an It. or Sp. dance, but now an instrumental composition based on a ground, i.e. a tune continuing throughout, usually, but not necessarily, in the bass, as it always does in the Chaconne. The best-known example actually called P. is Bach's for organ; the finale of Vaughan-Williams's Fifth Symphony is also a familiar P.

**Passage, Court of**, anct. existing civil court of record in the bor. of Liverpool. Formerly the mayor acted as presiding judge, assisted by bailiffs of the bor.; but by the Court of Passage Act, 1834, a qualified legal assessor was added to the bench, and four years later the mayor and bailiffs were dispensed with altogether. Finally an Act of 1893 made the assessor the sole presiding judge, with powers not inferior to those of a high court judge. Generally speaking only those actions can be tried in this court where the defendant at the time the action was launched resided or carried on business within the jurisdiction, or, by leave of the judge or registrar, where the whole or part of the cause of action arose within the jurisdiction.

**Passage Island**, see CULFRA.

**Passaic:** 1. City of New Jersey, U.S.A., 13 m. N.W. of New York. The E. part consists chiefly of a plain, whilst the W. is more hilly and almost entirely residential. The chief buildings of interest are the city hall, general hospital, general public library, and the J. ne Watson Reid Memorial Library. The prin. manufs. are rubber goods, metal wares, silk, cottons, and worsted. Pop. 61,400. 2. Riv. of New Jersey, U.S.A., rising in Morris co., and flowing between Union and Essex cos. for a course of about 100 m. into Newark Bay. The falls at Paterson supply

abundant water-power for the tns. of Newark, Paterson, and P.

Passamaquoddies, tribe of N. Amer. Indians of Algonquin stock, allied to the Penobscots. The remnant of them reside on the W. shore of Passamaquoddy Bay, in the state of Maine, and number about 850; they have a considerable admixture of Fr. and Eng. blood.

Passamaquoddy Bay, an inlet of the Atlantic between Maine, U.S.A., and New Brunswick, Canada. It is 15 m. in length and about 10 m. in breadth, deep, sheltered, and never blocked by ice.

Passaro, Cape, Battle of, battle fought between the Eng. and Sp. in 1718. The latter had captured the Is. of Sicily, and were besieging Messina. The Brit. fleet, under George Byng, Viscount Torrington, raised the siege and compelled the Spaniards to withdraw from Sicily. In the battle twenty-five ships out of the Sp. fleet of forty-five were taken or destroyed, and the Sp. admiral, Castaneta, was captured. For this service Byng was created Baron Byng of Southill and Viscount Torrington, and was given full power to negotiate with the princes and states of Italy.

Passarowitz, see POZAREVAC.

Passau, tn. and episcopal see in Bavaria, Germany, near the Austrian frontier, and 90 m. N.E. of Munich. It has four suburbs, viz. Innstadt, Ilzstadt, Auger, and St Nikola, and is one of the most picturesquely situated tns. on the Danube. It possesses eleven churches, the chief of which is the cathedral of St. Stephen. In the fine Dom Platz is a statue, erected in 1824, of the Bavarian king, Maximilian I. There is a univ. It is noted for manufs. of tobacco, beer, leather, porcelain, machinery, and paper. Pop. 26,000. See F. Mader, *Passau*, 1925.

Passchendaele, tn. in Flanders, near Ypres. The tn. and P. ridge, the high ground in front of Ypres, were the scene of bitter fighting in the third battle of Ypres on Oct. 12 and Oct. 26 to Nov. 10, 1917. The ridge was the immediate objective of the allies' offensive from Ypres after the Messines-Wytschaete ridge had been taken by the Brit. troops of Eng. and Irish and dominion units. The Ger. defences were strengthened with 'pill-boxes' or concrete redoubts bristling with machine guns, and, being level with the ground, difficult to reduce by artillery fire and fatal to attacking infantry. The Brit. forces, after heavy losses, entered P. itself on Oct. 30, but were driven out again almost immediately. The Canadians retook the tn. on Nov. 6, and held their positions in face of desperate Ger. counter-attacks, and throughout the next days the allies successfully cleared the sides of the ridge, the name of which will not be lightly forgotten by those who fought for it; its surrender in the battle of Ploardy (or the Lys) in April of 1918 was a sore blow to Brit. pride. The tn. was eventually recaptured at the end of Sept. 1918. Eng. military critics have severely criticised the Fr. and Brit. high commands for the whole conception and strategy of this costly and tragic battle of the days of static trench warfare.

Passenger Pigeon (*Ectopistes* (or *Columba*) *magratoria*), N. Amer. bird whose sudden and complete disappearance is the most remarkable in zoological hist. It was probably the most gregarious bird in existence, and during its breeding season used to occupy a crowded area of over 100 sq. m. On account of its value as a table delicacy it was ruthlessly persecuted, and in one year 15,000,000 dead birds were dispatched from Michigan and Pennsylvania. In 1888 it failed to take up its usual breeding quarters, and then disappeared without trace, the last known specimen dying in 1914 at Cincinnati zoological gardens. Its main features were its long wings and longer narrow tail.

Passeriformes, order of perching or passerine birds, characterised especially by the four-toed foot, the claw of the hind toe, which is separately controlled, being larger than that of any of the other toes. This is by far the largest order of birds and indeed comprises more than half the number of known birds. Only among its numbers is the power of song much developed. There is, however, a section of the order which includes a number of songless birds, none of which are found in Europe.

Passfield, Sidney James Webb, Baron (1859-1947), Eng. socialist, historian, and statesman; b. in London, son of Charles Webb. He was educated at private schools in London and spent some years in Switzerland and Germany, completing his education at the City of London College, Birkbeck College, and King's College. He was a clerk in a colonial broker's office in London, 1876-78; by open competition he reached the status of lower div. clerk in the War Office, 1878-79; he was surveyor of taxes, 1879-81; colonial office clerk, 1881-91. In 1885 he was called to the Bar, and gained the LL.B. of London Univ. He was member for Deptford on the L.C.C., 1892-1910. Prof. of public administration, London School of Economics, 1912-27; and one of the senate of London Univ., 1900-9; he served on the Royal Commission on Trade Union Law, 1903-6; the Coal Industries Commission, 1910; the Royal Commission under Development Act, 1910-22; and many important committees. Labour M.P. for the Durham div. of Durham co. 1922-29, he was P.C. in 1924, being president of the Board of Trade from Jan. to Nov. of that year. In 1929 he was ennobled and became secretary of state for the colonies and dominion affairs (from 1930 to 1931 for colonies only). His greatest achievement is the placing of the Brit. socialist movement in its historical setting by the books he wrote in collaboration with his wife, Beatrice Webb (q.v.). Although he held Cabinet rank in two Labour Govs. he was never a prominent figure in public life, and when he entered the House of Commons in 1922 his career had begun to draw towards its close. It was indeed with reluctance that he accepted the office of president of the board of trade in 1924, and he had already contemplated retirement when, as a peer, he once more assumed office in the dominions and

colonial offices. Yet in practical achievement he accomplished more than most politicians of his day as in the development of social and political reform. Through the Fabian Society, of which he was one of the pioneers (see under **FABIAN SOCIETY**), he played the most conspicuous part in converting Brit. Socialism from a propaganda of social revolution to a programme for the working-class movement, and more than any other led the Labour party to accept the Fabian interpretation of Socialism. But his greatest interest was education, and, having become chairman of the Technical Education Board, he strove to bring secondary and univ. education within reach of the working classes (he lectured in political economy at the City of London College and Working Men's College); and he was so far successful that the subsequent revolution in educational administration, the transfer of control to local authorities, the development of secondary education, and the enlargement of the univ. system were all for the most part due to his efforts. The Fabian programme, much of which the Education Act of 1902 embodied, was also his work. He was entitled to particular credit for his share in the creation of the Imperial College of Science and Technology, and the development of a unified library system in London.

The Webbs formed a partnership unique in the public life of their generation, and one to which the Socialist movement must be ever grateful. One of their striking achievements was a visit to Russia in 1932 and 1934, which resulted in *Soviet Communism: a New Civilisation?* (1935), which work, however, proved the least acceptable of the Webbs' writings, critics condemning its too ready acceptance of gov. statistics and its failure sufficiently to consider the loss of individual liberty in the Soviet system. This, however, in no way lessens the magnitude and importance of the work, both in affairs and in writing, which this long partnership performed. The ashes of Lord and Lady P. (d. 1913) were interred in Westminster Abbey in Dec. 1947. The great mass of pubs. by Lord P. include, with his wife, *History of Trade Unionism* (1894, revised 1920); *Industrial Democracy* (1897); and a series of vols. on the hist. of local government (*English Local Government*, 1908-22); also his *Socialism in England* (1890); *A Constitution for the Socialist Commonwealth of Great Britain* (1920); *English Poor Law History* (1927-29); and *Soviet Communism* (1935). See the autobiographies of Lady P., *My Apprenticeship* (1926) and *Our Partnership* (1918); also Margaret Cole (ed.), *The Webbs and their Work*, 1919.

**Passfield, Lady**, see WEBB, BEATRICE.

**Passion Flower** (*Passiflora*), genus of climbing herbs and shrubs, many of which bear flowers of a form which led devout settlers in S. America to give the plants their name. The three stigmas were seen to represent nails, one transfixing each hand, and one the feet, of the crucified Christ; the rays of the corona, the crown of thorns; the five anthers, the wounds;

the ten parts of the perianth, the ten faithful apostles; and the digitate leaves and tendrils, the hands and scourges of those who scourged Him. *P. corallaea* is hardy in warm, sheltered gardens, but the other species require culture under glass.

**Passionists.** 'The Congregation of Dis-calced Clerks of the Most Holy Cross and Passion of our Lord Jesus Christ' was founded by St. Paul of the Cross about 1730, its rule being approved in 1741 by Benedict XIV. They are engaged in revival and mission work in various parts of the world. The P. were introduced into England in 1841.

**Passion Music.** From the earliest days of the Christian Church it has been the custom to read the hist. of the Passion of Christ during Holy Week, but it is impossible to say at what date the hist. began to be solemnly chanted, though it was certainly before the eighth century. In the Rom. Church the Passion gospels are sung in plain chant by three ministers in three different tones, one taking the words of our Lord, another the words of the evangelist, and a third those of other characters. The people (*turba*) are, when possible, represented by the choir for whom magnificent polyphonic music was written by Palestrina and Victoria.

**Passion Play**, drama in the form of the old miracle plays depicting the Passion of our Lord. P. Ps. are found during the later Middle Ages, especially in Germany and the Tyrol, and they reached the height of their excellence during the sixteenth century. The best-known modern example is the Oberammergau P. P., first mentioned in 1633 in connection with a vow made by the peasants, after a severe visitation of the plague, that they would perform a passion drama once in every ten years. The text of the Oberammergau play has sev. times undergone revision. See F. W. Farrar, *Passion Play at Oberammergau*, 1890.

**Passion Week**, week preceding Holy Week (q.v.).

**Passive Resistance.** This term, which figured largely in the newspapers shortly after the passing of the Education Act, 1902, was the name given to the movement, whether organised or not, for the refusal to pay the new education rate. By this Act voluntary elementary schools became rate-aided for the first time in the hist. of the great education controversy, and the rate in aid, which was levied as part of the co., bor., or dist. rate (as the case might be), was vehemently objected to by nonconformist (mainly) ratepayers, on the ground that by compelling them to maintain church schools the legislature was guilty of endowing a particular religious denomination and one with which they had no sympathy. In India, between the two world wars, Gandhi (q.v.) embarked upon a campaign of opposition to what he conceived to be Brit. injustice and oppression, which was characterised by professedly non-violent tactics known as 'P.R.' as well as 'civil disobedience' and 'non-co-operation.' In industrial disputes the principle of P. R. is exemplified in dilatory tactics, variously known as

'going slow,' 'ca' canny,' and 'working to rule.'

Passivity, state induced in certain metals whereby they become insoluble in dilute acids. P. is caused by dipping the metal (e.g. iron, chromium) in concentrated nitric acid. It can be removed by rubbing with sandpaper, etc.

Passmore Edwards, see EDWARDS, JOHN PASSMORE.

Passmorean, see PASSURUAN.

Passos, John (Roderigo) dos (b. 1896), Amer. novelist, b. in Chicago, Illinois, graduated at Harvard Univ. in 1918. After leaving the univ. he travelled in Spain in order to study architecture. However, he shortly joined the Fr. Ambulance Service in the First World War, and later the U.S. Medical Corps. When the war was over he took to writing and his first book, *One Man's Initiation*—1917, appeared in 1920. In 1922 appeared a vol. of verse, *A Push Cart at the Curb*, and a vol. of essays, *Rosinante to the Road Again*. In 1923 he pub. a novel, *Streets of Night*, a typical story of the struggle of a sensitive and artistic young man with his philistine environment. His preoccupation with the social environment led him to plan and write his great trilogy of Amer. life, *42nd Parallel* (1930), 1919 (1932), *The Big Money* (1936). It was the culmination of his thinking and writing on the contemporary scene. The trilogy deals with Amer. life over a wide canvas, exposing the social evils of a corrupt and decaying commercial civilisation built upon a system of exploitation and greed. He uses a number of unusual technical devices e.g. he brings in news-reel and newspaper headlines, snatches of contemporary songs and adverts, as well as using a 'stream of consciousness' technique for the purposes of author's comment. In 1939 he pub. *Adventures of a Young Man* (a novel) and *The Ground we Stand On* in 1941. His book, *The Grand Design*, was pub. in 1949.

Passover (Heb. *pesah*), first of the three great festivals commanded to be observed in the Pentateuchal codes. According to Exodus xii. it was instituted to commemorate the exodus from Egypt, in particular the 'passing over' of the houses of the Israelites (distinguished by the sprinkled blood on the door-posts) by the angel of the Lord when the first-born of the Egyptians were slain. The order of its celebration was to be thus: A lamb or kid, a male of the first year, without blemish, was selected by each household (or, if the households were small, by two conjointly on the tenth day of the month Abib (Nisan), and it was kept till the fourteenth day of the month, when it was killed in the evening and roasted and eaten with unleavened bread and bitter herbs. . . . for thou canstest forth out of the land of Egypt in haste. . . . (Deut. xvi. 2). They were, therefore, to eat it in haste, standing, with their loins girded, their shoes on their feet, and their staves in their hands, as those prepared for a journey. None, whether Israelites or strangers, were to partake of it unless they had been circumcised. During the

seven days for which the feast lasted none but unleavened bread, called *Massoth*, was to be eaten, on penalty of being cut off from the people, and special sacrifices were appointed for each of these days. The first and the last of those seven days were considered as full feasts and 'no manner of work shall be done in them, save that which every man must eat' (Exod. xii. 16). Outside Palestine the P. lasts eight days (or rather, nine days, because on the P. eve no leavened bread may be eaten after breakfast), of which the first two and the last two are full feasts. On the other hand, as in all Jewish festivities, the evening of the last day is not considered as festal. Critical study of the biblical accounts of the P. make it arguable that it is to be regarded as the result of the union of two festivals, one of which was a pastoral feast for the offering of the first-born of the flocks in order to secure prosperity for the rest; the other was an agric. feast which the Hebs. adopted after their settlement in the land of Canaan.

Passport, warrant of protection and authority to travel. Where such document is necessary it is generally granted to the bearer by a consul or some other competent authority of the bearer's own country, and signed by the proper authority of the state to which he intends to proceed. It is necessary for Brit. subjects travelling abroad to do so under the protection of the Brit. Gov., and for that purpose a P. may be obtained from the P. Dept. of the Foreign Office and through local officers of the Ministry of Labour at a cost of 15s., or through the post if a crossed postal order for the above amount is enclosed. The applicant for a P. must sign a declaration in a specified form, and also obtain the declaration of a member of Parliament, justice of the peace, barrister, solicitor, clergyman, doctor, bank officer, or senior public official to the effect that he is a fit and proper person to be entrusted with a P. He must also produce two photographs and other documents specified in the form of application. Members of the navy, army, or air force may have their declarations verified by their commanding officer. Foreign Office P.s. are granted to natural-born Brit. subjects, or to the wives or widows of such persons, or to persons naturalised in the United Kingdom, the Brit. dominions, colonies, India, or Burma (the wife of an alien (q.v.) is deemed to be an alien). Where the applicant is a person naturalised in the dominions, a letter of recommendation from the high commissioner or agent-general in London of the state concerned is required, while applicants naturalised or resident in the colonies must obtain a letter from the Colonial Office. Brit. P.s. are available only for travel to the countries named in the P., but may be endorsed for additional countries, subject to compliance with the immigration regulations for the time being in force in Brit. or foreign countries or with the necessity for obtaining any visa required. Foreign P.s. are available for five years from the

date of issue, and may be renewed for further consecutive periods up to five years, but in no case beyond ten years from the date of original issue. The P. Office is in Queen Anne's Gate Buildings, Westminster, London, with a branch office in Liverpool. Persons resident in N. Ireland apply to the branch P. office in Liverpool.

**Passy:** 1. W. suburb (sixteenth arron.) of Paris, annexed in 1860, between the Bois de Boulogne and the Seine. 2. Comm. of the dept. of Haute-Savoie, in the arron. of Bonneville. Pop. 4400.

**Paste,** form of adhesive usually made by mixing flour with water (about 2 lb. to the gallon). The water is added gradually and the whole well mixed. An ounce of alum is added to increase the adhesiveness, and the whole boiled and well stirred. Bookbinders usually add about an ounce and a half of resin instead of the alum, thus getting a thicker and still more tenacious P.

**Pasteboard,** see CARDBOARD.

**Pastel, or Crayon,** Drawing, name applied to a method of painting with dry pigments. It has been practised in England from an early date, and John Riley (1646-91) produced many works in P. But Francis Cotes (1725-70) was the first Englishman to develop the art fully, and his portraits of Mr. and Mrs. Joab Bates and Lord Hawke testify to his high ability. He was followed by John Russell, R.A. (1765-1806), who brought the art to perfection. But it was a favourite medium not only in England (especially for portraiture), but also on the Continent, such names as Rosalba Carriera, J. E. Liotard, and the great master Quentin de la Tour being conspicuous. In more modern times it has been practised by Degas, Millet, and Whistler.

**Pasteur, Louis** (1822-95), Fr. chemist and scientist, b. at Dôle (Jura). He was educated at Artois, Besançon, the École Normale, and the Sorbonne. B.-ès-L. 1840, and became a mathematical master; B.-ès-Sc. 1842. He studied chem. and physics, and worked specially in the branch of isomerism. In 1852 he was appointed prof. of chem. at Strasburg, where he married Mlle Laurent. His earlier work on the tartarates, when he showed to Birt the hemihedral crystals and their action on polarised light, and discovered the left-handed tartarates, was steadily continued by research in stereochem. In Strasburg his attention was turned seriously to fermentation, and he showed that *Penicillium glaucum* destroyed only the right-handed portion of the inactive tartaric acid. He was appointed prof. of chem. at Lille in 1854. In the breweries of this tn. he examined the 'diseases' of beer, wine, and vinegar, and discovered the micro-organism of ferment, thus killing the growing theory of 'spontaneous generation' by proving the presence of micro-organisms in the atmosphere and the healthiness of injured living matter when protected from them. These researches led to the revolution of surgical practice by Lister. Meanwhile his work on acetous, lactic, and vinous

fermentations was pub. (1876) in *Études sur la bière*, with enormous advantages to an important industry of his native country. This was not his only service directly to industry. In 1885 he carried out a masterly and classical research in the disease attacking the silkworm, discovering two bacterial kinds and combating them successfully. Following up Jenner's vaccine treatment, he studied chicken cholera, and reduced the mortality in fowls from 10 to less than 1 per cent. A similar result followed his work in anthrax. By discovering the bacillus, isolating and cultivating it, a degenerate weakened form was obtained, which, when inoculated, produced a slight attack of the disease, and rendered the subject

Hachette

LOUIS PASTEUR

immune. Huxley states that P.'s work in terms of money only was enough to cover the whole cost of the Fr. war indemnity of 1870. The method has occupied the labours of pathologists ever since, and each disease is at any rate being elucidated, while many have now yielded up their special micro-organism. Although unable to isolate the microbe of hydrophobia, P. nevertheless successfully located it in the nerve centres, and by inoculating fluid from the spinal cord of a diseased dog into a healthy animal, thus producing the disease, he obtained an attenuated strain whereby immunity could be secured, and extended the treatment to human beings with success. The P. Institute was founded, and others have been erected in many countries. P. died near St. Cloud and was buried in a tomb at his institute. Not only as an eminent pathologist did he gain the honours of the whole world, but his character gained affection and reverence from all. See also PASTEUR TREATMENT; PASTEURISATION.

See R. Valéry-Rayot, *Vie de Pasteur*, 1900 (Eng. trans. 1901); also lives by his son-in-law, Bournand, Ducleux, and Mr. and Mrs. Percy Frankland, 1898.

**Pasteurisation**, process employed to reduce the number of bacteria in a medium. Pasteur found that about 95 per cent. of the bacteria in milk could be killed by heating it for 20 min. at a temp. from 60° to 80° C. The milk must be rapidly cooled, otherwise bacterial spores become active and reinfection occurs. P. of milk under certain conditions is recognised by health authorities. Longer heating (30 min.) and rapid cooling are insisted upon so that bacteria causing tuberculosis may be killed.

**Pasteur Treatment** for procuring active immunity against anthrax, hydrophobia, and other virulent diseases, consists in the injection of a preparation containing the particular organisms causing the disease. These organisms have had their virulence reduced by growth under unfavourable conditions. When injected they stimulate the blood to produce antitoxins which remain for some time and protect it from the particular disease. If the first injection be followed after a suitable interval with one containing more virulent bacteria, the antitoxins, and hence the probability of immunity, will be increased. The principle is based on Jenner's treatment of small-pox by vaccination.

**Pastiche**, or **Pasticcio**, in literature or art, a patchwork of borrowings, or work in imitation of another's style. In music a stage entertainment for which the music was not written by a single composer, but put together from various earlier works by any number of composers who happened to be popular. The words were therefore written to the music, not the reverse, as in opera, &c. In eighteenth-century Italy, however, words as well as music, especially from Metastasio's works, were often taken over by a P. The P. was especially fashionable in the eighteenth century. The ballad opera and the vaudeville were both P.s. of a kind.

**Pasto**, city of Colombia, S. America, cap. of Nariño prov., on a flank of P. volcano (14,000 ft.), 130 m. N.E. of Quito. It is the seat of a bishop, and has a Univ. There are gold mines near. Pop. 61,000 (partly Indian).

**Paston Letters**, correspondence of a Norfolk family of that name, together with state papers and other documents, covering the period from 1422 to 1509. They form an invaluable source of information as to fifteenth-century life and manners. Most of the collection was sold early in the eighteenth century by Wm. P., earl of Yarmouth, to Peter le Neve, and after changing hands sev. times came into the hands of Sir John Fenn, who ed. them in 5 vols. (1787-1823). The remainder was discovered in 1875. The best ed. is that of James Gairdner (6 vols.), 1904, and there is an abridgment in *Everyman's Library*.

**Pastor**, or **Rose-coloured Starling** (*Pastor roseus*), beautiful member of the starling family. The adult bird has a long

crest which, like the head, neck, and throat, is glossy violet-black; the back, shoulders, and under-surface are a delicate rose-pink; and the wings and tail greenish-black. It is common in India and occasionally visits Europe.

**Pastoral Epistles**, see **BIBLE** and **TIMOTHY**.

**Pastorales**, see **BARQUES**.

**Pastoral Letter**, letter addressed by the bishop of a diocese to the whole body of clergy and the people under his jurisdiction. Such letters are usually read out from the pulpit of each church.

**Pastoral Poetry**, poetry descriptive of country life, and includes pastoral drama, in which the characters represent shepherds or other country people. Except in such cases as the Dorsetshire poems of Barnes, it is a perfectly artificial genre, and the rustic setting does little more than mask the thoughts and emotions of the country and era in which the pastorals are produced. The origin of the pastoral must be sought in classical literature. Adianus makes Stasichorus of Himera (d. about 555 B.C.) its inventor, but the earliest extant pastorals are those of Theocritus (c. 270 B.C.). In these may be found the germ of the European pastoral, and many of the names of the shepherds and shepherdesses of Theocritus (e.g. Lycidas, Corydon, Daphnis, and Amariyllis) did duty in all countries. Virgil's ten *Ecloques* also exercised considerable influence. In Italy the first vernacular pastoral romance is the *Ameto* of Boccaccio (1342), but a more famous example is Sannazaro's *Arcadia* (1504). Petrarch, and after him Mantuan, made the pastoral a veil for satiric treatment of women, courtiers, and ecclesiasticals. Spenser's *Shepherd's Calendar* (1579) owes much to the pastorals of Mantuan. The first pastoral drama was Politian's *Favola di Orfeo*, which was produced at Mantua in 1472, and the most famous of its followers was the *Aminta* of Tasso (1573). The most famous Sp. pastoral was Montemayor's romance of *Diana* (1558), well known in Elizabethan England. In 1590 appeared Sir Philip Sidney's prose romance of *Arcadia*, which had, however, been written many years before. Many of the Elizabethan dramatists also wrote romances, mainly in the manner of *Euphrates*. The best known of these is Lodge's *Rosalinde* (1590). The pastoral drama found its three greatest exponents in Fletcher (*The Faithful Shepherdess*), Shakespeare (*As You Like It*), and Ben Jonson (*The Sad Shepherd*). There was a revival of the pastoral in the eighteenth century, which gave the pastorals of Pope and Ambrose Phillips, over which the pair quarrelled. Gay's *Shepherd Week* was intended as a parody of Phillips's, but was, in point of fact, the best of the group. It was, however, surpassed by Ramsay's *Gentle Shepherd* (1728), in which the artificial element is less obtrusive. Since that time the pastoral has not been a popular poetic form. See E. K. Chambers, *English Pastorals*, 1887, and W. W. Greg, *Pastoral Poetry and Pastoral Drama*, 1906.

**Pastoral Staff**, see CROSIER and LISMORE CROSIER.

**Pastoral Theology**, branch of theology which deals with the duties of the clergy as shepherds of souls.

**Pasture**, strictly a term applied to permanent grassland which is grazed but never mown, but often applied also to land which is both grazed and mown. Permanent P. is land which has been continuously under grass since it was sown from seeds, or since it went out of cultivation, and was allowed to sow itself. For temporary P. or ley the quicker-growing clovers and grasses are sown, to reach maturity within the period of the ley, and yet to yield a uniform rate of produce throughout the period. P. land in Britain has enormously increased since about 1870, but much of it is of inferior quality.

**Pasuruan**, or **Passoeran**, tn. of E. Java, on the N. coast, 50 m. by railway S.S.E. of Surabaya. It has considerable trade. Pop. 25,000.

**Patagonia**, S. portion of S. America, lying E. and W. of the Andes, and divided between Chile and Argentina. The name P. arises from the nickname 'Patagones,' or big feet, applied by early Sp. explorers to the clumsily shod aborigines of the extreme S. The Chilean portion lies S. of Llanquihue and comprises the provs. of Chiloe and Magallanes (Magellan ter.), while the Argentine extends S. from the Rio Negro, Chubut (q.v.), and part of Santa Cruz. The whole W. region is occupied by the Andes, rising from 3000 to 6000 ft., with forests on the lower slopes; the rainfall is very heavy. The E. dist. is a plateau, rising in terrace fashion with layers of sandstone and basalt. A great part is barren, but in the N. part irrigation enables wheat to be grown, and immense flocks of sheep graze the plains. The greater part is a vast plateau, almost uninhabited; the ter. of Santa Cruz has barely one inhab. to 25 sq. m. W. H. Hudson says: 'It has a look of antiquity, of desolation, of eternal peace, of a desert that has been a desert from of old, and will continue a desert for ever.' In the Chilean portion of Tierra del Fuego is Punta Arenas, a flourishing tn. and port, with a very large trade in wool. According to 1945 figures there were 5,500,000 head of sheep in Chubut, 8,500,000 in Santa Cruz, 850,000 in Argentine Tierra del Fuego, 1,000,000 in Neuquén, and 2,710,000 in Rio Negro. Local output of wool averages 50,400 tons per annum. The total area of P. is about 400,000 sq. m. The original natives belonged to two races, the Tehuelches, noted for their great stature, and the Gennakens, who are practically extinct. See also TIERRA DEL FUEGO. See W. H. Hudson, *Idle Days in Patagonia*, 1893.

**Patagonian Language**, see under SOUTH AMERICAN NATIVE LANGUAGES, *Southern Grassland and Forest*.

**Patan**: 1. Tn. of Nepal, India, 5 m. S.S.W. of Khatmandu. Pop. 105,000. 2. Walled tn. of Baroda, India, 64 m. N.N.W. of Ahmedabad, with manufs. of

swords, spears, and silk and cotton stuffs. There are numerous Jain temples. Pop. 38,000. 3. Tn. of Rajputana, 60 m. N.N.E. of Jaipur. Pop. 8000. 4. Tn. of Kathiawar Peninsula, Bombay, see SOMNATH.

**Patang**, see BAANFU.

**Patani**: Mionthon or state of Siam, between Kulutan and Singora, on the E. coast of the Malay Peninsula. Area 6000 sq. m. Pop. 295,000. 2. Tn., cap. of the above state, on the E. coast, in about 6° 51' N. 3. Tn. of the is. of Gilolo, Malay Archipelago, on the S.E. peninsula; inhabited mainly by Dutch 'post-holders.' 4. Cape on the E. coast of the Malay Peninsula, at the entrance to the gulf of Siam. 5. Riv. of Siam, Malay Peninsula, flowing N.E. and N. through P. into the gulf of Siam in about 6° 55' N.

**Patawium**, see PADUA.

**Patch**, Alexander McCarrell (1889-1945), Amer. soldier, b. in Arizona, son of a captain of West Point Military Academy. P. entered West Point in 1909, and was distinguished as an athlete. In the First World War he was a director of the Army Machine-Gun School in France, and later served in the Aisne-Marne, St. Mihiel, and Argonne offensives. In 1936 he joined the Infantry Board at Fort Benning in Georgia, after diligent study at the general staff school and at the army college. In 1941 he commanded the infantry training centre at Camp Croft, in S. Carolina. In 1943 he was put in command of ground forces at Guadalcanal, taking part in the assault which drove the Jap. from the Henderson Field area, personally leading the attack which stormed Mt. Austin. In March 1944 he succeeded Gen. Patton in command of the Amer. Seventh Army, leading the Amer. ground forces in the invasion of S. France. See further under WESTERN FRONT IN SECOND WORLD WAR.

**Patching**, see under NEEDLEWORK.

**Patchogue**, tn. and summer resort of New York, U.S.A., in Suffolk co., on Long Is., 50 m. E. of Brooklyn. There is an oyster and fish trade, also manufs. of lace curtains. Pop. 7000.

**Patchouli** (*Popostemon patchouli*), a shrubby plant (family Labiate), bearing spikes of white flowers with purple marks. Its leaves are distilled to yield a volatile oil, and the plants are dried for stuffing mattresses and pillows, the odour being supposed to be disinfectant.

**Patchwork**, see under EMBROIDERY.

**Patel**, Framjee Nasarwanjee (1804-1894), Parsi merchant and philanthropist, b. in Bombay. In 1819 he began a successful business career in the firm of Frith, Bonanjeo & Company. At this time in India prominent merchants became *de facto* bankers since few people had large capital resources. In 1844 P. founded the firm of Wallace & Company; from this he retired and in 1849 founded Framjee, Sanda & Company. He will be remembered, however, for the work he did for his fellow countrymen in India. Since the Parsis were exiled from Persia, Parsi law was in a chaotic state, particularly as regards the laws of marriage

and intestacy. P. served on a commission to investigate this and became president of the Parsi Law Association. He d. one of the most revered and distinguished of the natives of India. The name P. means 'mayor' (of Bombay), a title conferred upon an ancestor of his by the Eng. in 1892.

Patel, Vithulbhai Jahverbhai (1873-1933), Indian nationalist leader. b. in Gujarat. Trained as a lawyer, he practised in Bombay. He was elected to the Bombay Assembly in 1912, and to the Imperial Assembly in 1917, and represented the Indian Congress at the London Conference of 1919 on the projected Government of India Act. In 1920 P. joined Gandhi's non-co-operation movement. He was elected mayor of Bombay, but was compelled to resign. He then became a leader of the Swarajist party, and was a member of the Legislative Assembly in 1930, showing intense opposition to Brit. rule. He died in exile in Switzerland.

Patella, see KNEE; LIMPET.

Patent, or Proprietary, Medicine, popular terms for a medicine or specific for the cure or relief of any ailment, and of which the proprietors claim an exclusive right of sale. By the Pharmacy and Medicines Act, 1941, no one may sell an article 'consisting of or comprising a substance recommended as a medicine' unless the appropriate designation of the substance or of each of the active constituents or ingredients, together with the quantitative particulars of the latter, are clearly legible on the label, container, or wrapper. 'Substance recommended as a medicine,' in this context, means a substance which is referred to in terms which are calculated to lead to the use of the substance for the prevention or treatment of any ailment, infirmity, or injury and not being terms which give a definite indication that the substance is intended for use as, or as part of, a food or drink and not as, or as part of, a medicine. Selling in contravention of the Act is punishable by fine up to £20 and, for a subsequent offence, £100 or three months' imprisonment or both. It is the statutory duty of the Pharmaceutical Society of Great Britain to enforce the Act. Prior to 1941 excise duties were chargeable on P. Ms.

Patents and Inventions. P., or more correctly letters patent, are documents in which the Crown vests a subject with special rights or privileges, e.g. the privileges appertaining to the peerage are conferred on a newly made peer by the issue of letters patent. This article is exclusively devoted to such letters patent as confer upon a person the sole right to make, use, and vend an invention for a limited period of time. Such a grant creates a monopoly (see MONOPOLIES) in favour of the patentee. Apart from copyright (q.v.) and trade marks (q.v.), P. are the only species of property which give an exclusive right. A trade mark differs from a patent by reason that 'it has not merit and the benefit of mankind as its consideration,' its object being 'to indicate the source from which an article

comes; not to restrain others from manufacturing such articles.' There can be and is in law no exclusive right in a mere secret, and the original possessor of, for example, a secret process of manuf., cannot, in the absence of some contract, prevent another person from making use of his secret if he be successful in acquiring the knowledge of it, though it would be otherwise if the latter acquired the information confidentially from the former or during the progress of experiments conducted by the former. Difficulties as to the person entitled to a particular invention have very frequently arisen between masters and servants. The whole of this part of the subject of P. is obscure, but the principle underlying all the cases is that an employer who conceives an idea has no right to the inventions of a man, whether servant or an independent, whom he employs to carry it out.

To be entitled to letters patent for an invention, the applicant must be either the 'true and first inventor' of the subject-matter or the 'true and first importer' of an invention from abroad. The first of the above two phrases by no means speaks for itself; but it is generally understood that an actual inventor includes not only a person who is incontestably and literally the first man to light upon and carry out a particular idea, but any one who has embodied in practical form some idea which, in the main, is his own, though others may have contributed suggestions in details and improvements which in themselves do not amount to distinct and separate inventions. But it must always be borne in mind that if any one who is concerned to upset a patent in the chancery div. of the high court can prove that the patent, though admittedly novel so far as the world generally is concerned, was not discovered by the ingenuity of the patentee, but was borrowed from some book or another person, the court will decide against the patentee. The 'true and first importer,' on the other hand, need have displayed no merit whatever to be entitled to a patent: e.g. he may be a mere agent or trustee of a foreign inventor. By the Patents and Designs Act, 1907, any person who has applied for protection for any patent in any foreign state with which the Brit. Gov. has entered into international arrangements for mutual protection of inventions is entitled to a patent for his invention in England in priority to other applicants, and such patent, on registration, will be dated as of the date of the protection previously obtained in the foreign state, provided the application is made within twelve months from the time of applying for protection in the foreign state. The above statutory provision applies also to such Brit. dominions as have entered into mutual arrangements with the mother country.

By the Statute of Monopolies (see under MONOPOLIES) P. for inventions last fourteen years, but this term was increased by an Act of 1919 to sixteen years. By the same Act the subject-matter of a valid patent can only be a 'new manufacture.'

and the Act of 1907 defines 'invention' by reference to the old Act. A valid patent may be granted in respect of (1) The discovery of a principle together with a method of applying it to a practical result or making it applicable to the production of a new manuf. (2) A new and useful combination of old parts. (3) The novel application of an old principle, provided a useful manuf. results; but the patentee cannot go outside the application which constitutes his invention, and the method of application must be really novel. (4) The application of an old material to a new purpose, provided there is actual novelty in the mode of using the old or known material or thing as distinct from the novelty of purpose. (5) The invention of processes for manufacturing well-known articles of commerce. (6) A new combination of new and old or all old processes, materials, or contrivances so as to produce or do something more cheaply or quickly or effectively than before. Even if the ultimate result of a combination be both novel and useful, the combination will not be patentable unless there is invention or 'manufacture' in the mode of combination itself. (7) A new product, material, or machine. 'Novelty' as construed by the courts is essential. Either the patentee must be the true and first inventor, or the subject-matter of the grant must be a new manuf. in itself, or newly introduced into the realm. In the law courts, where 'novelty' is in issue, the inquiry really turns on how far there has been such 'prior use' or 'prior pub.' as will invalidate the patent. In this context it is to be noted that if a man makes an invention, the object of which is to obtain a new result, the patent is entitled to a much more liberal construction by the courts than if the invention were merely to obtain an old result by new means.

The element of novelty may be summed up in the following propositions: (1) If once the public generally become cognisant of an invention, no matter by what means, no patent can be granted for it. But everything essential to the invention must have been known in order to invalidate the grant. (2) The use of a thing for any particular purpose is not an 'anticipation' of a patent which claims the use of the same thing for an entirely different purpose. (3) Novelty is not the same as discovery, for a thing may have been discovered before, but never made public. (4) An invention that has been previously made by someone else, even though not disclosed to the public, is said to have been 'anticipated,' and if such anticipation be proved a patent cannot stand. (5) A prior unsuccessful experiment or useless machine is no pub. (6) Offering for sale amounts to pub. only if the article offered for sale shows the manner of its manuf. (7) Prior use in a Brit. dominion or colony will not bar the right to a patent in England. (8) Imparting a secret to another or others in confidence is not communication to the public unless the public generally have by reason thereof in fact become fully acquainted with the inven-

tion. (9) It is useless to try to upset a patent on the ground that some pub. book contains it, if in reality the book contains merely a suggestion of the invention as opposed to such a description as would enable a person to effect the manuf. The above principles may appear in the highest degree technical; but it is pertinent to observe that the progress of opinion against monopolies is inherently opposed to the endowment of any individual effort that cannot properly lay claim to originality.

To apply for a patent the inventor must first file a provisional or complete specification of the nature of his invention at the Patent Office, 25 Southampton Buildings, London, W.C. The services of an accredited patent agent are usually employed by the inventor to draw up the specification, for any substantial error in preparing the document may render the patent void; and further, if at any time during the subsistence of a patent some one can show that the description in the specification is so incomplete that no one could produce the result claimed, the patent will be null and void. Sometimes, however, a patentee will be allowed to amend his specification if the erroneous parts do not vitiate the whole patent. After the specification has been deposited the examiner of the Patent Office investigates the application in order to see whether the specification and drawings properly describe the invention, and whether the invention claimed has in fact been described in some anterior specification deposited at the office in connection with any application for a patent made within fifty years next before the date of the application under examination. (A prior provisional specification not followed by a complete specification will not affect the claim.) The comptroller-general of P. having satisfied himself that the above requirements have been satisfied, causes the specification to be advertised in the official jour. of P. The patent will then be sealed after two months, provided there is no opposition. There are only four grounds of opposition: (a) That the applicant got his invention from the opponent; (b) that the invention has been claimed in a complete specification for a Brit. patent of prior date other than one deposited pursuant to an application made over fifty years before the date of the application for the opposed patent; (c) that the specification does not sufficiently or fairly describe the nature of the invention or the manner in which it is to be performed; (d) that the complete specification describes and claims an invention different from that described in the provisional specification (a provisional specification protects for six months), and that the former really forms the subject-matter of an application made by the opponent in the interval between the hearing of the provisional specification and the complete specification. The comptroller's powers (which are subject to an appeal to the attorney-general) are, as may be inferred from the above enumeration of grounds of opposition, limited to determining either

the identity of an invention, or whether the applicant is fraudulent; he cannot oust the jurisdiction of the courts by deciding a question of infringement. The fees on patents for inventions are:

	£	s.	d.
On application for provisional protection . . . . .	1	0	0
On filing complete specification . . . . .	1	0	0
On notice to have patent sealed . . . . .	1	0	0
On application for certificate of payment of renewal:			
Before the expiration of the 4th year from the date of patent, and in respect of the 5th year, £5; of the 6th year £8; and so on up to the 16th year . . . . .	12	0	0
Total . . . . .	13	0	0

Other small fees are also payable as may from time to time be presented by the Board of Trade.

**Revocation.**—Any person may petition to revoke a patent on the ground (a) that it was obtained in fraud of his rights, (b) that he and not the grantee was the true inventor, or (c) that he has publicly used or sold the thing claimed as an invention before the date of the patent. If the petitioner satisfies the court that he is right, he may himself be granted a patent to expire on the date the revoked patent would have expired. A patent not less than four years old may also be revoked by the comptroller at the instance of any one who shows that it has, during those four years, been worked mainly outside the United Kingdom.

**Compulsory Licences.**—A patentee may be ordered by the court to grant licences to work his patent if it can be shown that he has not himself adequately worked his patent, or manufactured his patented article, or granted licences on reasonable terms, so as to prejudice any existing, or the estab. of any new, industry.

**Infringement.**—The remedy for infringement is by injunction (*q.v.*) to restrain further infringements, coupled with a claim either for damages or for an inquiry as to profits in respect of past infringements. The usual defences to such an action are: (a) A denial of infringement; (b) a denial that the plaintiff was the first and true inventor; (c) a denial of novelty; (d) an allegation of the insufficiency or incompleteness of the specification; (e) an allegation that the patent has been worked principally abroad; (f) an allegation of fraud on the defendant's rights; and (g) a denial of utility (doubtful as a defence).

The procedure in applications for the grant of P. is contained in the P. Rules, 1920 (Statutory Rules and Orders, 1920, No. 438). These rules repeal those in existence prior to March 31, 1920. The full list of fees payable on the grant of P. is contained in the first schedule to these rules.

In view of much criticism of the existing Patents and Designs Acts the gov. in 1944 appointed a departmental com-

mittee under the chairmanship of Kenneth R. Swan to consider what changes were desirable in the Acts (1907-38), and in the practice of the Patent Office and the courts. Recommendations made in the first interim report of the Swan Committee (Cmd. 6618, April 1945) were embodied in a short amending Act of 1946. This Act modified existing practice as a matter of urgency in view of patents lapsing daily, to enable patentees, who had been prevented from working their P. by war restrictions, to resume working under extended patent protection as soon as possible.

Important changes in the law relating to P. and registered designs were made by the gov. in an Act to give effect to many of the recommendations of the Swan Committee's second interim and final reports (Cmd. 6789, April 1946, and Cmd. 7206, Sept. 1947). The new Act makes no changes in fundamental principles, but adapts patent law to modern requirements. One of the main purposes of the Act is to strengthen the provision against abuse of patent rights or the insufficient use of patented inventions. This is to ensure that inventions are used to the fullest extent to increase industrial efficiency. All the existing remedies are retained, but the circumstances in which they can be resorted to are extended to cover cases where the invention is not being worked to the fullest extent, or where an export market is not being supplied, or where the working of another patent is hindered by the refusal of the patentee to grant a licence on reasonable terms. The Act provides for action being taken by a gov. dept. in the public interest, particularly in cases adversely reported on by the new Monopolies and Restrictive Practices Commission. This commission has power to inquire into all restrictive practices affecting P., but the Act which constituted it does not provide specific action to follow on adverse reports. Other clauses modify the provisions relating to the use of patented inventions for the service of the Crown, and make permanent provision for ensuring secrecy of inventions in the interests of the defence of the realm. The courts have held that when the patentee himself uses an invention for the services of the Crown a gov. dept. cannot relieve him from his contractual obligations to other persons. The Act provides this relief. When others are authorised to use the invention the patentee will, in general, receive compensation, but it is provided that he shall be liable to share this with any other person entitled to contractual rights against him. The Act also provides that an application for a patent may be made by the assignee of an inventor, and an inventor's application may be taken over at any time by his assignee. There will be introduced a new system of dating P. and allowing priority based either on provisional specifications or on earlier applications in countries belonging to the International Convention for the Protection of Industrial Property. Another amendment of the law will help to protect

the position of an inventor who is an employee in the event of a dispute arising with his employer as to the rights of the parties in respect of the invention. Power is given to the comptroller of P. to settle such disputes in appropriate cases, and he may act upon an application by either of the parties. This will enable an inventor to have a claim decided without incurring the heavy expense of a court action against an employer. It is proposed that in future all appeals from the comptroller's decisions should go to the P. Appeal Tribunal. The Act came into operation on Jan. 1, 1930.

In order to secure for Britain and its industries the benefit of inventions and discoveries by Brit. scientists the gov. in April 1948 introduced a Bill to establish a national corporation for the development and exploitation of inventions, to which body the Board of Trade may make advances of up to £5,000,000, within five years of its estab., for working capital. The functions of the corporation are to secure, where the public interest so requires, the development or exploitation of inventions which result from research by gov. or other organisations financed by public funds, and of any other invention as to which it appears to the corporation that it is not being developed or exploited or sufficiently developed or exploited; and to hold rights in inventions and to grant or dispose of such rights for consideration or otherwise. This Bill makes no proposals affecting the law of P., but legislation to amend the Patents and Designs Acts is under consideration.

There is considerable similarity between Eng. and Amer. patent law. Perhaps one of the most important distinctions is that while Eng. law regards public advantage in the first place, Amer. law looks to the reward of the inventor for his industry. The best definition of patent ability in the U.S.A. is given in the revised statutes as amended in 1897 (the amendments are italicised):

'Any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country before his invention or discovery thereof, and not patented or described in any printed publication in this or any foreign country before his invention or discovery thereof or more than two years prior to his application, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned, may, upon payment of the fees required by law and other due proceedings had, obtain a patent therefor.'

Under the law of 1790 the duty of granting P. was discharged by the secretary of state, the secretary of war, and the attorney-general. From 1793 to 1836, the law being almost identical with Eng. law, the duty fell to the secretary of state, subject to the approval of the attorney-general.

From 1837 onwards the divergence of

Amer. from Eng. law began. In that year a P. office was opened: there is a commissioner of P., with assistants and examiners; he is appointed by the president, and has extensive power in interpreting the patent law. An official *Gazette* is pub. In applying for a patent the first step is to lodge an application, giving details and, if necessary, drawings and models. The fee for filing this application is \$15. The applicant must verify his claim by oath before any person competent to administer oaths. If on examination the commissioner is satisfied, the patent is issued, and a further fee of \$20 must be paid within six months. The maximum period is seventeen years.

Ferrell, *Law and Practice relating to Letters Patent for Inventions* (9th ed. by K. E. Shelley, 1947).

**Pater, Walter Horatio** (1839-94), Eng. critic and humanist, b. at Shadwell, London; educated at Enfield, Canterbury, and Queen's College, Oxford. In 1864 he became fellow of Brasenose College, in 1865 M.A., in 1866 junior dean, in 1867 tutor, in 1871 dean, and in 1873 lecturer. He was associated with the Pre-Raphaelites, especially with Swinburne. His literary celebrity dates from an essay on Winckelmann, pub. in the *Westminster Review* in 1867. P. has a definite place in the growth of the Romantic movement, which developed first into the Pre-Raphaelite phase and then into the aesthetic. His writings crystallised this latter before it degenerated into extravagance. With the apparent undermining of religion by science and with the increasing ugliness of civilisation, beauty and truth seemed to be found together only in works of art, or at moments in nature, or in transient experience. P. defined this creed in the conclusion to *The Renaissance*. In *Marius the Epicurean* its application to lit. was portrayed in the 'sensations and ideas' of its hero, set deliberately in an epoch of transition in the past. Of P.'s style George Moore said: 'In the pages of Pater the English language has its state.' His works include *Studies in the History of the Renaissance* (1873, 1877); *Marius the Epicurean* (1885; Everyman's Library, 1934); *Imaginary Portraits* (1887); *Appreciations. With an Essay on Style* (1889); *Plato and Platonism* (1893); *An Imaginary Portrait: the Child in the House* (1894); *Greek Studies and Miscellaneous Studies*, prepared for the press by C. L. Shadwell, were pub. in 1895; and numerous essays in the *Fortnightly Review*, etc. He is caricatured as 'Mr. Rose' in W. H. Mallock's *The New Republic*, 1877. See lives by A. C. Benson, 1906, and Edward Thomas, 1913; and studies by A. Symonds, 1932, and J. G. Esker, 1933; also R. Aldington (ed.), *Walter Pater: Selected Works*, 1948.

**Paterculus, Marcus Velleius** (c. 19 B.C.-A.D. 31), Rom. historian; fought with Tiberius in Germany and Illyria, and in A.D. 14 was praetor. His two-volumed *Historia Romana*, in which he treats of Gk. as well as Rom. hist., has survived.

**Paterniacum**, see **PAYERN**.

**Paterno**, tn. of Sicily, prov. of Catania, at the foot of Mt. Etna, and built on the site of the anc. Hybla Galeatis. There are mineral springs, and a trade in wine, flax, and olive oil. Pop. 36,000.

**Paterson, William** (1858-1719), Brit. bank projector, b. in Dumfriesshire and brought up in England. He was a wealthy and influential merchant, and in 1681 became a member of the Merchant Taylors' Company. He was one of the founders of the Bank of England, and it is said that the project originated with him in 1691. On the foundation of the bank in 1694 he became a director. In 1695, owing to a disagreement with his colleagues, he withdrew from the board and devoted himself to the colony at Darien, unsuccessfully planted in 1698.

**Paterson**: 1. City of New Jersey, U.S.A., and the cap. of Passaic co., on the Passaic R., 17 m. N.W. of New York. It is a great manufacturing centre, and is styled the 'Lyons of America,' because of its extensive silk industry. There are also cotton and paper factories, rolling mills, etc. Pop. 139,600. 2. Tn. of New S. Wales, Australia, in Durham co., on the Paterson R., 25 m. N.N.W. of Newcastle. Pop. 5000.

**Pathans**, Muslim race living on and beyond the N.W. frontier of India. Including the Mohmands, Afridi, Wazirs, Mahsuds, Khattaks, and Yussufzais. Many members of these tribes were at one time enlisted in the Indian Army.

**Pathe**, named used by one of Britain's leading film production and distribution companies, which in 1919 changed its title from P. Pictures to Associated Brit.-P. Ltd. Founded as P. Freres Ltd., by Charles Pathe in 1911, the company produced Britain's first newsreel, still issued twice weekly under the title of *Pathe News*, and Britain's only weekly screen magazine, the popular *Pathe Pictorial*. The P. trade mark, a crowing cockerel, appears on many screens throughout the world, the company having newsreel affiliations with the *Pathe Journal* of France and the *Warner-Pathe News* of America. In 1911 P. Pictures took over the distribution of the entire film output of the Associated Brit. Picture Corporation, and the company has since functioned as the distributing arm of that organisation which, besides controlling Britain's largest cinema circuit of 430 cinemas (A.B.C.), owns the reconstructed Elstree studios and Welwyn studios. A subsidiary company, Brit. Instructional Films Ltd., produces educational films and filmstrips in conjunction with P. In Wardour Street P. operate the only fully equipped film studio in London's W. End, on the site of the original studio used by Charles Pathe. Associated Brit.-P. now produce and distribute over 300 films a year, ranging from educational

'shorts' and documentaries to full-length documentary and entertainment features. The company was among the first in Britain to produce and adapt films specially for the Amer. television market. Among the more famous feature films distributed by Associated Brit.-P. after the Second World War were *The Dancing Years*, *The Intruder*, *The Hasty Heart*, *Private Angelo*, *The Queen of Spades*, *Scrapbook for 1922*, *Scrapbook for 1933*, *The Peaceful Years 1919-1939*, *The Guinea Pig*, *No Room at the Inn*, *My Brother Jonathan*, *Brighton Rock*, and *Piccadilly Incident*.

**Pathology**, science of disease, including structural abnormalities not usually regarded as diseases. Health may be considered as the condition in which structure and function are perfect. Symptoms of disturbance of function may be subjective or objective, or both. Such disturbance is associated with change in structure of cells, tissues, or organs, and this structural change may be either physical, chemical, or anatomical, and may be visible to the naked eye, or revealed only by microscopic examination. Microscopic changes are the prov. of pathological histology; others are included in pathological anatomy. Pathogenesis is the description of the changes from their beginning and during their course; the inquiry into their causes forms the dept. of aetiology. Until Virchow pub. his *Cellular Pathology* in 1858, the science was hardly in existence, for not until the microscope revealed the fact that man was a community of living cells was it recognised that their vicissitudes were the true basis of the study of human disease. The rapid rise and wonderful development of biochemistry has made important contributions to knowledge of the metabolism of the cell in health and in some forms of disease; of the production of endocrines and their effect on the body; of toxins and antitoxins. Pasteur's (q.v.) work, originally chemical, in connection with fermentation led to bacteriological science, and showed that the cell had friends and enemies; his eradication of specific disease among silkworms conclusively showed how science could wage war on germs inimical to cells. Koch's discovery of the anthrax parasite in 1876 and the tubercle bacillus in 1882, by his culture method of isolating bacteria, led to the discovery of the organisms responsible for fowl cholera, septic disease, typhoid, cholera, diphtheria, tetanus, etc. Lister's work in antiseptic treatment of wounds was of equal importance, and Jenner's in smallpox; nor must the peculiar genius of Huxley, outside the ranks of medical scientists, be overlooked. In 1893 Theobald Smith, in the case of bovine malaria or Texas fever, showed for the first time that parasites (q.v.) such as the tick could act as intermediary hosts and transfer disease from animal to animal; Manson and Ross proved that malaria was transmitted by a mosquito (*Anopheles*), so that every parasite has subsequently been a suspected agent in the transmission of disease. Ehrlich's researches in chemotherapy, with his theory

of 'side-chains' or 'receptors,' proved of great use in practical investigations. Metchnikoff's study of immunity and the discovery of anti-toxin by von Behring were also landmarks in the general advance. Some advance has been made in classification of parasitic diseases; of those due to schizomycetes (bacteria), suppuration and septicaemia, erysipelas, infective endocarditis and gonorrhoea are caused by pyogenic micrococci; specific bacilli are responsible for cholera, plague, pneumonia, etc.; hydrophobia, measles, and mumps are caused by viruses, whilst scarlet fever is an infection by a streptococcus. Protozoa are the cause of dysentery, malaria, black-water fever, etc., while other animal parasites, such as tapeworms, hookworms, and threadworms, are responsible for other types of diseases. Sexually transmitted diseases, such as actinomycosis, Madura foot, aspergillosis, and ringworm, have been traced to plant parasites.

The study of healing processes in wounds, as observed when means are taken to prevent the attack of germs, has shown that cells are capable of readjusting, after disturbance, the normal healthy life. Some leucocytes in  $\times \times \times$  numbers accumulate and carry off the dead cells, while others are phagocytic and destroy the attacking micro-organisms; at the same time the blood-vessels penetrate the disturbed area, the capillaries budding and anastomosing, so producing a new vascular system. Such recuperative power points to the possibility of similar processes in all forms of disease, even when deeply seated. Advancing age is a condition which may be healthily decay as distinguished from disease setting in. Other causes are largely within our control: general unhealthy surroundings, which our form of civilisation has produced but not yet remedied; a general malnutrition; the imposition of too much effort on certain organs, too little on others. Of nutritional diseases, rickets, beri-beri, and scurvy are amongst those due to deficiency in vitamins. Insufficient food and deficiency of any essential article of diet, such as protein, will also cause disease. Extremes of temp. cause the pathological phenomena of frostbite and burns. Chemical agents may induce various diseases, of which lead poisoning and phosphorus poisoning are common examples. Considerations of the conditions that are under our control have led to the attempt more clearly to define what are the natural conditions outside the body which aid recuperation. In the case of tuberculosis, sunshine and fresh air, together with rest, have already proved the enormous extent to which they aid recuperative processes. Perhaps the greatest problem  $\text{P.}$  is faced with is that of cancer, for which no certain cure can yet be announced, though steady progress has been made in treatment by surgery, X-rays, radium, and hormones (e.g. stilboestrol); the classification of different types of cancer based on the microscopic appearance of the cells has been placed on a firmer basis. Since some diseases and predispositions are

hereditary,  $\text{P.}$  involves some knowledge of heredity (q.v.). Haemophilia, colour blindness, diabetes, and certain deformities are transmitted, and tendencies to diseases such as tuberculosis; these tendencies need not be realised if the conditions of life are wisely controlled. Throughout all the progress since the middle of the nineteenth century there has been a steadily increasing knowledge of the physiology of the human body; organs such as the thymus gland and suprarenal bodies, the pituitary, parathyroid, and thyroid glands, have been more fully investigated and at least part of their function discovered. Some progress has been made in the recognition of the relation between psychogenic phenomena and the glandular secretions, and possibly the greatest advances in the future will be made in connection with psychopathology. The discovery of the sulphanamide drugs, such as sulphanilamide, and antibiotics such as penicillin (q.v.), streptomycin and chloromycin, have provided new weapons in the battle against bacteria. See also BIOLOGY; BACTERIOLOGY; PARASITOLOGY; CANCER; HOPKINS, SIR FREDERICK GOWLAND; PSYCHOPATHOLOGY; TUBERCULOSIS; VITAMINS.

See E. R. Long, *History of Pathology*, 1928; A. W. Hewlett, *Pathological Physiology of Internal Diseases* (3rd ed.), 1928; H. D. Power and W. W. Hala, *Principles of Pathology*, 1929; W. G. MacCullum, *Pathology* (7th ed.), 1940; R. Muir, *Textbook of Pathology* (5th ed.), 1942; W. Boyd, *Surgical Pathology* (5th ed.), 1943; H. T. Karsner, *Human Pathology* (6th ed.), 1943; E. T. Bell, *Textbook of Pathology* (5th ed.), 1944; and E. H. Kettle, *Pathology of Tumours* (3rd ed.), 1945.

Patiala and E. Punjab States Union, federation of Indian states set up on May 5, 1948. It is formed of the states of Faridkot, Jind, Kalisa, Kapurthala, Mukerikotla, Nabha, Nalagarh, and Patiala, and more than one-third of the mahab. are Sikhs. Area 10,119 sq.m. Pop. 3,421,000 (of which about 2,000,000 are in Patiala state).

Pathology of Plants, see PLANTS.

Patino, see PATMON.

Patmore, Coventry Kersey Dighton (1823-96), Eng. poet, b. at Woodford, Essex, the son of Peter George P. (1786-1855), author and sometime editor of the *New Monthly Review*; began to write poetry while still at school, and pub. his first vol. of verse in 1844. Two years later he was appointed to an assistant librarianship in the Brit. Museum. In 1849 he contributed to the organ of the Pre-Raphaelites, the *Germ*. He was largely responsible for promoting the volunteer movement of 1861. His prin. poetical works are *Poems* (1844); *The Betrothal* (1851); *The Espousals* (1856); *Faithful for ever* (1860); and *The Victories of Love* (1862); the four poems, and a selection of earlier poems, making up *The Angel in the House* (1863); *Odes* (1868); and *The Unknown Keros* (1877). While he is not to be identified with the intellectual movement of the mid-nineteenth century or with the Pre-Raphaelites,

he has a gift of verse somewhat akin to Wordsworth's in its simple, dignified treatment of homely themes. *The Angel in the House* is really a novel in verse, with domestic virtues as its poetical theme. The more philosophical parts of the poem reveal the mysticism which is to be found still more developed in *The Unknown Eros*, a series of odes notable for the poet's power of expressing intricate thought in verse. Eds. of his poems include that of 1897 (new uniform ed.) and of B. Champneys (1906), who ed. also his correspondence, 1900. *See studies* by Sir E. Gosse, 1905, and O. Burdett, 1921; also F. Page, *Palmore: a Study in Poetry*, 1933; D. Palmore, *Portrait of my Family, 1783-1798*, 1935, and (ed.) *The Life and Times of Coventry Palmore*, 1949.

**Patmos** (It. *Patmo*; Turkish, *Batmos*), volcanic, rocky, and barren is. (length 10 m., greatest breadth 6 m.) belonging to the Sporades, in the E. Aegean. It was ceded to Italy by Turkey in 1924. Here St. John the Evangelist is believed to have written his Revelations after his banishment by Domitian in A.D. 95. The monastery of St. John was founded in 1098 by St. Christodulus. Pop. 3100.

**Patna**, name of a div., dist., and city in the prov. of Bihar and Orissa, India: 1. The div. comprises the dists. of P. Gaya, and Shahabad which lie S. of the Ganges. Before 1904 it embraced what is now the div. of Tirhut. Area 11,338 sq. m. Pop. 2,266,000. 2. The dist., which covers 2164 sq. m., is watered by the Ganges and the Son. The Raigir Hills, in the S.E., interrupt a broad fertile plain, but rarely exceed 1000 ft. in height. Wheat, rice, maize, barley, and potatoes are cultivated. Pop. 2,162,000. 3. The city, the cap. of Bihar, lies on the Ganges, opposite the confluence of the Gandak, 144 m. E. of Benares. It exports tobacco, opium, oil, and indigo. Europeans live in the suburb of Bankipur. The P. high court came into existence in 1916. There is a federal univ., founded 1917, and a fine library. The Gola is an immense circular structure built in 1788, and now used as a public granary. The anct. and beautiful Patliputra, which Megasthenes describes as Palibothra, and which Asoka aggrandised, once stood on the site of P. Pop. 177,000.

**Paton**, Sir Joseph Noel (1821-1902), Scottish painter of the modern school, b. at Dunfermline, Fife. At a comparatively early age he attained considerable celebrity by the imaginative tendency of his works, the subjects of which were usually of a spiritual nature or dealt with some episode of fairy life. Thus the 'Quarrel of Oberon and Titania' exhibits much imaginative power and a bewildering variety of detail. In such pictures, again, as 'Lux in Tenebris' and 'Mora Janna Vitae' and 'The Evening Star' he achieved a height of spirituality which few modern painters have equalled. A famous rose window in Dunfermline Abbey was designed by him. He achieved some success as a poet, and many of his songs have been set to music.

**Patras**, or **Patrae**, centre of the export trade of Greece and the cap. of the prefecture of Achaea and Elis, on the gulf of Patras, 13 m. S.W. of Lepanto. It exports wines, currants, woollen goods, skins, fruit, honey, and olive oil. An important city in the days of Augustus, it became the cap. of Achaea under the E. empire, but was destroyed by the Turks in 1828. The modern city is built to a regular plan. Pop. 61,200.

**Patras**, Gulf of, inlet of the Ionian Sea, opening out of the gulf of Corinth, between Acarnania to the N. and Morea to the S., on the W. coast of Greece. Length 22 m.

**Patres Conscripti**, *see under* SENATE.

**Patriarch** (Gk. *patriarchēs*, the head of a family): 1. Name given to the fathers of the human race, spoken of in the Scripture hist., such as Noah, and also to the great progenitors of the Heb. race, Abraham, Isaac, Jacob, and Jacob's twelve sons. 2. Name also given in the Christian Church to the bishops of certain metropolitan sees, especially in the E. The sixth canon of the Nicene Council mentions Rome, Antioch, and Alexandria as the three metropolitan sees at the time.

**Patriarchs** (Lat. *patriarii*, the kin of the *patres*, or heads of the old Rom. *gentes*, or tribes) were the aristocracy of anct. Rome. In primitive times they were the whole *populus Romanus* (Rom. people), who assembled together in the national *comitia curiata*. The political hist. of early Rome is an account of the fierce and prolonged struggle between the upstart plebeians, sprung chiefly from the conquered tribes, and the hereditary P., descended from the old Rom. families. The victory rested with the former, who by 300 B.C. were eligible for all the offices of state, from the questorship to the dictatorship, and even for the pontificate, long jealously withheld. Under the old Rom. law no child was released from *patria potestas* (father's power) by having any dignity or office (except a vestal virgin). Justinian conferred the privilege of being *sui juris* or independent of the paternal power on those enjoying the dignity of the *patriarii*, the son being freed immediately on the grant of the imperial patent. Constantine changed the meaning of *patriarius*, by making it a title of the highest honour conferred on persons who enjoyed the chief place in the emperor's esteem. The power of making *patriarii* was, in general, used very sparingly by the emperors, and hence the title became an object of ambition even to foreign princes. The anct. order of *patriarii* was in time replaced by the *nobiles*, whose rank depended on their wealth and office.

**Patrick**, Saint (c. 380-461), distinguished missionary of the fifth century, commonly known as the Apostle of Ireland. Of his bp. it is only known for certain, from his own confession, that his father had a small farm near Bonavem Taberniae; and in one of the anct. lives he is said to have been born at Northur. Arguing on these data, connected with other collateral indications, some writers assign his bp. to the present Boulogne-sur-Mer; others to a place in the estuary

of the Olyde (called from him Kilpatrick). His father, he himself tells, was a deacon named Calpurnius; his mother, according to the anc. biographers, was named Conches, or Conchessa. P.'s original name is said to have been Sucrath, Patricius being the Rom. appellation by which he was known. In his sixteenth year he was seized while at his father's farm at Bonavent Tabernie by a band of pirates and sold to a petty chief, in whose service he remained for six years; after which he succeeded in effecting his escape, and went to France, where he became a monk, first at Tours, and afterwards in the celebrated monastery of Lérins. In the year 431 he went to Rome, whence he was sent by the pope of the day, Celestine, to preach in Ireland, but Dr. Todd fixes the date of his coming to Ireland eight years later. By degrees he visited a large portion of the kingdom, and baptised great numbers. According to the accounts of his Irish biographers, he founded 365 churches, and baptised with his own hand 12,000 persons. He is said also to have ordained a vast number of priests, and to have blessed very many monks and nuns. After he had been about twenty years engaged in his missionary enterprise, he is said to have fixed his see at Armagh about the year 454; and having procured two of his disciples to be ordained bishops, he held probably more than one synod. The foundations which he estab. for the Church in Ireland proved solid and lasting. He died at a place called Saul, near Downpatrick; and his relics were preserved at Downpatrick down to the Reformation. He is commemorated on March 17, a Holy Day of Obligation in Ireland. The only authentic literary remains of St. P. are his *Confessio* and a letter (*Epistola ad christianos*), both of very rude Latinity, but of much historical interest. The letter is addressed to Coroticus, who is supposed to have been a Welsh chieftain named Caradoc, who had made a descent on the Irish coast, and slain or carried off a number of the Irish, many of whom were neophytes. Both works were ed. by N. White (Dublin, 1805). See lives by J. H. Todd, 1893. J. B. Bury, 1905, and E. MacNeill, 1934.

**Patricroft**, tn. of S.E. Lancashire, England, 5 m. W. of Manchester, with silk throwing and weaving mills, cotton mills, quilting factories, iron works, etc. Pop. 21,000.

**Patricians**, see MONARCHIANISM.  
**Patristic Literature**, see FATHERS OF THE CHURCH.

**Patroilus**, see ACHILLES.

**Patrol**, ultimately from Fr. *patrouiller* - *patrouiller* - to flounder in mud), detachment of troops sent out in advance of the main body to reconnoitre the country and gain information as to the position and movements of the enemy. The same duties are now often carried out by armoured cars or tanks, and of course by reconnoitring aircraft during mobile warfare, especially during pursuit. Military Ps. are of two kinds: 'reconnaissance', usually in search of information above the ground, and especially about mines, and

'fighting' Ps., usually in search of information about enemy strength. They must fight to obtain prisoners or identifiable corpses. The chief non-military use of the term is in connection with motorised police detachments and the fire-fighting sections of forestry services. See also DOVER PATROL.

**Patrology**, see FATHERS OF THE CHURCH.  
**Patron** (lat. *patronus*, from *pater*, father), important term in Rom. law. It was the duty of the *patronus* to safeguard the interests of his *clientes* (dependants), men, that is, who were not admitted to the full rights of citizenship. The P. fed, boarded, and advised his client, gave him land usually, and was his representative in the eyes of the law. In return the client obeyed him, followed him to war, and gave him pecuniary aid. In the latter days of the republic the client was practically a free citizen; under the empire he was often merely a sycophant in his P.'s household. Technically a P. in this country is one who has church living in his gift, but the word is generally used of all benefactors and protectors, including the saints.

**Pattern-making**, see under CASTING.  
**Patti**, Adelina Juana Maria (1843-1919), It. singer, b. at Madrid. At an early age she gave a series of concerts. After a course of training, she made her debut in New York in 1859 as Lucia in the opera by Donizetti. In 1861 she came to England and took London by storm with the exquisite clearness and beauty of her voice. The year after she went to Paris, and she resided there until 1870, paying yearly visits to London, where she remained the prime favourite for many years. Her most famous roles were those from *Puritani*, *Sonnambula*, *Norma*, *Troatore*, *Lucia di Lammermoor*, and *Traviata*. In later years she gave up the stage for the concert hall. The last time she sang in public was at a St. John's Ambulance Association concert, Albert Hall, Oct. 24, 1914. She married the Marquis de Caux, but was divorced from him in 1885; in the following year she became the wife of the lt. tenor, Nicolini. On his death in 1898 she married the Baron Cederström. See H. Klein, *The Reign of Patti*, 1920.

**Patti**, port and cathedral city close to the gulf of P., in the prov. of Messina, Sicily. Its cathedral dates from the thirteenth century. Pop. (com.) 11,000.

**Pattison**, Mark (1813-84), Eng. author, b. at Hornby, Yorkshire; went in 1832 to Oriel College, Oxford. In 1861 he was elected rector of Lincoln College. In 1875 he pub. a biography of Isaac Casanbon. His *Sermons and Collected Essays*, ed. by Henry Nettleship, appeared in 1889. His memoirs, ed. by Mrs. P., were also pub. posthumously (1885).

**Patton**, George Smith (1885-1945), Amer. gener. b. at San Gabriel, California, of a family of soldiers. P. graduated at W. Point in 1909. Commissioned in the cavalry, he was aide-de-camp to Gen. Pershing in 1916 in Mexico, and later, in the First World War, was a captain on Pershing's staff and attended a course at the Fr. Tank School. He

organised the Amer. Tank Centre and also an Amer. tank brigade, which he commanded with distinction in the Saint-Mihiel attack of Sept. 1918, and later in the Meuse-Argonne battles. Between the world wars he held a cavalry command, served in Hawaii, and became a lieutenant-colonel. In 1940 he was appointed to command the 2nd Armoured Div., becoming, in 1941, commanding general of the First Armoured Corps. In anticipation of the allied N. African campaign he estab. a desert training centre in California and built a co-ordinated offensive force. He led the Amer. attack on Casablanca, and was afterwards chosen to command the Seventh Army in the invasion of Sicily. In April 1944 he was transferred to the W. front, taking command of the Third Army. He cut off the peninsula of Brittany and then swept on to Paris, the Ger. frontier, and the Siegfried line. When the Gers. made their last big effort of the war in the Ardennes offensive, P., whose forces were fiercely engaged on the Saar, answered the First Army's call for help by pulling out and changing direction to strike 60 m. northward over frozen roads against Rundstedt's (G.F.) flank, probably his greatest military feat. In the advance to the Rhine, after Rundstedt's repulse, he again played a leading part. Crossing the Rhine at Frankfurt, he maintained the impetus of his advance through central Germany and into Bohemia. Prague lay open to him, but for political reasons he was not allowed to occupy it, and at Pilsen his great advance ended. In April 1945 he was nominated a full general and his army occupied Bavaria. Owing to his scepticism over the necessity for the 'de-Nazification' programme, he was removed from the command of the Third Army and transferred to the command of a skeleton force, the Fifteenth Army. He died on Dec. 21, as the result of spinal injuries received in a motor accident near Mannheim twelve days previously. See J. Wellard, *The Man in a Helmet*, 1947.

**Patun**, see **PATAN**.

**Pâturages**, tn. in the prov. of Hainaut, Belgium, 5 m. S.W. of Mons. There are coal-mines, construction workshops, and manufs. of paints and shoes. Pop. 10,200.

**Patzeuaro**, tn. of Mexico in the state of Michoacan, situated near the lake of the same name. The lake, which is 6700 ft. above sea level, is 30 m. in circumference, with native Tarascan vils. on its shores and is. Wildfowl and fish are abundant. The tn., which has narrow cobbled streets, is 270 m. from Mexico city. Pop. about 10,000.

**Paul**, cap. of the dept. of Basses-Pyrénées, France, on the Gave de Pau, at the confluence of the Soust and Ousse. It has grown up on the edge of a plateau overlooking the plain of Jurançon, and is divided into two parts by a small stream called the Hédes. The castle, which dates from the fourteenth century, and was built by Gaston Phœbus, contains fine tapestries and the actual cradle and room in which Henry IV. was born. A

statue of this king stands in the Place Royale, famous as a view-point for the Pyrenees. P. is noted for its wines, cloths, and hams, but its prosperity to-day depends on the many visitors that the mild winter climate attracts. There is a court of appeal and a court of assizes at P., besides other tribunals. Pop. 46,200.

**Paul**, St., the Apostle (c. 3-c. 67), the great apostle of the Gentiles, was b. at Tarsus in Cilicia. Though a Jew of the tribe of Benjamin, a Heb. sprung from Hebs., he was by birth a Rom. citizen, having inherited this privilege from his ancestors, upon one of whom it had been conferred. The year of his birth is uncertain, and the first mention of his name in the N.T. writings is in connection with the martyrdom of Stephen (A.D. 33). His Jewish name was Saul, the form Paul being used in the Gk. and Rom. world. It is highly improbable that there is any connection between this name and that of his first great Gentile convert Sergius Paulus. Saul learned the art of tent-making, of which industry Tarsus was a local centre, for it was a custom among the Jews to instruct their youth, even of the highest respectability, in some mechanical art. He was educated in the learning of the times, and later went to Jerusalem to study the laws and traditions of his people under Gamaliel, a distinguished Rabbi. Being a man of great talent, ardent mind, and inflexible resolution, and being devotedly attached to the institutions of his country, he contemplated with alarm and anxiety the progress of the new religion. Accordingly he took an active and prominent part against the Christians, pursuing them with zeal and unrelenting fury. He obtained letters from the Sanhedrin to the synagogue of the Jews at Damascus, and also to the governor, authorising him to apprehend and bring to Jerusalem whomsoever of the disciples he might find there. While on this journey his miraculous conversion took place. The journeys and events of his laborious life up to his captivity in Rome are described in the Acts of the Apostles. He may subsequently have revisited the E. and Spain. P. suffered martyrdom at Rome c. A.D. 67.

The Canon of the N.T. assigns to P. the authorship of thirteen epistles, and the Rom. Catholic Church also attributes to him the Epistle to the Hebrews. Some of his speeches are recorded in the Acts. From these writings we learn that P. suffered from physical defect, the exact nature of which is unknown. But though weak in body he was a man of unflinching energy and of a bold and passionate nature.

**Theology of Paul**—The letters and speeches of P. which have come down to us were all directed to one purpose, the proof of Christ's claims to be the Messiah promised to the Fathers and the exposition of what these claims meant, with exhortations to the fulfilment of moral duties and advice as to the management of ecclcs. affairs. P.'s interpretation of the meaning of his Lord's work was accepted by the early Church, as may

be seen in 1 Peter, the Johannine writings and epistle to the Hebrews. It is difficult to formulate Pauline theology because we have to cull it not from treatises, but from occasional letters which only contained what bore on the question at issue. All that can be attempted is to sketch the system of P in its central ideas. To P as a Jew, righteousness with its converse sin is of primary import; this at first was purely external, but the Fifth Commandment led him to recognise the spirituality of the demands of the law (Rom vii 7). Over against this is his Christology. The crucifixion was the 'stumbling block' which hindered him from recognising Jesus as the Christ. When Jesus met him on the way to Damascus he was forced to recognise his Messiahship with this the problem assumed a new shape. The question: Why had the Messiah died? led him to the idea of atonement. The wages of sin is death, but he had no sin. Hence he was led to look on his death as substitutionary. Death was wide as the race; therefore sin must also be universal, if so the origin of sin must be found in the origin of the race. In Adam he died; Jesus is the second Adam in whom all are made alive (1 Cor xv 22), the result of the physical union to the first Adam is counterbalanced by spiritual union to Christ (1 Cor vi 17). All however do not benefit by the life-giving power of Christ's death, only those who believe. Those who believe will be received into glory at the coming of the Lord (1 Thess iv 15). With this is connected the Last Judgment and the resurrection (Acts xviii 31; 1 Tim ii 16). I did not look forward to the salvation of individuals only, and that in the present life; he also contemplated a regeneration of the church. The Church, the assembly of all believers, was the new Israel. From the old covenant he drew the idea of the conjugal symbol for the relation of the Church to her Lord (Eph v 12). The Church was to be a self-sufficing republic not going before civil tribunals (1 Cor vi 1-6). The psychology by which P explained conversion and the consciousness of sin after it as also inspiration and prophecy and the explanation he gives of the use of Church orders are all subjects of study.

The works on St P are very numerous. See W J Conybeare and J S Howson *The Life and Letters of St Paul* 1962; E C Bant *Paul his Life and Work* 183; O Pfleiderer *The Influence of the Apostle Paul on the Development of Christianity* 1885; A Sabatier *L'Apôtre Paul* (trans.) 1891; G B Stevens, *The Pauline Theology* 1892; A B Bruce *St Paul's Conception of Christianity*, 1894; J G Machen *Origin of Paul's Religion*, 1921; P Prat *Théologie de St Paul* (trans.), 1928, and *St Paul* (trans.), 1928; C A Scott *Christianity according to St Paul*, 1927; A Schweitzer, *Mysticism of Paul the Apostle*, 1931; C H Dodd, *The Mind of St Paul*, 1936; J Marstein, *St Paul*, 1942, 1948, and R Sencourt, *St Paul*, 1948.

Paul, the name of five popes

**Paul I** (757-67), a brother of Stephen II. With the help of Pepin, king of the Franks, he continued the opposition to the Lombards, but his pontificate was of little importance.

**Paul II** (1461-71) (Pietro Barbo), b at Venice 1417 or 1418, was hardly more important. He added greatly to the magnificence of the city of Rome. In 1470 he decreed the observance of the Jubilee every twenty five years.

**Paul III** (1534-49) (Alessandro Farnese), b at Cambrino 1468, belonged to a very noble family. He was a man of great learning and wealth unequalled in tact and diplomacy, but his early life was stained by great excesses. After his consecration much agitation was excited by the elevation to the cardinalate of his two young grandsons aged fourteen and sixteen respectively. He convoked the Council of Trent which assembled in 1545 and approved the foundation of the Jesuit Society.

**Paul IV** (1555-6) (Giovanni Pietro Carafa), b at Capri 1501, came also of an illustrious family. His early life had been most ascetic and he was one of the founders of the order of the Minors. His pontificate was marked by many reforms though when elected he was already seventy nine years of age. His diplomatic ability was less marked as was shown by his relations with England and Cardinal de Lorraine.

**Paul V** (1600-21) (Camillo Borghese), b at Rome, 1552, had been specially trained in jurisprudence and his excellence as a canonist is shown in the course of his pontificate. He was a strict disciplinarian and his excommunication of the English publican produced a schism which lasted a year. He did much for the city of Rome itself.

See L Hayward *History of the Popes*, 1929; Ingtrams 1931.

**Paul I** (1754-1801) emperor of Russia, second son of Peter III and the Empress Catherine II. He became heir apparent in 1763 and succeeded his mother in 1796. He was unfitted for his position by his violent temper and weak intellect and his impetuous actions caused much trouble. Among his earliest measures were the exile of his father's murderers and the pardon of Polish prisoners. He was a keen supporter of monarchy, declared for the allies against France, and in 1798 sent 50,000 men under Suvarov and another force under Korsakov to assist the Austrians in Italy. In 1799 he made a treaty with Great Britain, but in 1800 violated it by entering into the N coalition resolved by Nelson's fleet in the battle of 1801. P was compelled to abdicate and was strangled in a struggle. See F Golovkin, *La Cour de la régence de Paul Ier*, 1905.

**Paul-Boncour**, Joseph (b 1873), French politician and statesman b at St Aignan-sur-Cher. After a brilliant career at the university he was called to the Paris Bar. In 1900 he pub *La Fédération économique*. His sympathies were of the left and he

was an advocate of trade unionism. In 1906 he was elected to the Chamber as an Independent Socialist for the dist. of Loire-et-Cher. In 1911 he became Labour minister in the Radical Monis-Bertaux Cabinet. During the First World War he held a command in Lorraine and after it he joined the Socialist party. He was returned to the Chamber in 1919 and joined forces with Léon Blum; he was returned again in 1924 for the dist. of Tarn. He was a prominent member of the trade delegation to the League of Nations and took part in the discussions on disarmament. He resigned from the League of Nations in 1928 and was Prime Minister for the short period of Dec. 1932-Jan. 1933, when his gov. fell over a minor financial question. Under the leadership of Blum he was in 1933, and again in 1938, minister for foreign affairs when his policy was to secure collective security in Europe. In this his policy towards Spain and Italy (as regards Abyssinia) did not find favour with Great Britain.

Paul, Canons of St., see BARNABITES.

Paul, Father (Paolo Sarpi) (1552-1623), Venetian patriot and ecclesiastic, is important chiefly for his place in the contest between the city of Venice and the papal see during the pontificate of Paul V. He carried on a vigorous controversy with Bellarmine as to the papal prerogatives, and his activity was only ended by an attempted assassination in 1607, in which he was severely wounded. His most important literary work is a highly tendentious *History of the Council of Trent*.

Paul, Jean, see RICHTER, JOHANN PAUL FRIEDRICH.

Paul, Vincent de, see VINCENT DE PAUL.

Paula, see FRANCESCO DI PAOLA.

Paulding, James Kirke (1779-1860), Amer. author, b. at Pleasant Valley, New York. Self-educated and early developing a tendency to literature, he was a friend of Washington Irving, and wrote a portion of *Salmagundi*. During the war of 1812 he pub. the *Dwelling History of John Bull and Brother Jonathan*; in 1813 a parody of the *Lay of the Last Minstrel*, entitled *A Lay of the Scottish Minstrel*; and in 1814 a more serious work, *The United States and England*, a defence against articles in the *Quarterly Review*. This work attracted to him the attention of President Madison, and caused him to be appointed a member of the Board of Naval Commissioners. In 1817 he pub. a defence of the S. states and of slavery in *Letters from the South, by a Northern Man*. His numerous other works include *Königsmarke*, a novel (1825), *Merry Tales of the Three Wise Men of Gotham* (1826); *The New Pilgrim's Progress* (1828); *Tales of a Good Woman* (1829); *Book of St. Nicholas* (1830); *The Dutchman's Fireside* (1831). These were followed by a *Life of Washington* (1835) and *Slavery in the United States* (1838), in which the institution is defended on social, economical, and physiological grounds. Later he was appointed secretary of the navy, which gave him the position of cabinet minister.

Pauli, George Reinhold (1823-82), Ger. historian, b. in Berlin; spent a year at Oxford and travelled in other parts of England and in Scotland before he became private secretary to Baron von Hunsen, the Prussian ambas. in London (1849-52). He held the chair of hist. successively at Rostock (1857-59), Tübingen (1859-60), Marburg (1867-70), and Göttingen (1870-1882). His genial and erudite vols. written in continuation of Lappenberg's *Geschichte von England* give a vivid and truthful picture of this country in the Middle Ages, whilst he also wrote monographs on King Alfred (1851) and Simon de Montfort (1867), and a *Geschichte Englands* between the years 1811 and 1852 (1864-75).

Pauli, Wolfgang (b. 1900), Swiss physicist (b. in Vienna), of the Federal Technical High School at Zurich. He went to Princeton as a disciple of Sommerfeld. As a student he wrote the article 'Theory of Relativity' for the *Mathematical Encyclopaedia*, still one of the best presentations of the subject. He played a large part in Niels Bohr's interpretation of atomic spectra in terms of quantum theory, and made further discoveries in the quantum theory, which served Bohr as the main factor in his explanation of the periodic system of the elements. P. also had a share in the development of matrix mechanics. In 1945 he was awarded the Nobel prize for physics. He has pub. papers on nuclear physics, equilibrium of radiation and molecules, entropy in quantum statistics, and similar subjects.

Paulicians, heretical sect which arose in Syria and the E. during the seventh century, and whose beliefs were a blend of Manichæism and Gnosticism. The name is generally said to be derived from the apostle Paul, for whose writings the sect had an especial veneration. The sect appears to have been founded by Constantine of Mananalis, near Samosata, a little before 660. The P., who themselves refused to accept any title but 'Christians,' underwent severe persecutions from the E. emperors, and they are said finally to have died out in the reign of Alexius Comnenus. The Bogomiles, Cathari, Albigenses, etc., are their spiritual descendants, and in Armenia P. communities continued till recent years. See G. A. Scott, article 'Paulicians' in Hastings's *Encyclopaedia of Religion and Ethics* (vol. ix.), and G. G. A. Harnack, *History of Dogma* (vol. ii.), trans. 1895-96.

Paulinus, St. (d. 641), archbishop of York. A Rom. by birth, he became a monk and was sent out in 601 by Gregory the Great as auxiliary to St. Augustine. He laboured as a missionary first in Kent and then in Northumbria, whither he had accompanied Ethelburga, sister of the Kentish king, Eadbald, on her marriage with King Edwin. He is described by Bede in Book II. of the *Historia Ecclesiastica*.

Paulinus, Gaius Suetonius, Rom. governor of Britain during A.D. 59-62. He subdued the rebellious Ireni and defeated Hadroca (q.v.) in 61. In 66 he became

a consul, and in 69 was a general in Otho's wars against Vitellius.

Paulinus of Nola (c. 354-431), priest and poet, b. at Bordeaux, son of the Rom. praetorian prefect in Gaul. Prefect of Rome for a time, he went to Spain, became a priest, and later bishop of Nola in 410. Some of his letters, and most of his poems are extant, showing fluency and high quality of writing.

Paul of Samosata (fl. third century A.D.), heretical teacher, b. at Samosata, and about 260 became bishop of Antioch, where he also acted as viceregent to Zenobia, the queen of Palmyra. He taught the Monarchian heresy that God is one, and that the Trinity is only a name for the three forms in which God has expressed Himself. In 264 Paul's teachings were condemned at the Council of Antioch, and five years later he was deposed. But he was supported by Zenobia, and continued to retain his position until the city was taken by the Emperor Aurelian in 272. Followers of P. of S. existed as late as the fourth century. See C. G. A. Harnack, *History of Dogma* (vol. iii.), 1894.

Paul the Deacon (Paulus Diaconus, known also as Varnafidius) (c. 720-801), a Lombard, b. in Friuli, who became a monk in the monastery of Monte Cassino. He wrote *Historia gentis Langobardorum Libri VI.*, dealing with the period from 568 to 744, as well as other works of importance in the hist. of monasticism. His *Historia romana* is a sequel to the *Freriarium* of Eutropius.

Paulus, family of the Æmilian clan at ant. Rome. The chief members were:

*Lucius Æmilius P.*, Rom. consul in 219 B.C. and in 216 B.C. During his second consulate he was persuaded, contrary to his wish, by his colleague Terentius Varro, to fight the battle of Cannae against Hannibal, and fell.

*Lucius Æmilius P.*, surnamed *Macedonicus* (c. 229-160 B.C.), son of the preceding. He was re-elected consul in 168 B.C., and was entrusted with the command in the Macedonian war, defeating Perseus at the battle of Pydna. He became censor in 164. His son, *Publius Scipio Africanus the Younger*, was adopted into the family of the Scipios. See Pintarch's *Lives*, 'Æmilii Paulus.'

Paulus Ægineta (fl. seventh century A.D.), Gk. physician, b. in Ægina. He was connected with the medical school of Alexandria. He was particularly skilled in surgery in the branch of obstetrics. His chief pub., *Synopsis of the Medical Art*, went through numerous eds. and trans. (see Eng. trans. by F. Adams, 1844-48).

Paulus Julius (fl. third century A.D.), distinguished Rom. lawyer, of the circumstances of whose birth little is known. He acted as jurist in the reigns of Septimius Severus and Antoninus Caracalla. He was a prolific writer, his chief work being *Ad Edictum* in 80 books. He handled a variety of subjects, and was one of the greatest legal writers of ant. times.

Paul Veronese, see VERONESE, PAUL.

Pauncefote of Preston, Julian, Baron (1828-1902), Eng. diplomat, b. at Munich. In 1865 he became attorney-general, and nine years later was appointed chief justice of the Leeward Is. In 1889 he was appointed minister to the U.S.A., and was made first ambas. to the U.S.A. in 1893. He negotiated a general arbitration treaty between Great Britain and the U.S.A., and his diplomatic ability did much to further cordial relations between these countries.

Paupers, see under MENDICANCY; POOR LAWS; VAGRANTS.

Pausanias (fl. fifth century B.C.), Spartan general, son of Cleombrotus and nephew of Leonidas. In 479 B.C. the Spartans allied with the Athenians against the Persians, and placed P. in command. At the great battle of Plataea the Persian forces were routed, and P. is said to have acquitted himself with great valour. He continued the war against Persia in 478, and aimed at becoming tyrant over the whole of Greece. To bring this about it was necessary to gain the support of the Persian king, and he conducted a treasonable correspondence with Xerxes. His perfidy was discovered, and he was starved to death as a punishment, by order of the ephors.

Pausanias (fl. second century A.D.), celebrated Gk. traveller and geographer, probably a native of Lydia, and there is evidence to show that he had lived long near Mt. Sipylus. Of his personal hist., however, little is known, but passages in his great work, a *Periegesis or Itinerary of Greece*, prove him to have been a contemporary of Hadrian and the Antonines. This work is in ten books and contains a description of Attica and Megaris (book i.), Corinthia, Sicyonia, Phliasia, and Argolis (ii.), Laconica (iii.), Messenia (iv.), Elis (v. and vi.), Achæa (vii.), Arcadia (viii.), Boeotia (ix.), and Phocis (x.). It is full of mythological, historical, and artistic matter, and with the exception of Herodotus there is no writer of antiquity who has collected so many valuable facts in so small a vol. The latest ed. of P. is by H. Hitzig and H. Blumer (1896-1910). Eng. trans. by Sir J. G. Frazer, 1898, 1913. See also Sir J. G. Frazer, *Pausanias and other Greek Sketches*, 1900.

Pavetta, dwarf shrub with white flowers and ornamental leaves, cultivated in greenhouses. The best-known species is *P. cafra*, 3 to 4 ft. high.

Pavia: 1. Prov. of Lombardy, Italy, watered by the Po and its tribs., the Sesia, Ticino, Olona, and Trebbia. There are numerous canals, the most important one connecting the Ticino and the Olona (20 m.). It is mainly a level, fertile plain, but the S. is mountainous. Silk, cheese, cattle, rice and cereals, chestnuts, fruit, and wine are the chief products. Area 1287 sq. m. Pop. 500,000. 2. (Auct. Teinonum.) (cap. of the above, on the r. b. of the Ticino, 18 m. S. of Milan. The riv. was crossed by a magnificent granite bridge of seven arches (1353), unfortunately destroyed in the Second World War, and an iron railway bridge (1865). The city is still surrounded by its old

walls, and among its interesting buildings are the cathedral, begun in 1468 but not completed until 1898, and the church of San Michele, in which the old 'kings of Italy' were crowned. The 'Certosa di Pavia,' founded in 1396, is 5 m. N. of the tn. The univ., said to have been founded by Charlemagne in 774, but estab. as a univ. by Galeazzo Visconti in 1361, was a famous seat of learning in the Middle Ages. The Palazzo Malasпина contains a museum of antiquities and a collection of paintings and engravings. The Collegio Borromeo was founded in 1563.

P. has manufs. of no great importance and a trade in such local products as

The covered bridge over the Ticino destroyed in the Second World War

wine, olive oil, silk, corn, hemp, and cheese. There are important marble-works. P. was founded by the Ligurii, and became a place of great importance. Charlemagne took it from the Lombards in 774. In 924 the tn was destroyed by the Hungarians. It was the scene of church councils in 1081, 1160, and 1423. In 1359 it was taken by the Visconti of Milan. At P., in 1525, Charles V. defeated the Fr. and captured Francis I. It was annexed by Austria in 1714, pillaged by Napoleon in 1796, and joined to Italy in 1859. Pop. 56,100.

**Pavia y Albuquerque, Jose Manuel** (1828-95), Sp. statesman, *b.* at Cadiz. He took part in the revolutionary movements of 1866 and 1868, and commanded the Federalists against the Carlists. He retired into private life in 1874.

**Pavlitza, see PHIGALIA.**

**Pavlodar, Region of the Kazakh S.S.R., Russian Central Asia.**

**Pavlograd, tn. in the Dniepropetrovsk**

**Region of the Ukrainian S.S.R., 40 m. E. of Dniepropetrovsk, on the R. Voltoha.** Trade in cattle and grain is carried on, and there are manufs. of tobacco, bricks, and flour. Pop. 50,000.

**Pavlov, Ivan Petrovich (1849-1936),** Russian physiologist, *b.* at Ryazan, son of a vil. priest and educated first at a theological seminary and then in St. Petersburg, in general science at the univ. and in medicine at the Military Academy. In 1891 he was made director of the physiological dept. of the newly estab. Institute of Experimental Medicine, in 1897 prof. of physiology at the Military Academy; and in 1907 one of the four scientific members of the St. Petersburg Academy. His earliest important work was on the physiology of circulation. His next was on digestion, involving researches on conditioned reflexes, and, through them, on animal psychology. These researches reformed all ideas of the processes of digestion and were the foundation of modern knowledge of the subject. Subsequently he began to study the higher nervous activity of man, using individuals with functionally and automatically diseased brains. On his eighty-fifth birthday the Soviet Gov., which he was always criticising, gave him a large sum for the extension of his laboratories and a pension of 20,000 roubles. He won the Nobel prize in medicine in 1904 and received the Copley Medal of the Royal Society in 1915. *See also* BEHAVIOURISM, CONDITIONED REFLEXES.

**Pavlova, Anna (1885-1931),** famous Russian ballerina, *b.* at St. Petersburg. At the age of ten she entered the state-endowed Imperial Ballet School attached to the Marianski Theatre in St. Petersburg where later, having passed rapidly through all its grades, she became prima ballerina. She came to London in 1910, having already been to Berlin, New York, Vienna, and Paris, where she brought the revelation of a perfect art. With her then was the male dancer, Michael Mordkin, and among her famous ballets were 'Les Papillons,' 'Valse Caprice,' and 'The Swan' of Saint-Saëns, which last-named remains in the popular mind as her supreme achievement. In Paris, with Diaghilev's ballet, she danced in 'Les Sylphides,' 'Pavillon d'Armide,' and 'La Nuit égyptienne.' With Novikov she danced in interpretations of Chopin's music, revealing a technical mastery in creations of rare beauty. She appeared with regularity in London, and in 1923, 1924 and 1925 she gave seasons of ballet at Covent Garden with her own company. In 1926 she made what was almost a triumphal progress through S. Africa, Australia, and New Zealand. She subsequently settled in London, where for some years she conducted a dancing academy. P. is an historical figure in the evolution of the dance. Before her ascendancy, the traditional technique of ballet dancing had been perfected. It had become, however, with its *pointes* and *entrechat*, an end in itself, but, as against the ultra-artificiality of these performances, P. brought ballet dancing back

to nature and, paradoxically enough, by way of its traditional technique, and besides being unique in personality she was a supreme artist in that kind. See V. Svetlopp, *Anna Pavlova: a Choreographic Portrait*, 1929, and W. Hyden (her husband), *The Genius of the Dance*, 1931.

ANNA PAVLOVA

L. N. J.

Pavlovo, tn. in the Gorky Region of the R.S.F.S.R., on the Oku, 12 m. S. of Gorbato. It is an important industrial centre, producing cutlery, hardware, steel goods, etc. Pop. 20,000.

*Pavonia*, genus of Malvaceae, small shrubs or herbs found in tropical America and Asia. *P. odorata* is cultivated in Indian and Burmese gardens for its fragrant flowers. It is grown in Britain as a greenhouse plant, the chief species being *P. intermedia*, a hybrid with white flowers, *P. kermesina*, a dwarf hybrid with white flowers, and *P. multiflora*, 1 to 2 ft. high, with purple flowers.

*Pavonidae*, see *Peacocks*.

**Pawnbroker.** By the Pawnbrokers Act, 1922, a P. is defined as a person who keeps a shop and purchases or takes in goods, paying or lending thereon any

sum not exceeding £10 under an agreement, express or reasonably to be implied, that the goods may be afterwards repurchased or redeemed. A P. may not act without a licence from the Inland Revenue Commissioners, the penalty for so acting being £50. Such licence, the duty on which is 27 10s., can only be obtained on production of a certificate from a magistrate. For dealing in silver a plate licence (£5 15s.) is required, and a moneylender's licence (£15) if the P. wishes to advance more than £10. Magistrates must grant certificates to applicants within their jurisdiction unless the applicant is of bad character or his shop or any adjacent premises owned by him are frequented by persons of bad character. Twenty-one days' notice of an intended application must be given by registered letter to the dist. superintendent of police, and twenty-eight days prior to application a notice must be affixed for two consecutive Sundays on some church door, or, if there be none, some conspicuous public place. Pledges must be redeemed within twelve calendar months from (and exclusive of) the day of pawning (with an additional seven days' grace). Pledges for 10s. or under if not redeemed become the P.'s absolute property. Pledges for more than 10s. must be sold by auction, and any P. may purchase at the sale. A P. must not take goods if the pawner has lost his ticket or had it stolen or destroyed; he must get from the P. a form of the declaration to be made before a magistrate with respect to the missing ticket. Both the pawner and some person who can identify him as the owner of the goods or as the person entitled to hold the lost ticket must make the declaration. The form of declaration when completed and delivered back to the P. operates to put the declarant in the same position as if he had produced the ticket, and the P., unless he knows the declaration to be false, will then incur no liability for delivering the goods to him. If a pledge be destroyed or damaged by fire, the P. must pay within the redeemable period the value of the pledge less loan and profit; the value is taken to be the amount of the loan plus profit plus 25 per cent. on the amount of the loan. For the ticket of goods pledged for 10s. or less the P. is entitled to charge 1d. and an additional charge of 1d. for each 5s. or part of 5s. lent; loans above 10s. and not exceeding £2, 1d. for the ticket and the same rate of profit as above, for loans above £2, the profit of 1d. per month is reckoned on each 2s. 6d. or part of 2s. 6d. unless a special contract is made and a special ticket given in accordance with the prescribed form under the Act of 1922. A P. may not, without rendering himself liable to a penalty of £10, receive a pledge from any person appearing to be under fourteen (in London, under sixteen) or intoxicated. A P. who takes stolen goods may find himself ordered by a magistrate to restore them to the true owner if the pawner be convicted; but the magistrate will ordinarily consider the conduct both

of the P. and the owner in making any order. It is provided by the Firearms Act (1937) that a P. may not take in pawn firearms or ammunition of certificated dealers. The Liability for War Damage Act, 1939, provides, in the case of loss or damage of a pledge by fire due to war, that the P. is not liable to make any payment and, unless the pawner redeems the pledge he is not liable to repay the loan. This provision applies only to pledges on which a loan of +10 or less has been made. Before 1939 there were 2700 Ps. in Britain; in 1949 the number had declined to 1800, including 150 in London. See also MONT DE PIÉRE. See L. P. Stubbs, *Guide*, 1866; A. Hardaker, *Brief History of Pawnbroking*, 1892; L. Lallemand, *Histoire de la charité*, 1912.

**Pawnees**, tribe of N. Amer. Indians, formerly living on the Platte R. in Nebraska, and in Kansas and Texas. They were a brave, warlike tribe, and their hist. is one of continual strife with their neighbours. They lived in log huts and supported themselves on the produce of their fields during the winter months, and the remainder of the year hunted the buffalo on the plains. Their vil. was burnt by the Delawares in 1823, and ten years later they ceded all their ter. S. of the Platte, surrendering all the remaining land, save a small part on the Loup R., in 1853. In 1874 they removed to the Indian reservation of Oklahoma, where they now number about 600. See G. B. Grinnell's *Pawnee Hero Stories and Folk-tales*, 1893; F. Denmore, *Pawnee Music*, 1929; and W. R. Wedel, *Louise Archaeology*, 1936.

**Pawpaw** (*Asimina triloba*), tree of the family Anonaceae, indigenous to N. America, but now widely cultivated in the tropics, yielding a fruit the size of a melon, edible when boiled, whose juice renders tough meat tender.

**Pawtucket**, city of Providence co., Rhode Is. U.S.A. 4 m. N. of Providence, and near the city of Central Falls. It lies on both sides of P. R. which is navigable below the falls and covers an area of about 10 sq. m. The chief industries are the manuf. of textile cottons, silks, braids, hosiery, etc., the first U.S.A. cotton factory being estab. here in 1790. Pop. 75,800.

**Paxo**, smallest of the seven chief Ionian Is., 10 m. S.E. of Cephal. Its total length is 5 m. and breadth 2 m. The surface is mountainous and it produces oil and fruits. Cap. Porto Gavo (Gaios), on the E. coast. Pop. of 4000.

**Paxton**, Sir Joseph (1801-65), Eng. gardener and architect, b. at Milton Bryant, Bedfordshire. While serving as a gardener, attracted the attention of the duke of Devonshire, who in 1826 appointed him superintendent of the gardens at Chatsworth. He designed the building for the great exhibition of 1851, and two years later removed the glass and iron structure to Hydenham, where it was called the Crystal Palace. He represented Coventry in Parliament from 1854 until his death. He wrote sev. horticultural works, including *A Botanical Dictionary of all Plants known in Britain* (1863).

**Pax Romana**, abstention from war enforced on states subject to the Rom. Empire. The orderly administration of justice and the universal peace, which the Rom. Empire estab. from the Atlantic to the Euphrates, did not, however, long survive the inroads of the Teutonic tribes who in W. Europe apportioned the inheritance of the Lat. *orbis terrarum* between them. Rom. power had become weakened by Julius Caesar's time, but the Gallic conquest added to the ageing body of the Rom. state a limb which contributed largely to the renewal of its youth; for Caesar himself laid the foundation of his monarchical power, and in the world's hist. it played a part of incomparable importance simply by the fact that the current of the Germanic invasion into the Rom. Empire was thereby dammed at a time when the Germanic world could have shattered Rom. and, with it, classical civilisation, but could not have absorbed it.

Augustus gave Rome fifty years of peace and good government, and he estab. a form of empire which was destined to endure for many years. But all the early Teutonic codes being based, however remotely, on the right of private war and private vengeance, might deteriorate but could not eradicate the instinct which urges the members of semi-civilised communities to avenge their own wrongs. Hence the P. R. died with the empire, and the able organisation of Charlemagne could effect no more in the W. half of the empire than a very partial reconstitution (see also under JON'S TRUCE). Pax Britannica has the same connotation in relation to the Brit. Empire (q.v.).

**Pax Romana**, name of a Rom. Catholic organisation devoted to the maintaining of contacts between univ. students and promoting moral and social welfare through their influence. It was founded in 1921 by students and undergraduates of eighteen nations at Fribourg in Switzerland. Since then it has grown to world-wide extension by affiliating existing organisations. In 1946 it was divided into a senior or graduate branch and a junior branch. In England the Newman Association and the Union of Catholic Students are respectively the senior and junior Brit. constituents of these branches.

**Pay As You Earn**, see under INCOME TAX.

**Payenne** (sanct. Paterniacum), tn. of Switzerland, 10 m. W. of Fribourg, in the canton Vaud. Pop. 5000.

**Paymaster**, in navy, see PURSER.  
**Paymaster-General**. The office of P.-G. was reorganised in 1836, the various offices of paymaster of the army, navy, ordnance, and civil service being by that act consolidated into one office. To this office are now paid all the public moneys due for the army, navy, and civil services. The issue of money for the Consolidated Fund service is made by Treasury requisition to the comptroller and auditor-general; and when the latter, being satisfied that the requisition complies with Acts governing the proposed expenditure, makes the necessary order, the Treasury

directs the Bank of England to transfer the sums required from the Exchequer account to that of the P.-G. Similarly requisitions for credit are made by directions from the Treasury to the bank to transfer the sums specified to the 'supply account' of the P.-G. The depts. concerned are then informed that the sums voted by Parliament are placed to their respective accounts with the P.-G., and from that moment they become responsible for its disbursement in accordance with the votes. The office is unpaid. See Sir W. R. Anson, *Law and Custom of the Constitution*, 1886-92.

**Payn, James** (1830-98), Eng. novelist, b. at Cheltenham, began his literary career when, as a Cambridge undergraduate, he pub. in 1852 two vols. of verse. He then became a contributor to *Chambers's Journal*, of which he was editor from 1859 to 1874. From 1853 he was editor of the *Cornhill Magazine* until within two years of his death. His first novel, *The Foster Brothers*, appeared in 1859, and had some scores of successors, including *Lost Sir Maesungberd* (1861); *Walter's Word* (1875); *By Proxy* (1878); *The Canon's Ward* (1884), and *The Tale of the Town* (1885). Most of P.'s stories are sensational or have an element of mystery in them, and, though the chain of coincidence is often strained, the plots are usually ingenious and well worked out.

**Payne, John Howard** (1791-1852), Amer. actor and dramatist, b. in New York. His first appearance on the stage was in *Home's Douglas*, in which he at once achieved success. In 1813 he appeared in London and estab. himself in England and had a successful career both as actor and author for upwards of thirty years. He wrote *Clari, or the Maid of Milan* (1823), containing the well-known song, *Home, Sweet Home*; *Charles II.* (1824); *Procrastination*, and others, and adapted plays from the Fr. See G. Harrison, *The Life and Writings of John Howard Payne*, 1885, and W. T. Hanson, *The Early Life of John Howard Payne*, 1913.

**Paysandu**, dept. of Uruguay, S. America, with an area of 5115 sq. m. and an important cattle industry. Wine is produced and the dept. is rich in minerals. The fn. of P., on the Uruguay R., is the cap. of the dept. of P. and the second city in the republic. There are large slaughter-houses, and tinned meat and tongue are exported. P. is the centre of the meat-preserving industry. Other activities are breweries, distilleries, tanneries, sugar refineries, shoe and soap factories. P. is the headquarters of the Midland Railway. The city is being modernised. By rail it is 300 m. from Montevideo. Pop. (dept.) 84,200; (city) 50,000.

**Pazand, or Avesta**, see under *PERSIAN Language and Literature*.

**Paz, La**, see *LA PAZ*.

**Paz Soldan, Mariano Felipe** (1821-86), Peruvian historian and geographer, b. at Arequipa; studied and later practised law there and at Lima, in 1860 he became director of public works. He wrote *Atlas Geografico del Peru* (1861); *Historia*

*del Peru independiente* (1866); *Diccionario Geografico estadistico del Peru* (1877); and *Historia de la Guerra del Pacifico* (1884).

**Pea**. Two species of *Ps.* are cultivated in Britain, and of both there are a large number of varieties. The garden P. (*Pisum sativum*) is not known to exist in a wild state; its flowers are white, and its seeds are yellowish-white or bluish-green. They are gathered unripe and eaten as green *Ps.*, one of the most nutritious and popular vegetables. The earliest crops are raised from seeds of forcing varieties sown in gentle heat in Dec. The earliest outdoor plants are raised from seed sown under glass in Feb. and planted out in

PEA  
A garden pea; B, sugar pea

March or April. The field P. (*Pisum arvense*) has purplish flowers, and is harder than the garden P. It is, however, a very uncertain farm crop, doing best on light land rich in lime; it follows barley in a rotation. The dry straw or haulm averages about a ton per acre, and is used as fodder. The variety known as the sugar P. has an edible pod.

**Peabody, George Foster** (1795-1869), Amer. philanthropist, b. at Danvers (later Peabody), Massachusetts; but having amassed a fortune as a dry goods merchant, he settled in England in 1837, where he continued in business. He gave largely to educational institutions, and was a lavish donor to Harvard and Yale. He is principally remembered in England for his gifts to the London poor, amounting in all to half a million sterling. Out of this sum were built the 'P. Dwellings,' the first of which was opened in Spitalfields, in 1864. A retiring man, he declined a baronetcy and the G.C.B. In 1868 he estab. a museum of archaeology and ethnology at Harvard and of natural hist. at Yale. In 1940 there was estab. in his memory Radio Awards for meritorious service by broadcasters.

**Peabody**, city of Massachusetts, U.S.A., in Essex co., 17 m. N.E. of Boston, with leather industries. Formerly S. Danvers,

in 1868 it was renamed after George Peabody (q.v.), who was a native. Pop. 21,700.

**Peace, Albert Lister** (1844-1912), musical composer, b. at Huddersfield, and commenced his career at the early age of nine years, when he was organist of Holmfirth par. church. In 1875 he was doctor of music at Oxford Univ. His compositions are extremely difficult—quite beyond the range of the ordinary organist—and include a setting of Psalm cxxxviii., a cantata, 'St. John the Baptist,' numerous anthems, services, etc.

**Peace, Charles** (1832-79), Brit. criminal, b. at Sheffield, where he received his first sentence for robbery in 1851. Before his execution at Leeds on Feb. 25, 1879, for the murder of Arthur Dyson on Nov. 29, 1876, he confessed to many burglaries and to the murder of a policeman at Manchester in 1876.

**Peace Ballot**, unofficial referendum on the subject of peace or war sponsored by the League of Nations Union in 1935 to test public opinion on four specific questions, the public being asked to reply 'Yes' or 'No' to each: whether they were in favour (1) of the League of Nations; (2) of all-round disarmament; (3) of the private manuf. of arms; and (4) (a) of economic and (b) military action against an aggressor nation. The total papers returned was 11,640,066, and exceeded the most sanguine expectations of the organisers. The vast majority of the answers to most of the questions were in the affirmative, the largest number of negative answers being to question (4) (b) 2,366,184, and to question (3). The moving spirit in the ballot was Lord Robert Cecil (q.v.). The announcement came at an opportune moment, for Brit. attachment to the ideals of the League of Nations was soon to be put to the test over the Italo-Abyssinian crisis.

**Peace, Breach of**, see BREACH.

**Peace, Clerk of the**. This Eng. functionary is clerk to the co. council and is appointed by a joint committee of quarter sessions and the co. council. He is not salaried, but is paid fees for his various duties. He keeps the records of quarter sessions, issues precepts to overseers for the collection of rates, attends either personally or by deputy the justices in quarter sessions and advises them on the law relating to cases before them, and receives and takes custody of the quarterly returns of deaths from the local registrars of births, deaths, and marriages. A C. of the P. is generally by profession a solicitor, like a tn. clerk of a bor. He cannot sit in parliament, as he is bound to devote all his time to his official duties. Formerly voters' lists were dealt with by the C. of the P. through the overseers, but, since the Local Government Act of 1925, these duties were transferred to the registration officer, who is usually the tn. clerk.

**Peace, Commission of**, see JUSTICES OF THE PEACE.

**Peace Conference**. For P. Cs. before the First World War, see HAGUE CONFERENCE. For P. Cs. after the First World

War, see PEACE CONFERENCE (1919); LOCARNO CONFERENCE AND TREATIES; also COVENANT OF THE LEAGUE OF NATIONS.

**Peace Conference (1919)**, assembled on Jan. 18, 1919, in Paris. There were seventy delegates representing thirty states. Great Britain, the U.S.A., France, Italy, and Japan sent five delegates each; Belgium, Brazil, and Serbia three each, and the remainder two or one. After the formal opening, the conference sat but rarely, its sessions being largely ceremonial. The actual work was carried on by special committees, which discussed such individual topics as the 'league of nations,' 'reparations,' 'war responsibility,' 'labour legislation,' etc. The committees sat *in camera* and only such reports as were approved by the spokesmen of the Great Powers were submitted to the plenary conference. Originally there was a Council of Ten, constituting the Supreme Council; this was reduced to five and then, after Japan dropped out, to four—Wilson, President of the U.S.A., Clemenceau, Lloyd George, and Orlando of Italy. Then Italy withdrew over the Fiume question and the council was reduced to the 'Big Three.' Differences of outlook were hard to reconcile. Wilson's main preoccupation was with his project for a league of nations (see also FOURTEEN POINTS), while Great Britain was concerned chiefly with the supremacy of the seas and the control, through the mandatory system, of the Ger. colonies. The principle of self-determination proved a thorn in the settlement of boundary disputes, notably as between the Balkan states, Poland and the Ukraine, the Poles and the Czechoslovaks, and Italy and Yugoslavia. France held strong views on her rights to economic privileges in Germany and special political and financial privileges in the Saar valley. A proposed defensive alliance between Great Britain, France, and the U.S.A., contrary to the earlier pronouncements against alliances within the league, was also one of the causes of delay. In the result, President Wilson, rather than incur possible opposition to his League of Nations, gave way on such of the above questions as were really opposed to his ideals; but even though the It. delegates acceded for a time, he refused to yield to the It. demand for the cession of ter. guaranteed to Serbia by various secret treaties. Difficulties also arose over a territorial settlement in the Pacific, owing to the traditional conflict of interests between Australia and New Zealand on the one hand, and Japan on the other. But after some four months of deliberations, the allied diplomatists submitted the draft of the proposed treaty with Germany to the Council, and this draft was accepted by the P. C. in plenary session on May 6. On May 7, the P. C. having become the Peace Congress, at which Germany was to be represented, the draft was handed to Count Brockdorff-Rantzau, the foreign secretary of the Ger. republic, at Versailles, and accepted, though only after protests and

a political crisis in Germany, unconditionally on June 23, the last day of grace. After the treaty was ratified, further conferences were held at San Remo, The Hague, and Spa in April, May, and June 1920 respectively, to discuss reparations, disarmament, mandates, and the Adriatic question. For Peace Conference with Turkey see under LAUSANNE.

*Sequel to the Peace Settlement of 1919-1920.*—The peace settlement of 1919-20 was ill calculated to promote peace even for a limited period. The new co-operative system embodied in the League of Nations was stultified from the start by the defection of its protagonist's (Wilson's) country and by the fact that it was not sustained by the organised opinion of the nations as a whole. There were grave inherent imperfections in the treaty of Versailles, not the least of which was the lack of large-scale economic planning. The severity of the treaty struck the weak Weimar Republic a mortal blow, for in Ger. opinion it identified democracy with humiliation. Moreover the Fr., under the lead of Clemenceau, were dissatisfied with the peace settlement which, in their view, afforded them no real security because of the Anglo-Amer. veto on the separation of the I. b. of the Rhine and on the Fr. annexation of the Saar. France, too, regarded the League of Nations as an Anglo-Amer. creation and therefore reposed no confidence in its practical utility in time of need. The League membership seemed to show that the body was merely a perpetuation of the victorious allied and associated powers (minus America), involving the sharp div. of Europe between the satiated and the hungry, or the 'Haves' and the 'Have-nots.' As a fully satisfied power it was natural for the Brit. Empire to welcome the experiment of the League and its Covenant as a stabilising influence in the world offering, through the machinery of collective security, a way of escape from nineteenth-century isolationism on the one hand and, on the other, from provocative alliances like the Anglo-Fr. *entente* and the Brit. alliance with Japan. Thus the 'peace settlement' contained the seeds of a new conflict and the peace was lost as soon as the military victory was won. It has been said with truth that there were only two ways of averting another contest: the first was the path of reconciliation implicit in the Fourteen Points (q.v.) and outlined in Lloyd George's memorandum of March 25, 1919; the rival policy, favoured by most Frenchmen, consisted in depriving Germany of the means of aggression. The first would have involved admitting Germany to the League of Nations soon after the foundation of that body, fixing reparations (q.v.) at an amount capable of being paid within a generation, the fulfilment of Article VIII. of the covenant concerning disarmament, and the return of some colonial ter. under mandate. During the Locarno quinquennium it seemed as if France were converted to the policy of reconciliation, but the change was only

superficial. Locarno was a failure, not necessarily because it was based on unsound principles, but because it was not implemented by larger measures of conciliation. The Locarno treaties, though they had their origin in Germany, were never more than an illusion, for Russia necessarily looked upon them as a one-way arrangement designed to stabilize the W. while leaving the E. open to Ger. attack. Throughout the two decades between the two world wars the theory of the balance of power was never abandoned and, rightly or wrongly, Germany regarded the Franco-Russian Treaty of 1933 as a violation of the Locarno settlement. Briand's scheme for a European federation, outlined at the League Assembly of 1929, provoked much discussion, but was soon dropped, for the states and peoples had too little confidence in one another to co-operate systematically in great affairs. The various pacts and protocols, and treaties of mutual assistance drafted from time to time at Geneva, were regarded by many as likely to revive the old system of military alliances and therefore as being contrary to the spirit of the covenant; while the much-advertised Kellogg Pact, which declared that the signatories were not debarred from the right to defend themselves against unprovoked attack, was thereby reduced to the level of a pious assertion. The optional clause (q.v.), referring disputes to the permanent court of international justice, was futile, for the signatories pledged themselves only to the submission of legal or treaty disputes, thereby excluding many of the most inflammable problems. Disarmament proved a snare, for no one could force, after the Washington treaties, which were proudly described by Balfour as an unmitigated benefit to mankind, that Japan would before long abandon her conciliatory mood, resume her expansionist drive, and repudiate her treaty obligations. France, following the repudiation of Wilson by Congress in 1920, concluded agreements with Belgium in 1920, Poland in 1921, and Czechoslovakia in 1924, and then looked in vain to Curzon for a new military alliance with England. In 1934, when France, alarmed by Hitler's armament estimates, broke off discussions with Germany, disarmament was dead. Finally the rearmament of Germany, the It. invasion of Abyssinia followed by a vacillating policy of sanctions by Britain and France, the dispatch of Italo-Ger. troops to Spain to support Franco, to say nothing of Jap. aggression in China, not only threw peace to the winds but were in effect the rather obvious beginnings of the new world conflagration, which was indeed the more probable from the undignified efforts of Britain to appease the dictators coupled with her glaring military weakness. When Britain's belated rearmament campaign at last got into its stride its effect was to bring war nearer, for with her vast resources her strength was bound to grow quickly from year to year, while Hitler and Mussolini, who had then long been preparing for conflict, adjusted their time-tables accordingly and,

in the result, struck when their power was at its zenith. The attempt to organise the world was, however, again made after the end of the Second World War, in the United Nations Organisation. In the result of the race between global unity on the one hand and means of mass destruction on the other, the future of civilisation lies.

**Peace River**, riv. of W. Canada, rising in the Rocky Mts., near 50° N. lat., Columbia. It flows N.E., receiving the drainage of Lake Athabasca, and finally empties its waters into the Great Slave

National Film Board, Canada

**PEACE RIVER BRIDGE ON THE ALASKAN HIGHWAY, AT THIRTY-FIVE MILE POST**

Lake, being for the last 120 m. called Slave R. The dist. drained by it is usually known as the P. R. dist. Its length is estimated at 1100 m. See F. H. Killo, *Peace River Country*, 1927.

**Peace Treaties:** 1. First World War. Treaty of Brest-Litovsk, between Russia and Germany, March 3, 1918; preliminary peace between Rumania and Central Powers, signed at Bucharest, March 6, 1918,

and ratified May 7, 1918; annulled at Versailles, 1919; treaty of Versailles signed by the Allies and Germany, June 28, 1919, ratified in Paris, Jan. 10, 1920; treaty of Saint-Germain-en-Laye, between Allies and Austria, signed Sept. 10, 1919, ratified at Paris, July 10, 1920; treaty of Trianon, between Allies and Hungary, signed June 4, 1920; treaty of Neuilly, between Allies and Bulgaria; signed Nov. 27, 1919, ratified in Paris, Aug. 9, 1920; treaty of Sevres between Allies and Turkey, signed Aug. 10, 1920 (never ratified); treaty of Lausanne, between Allies and Turkey, signed July 24, 1923; ratified in the autumn of 1923 (for clauses see under individual heads). 2. Second World War. Treaties between the Allies and Ger. satellites were signed and ratified in 1947, namely with Italy, Hungary, Rumania, Bulgaria, and Finland (the U.S.A. was not at war with the last of these), having been drafted by Britain, America, Russia, and France.

**Peach**, luscious fruit of *Prunus persica*, a tree (family Rosaceae) which was introduced from the E. to S. Europe early in the Christian era and to Britain in the sixteenth century. The P. and the neotame, a smooth-skinned variety, were formerly much grown in the open air, but the bulk of the market supply at the present time is grown under glass, where temps. of 45° at night and 55° by day are sufficient until the fruit has stoned, when it may be raised 10°. For the production of fruit by June the trees are started in Dec.; they are sometimes trained on walls and sometimes on wire frames. Both soil and atmosphere must be kept moist through the growing season. Outdoor culture on walls facing S. with proper management is successful in S. England. The early bloom and growth need shelter from spring winds and frosts by means of a coping fixed near the top of the wall over the trees, light (canvas or other material being suspended from it during frosts nights. Planting is best done in the autumn in soil only moderately rich, but containing lime. Ps. were introduced into N. America by European settlers, and are now extensively cultivated. The P. reaches its highest perfection in the middle states: they are grown in orchards like apples.

**Peacham's Case.** The case of Edmund Peacham, rector of Hinton St. George, Somersetshire, who was convicted in 1616, of high treason for having written a sermon which made seditious reflections on the Crown and gov., but which had neither been printed nor pub. The case arose over the gov.'s resolution to call upon all England for a general benevolence. Somersetshire was one of the cos. which had taken the lead in protesting against the imposition. Peacham had been prosecuted in the high commission court for a libel on his bishop and on the consistory court and sentenced to be deprived of his orders. Pending that prosecution his house was searched, apparently for papers connected with the alleged libel, and the officials happened to find a MS. treatise in the form of a sermon,

together with some loose sheets containing, in very offensive language, such an attack on the personal conduct of the king and the actions of his ministers as would, if published (on 'publication' in this context, see *IBST*), have amounted to a seditious libel. The king's council jumped to the conclusion that the sermon, far from being an isolated piece of puritanic intemperance, had been prepared to further a conspiracy of the Somersetshire gentry. Peacock was put to the rack in the vain expectation that he would reveal a plot which had never existed. The king and his council then decided to proceed against him, not for a seditious libel, but for treason under the statute of Edward III. (see *THEYSON*) in 'compassing the king's death.' Lamb directed Bacon, then attorney-general, to confer with the judges of the king's bench to ascertain, and no doubt influence, their opinion. Chief Justice Coke objected to this mode of taking judicial opinions as contrary to the custom of the realm. The service judges, however, did not hesitate to give an opinion favourable to the Crown. Coke gave an equivocal written opinion, of the two grounds for questioning the treasonable nature of the sermon first, that it had never been pub., secondly, that even if it had it did not amount to treason. Coke appears to have passed over the first, but boldly asserted that no mere declaration of the king's unworthiness to govern amounted to treason. P. was brought to trial at Taunton assizes, convicted and sentenced to death. He was not, however, executed but died in jail seven months later.

Another notorious case which arose out of the forced benevolence was that of Oliver St John who on being applied to by the mayor of Marlborough for a contribution, replied in a letter that all such contributions were contrary to Magna Charta and other Acts including the well-known Act of Richard III. and that it was improper for private individuals to oppose their judgment to that of the Commons in Parliament, who had refused to grant any supply. He concluded by charging the king (James I.) with breaking the coronation oath and declared his belief that to pay the benevolence would be to support the sovereign in perjury. In consequence of the letter St John was committed to the Tower and sentenced by the Star Chamber to pay a fine of £5000 and to be imprisoned during the king's pleasure. The fine was afterwards remitted, but he was not set at liberty for some time.

**Peacock, Thomas Love** (1755-1866), Eng. novelist and poet, b. at Weymouth, son of a glass merchant, Samuel P. of London, who left him an orphan at the age of three, his mother being Sarah Love, daughter of a master in the navy, a woman of strong character, who sympathised with her son's literary aspirations. He pub. a vol. of poetry, *The Monks of St Mark*, in 1801, and another, two years later, *Palmyra*. In Wales, where he passed 1810-11, he met his future wife, Jane Gryffith, whose

personality he is said to have adumbrated in his fragmentary romance, *Sir Calindore*. He pub. more poetry, including *The Philosophy of Melancholy* (1812), and in 1811 produced a satirical ballad, *Sir Prichard*. He became friendly with Shelley, who assisted him with money. His novels of this period were *Headlong Hall* (1816); *Melincourt* (1817), and *Nightmare Abbey* (1818). These with *Sir Calindore*, are brilliant prose extravaganzas, and full of humorous dialogue and situations; but, if they secured a certain vogue, they were not productive of much profit. About this time he was given an appointment in

T. L. PEACOCK

the India Office, which made him independent. Just prior to this he had nearly completed his romance *Maid Marian*, its delayed pub. (1822) led to the supposition that he had plagiarised Scott's *Ivanhoe* but in fact it was written before that work. It was dramatised in Planché's opera libretto of the same title (music by Bishop). He seems to have shown marked ability in his official capacity, particularly in drafting official papers. His official work interfered somewhat with his literary labours, but in 1829 he pub. *The Misfortunes of Elphin* (travesties the Reform Act under the guise of anct. Welsh hist.), and in 1831 *Crochet Castle*. His last novel was *Grange* (1861). His short novels (*Headlong Hall*, *Nightmare Abbey*, and *Crochet Castle*) are unique in form and content in Eng. literature. Many of the leading figures of his day—Coleridge, Shelley, Byron, Annan—are the butt of his good humour, Aristophanic satire. In each the scene is laid in the country house of some *parriculi* Maxima, who gives a house party at which a number of ill-assorted and violently opposed intellectuals drink and pass the bottle and gormandize while wrangling with each

other in a witty disputatious symposium. Talk is the action in these novels. Slen-derly interwoven amongst the disputation are one or more love stories of an agreeable if flimsy character which the author doubtless only inserted as a concession to the literary conventions of the day. Interspersed in the dialogue are many delightful lyrics and snatches of verse, largely of a convivial strain, and indeed here may be found some of the finest drinking songs in the language. The 'Headlong ap Headlong' chorus in *Headlong Hall* and 'If I drink water while this doth last' in *Crichton Castle* are excellent examples of a now vanished form while *Cypriotes* (Byron) song in *Nightmare Abbey* (There is a fever of the spirit) is as Byron in the best sense as anything Byron himself wrote. His works all too little read give abundant evidence of a strong personality, and of gifts of humour and satire. He is described by Sir Edward Blyden as a kind hearted genial friendly man who loved to share his enjoyment of life with all around him and self indulgent without being selfish. The standard ed. of P's works is the *Hallford ed.* in 10 vols by H. F. B. Brett-Smith and C. E. Jones (1924-34). There is also an ed. of his novels by D. Garnett (1948). See lives by C. van Dorn (1911), J. B. Priestley (1927) and B. T. Collier, 1937 and memoirs by Sir Henry Cole 1875 and R. Garnett 1891 prefixed to their eds. of *Life and Works*. See also A. M. Freeman *John is John* 1891. *Peacock: a critical study* 1911 and A. H. Able, *Meredith and Peacock: a study in literary influence* 1933.

PEACOCK

Peacock, or Peafowl (*Pavo*) small genus of beautiful gallinaceous birds. The common P (*P. cristatus*) is a native of India and Ceylon, in parts of which P

shooting is a recognised sport. It is bred to a small extent in France for the production of the feathers. The flesh of young birds is white and resembles a pheasant's in flavour but though formerly much valued as a table delicacy is now rarely eaten. The eggs are also edible; but it is chiefly for the beauty of the cock's plumage that it is kept. If enclosed they are very mischievous and are best given a large space containing a shrubbery or they may not breed. The male should have three to six hens with him. The hen lays about ten eggs in the spring and incubation takes thirty days. She remains with her chicks eight months, and is therefore the best mother for them. The male's head, neck and breast are blue purple and the head bears a crest of feathers webbed only at the tip. The feathers of the back are green with copper coloured lining the whitish wings are striped or barred. The glossy green feathers on the tail are the tail coverts the true tail feathers being a dark rich chestnut. The female's plumage is much less subdued. The lap I (*P. mutus*) is a very beautiful species and breeds freely with the other. There is a third species the black winged I (*P. p. jennys*) which is believed to be a hybrid of the common species.

Peacock Butterfly (*Panassa io*) beautiful and common butterfly measuring about 2 in across the wings which are a dull blue or brownish red and which bear a black eye rather like those in the peacock's tail. The butterfly hibernates through the winter and in early spring lays its eggs on stinging nettles; they hatch into a black and yellow caterpillar, with six rows of black spines and a series of white dots arranged transversely along the body.

Peafowl, see PEACOCK.

Peake, Harold John Edward (1867-1941) Brit archaeologist and anthropologist at Liverpool trained at Leicester for estate management whence he acquired considerable knowledge of land tenures and thus enabling him to write on old records in *Memorials of Leicestershire*. He travelled widely in India and the Far East countries. He was made honorary curator of Newbury Museum which he developed as an important archaeological centre. A pioneer in the investigation of the distribution of types he realised the close interdependence of physical anthropology and material archaeology, as may be seen from his *Beginnings of Civilisation* (1913). P was a member of the council of the Society of Antiquaries (1928-30), and was awarded the Huxley medal of the Royal Anthropological Institute in 1940, for his *Study of Prehistoric Times*. His other works in this field include *The English Village* (1922), based on his lectures at the Univ. College of Wales, *The Corridors of Time* (with H. J. Fleure 1921), *The Archaeology of Berkshire* (1926), while his more popular works include *The Origin of Agriculture* (1926), *The Flood* (1930), and *Early Steps in Human Progress* (1933).

Peak, The, mountainous tract of NW

Derbyshire, England, much visited by tourists on account of its extraordinary caverns and other curiosities. It forms the culminating point of the Pennine Chain, and its prin. summits are Kinder Scout (2084 ft.), Axe Edge, and Mann Tor. Castleton is the chief tn. of the dist., which is drained by the Derwent, the Wye, and the Dove. Peveril Castle, now in ruins, was built by a natural son of William the Conqueror, and stands on a rocky eminence. The Devil's Hole, near Castleton, is another feature of interest. The dist. abounds in minerals. The P. is scheduled to become a national park. See Sir W. Scott, *Peril of the Peak*, 1822.

**Pea Nut, Ground Nut, or Earth Nut, see GROUND NUT.**

**Pear.** The origin of the P., as of many other long cultivated fruits, is uncertain. Flay mentions thirty-two varieties in cultivation by the Romans, and some authorities hold that all the existing races are derived from a single species. Two distinct forms appear to be natives of Britain—*Pyrus communis*, with small and bitter fruits, and *P. cordata*, the lesser, or Celtic P., with small apple-like fruits and leaves heart-shaped at the base, occurring wild in Devonshire, Cornwall, and Brittany. The bergamot Ps. are derived from *P. persica* (peach), and some Fr. varieties owe their origin to the Austrian snow-leaved P. The edible fruit of *Persea gratissima* (or *americana*) is the avocado P. of the tropics. It is also known as the Alligator P. The P. tree is less straggling and more erect than the apple, and its long-stalked leaves, which vary considerably in shape, turn black when dried. A red-flowered P. occurs in S. Europe, but as a rule the corymbose clusters are white and appear two or three weeks before the apple bloom. The wood of the P. is fine-grained, heavy, and strong; its chief use is for making drawing instruments. Ps. are naturally deep rooting and are therefore often grown on quince stock, the roots of which are shallow; though some varieties, which dislike direct contact with the quince, have to be double-grafted. Trees should be planted in the autumn in a well-drained site protected from the N., and the larger varieties do best on S. walls. Ps. are best gathered before they are absolutely ripe and stored in a slightly warmer temp. than apples.

**Pearl, Raymond** (1879-1940), Amer. biologist; b. at Farmington, New Hampshire. He graduated at Dartmouth, 1899, gained his Ph.D. at the Univ. of Michigan, 1902, and studied in Leipzig and London. From 1925 he was director of Institute for Biological research, Johns Hopkins Univ. He is chiefly known for his work on heredity and variation. *Publ.* include *Variation and Differentiation in Ceratophyllum* (1907); *Modes of Research in Genetics* (1915); *The Nation's Food* (1919); *The Biology of Death* (1922); *Introduction to Medical Biometry and Statistics* (1923); *Studies in Human Biology* (1924); *The Biology of Population Growth* (1925); *Alcohol and Longevity* (1926); *To Begin With* (1927); *The Rate of Living* (1928); and *The National History of Population* (1939).

**Pearl**, lining of the shell of many marine and fresh-water molluscs. It is a secretion laid on in a very thin coat and overlaid repeatedly so that it attains considerable thickness. It consists of calcium carbonate, with various organic matters; sp. gr. 2.3 to 2.7. The iridescence is partly due to the number of very thin layers and probably to the varying conditions of growth. P. is produced chiefly by *Arviculidae*, *P. oysters*, and the riv. mussels, *Unionidae*.

*Mother of Pearl* consists simply of the lining, which is cut out and fashioned into useful and ornamental articles, and is particularly used for inlay work. It is obtained from species and varieties of the genus *Margaritifera*, the best coming from Macassar, Maula, and W. and N. Australia. The Straits Settlements, Panama, and some Pacific Is. send large quantities into the markets.

**Distribution.**—The Persian Gulf, particularly round the Is. of Bahrain, is especially noted for its auct. and magnificent ground. There are other fisheries in the Polyneesian Is., the Sulu Archipelago, off New Guinea, W. Australia, Queensland, Torres Strait, Ceylon, and America off Lower California. The species containing the Ps. are *M. vulgaris*, *Arlicula macroptera*, and *M. fucata*; the last-named provides the finest specimens in the Persian Gulf.

**Formation.**—Ps. are due to the attempt on the part of the mollusc to kill and rid itself of a minute worm. In the case of the Ceylon fisheries, Herdman made a complete study of the question; the parasite was a larva of a tapeworm, and the life-history is traced; in the free-swimming stage it attacks the oyster, which is devoured by the file-fish, the ray which feeds on this being the host of the adult form. Lyster Jameson, in the case of the common mussel, found that the pest was a trematode, the adult of which is found in the eider duck and scoter; their droppings infect the cockles and carpel shells and those in their turn the mussels. Sand and other irritants may in some cases also be the nucleus round which the Ps. are formed. In any case the mollusc surrounds the irritant with an excretion which solidifies into a thin layer of 'nacre,' more and more concentric layers are added, until an almost truly spherical P. is formed. These are found chiefly in the soft parts of the mollusc, or loose. Some are found in the shell and are hemispherical, the *perle bouton*. *Perle Baroque* is solid and not so well shaped, while *coq de perle* is hollow and covered with irregular knobs. *Fresh-water pearls* are found in the N. hemisphere in riva. of the temperate region; fishing was carried on in Scotland some three hundred years ago, and Brit. Ps. are mentioned by Pliny and Tacitus. *False pearls* are clever imitations; the scale of fresh-water fish is digested in ammonia and injected into thin glass balls till the film forms on the inner surface; wax or gum is then injected to give a solid interior, while the glass is removed by hydrofluoric acid. 'Cultured' Ps. are

produced by introducing into its flesh a foreign substance, which the oyster covers with nacre.

See E. W. Streeter, *Pearls and Pearling Life*, 1886; Sir W. A. Herdman, *Report to the Government of Ceylon on the Pearl-oyster Fisheries of the Gulf of Manaar*, 1903-5; G. F. Kunz and C. H. Stevenson, *Book of the Pearl*, 1908; L. Rosenthal, *Au Royaume de la perle*, 1926; and F. D. Burdett and P. J. King, *Odyssey of a Pearl Hunter*, 1931.

Pearl-ash is prepared from wood ash. The potash is extracted by solution, evaporated out and strongly heated, thus giving a refined 'potash.' The chief

submarine was sighted at 6.30 a.m. in the prohibited area outside P. H. and sent to the bottom. Later three midget Jap. submarines passed unmolested into the harbour, the net across the entrance not having been closed. The air attack, carried out by small waves of planes from sev. aircraft-carriers came from the N. Less than 200 Jap. planes took part, but their attack was directed to predetermined objectives. The prin. airfields (those at Kurehok, Ewa, Wheeler Field, and Hickam field) were singled out for attack. There was heavy loss of Amer. life, and almost every Amer. plane was destroyed or disabled on the ground.

Imperial War Museum (rown copyright)

PEARL HARBOUR: DECEMBER 1941

constituent of P. is potassium carbonate,  $K_2CO_3$ . P. is of interest as the first drying agent for gases; it was introduced for this purpose by H. Cavendish about 1770.

Pearl Harbour, inlet with a narrow entrance, about 7 m. W. from Honolulu, Oahu Is., belonging to the Sandwich or Hawaiian group, in the E. Pacific Ocean. In order to protect the Pacific coast and to control the Panama Canal, the U.S.A. Gov. fortified it; important and extensive military works were constructed. The dredging of P. H. was finished in 1912, and dry docks, fortifications, as well as a naval station, constructed. The dry dock at the naval station was officially opened in Aug. 1919. On Dec. 7, 1941, P. H. was suddenly attacked by a large force of Jap. bombers and great damage was done to warships, installations, etc., with considerable loss of life. Thus was America forced into the Second World War.

*The Japanese Attack on Dec. 7, 1941.*  
—Prior to the Jap. air attack a Jap.

Later, Jap. torpedo-planes came in line astern, turned round Ford Is., and headed for the Amer. battleships, which were anchored bows to stern like a string of barges. Again there were serious casualties, and many ships were sunk, including the battleships *Oklahoma* and *Arizona*.

Fifth-column treachery played a large part in the success of the Jap. attack. The official report of the Roberts Inquiry Board shows that there were some 200 agents in Honolulu alone who were acting under orders from the Jap. consul-general. A host of spies were organised as café-owners, petty merchants, and contractors, all in the pay of the Jap. 'tourist bureau,' and all profiting by their Amer. citizenship. The chief fifth-columnist body, composed largely of Jap. 'students,' was financed by agents of the S. Manchurian Railway Company and, being sufficiently numerous to control elections, they placed their own officials in important posts in the public utility services and in the civil service. This gave them ample oppor-

tunity to gauge the precise naval strength in P. H. The board, however, considered that the attack would have been far less damaging but for the over-confidence and complacency of the Amer. armed forces. Months before the attack the commanders, Lt.-Gen. Short of the army and Adm. Kimmel, commander-in-chief of the Pacific Fleet, had been warned by the Amer. Gov. in Washington to expect war with Japan, which would probably begin with a surprise attack on P. H.; but the sole precaution taken was to increase the guard against sabotage. The all-important airfields were laid out without the slightest concealment or camouflage. Yet although the commanders above mentioned had to assume responsibility for Hawaii's military unpreparedness, all America was morally guilty. As has been well said, Hawaii, sitting behind its 'Magnificent Line' of the Pacific Fleet, simply reflected the over-confidence and complacency of the mainland. The reports of the army and navy boards of inquiry and statements on them by the secretaries of war and the navy were made public in Aug. 1915. The Army Board concluded that the extent of the disaster was due primarily to the failure of Gen. Short adequately to alert his command; to the failure of the war dept. to direct him to make an adequate alert; and to the failure to keep him sufficiently informed of developments in negotiations between Japan and the U.S.A. The board also criticised Gen. Marshall for not keeping Gen. Short fully advised of the growing tenseness of the Jap. situation and for not investigating the state of readiness in Hawaii between Nov. 27 and Dec. 7 (information in Washington on Dec. 6 indicated an almost immediate break with Japan). But the secretary of war, while considering that Gen. Short's relief of command was sufficient punishment for his errors of judgment, resisted the criticism of Gen. Marshall as also criticism of Mr. Cordell Hull. The Navy Board found that Adms. Stark and Kimmel did not do the necessary things to prevent just such a defeat as had occurred and that they failed to demonstrate superior judgment. The secretary of the navy directed that neither Adm. Kimmel nor Adm. Stark should hold any position which required the exercise of superior judgment. Neither the secretary of war nor the secretary of the navy considered that any officer concerned with the disaster should be court-martialled, and in this they agreed with the recommendations of the boards of inquiry that nothing further should be done. See U.S. State Dept. White Paper, *A Record of the Efforts for Peace and American Foreign Policy during the Fateful Decade from 1911 to 1941*; O. D. Tollsma, *Tokyo Record*, 1943; and D. Marley (ed.), *The Daily Telegraph Story of the War*, vol. II., 1913.

Pearl Islands, small group of is. in the bay of Panama, 80 m. S.E. of Panama, belonging to Colombia. Pearl fisheries are carried on.

Pearall, Robert Lucas de (1795-1856), Eng. musician and composer, b. at Clifton.

Besides his musical works (including madrigals and cantatas) he made a trans. of Schiller's *Wilhelm Tell*. He lived much in Germany, and his compositions and theories were influenced by the strict style of the classical Germanic composers.

Pearse, Padhraic (Patrick) Henry (1879-1916), Irish politician and scholar, b. in Dublin; associated from his youth with the literary side of the extreme nationalist movement and an original member of the Sinn Féin organisation. He founded St. Enda's College, a secondary school for boys, designed for the encouragement of Irish nationalism. In 1897 he also founded the New Ireland Society. He was elected to the executive of the Gaelic League and ed. its weekly journal. On the outbreak of the Easter rebellion (1916) he became commander-in-general of the Irish Republican Army and president of the Provisional Gov., and he was a signatory of the declaration of the Irish Republic. After holding out for a week against the gov.'s troops he surrendered unconditionally, was tried by court martial and executed. He was the author of poems, stories, critiques, and plays. His *Collected Works* were pub. in two vols. (1917 and 1918).

Pearson, Sir Cyril Arthur (1866-1921), Eng. journalist and newspaper proprietor, b. at Wokeley, near Wells; educated at Winchester. He began his journalistic career by joining the staff of Sir George Newman. Having won a competition, he secured a sub-editorship on *Tu-Bits* as a prize. He became manager of the firm; but, after remaining in this position for four years, left to start *Pearson's Weekly* as an independent venture. This was followed by *Home Notes*, *Pearson's Magazine*, *Short Stories*, *Ladies' Magazine*, *M.A.P.*, *Daily Express* (1900), and *Rapid Review*. In 1905 he became owner of the *Standard* and chief owner of the *St. James's Gazette*. In 1910 his sight began to fail, and he soon went totally blind. Thereafter, he devoted his chief energies to promoting the welfare of the blind. Founded St. Dunstan's charity for blinded sailors and soldiers, 1915. In 1916 he was made baronet; G.B.E. 1917. Wrote *Victory over Blindness* (1919). See life by S. Dark, 1922.

Pearson, Hesketh (b. 1887), Eng. author, b. at Hawford, Wiltshire; educated at Bedford Grammar School. In 1911 he went on the stage, and took part in various productions by Treco, Granville Barker, and George Alexander. After service in the First World War he returned to the stage, but during the next ten years he also made a beginning in literature with the pub. of four books, of which *Modern Men and Manners* was the first (1921). With *Doctor Parva*, pub. in 1930, he entered upon the career in which he has since made a wide reputation in England and America as a writer of biographies notable for their zest, humour, and power in delineating character and describing incident. These include Sydney Smith (*The Smith of Smiths*, 1931), Heslitt (*The Fool of Love*, 1934), Gilbert and Sullivan (1935), Lauchcourie (*Lobby*, 1936), Tom Palus (1937), John Nicholson (*The Hero*

of Delhi, 1939) and Bernard Shaw (1942). He has since written lives of Conan Doyle (1943), Oscar Wilde (1946), and Dickens (1949). His autobiography, *Thinking It Over*, was pub. in 1938.

**Pearson, John** (1813-86), bishop of Chester, b. at Great Snoring, Norfolk; studied at Cambridge, fellow of King's College (1834-40), M.A. (1839), D.D. (c. 1860). In 1840 he became prebendary of Salisbury and rector of Thorington, and in 1845 acted as chaplain to Goring's army, the last remnant of the Royalist forces. In 1854 he accepted a charge at St. Clement's, Eastcheap, London, and in 1859 pub. his sermons. In *Exposition of the Creed*, a work of great ability and reputation. In 1860 he became master of Jesus College, Cambridge; in 1861 joint superintendent with John Karle of a trans. of the Prayer Book into Lat.; in 1862 master of Trinity College, Cambridge; and in 1873 bishop of Chester. His *Minor Theological Works*, ed. with a memoir by E. Churton, were pub. in 1844.

**Pearson, John Loughborough** (1817-97), Eng. architect, b. at Brussels. He came to London and worked with Anthony Salvin and Philip Hardwick, and in 1843 set up independently, becoming famous as a restorer of Eng. cathedrals. In 1870 he was responsible for the restoration of Lincoln Cathedral, and in 1879-87 accomplished his greatest original work as architect of Truro Cathedral. He also restored Westminster Hall, part of Westminster Abbey, and the cathedrals of Peterborough, Canterbury, Bristol, Rochester, Chichester, and Exeter. He became M.A. in 1853; F.R.I.B.A. in 1860, gold medalist, R.I.B.A., and R.A. in 1880.

**Pearson, Karl** (1857-1936), Eng. scientist, b. in London. Educated at Univ. College School, London, and Cambridge, where he was third wrangler. In 1882 he became prof. of geometry at Univ. College, London, and in 1885 prof. of applied mathematics and mechanics there. He was Galton prof. of eugenics in the Univ. of London, and Darwin medalist of the Royal Society. His works include *Inquiries into Human Faculty and its Development* (1883); *The Moral Basis of Socialism* (1885); *History of the Theory of Evolution and Strength of Materials* (with J. Toddhunter, 1886-93); *Socialism in Theory and Practice* (1887); *The Chances of Death, and Other Studies in Evolution* (1897); *National Life from the Standpoint of Science* (1901); *Grammar of Science* (1902, Everyman's Library, 1931); *Tables for Statisticians* (1914-30); *Life and Letters of Francis Galton* (1915-25); ed. *Biometrika* (1902-30), and *Annals of Eugenics* (1925-1930).

**Pearson, Lady**, see COOPER, GLADYS.

**Pearson, Westman Dickinson**, see COWDRAY, VISCOUNT.

**Perry, Robert Edwin** (1856-1920), Amer. Polar explorer and admiral; b. at Cresson Springs, Pennsylvania. Entered the navy in 1881, and worked as engineer's assistant on the Nicaragua Canal. In Arctic exploration he is celebrated as the first to reach the N. pole. In 1886 he reconnoitred the ground in Greenland; in 1891-

1892 he spent thirteen months in N. Greenland, crossed it by sledge, a 12,000-m. journey, and proved it to be an is. A similar sledge journey was performed in 1893-95 in N. Greenland during a twenty-five-months' stay there, and P. discovered the meteorites at Cape York. In all his journeys P. utilised Eskimoes; and we are indebted to him for studies of them, particularly those of Whale Is. Summer voyages were undertaken in 1896 and 1897. The next journey occupied four years, 1898-1902, and was again spent in exploring the N. end of Greenland and its is. The *Roosevelt*, a specially built vessel, equipped with wireless telegraphy, was used in the expedition of 1905. He reached the then furthest N. in lat. 87° 6', 200 m. from the Pole—the big 'leads' and ice drift causing great trouble. He wintered 1908-9 at Cape Sheridan in the *Roosevelt*, and started on a sledge journey in the following season for the Pole; this he reached April 6, 1909. He pub. *Northward over the Great Sea* (1898); *Near the Pole* (1907); and *The North Pole* (1911); also addresses to the Royal Geographical Society in their *Journal* (1903 and 1910). He was made a rear-admiral in 1911. See lives by F. Green, 1926, and W. H. Hobbs, 1937.

**Peasant Proprietor**, see METAYER SYSTEM and SMALL HOLDINGS.

**Peasantry**, term applied to rustics or countrymen, including agric. labourers and peasant proprietors, i.e. persons owning their own cottage and small amount of land. Every country has its peasants or rustic classes. See VILLAGES for hist. of Eng. peasants; METAYER SYSTEM and SMALL HOLDINGS. See J. C. and H. F. Cox, *Rise of the Free Labourer*, 1874; J. W. Robertson-Scott, *The Dying Peasant*, 1926; Eileen Power, *Peasant Life (c. 1100-1500)*, 1932; and M. E. Fordham, 'European Peasantry,' in vol. v. of *European Civilisation*, 1937.

**Peasants' Revolt** (1381). In the reign of Richard II. the general distress among the poorer classes in England, following on an epidemic of the Black Death, and discontent at the enactment of a statute of labourers, which attempted to prevent the peasantry taking advantage of the scarcity of labour resulting from the Black Death, came to a crisis when the poll-tax was enforced in 1379. Riots broke out in sev. parts of England and a mob, sev. thousands strong, seized Rochester Castle and marched to Maidstone. They chose Wat Tyler to be their leader, a man of obscure origin but undoubted courage. Canterbury was seized and sacked; they then marched to London. John Ball, 'the mad priest of Kent,' joined them, having been liberated from the archbishop's prison. They continued burning and plundering, and many beautiful buildings were burnt and sacked, among them John of Gaunt's palace of the Savoy. On reaching London they seized the prisons of Newgate and Fleet. London was the scene of pillage and riot. The boy king rode out to confer with Tyler, but with little effect. The mob then seized the Tower and murdered Arch-

bishop Sudbury and Sir Robert Hales. Richard again went to make peace at Smithfield; Sir Wm. Waiworth, the lord mayor of London, who rode with the king, killed Tyler; meanwhile the bishop of Norwich had routed the Norfolk rebels, and the revolt was broken. See E. Powell, *Rising in East Anglia in 1381, 1385*; Sir C. Oman, *The Great Revolt of 1381, 1386*; and L. A. G. Strong, *King Richard's Land* (for children), 1936.

**Peasants' War.** In 1524 the peasants of the Black Forest, Germany, influenced chiefly by economic distress, banded together and rose against the nobles. The revolt rapidly spread throughout the S. of the country. They demanded in twelve articles the right to elect their own ministers, to be allowed to kill wild game and to fish, and the reduction of the villain service. In Thuringia the peasants were exceedingly determined and violent. The army of the Swabian League, encouraged by Luther, defeated them at Leipheim in 1525, and over 100,000 were killed. See F. Engels, *The Peasants' War in Germany* (trans.), 1927, and O. H. Brandt, *Der Deutsche Bauernkrieg (1525)*, 1929.

**Peastone**, see **OOLITE**.

**Peat**, deposit of decaying vegetable matter in the presence of stagnant water, and formed of mosses, marsh, heath, and moorland plants. In a P. bog the surface is generally covered with growing plants, while below is the decomposing matter; the deposit may be many feet deep, becoming in the lower part brown or black in colour and compact in structure; indeed, under great pressure and at high temp. coal is produced in this manner, oxygen and hydrogen being given off till little else but carbon remains. In dists. where it abounds, as in Ireland, where P. is estimated to cover one-seventh of the whole area, P. is cut into turfs, stacked to dry, and employed as fuel; but its other uses are numerous. It makes an excellent absorbent litter, has been manufactured into numerous fabrics, and from upland P. the fibrous material used in the culture of many garden plants is obtained. See also under **FUEL**. See B. F. Haanel, *Facts about Peat*, 1924; and H.M.S.O., *The Winning Harvesting, and Utilisation of Peat*, 1918.

**Peat Moss**, see **Bog Moss**.

**Peš** (Ipek, Pekia, Pecs, or Petch), prov. and tn. of former European Turkey, vilayet of Koseovo, 73 m. from Scutari, on the White Drin, or Idrina. Now included in Serbia, Yugoslavia. It has a noted monastery, residence of the Serbian patriarchs up to 1690. Pop. about 13,000 (mainly Muslim Slavs). See Edith Durham, *Through the Lands of the Serb*, 1904.

**Peasan**, or **Pecan** (*Carya oliviformis*), tall hickory tree, native of N. America, bearing long leaves and edible nuts of exceptionally good flavour. The shell is thin and the kernel is easily extracted.

**Pecary** (*Didactyles*), genus of two species of tropical Amer. pigs, which differ from old-world swine in the presence of a strong-smelling gland in the middle of the

back, secreting a musky substance, and by the upper tusks being directed downwards instead of upwards. They have no tail and the fifth toe of the hind foot is absent. Only two young are produced at a birth. Adult animals are from 16 to 18 in. high and weigh from 40 to 60 lb. The collared P. (*D. takajii*) extends from Patagonia to the S. border of the U.S.A. The white-lipped P. (*D. labialis*) ranges between Brit. Honduras and Paraguanay, where it associates in large herds which often seriously damage cultivated crops. Both P's. are pugnacious and dangerous, capable of inflicting severe bites. They are generally hunted with well-trained dogs, and after a short chase are brought to bay, when they are killed with fire-arms.

**Pecci**, Giocchino, see **LEO** (popes), **Leo XIII.**

**Pechonga**, see **PERAMO**.

**Pechili**, Gulf of, inlet of the Yellow Sea, between Shantung and the Korean Peninsula. The rivers Hwang-ho and Petchi-ho discharge into it, and the port of Peking stands at its head.

**Pechora**, see **PERCHORA**.

**Pechham**, dist. of London, and part of the bor. of Camberwell, lying on the boundary of Kent and Surrey. P. was once a vil. with an eighteenth-century manor, in the par. of St. Giles, and was mentioned in *Domestick Book*. At one time P. manor was the property of Westminster Abbey, and later of Henry I. In P. are the South Metropolitan Gas Works, the Licensed Victuallers' Assylum, and the Pioneer Health Centre, whilst the manor is devoted to the cure of nervous diseases. After 1840 P. became built up and industrialised, but P. Rye Park still remains unspoilt. Browning and Goldsmith lived in P.

**Pechham Health Centre**, see **PIONEER HEALTH CENTRE**.

**Pecock**, Reginald (c. 1395-c. 1460), Welsh bishop and author. He became a fellow of Oriel College, Oxford, in 1417, and took holy orders. In 1431 he became master of Whittington College, London, and rector of its church; in 1444 bishop of St. Asaph, and in 1456 bishop of Chichester. He was an active controversialist, most of his energies being directed against the Lollards. In 1447 he roused popular indignation by a sermon against church reform, delivered at St. Paul's Cross. His works, including *The Douet* (c. 1410), *The Repressor of Overmuch Blaming of the Clergy* (1445), and (1456) *Book of Faith* (A Treatise proving Scripture to be the Rule of Faith), brought him into disrepute with the authorities. In 1457 he was expelled from the Privy Council, of which he had been made a member, and resigned his bishopric. In his prose he had clarity, the gift of choosing homely examples, and a wealth of words. His vocabulary was even excessive; drawing on its double source, Eng. and Fr., he is tautologous and redundant. The standard work on P. and his writings is C. Babington's ed. of *The Repressor* (Rolls series, 2 vols., 1880). **Pecos**, riv. of the U.S.A., rising in N.M.

New Mexico, and flowing S.E. and S. to join the Rio Grande 37 m. N.W. of Del Rio. Its prin. importance is as a source of irrigation, the U.S. national reclamation service having estab. projects at Carlsbad and Hondo to serve 30,000 ac. Erosion control experiments have been made. Length 800 m.

**Pecs** (Ger. *Funkirchen*), tn. of Hungary, once a royal free city, cap. of the co. of Barána. It is situated on Mt. Meczek, 106 m. S.W. of Budapest and on the railway to Mohacz. Reputed to be one of the oldest tns. in Hungary, it existed in Rom. times, and, in the Frankish-Ger. epoch, was known as *Quinque Eccles.*, whence the name *Funkirchen*. The cathedral is believed to have been founded by St. Stephen of Hungary, and its bishopric instituted, in 1009. In the fourteenth century P. had a univ. but it did not survive the Magyar annihilation by Suleyman in 1526. The Hungarian Univ. of Bratislava has lately been removed to P. The tn. is noted for its sparkling wine and porcelain. P. is now one of the army dists. of Hungary. Pop. 46,000.

**Pécs** (Yugoslavia), see **PERČ**.

**Peculiar** (O.F. *peculiar*, private; Lat. *peculiaris*, of private property), in Eng. law, a particular par. or church having jurisdiction within itself, and exempt from the jurisdiction of the ordinari. The courts of Ps. in these jurisdictions amounted to about 300 in England and Wales, and had jurisdiction in reference to probates of wills before the constitution of the Court of Probate. Their jurisdiction is still somewhat obscure.

**Peculiar People**, see **FAITH-HEALING**.

**Pedal** (Lat. *pes*, foot), name given to a lever worked by the foot in various musical instruments, also on a bicycle, etc. The organ has a P. keyboard of twenty or more P's, the Eng. piano usually only two (sustaining, improperly called 'loud,' and 'soft'), whilst the harp has seven foot levers to raise the pitch of the notes.

**Pedanius**, see **DIOSCORIDES PEDACIUS**.

**Pedestrianism** (walking in athletics), see **ATHLETICS**.

**Pediculus** and **Pediculosis**, see under **LICE**.

**Pedigree**, tabular view of the members of any particular family, with the relations in which they stand to each other, together, usually, with some slight notice of the prin. events of the life of each, such as the time and place of birth, marriage, death, and burial. Sometimes these are accompanied by reference to par. registers, monumental inscriptions, marriage settlements, or other documents containing evidence of the facts mentioned in the P. But when much of such additional information is introduced, the record is a genealogical hist. rather than a P. P's. properly so called are not of very frequent occurrence in the writings of the Middle Ages, but later the continual claims to dignities and armorial insignia prompted the College of Heralds to compile a public record of all the families of distinction, and, as a consequence, a splendid collec-

tion of Ps. (to be found in the visitation books at the College of Arms) has come down to us. Besides these, there are private collections in the library of the Heralds' College and in the Brit. Museum, and in private possession. It is only in the case of peers that the registration of a P. is compulsory. See J. H. Round, *Family Origins*, 1930, and A. W. H. Clarke, *London Pedigrees and Coats of Arms*, 1935.

**Pediment**, triangular space over the portico at the ends of the roof of classic buildings. It is enclosed by the horizontal and the raking cornices, the latter of which follow the slopes of the roof. The P. may be called the gable of classic buildings. It is frequently enriched with sculpture, for which it forms a fine setting. The doors and windows of classic buildings are often surmounted by Ps., either straight-sided or curved.

**Pedlars**, see **HLAWKES AND PEDLARS**.

**Pedometer**, instrument which indicates the distance walked. Shaped like a watch and carried in the pocket, it is so constructed that when the body is raised by the spring of the foot then a lever acts upon the wheels and an index-hand indicates on a dial plate the number of paces (usually) or the number of miles (more rarely and less accurately) travelled. A *hodometer* (Gk. *hodos*, way) is a similar instrument for indicating the distance travelled by any wheeled vehicle. Since the mechanism is worked by the revolution of the axle, it is obviously more reliable than a P. A *cyclometer* is another form used on bicycles.

**Pedro I.** (Dom Pedro de Alcântara) (1798-1834), emperor of Brazil, b. in Lisbon; the second son of John VI. of Portugal and Charlotte Joachima, sister of Ferdinand VII. of Spain. He became heir-presumptive to the throne of Portugal by the death of his brother Antonio. In 1807, when Napoleon's troops under Junot invaded Portugal, Dom P. and the rest of the royal family went to Brazil under Brit. protection. In 1817 he married Leopoldina, archduchess of Austria, daughter of the Emperor Francis I. On his father's return to Portugal in 1821 he became prince-regent of Brazil, and, declaring for Brazilian independence, was crowned emperor in 1822. On the death of John VI. of Portugal, March 10, 1826, he became Pedro IV. of Portugal. In 1824 he was ousted by his brother, Dom Miguel, but abdicating the throne of Brazil in 1831, Dom Pedro returned to Portugal and conducted a successful campaign against his brother.

**Pedro II.** (Dom Pedro de Alcântara) (1825-91), emperor of Brazil, b. in Rio de Janeiro. His father, Pedro I., abdicated in his favour in 1831, and, after a regency, he was crowned in 1841. He ruled with much tact and judgment, but was forced to abdicate in 1889.

**Pedro the Cruel** (1334-69), king of Castile and Leon, succeeded his father, Alfonso XI. in 1350. He was popular with the common people on account of his justice but alienated the clergy and nobility. When he marched to put down

rebellion in Estremadura his brother, Henry, betrayed him and he was taken prisoner; but escaped and in turn speedily crushed the rebels. Becoming suspicious of every one the rest of his reign was occupied in reinforcing his own authority as a feudal tyrant and also in wars against Aragon and Granada. The epithet 'Cruel' was due to the murder of his brother Don Fadrique in 1358. Oppressive taxes now destroyed the popularity he had earned for even-handed justice. His other brother Henry returned from France at the head of other exiles, and supported by Du Guesclin with forces from Aragon and France and with aid from the pope, Edward the Black Prince was, however, persuaded to ally himself with P. and defeated Henry and Du Guesclin at Navarrete, 1367. But when P. failed to fulfil his promises, Edward recrossed the Pyrenees and left P. to his fate. Rebellions now broke out everywhere against him, and when Henry returned a second time P. was routed at Montiel and slain. See works by Prosper Mérimée, 1848, and E. Storer, 1910.

**Peebles, co.** in the S. of Scotland, also called 'Tweedda', a. d. consists mainly of the upper valley of the Tweed, a riv. which originates in the co. P. is bounded by Dumfries and Selkirk shires on the S., Lanarkshire on the W., Midlothian on the N., and Selkirkshire on the E. The co. is small, comprising only 348 sq. m. Its lowest point above the mean level of the sea is about 450 ft., from which to 1200 ft. is the region of cultivation, but the co., being a group of hills, is mostly pastoral, with the arable lands chiefly in the valleys. The highest hill is Broad Law, which reaches an elevation of 2754 ft.; other hills are Hartfell (2650 ft.) and Minchmoor (1855 ft.). Within the co., the Tweed has for tribs. the small rivs. Eddleston, Lethen, Quair, Manor, and Lyne, besides many int. rivulets. Drachill and Neidpath castles are of interest. The chief tns. in the co. are Peebles (which is the co. tn.), an anct. royal burgh, pleasantly situated on a peninsula formed at the confluence of the Eddleston with the Tweed, and Innerleithen. Agriculture and cattle raising are the chief pursuits. Coal is mined in the N. portion of the co. Among the manufs. that of woollens is the most important. P. abounds in the remains of Brit. hill-forts, border towers, and other antiquities, and possesses numerous modern mansions of a handsome kind. It unites with Midlothian to send one member to the House of Commons. Pop. 10,200. See J. W. Buchan (ed.), *History of Peebleshire*, 1925-27.

**Peekskill, tn.** of New York, U.S.A., in Westchester co., on the Hudson, 42 m. N.E. of New York City. Pop. 17,300.

**Peel, Arthur Wellesley Peel, Viscount (1828-1912)**, distinguished Speaker of the House of Commons, youngest son of the great statesman Sir Robert P., b. in London. He was educated at Eton, and Balliol College, Oxford, and was elected in 1865 Liberal M.P. for Warwick. P. became parl. secretary to the Poor

Law Board in 1868, secretary to the Board of Trade in 1871, and in 1880 under-secretary for the Home Dept. In 1884 he was chosen to fill the important office of which his name will always be associated, Speaker of the House of Commons, and to which he was thrice re-elected. He was a favourite with both sides of the House for his good judgment and impartial rulings. On his resignation (owing to failing health) in 1895, he was created a viscount and granted a yearly life pension of £1000.

**Peel, John (1776-1851)**, Cumberland yeoman, who for fifty-five years maintained a pack of hounds at Caldbeck, where he was born and lived all his life. He is known chiefly as the hero of the song *D'ye ken John Peel*, said to have been written impromptu by his friend, John Woodcock Graves, about 1829 (some say 1820), to a folk-tune *Bonnie Annie*. It is the regimental march of the Border Regiment.

**Peel, Sir Robert, second Baronet (1788-1850)**, Eng. statesman, b. near Bury, Lancashire, the eldest son of Sir Robert P., first baronet. He went to Harrow, and afterwards to Christ Church, Oxford, where in 1807 he took a double first. He entered Parliament in the Tory interest in 1809, and in the following year Lord Liverpool appointed him under-secretary for war and the colonies. This office he held until 1812, when he became chief secretary for Ireland for six years, during which period he contended against the growing influence of O'Connell, opposed Catholic emancipation, and established the Royal Irish Constabulary. He retired from office in 1818 with a considerable reputation as a judicious administrator and an able debater. Four years later he entered Liverpool's Cabinet as home secretary, which office he retained until the premier's death in 1827. His valuable reforms included the reduction in the number of capital crimes, prison amelioration and the foundation of the Metropolitan Police (hence called 'Peelers' or 'Bobbies'). In the following year he was, under Wellington, home secretary and leader of the House of Commons, and in 1829, being convinced of its necessity for the peace of Ireland, supported Wellington's measure for Catholic emancipation. In 1834 he became Prime Minister and chancellor of the Exchequer, but he held office only for a few months. In opposition he set himself the task of organising the Conservative party, and in 1839, when Melbourne resigned, he was invited to form his second gov., but abandoned the task in consequence of the 'bedchamber scandal'. He became Prime Minister again in 1841. He held no office save that of the first lord of the Treasury, but he was for all effective purposes chairman of the Exchequer. As a financier he proved himself very capable, and introduced many reforms in the fiscal system of the country; he took steps to develop free trade, taxed incomes over £150 per annum, and carried a Bank Charter Act in 1844. In other spheres, Catholic Irish endowments were permitted,

and the Canada Oregon border dispute settled.

He was opposed to the repeal of the corn laws, for which measure there was a strong agitation throughout the country, but after the failure of the harvest in 1845 he became convinced of its necessity. His colleagues would not support him in this, and he resigned, but Lord John Russell failing to form a gov. he returned to office and brought in and carried his Corn Law Bill. He was bitterly attacked for his change of face on this question but he had earlier laid down the principle which guided him 'As minister of the crown I reserve to myself, distinctly and

SIR ROBERT PEELE

unequivocally, the right of adapting my conduct to the exigencies of the moment and to the wants of the country.' A few days after this measure became law he was defeated on an Irish Bill and retired from office. He was thrown from his horse on Constitution Hill on June 21, 1850, and died from his injuries three days later. P. was one of the leading statesmen of his era distinguished not only for his considerable administrative ability, but also for the intellectual honesty which led him to sacrifice his own interests and those of his party for the sake of measures he considered necessary for the general welfare. His speeches were published in 1853, and his memoirs ed. by Earl Stanhope and E. Cardwell in 1850. See lives by W. Taylor 1848, Sir Lawrence Peel, 1860, Lord Dalling 1874, Viscounts Hardinge and Peel, 1891, Justin McCarthy, 1891, C. S. Parker (*Sir Robert Peel, from Private Papers and Correspondence*), 1891-1899, J. R. Thursfield 1898, and T. Lever, 1942, see also H. W. Davy, *The Age*

of Grey and Peel, 1929, and W. P. Morell, *British Colonial Policy in the Age of Peel and Russell* 1930.

Peel, tn and watering place on the W coast of the Isle of Man, 11 m N.W. of Douglas. On the summit of a rock in Peel Bay are the ruins of an ant. castle and cathedral. There are fisheries, and boats, sails, nets etc. are made. Pop. 2600.

Peel (Lat. *palus*, a stake) fortified tower or keep, especially those built in the sixteenth century in the border country of England and Scotland as a defence against raids. It was originally a structure of earth and timber, strengthened with pallisades. The later Ps. had massive square towers with turrets at the angles and a door half way up the lower vaulted part being used for cattle, whilst the upper portion served as a dwelling place.

Peels, George (c. 1558-c. 1597) Eng. dramatist b. in London began writing verse while at Oxford and in those early days wrote his *Tale of Troy* (1559). It is generally assumed that after coming down from the Univ. he became an actor, but of his performances nothing is known. His first play was *The Arraignement of Paris* (1584) and this was followed by many others including *The Tattle of Aler* (printed 1594) and *The Old Wives' Tale* (printed 1595) most of which were rewarded with success. He wrote many miscellaneous verses and the best among them perhaps is his 'statutory' poem entitled *The Honour of the Carter* (1593). His works were ed. by A. Dyce (1861) and A. H. Bullen (1885). See study by P. H. Chaffand 1913 and H. D. Sikes *Sidelights on Shakespeare* 1911 and *Sidelights on Elizabethan Drama* 1923.

Pegasus, ant. Gk. constellation. By Ptolemy the Alexandrian astronomer (c. 150) it was called *πτερόπτερον* by Hugh Bigg the Tartar (1137) 'Stellæ equine' and by P. de Brabé (1628) 'Pegasus alatus'. These names all refer to its resemblance to the form of a horse, P. being the winged horse of Gk. legend. It is one of the twenty one constellations and lies between Andromeda and the head of Aquarius. The 'great square' of P. is formed by a Pegasus, β δ ε ζ γ Pegasus and a Andromeda.

Pegasus, winged horse of the fountain, which sprang from the blood of Medusa when her head was struck off by Perseus. While drinking at the fountain of Pirene he was caught by Bellarophon with a golden bridle which Athena had given the hero. With the assistance of P., Bellarophon conquered the Chimera, but endeavouring to ascend to heaven upon his winged horse he fell down upon the earth. P., however, continued his flight to heaven, where he dwelt among the stars. P. was also regarded as the horse of the Muses, and in this connection is more celebrated in modern times than in antiquity. The badge of a winged horse

was adopted by Brit. airborne forces of the Second World War.

**Pegu:** 1. cap. of P. dist., in a div. of the same name, Lower Burma, stands on the riv. of the same name, 45 m. N.E. of Rangoon. The tn. was founded in the latter half of the sixth century A.D., and rose to a position of great importance in the sixteenth and seventeenth centuries, being cap. of the P. Empire overthrown by Burma in 1757, and there is a fine pagoda still remaining. P. became Brit. in 1852. It is now a railway junction. In the Burmese campaign of 1915 the Jap. Twenty-eighth Army, trying to escape from the Allies' trap near P., were mown down by the allied Fourteenth Army (g.r.). Pop. 25,400. The div. has an area of 13,258 sq. m. and a pop. of 2,961,000. The dist. has an area of 4401 sq. m. with a pop. of 583,000. 2. Riv. of Lower Burma, has a length of 180 m. It has its source in the P. Yoma Mts., and flows S.S.E. and S.W. to join the Rangoon R.

**Péguy, Charles (1873-1914),** Fr. writer, b. in Orleans of peasant stock. His father died when he was a youth and his mother earned her living by repairing chairs. Overcoming all obstacles, the boy managed to take the courses at the Ecole Normale, and later attended the Sorbonne. He determined to remain in Paris and, with no money, he founded in 1900 a pub. which was destined to become famous, *Les Cahiers de la Quinzaine*. The *Cahiers* were something new in Fr. literary pub. They were not magazines. Rather they were complete books, often written by himself on some burning topic of the day. Romain Rolland contributed some of his best books. Others who were introduced to the Fr. public were the brothers Tharaud, Julien Benda, André Suarez, André Spire, and Bernard Lazare. But P. himself was the ardent soul of the pub. Influenced by Bergson, he proved himself a passionate seeker of the truth. Men found it difficult to understand him. The anti-clerical Socialists and the Catholics were puzzled by P., who was at the same time an ardent Catholic and an ardent Socialist. In the Dreyfus affair he became a zealous Dreyfusard, but he made a distinction between the political Dreyfusards and what he called the Dreyfusard mystics, who battled unselfishly only for the triumph of justice. As lover of Fr. hist. and an ardent Catholic at heart, he devoted much of his poetry to a celebration of the youth of Joan of Arc. In rapid succession he wrote gigantic poetical works on this subject: *Le Mystère de la charité de Jeanne d'Arc* (1910); *Le Mystère des saints innocents* (1912); *La Tapisserie de sainte Geneviève et de Jeanne d'Arc* (1913). He wrote also an enormous poem entitled *Ève* (1913). One of his most famous *Cahiers* was devoted to his master Bergson. In both his prose and his verse he hewed out a style for himself in which he did not fear to write in the popular tongue. When the war broke out with Germany he reported at once for active duty, was offered a captaincy, but preferred to be a

simple soldier. He was killed on Sept. 5, 1914, when fighting in the battle of the Marne. Since his death a whole library has been written about him, notably books by J. and J. Tharaud (1926), Daniel Halévy (*Péguy et les 'Cahiers de la Quinzaine'*, Eng. trans., 1947) and his own son Marcel, who has also revived the *Cahiers*, and above all by his friend Romain Rolland. Rolland, in his *Charles Péguy* (1942), has created a brilliant work of art out of the confused material of interminable pamphlets and even more interminable poems left by P. P. is on the whole a political writer with, however, except in such works as *Victor-Marie, Comte Hugo* (1910), in which he is a great moralist and a great critic, though his style is marred by endless repetition and intolerable exaggeration. In this latter work P. admirably reveals the pagan natural values in Hugo. His own Christian feeling, far from hindering him from seeing the beauty of Hugo's deep pantheism, is a help to clear judgment (Saurat). See also studies by P. Archaubault, 1939; J. Delaporte, 1944; and A. Rousseaux, 1946.

**Pehlevi, or Pahlavi,** name given by the followers of Zoroaster to the language into which the sacred books were trans. The term is also used for a written language in Persia under the Sassanian kings (see PAHLAVI).

**Peiho, or Pahiho** (white riv.), riv. of N. China, rises near the Great Wall, N. of Peking, on the slopes of the Mongolian Mts., and flows generally S.E., past Tientsin, to fall into the gulf of Pechili at Taku, after a course of 350 m. It is connected by the Grand or Yun Ho Canal with the Hwang-ho and Yangtze-kiang. There is a bar of stiff clay at its mouth which greatly detracts from its value as a waterway, and its waters are thick with silt, but it is navigable by steamers as far as Tientsin and by native boats to T'ung-chow. Its largest trib. is the Hun-ho. See Taku.

**Peine, tn. of Hanover, Germany,** in Hildesheim, 19 m. E. of the city of Hanover. It has a palace and a Capuchin convent. Its chief industries are connected with the iron trade, but jute and sugar are also manufactured. Pop. 17,800.

**Peine Forte at Dure,** species of torture formerly applied by the law of England to those who, on being arraigned for felony, refused to plead and stood mute, or who peremptorily challenged more than twenty jurors, which was considered a contumacy equivalent to standing mute. In the beginning of the thirteenth century this penalty seems to have consisted merely in a severe imprisonment with low diet, persisted in till the contumacy was overcome. But by the reign of Henry IV. it had become the practice to load the offender with weights and thus press him to death; and till nearly the middle of the eighteenth century pressing to death was the lawful mode of punishing persons who stood mute on their arraignment for felony. During the fifteenth, sixteenth, seventeenth, and even the eighteenth century various cases are recorded of the

infliction of the punishment in question. Latterly a practice prevailed, which had no sanction from the law, of first tying the effect of tying the thumbs tightly together with whipoord. Juliana Quick, in 1442, charged with high treason in speaking contemptuously of Henry IV, was pressed to death. Walter Calverly, of Calverly in Yorkshire arraigned at the York assizes in 1601 for murdering his two children and stabbing his wife was pressed to death in the castle by a large iron weight placed on his breast. In 1720 a person of the name of Phillips was pressed in Newgate for a considerable

Manchu city are 50 ft. in height and from 60 ft. in thickness at the base to 40 ft. at the top; those of the Chinese city are about 30 ft. high and from 25 ft. to 15 ft. in width. P. is less typically Chinese than for example Canton or Hangchow. Frequently invaded by Tartars and Mongols, it fell eventually to the Manchus in 1644 who made it the cap. of their empire and ruled there until the revolution of 1911. All these invasions have left their impress on the inhab. Thus, when the Mongols conquered China in the twelfth century they laid out a new city on the lines of a Mongol camp and the

E. N. A.

PEIPING THE LITTLE TEMPLE AT THE ENTRANCE TO THE TEMPLE OF HEAVEN

It is on the Marble Way from the Altar of Agriculture

time till he was released on his submission. As late as 1741 a person is said to have been pressed to death at the Cambridge assizes, the tying of his thumbs having been first tried without effect.

Peiping, or Peking, in the prov. of Chihli, lies between the Peiho and the Hunho Ks in lat. 39° 54' N. and long 116° 27' E. It was the cap. of China until 1928, when the gov. moved to Nanking. The name Peking (used until 1928) signifies the N. court, to distinguish it from Nanking the S. court, where the former emperors of China resided, and where the Republican Gov. prior to the Jap invasion, held its court. P. is really composed of two cities, the outer one being inhabited by the Chinese and the inner by the Tartars or Manchus. Both cities are surrounded by massive walls, pierced by many gates which are surmounted by towers 100 ft. high. The walls of the

very broad main streets intersecting at right angles are the outcome of this plan. The inhab. too are not pure Chinese, but have strong traces of the blood of their conquerors. Although P. has most of the amenities of modern civilisation, its roots are in the remote past and the impact of the W. has had less impression on it than on any other great Asiatic city. Especially marked is the contrast with Shanghai. In any part of Shanghai the atmosphere is that of an entirely modern city. Within the walls of P. however, the S. part shows rural scenes similar to those of a typical Chinese vil., while in the N. part of the city whole districts remain much as they were two centuries ago. Distances between the walls are great, but there is no underground or overhead railway, and only a small section is served by trams or buses. The rickshaw pullers of P. once famous for endurance and speed,

have gone, for the rickshaw has been ousted by the 'pedicab,' a kind of tricycle with the passenger seated behind the driver. P. has no industries of any importance. It has become a superior kind of prov. tn. and is looked upon as the main city of culture in China, with a univ. student pop. of 20,000. The period 1900-28 saw the peak of foreign residence, with legation guards, foreign advisers, foreign firms, etc., but, following the transfer of the cap. to Nanking, came the period of decline when diplomats, guards, foreign officials, and others gradually disappeared. Externally P. has undergone no radical change. The chief period of transformation was after 1900 when the Legation Quarter which had been destroyed in the siege was rebuilt as a small modern city and many new gov. offices were built in W. style in the surrounding dist. The special characteristic of P. is its old-world charm, its memories of former glories as reflected in its palaces, parks, and temples. Pop. of the metropolitan area 1,602,000. P. is an extremely ant. city and occupies the site of a former city dating back to the twelfth century B.C. It has borne many names through the ages, and is, or was, also known officially as Shan-tien-tu. It was the scene of the Boxer rising in 1900, the siege of the legations, and their subsequent relief by a European force in Dec. of the same year. P. is the seat of a national univ., which was founded in 1898, re-organised in 1917, and admitted five women to its privileges in 1920. There is also a normal univ., and the Chiao Tung or Communications Univ., founded in 1921, has a branch at P. The Peking Union Medical College was founded in 1906. In 1915 its support was under taken by the China Medical Board of the Rockefeller Foundation. Peking was the cap. of China for 900 years till 1928, when Chiang Kai-shek's Gov. moved the cap. to Nanking. The Jap., during their occupation, restored the old name. P. was occupied by Communist forces on Feb. 1, 1949. See J. Bredon, *Peking: a Historical and Intimate Description*, 1920, and H. F. Johnston, *Twilight in the Forbidden City* (1898-1932), 1931.

**Peipus** or **Chudskoye Lake**, lake of N.W. Russia, between the Estonian S.S.R. and the Leningrad Region of the R.S.F.S.R. Its length is 90 m., and the width 32 m., with an area of 1350 sq. m. It abounds with fish, and discharges its waters by the R. Narova into the gulf of Finland. In 1941 the Gers. advanced on both sides of the lake, which was the right-hand support of the Stalin line, to threaten Leningrad. The Russians reached and passed the lake in an offensive of Feb. 1944.

**Peirce, Charles Santiago Sanders** (1839-1911), Amer. physiologist and logician; b. at Cambridge, Massachusetts. Graduated, Harvard, 1859. On U.S.A. coast survey. Conducted investigations into earth's density and ellipticity, and light-wave lengths. First to use term 'pragmatism' in connection with philosophy, to connote a commonsense system in which Belief

is identified with Action (see *Popular Science Monthly*, Jan. 1878). When Wm. James, professing to follow P., substituted Truth for Belief in this formula—thus producing a Pragmatism the opposite of P.'s—P. renamed his own principle Pragmatism. His chief pub. work was *Studies in Logic* (1883).

**Peirene Fons, see PIRENE.**

**Peirese, Nicolas-Claude Fabri de** (1580-1637), Fr. archaeologist and naturalist, b. at Beaune-en-Auxois. His interests were many, as he included numismatics, archaeology, and the study of oriental MSS. among his pursuits, whilst he sent expeditions of savants to Egypt. Among his friends were François Pithou, Thou, Casaubon, and Pierre and Jacques Dupuy. Seven vols. of his correspondence were pub. by M. J. de Laroque in his *Collection of Unedited French Historical Documents* (2nd series), 1885-9.

**Peisistratus, see PISI-STRATOS.**

**Pekan** (native name), **Fisher Marten**, or **Pennant's Marten** (*Martes pennanti*), N. Amer. species, larger than those found in the Old World, being about 4 ft. in length, including the tail. Its face is dog-like; fur brown, with white patches on chest and belly. Its favourite food is said to be the Canadian porcupine (*Erythron dorsatus*), but it frequently steals the fish used to bait traps, whence its popular name *fisher marten*.

**Pekin**, cap. city of Tazewell co., Illinois, U.S.A., on Illinois R. 9 m. S.W. of Peoria. Chief industries, pork packing, coal mining, the manuf. of agric. implements, brewing, and distilling. Pop. 19,300.

**Pekinese**, breed of lap-dog. It is of Chinese origin, and differs from the Eng. toy spaniel in having a flat skull and tail curved over the loins. Preferably weighing five to six pounds, it is heavy in front, with short broad muzzle, falling away lion-like behind. Long-haired, with thick undercoat, it is light-red or yellow, mottled with white. The golden tan are trusted to type.

**Peking, see PEIPING.**

**Peking Man, see under ANTHROPOLOGY.**  
**Pelagic Fauna.** The earth's marine fauna may be classified according to its distribution into three divs. These are the well-known littoral or shore animals, the deep-sea or abyssal (g.r.) animals, and those which inhabit the surface or upper strata of the open sea or ocean (*pelagic*). Among the P. F. are representatives of most of the great divs. of the animal kingdom from the lowest and simplest organisms (plankton) to the mighty cetaceans and the marine carnivora, including even one family of insects (Halo-batidae). In the great depths of the ocean plant life is entirely absent, but it undoubtedly forms the basis of pelagic life. In some late minute P. F. is very scarce, and Darwin in his *Naturalist's Voyage* comments on the mystery how whales and seals, petrels and albatross, are able to subsist, a problem which in recent years was investigated by the *Discovery* Committee of the Colonial Office. The warmer parts of the ocean

swarm with life, and many of them, such as the tunicate *Salpas*, live in a 'living broth,' so abundant is the supply of Radiolaria, Foraminifera, and other Protozoa, many of which give rise to phosphorescence. The transparent glass-like appearance of many of the lower forms of P. F., often accompanied by prismatic colours, is undoubtedly a protective coloration by which the notice of pelagic birds and other enemies is escaped. Many animals pass their whole life in the open sea, but others are accustomed to visit the shores occasionally in search of prey or periodically to breed, while some, such as the larvae of echinoderms and young of molluscs, spend only a stage of their life in open water, seeking the shores to pass into the adult stage.

Pelagius, celebrated heresiarch of the fifth century, author or systematiser of the doctrine known as Pelagianism. According to this doctrine there is no original sin, and man does not need grace in order to avoid actual sin and to attain salvation; man's free will is sufficient for this purpose, though grace makes the attainment of salvation easier. P. was probably b. about the middle of the fourth century in Britain, his name being supposed to be a Gk. rendering of the Celtic appellation *Morgan*, or sea-born. He was a monk; it is certain, however, that he never received holy orders. He settled in Rome, and at the end of the fourth century he had already acquired a considerable reputation for sanctity and learning. In 410, after the sack of the city by the Goths, he and his disciple Celestius withdrew to Carthage. Here Celestius sought ordination, his doctrines became the subject of discussion, in which St. Augustine took a prominent part, and in a synod sev. opinions ascribed to Celestius were condemned. P. had meanwhile gone to Jerusalem, and news of the proceedings at Carthage having been carried to Palestine in 415, he was accused of heresy before the synod of Jerusalem by Orosius (q.v.). The impeachment failed, and in a synod subsequently held at Diospolis in the same year, P. evaded condemnation by accepting the decrees of the synod of Carthage. The W., however, was more sharp-sighted or less indulgent. A synod of Carthage, in 416, condemned P. and Celestius, and wrote to Pope Innocent I. requesting his approval of the sentence, with which request Innocent complied by a letter which is still extant. On the death of Innocent, Celestius came to Rome in person, and P. addressed a letter to the new pope Zosimus, and in a council which Zosimus held Celestius gave such explanations that the pope was led to believe that the doctrines of P. had been misunderstood. A further council of 214 bishops, however, was held in Carthage, in which the doctrines of P. were formally condemned in nine canons, which were sent to Rome with full explanations, and on receipt of these decrees Zosimus reopened the cause, cited and condemned Celestius and P., and pub. a decree, called *Epistola Tractoria*, adopting the canons of the African council. Nin-

teen It. bishops refused to accept these canons, and were deposed. Their leader, who may be regarded as the greatest theological advocate of P., was the celebrated Julian, bishop of Eclanum, near Beneventum. P. himself was banished from Rome, in 418, by the Emperor Honorius. After his banishment, P. is supposed to have returned to his native country, and to have died there. The controversy, considered as an exercise of intellectual energy, is the most remarkable in the anct. hist. of the Church. P.'s *Fourteen Books of a Commentary on St. Paul's Epistles*, his *Epistle to Demetrius*, and his *Memorial to Pope Innocent* have escaped destruction, probably from their being included by collectors in the works of St. Jerome. They are much mutilated, but yet almost certainly genuine. See G. Vossius, *History of Pelagius*, 1655, and commentaries by J. F. Buddeus, 1719, and T. C. Lillenthal, 1738.

Pelargonium, commonly but incorrectly called Geranium, a genus of perennial plants (family Geraniaceae) which, since their introduction from S. Africa at the beginning of the eighteenth century, have been highly valued as greenhouse and border plants. As exhibition plants they have not the vogue they formerly had. They are classified into five main groups: (1) zonal, with marked leaves; (2) show, with large flowers, which when semi-double are called regal; (3) fancy, with smaller flowers; (4) ivy-leaved, valuable for hanging baskets; (5) scented-leaved. Cape P., yet another group, are mostly evergreen shrubs from the Cape of Good Hope; they need greenhouse culture, as do the show and fancy kinds. All are easily propagated from cuttings. Bedding plants are set out in June and lifted again in Sept. Greenhouse plants can be brought into flower at any time by pinching off flower buds through the summer and properly regulating temp. The true *Geranium* belongs to the same family; there are sev. species, e.g. *G. molle*, *G. lucidum*, etc., commonly known as cranebills, from the long, beaked fruits.

Pelagian means belonging to the Pelagii, a term used by anct. Gk. writers apparently with two distinct meanings. It is used in some places simply as an equivalent of prehistoric or primeval, whilst in other passages a definite race appears to be indicated. If such a race existed it was widely spread over the coasts and is. of the E. Mediterranean and the Egean; its ethnological relations are obscure. The later Gk. writers, such as Hesiod, talk of the Pelagii as a separate race, but their evidence was probably scanty. See *Iliad*, II. 681-84 and 840-43; x. 128-429; xvi. 233-35, etc.

Pelayo, or Pelagius, was supposed to be the first Christian king of Spain, founding the monarchy of Asturias about A.D. 718. See SPAIN and ASTURIAS.

Pelocypoda, see BIVALVES.

Pelidii, see under PELEW ISLANDS.

Peleus, in Gk. legend, son of Æacus and Endeis, brother of Telamon, and king of the Myrmidones at P'ithia. Together with Telamon, he was banished for the

murder of Phocus, and fled to Eurytion, king of Phthia, in Thessaly, who gave him his daughter Antigone to wife with a third of the kingdom as dowry. P. accidentally slew Eurytion at a hunt, and had to flee to Iolous. Later he was married to the Nereid Thetis, and by her was the father of Achilles.

Pelew or Palau Islands, group of the W. Caroline Is. in the W. Pacific Ocean. Lat. 2°-9° N.; long. 130°-135° E. There are twenty-six is., of which six are inhabited. The largest is Babeltop (Babelthuap), and next in order are Korror, Arguar, I'elellu, and Elluwalk. The total area is about 175 sq. m. The group is surrounded by a coral reef. The is. are mountainous, well watered, and fertile, with a hot but healthy climate. They were sold to Germany by Spain in 1899. In 1914 they were occupied by Australia, and the treaty of Versailles placed them under Jap. mandate. Pop. (1941) 6500 Jap. and 6000 natives. An Amer. carrier force on March 29-30 (1944) attacked the Jap. base at P. in the vain hope of inducing the Jap. fleet to come out. The is. were a repeated target later in the year on the eve of the invasion of Saipan. In conformity with the allied agreement in Cairo (1943), the is. were not returned to Japan after the war, but remain under Amer. trusteeship for the United Nations. See E. M. Forster, *Letter to Madan Blanchard*, 1931.

Pelham, Henry (c. 1695-1754), Brit. statesman. He was the son of Thomas, first Baron P., and was educated at Westminster and Hart Hall, Oxford; he entered Parliament in 1717, and seven years later became secretary for war. He was paymaster of the forces in 1730, and in 1743 first lord of the Treasury and chancellor of the Exchequer. His influence in the House of Commons was great, and was based upon systematic corruption. He was not a great politician, but he was a sound, if uninspired, financier.

Pelham-Holles, Thomas, elder brother of the above, see NEWCASTLE, DUKE OF.

Pellae, son of Poseidon and Tyro, a daughter of Salomonos, and twin brother of Neleus. The twins were exposed by their mother, but were preserved and reared by some countrymen. They subsequently learnt their parentage, and after the death of Cretheus, king of Iolous, who had married their mother, they seized the throne of Iolous. P. soon afterwards expelled his own brother, Neleus. After P. had long reigned there, Jason came to Iolous and claimed the kingdom. In order to get rid of him, P. sent him to Colchis to fetch the golden fleece. Hence arose the celebrated expedition of the Argonauts. After the return of Jason, P. was cut to pieces and boiled by his own daughters (the Pellides), who had been told by Medea that in this manner they might restore their father to vigour and youth.

Pelican (*Pelecanus*), genus of steganopodous birds, i.e. characterised by the four toes being united by a web. They have a huge extensible or dilatible pouch which is supported by the two flexible bony arches in the lower mandible. The

legs are short and the feet large, the tail short and rounded, the neck long, and the body large and ponderous. The wings are long and expansive, and with them the birds are capable of rapid flight, and also of soaring without perceptible movement of the wings. The species are widely distributed, frequenting the seashore, margins of lakes, and feeding almost exclusively on fish, which is deposited in the pouch for subsequent digestion. The common P. (*P. onocrotalus*) formerly existed in Britain, and is now found around the Mediterranean. Its plumage is white, tinged with red. It usually nests on the ground and lays two or three white eggs. The young are at first brown, and the mother feeds them by pushing their beak into her pouch. The appearance of the red tip of the bill pressed against her breast probably gave origin to the fable that she feeds her young on her own blood. *P. erythrorhynchus* occurs in N. America, where also is found *P. occidentalis*, the only diving P. Species also occur in Australia and Asia.

Pelican State, see LOUISIANA.

Pellon, anct., name of a range of mts. on the coast of Thessaly, associated in Gk. mythology with Ossa. The giants are said to have piled these two mts. together to reach Olympus. The chief summit is now called Mt. Plessidi (5398 ft.).

Pelissier, Aimable Jean Jacques, Duc de Malakoff (1794-1864), marshal of France, b. at Maromme, near Rouen. He joined the first expedition to Algiers in 1830. In 1839 he was made lieutenant-colonel and returned to Algeria, taking part in the battle of Isly in 1844. He was made general of a div. in 1850, and in the Crimea was at first in command of the first corps and afterwards held the chief command before Sebastopol. The storming of the Malakoff was his most notable success; for this he received a marshal's baton, was created Duc de Malakoff on his return to France, and was granted 100,000 francs. He was Fr. ambas. in London from 1858 to 1859, and fr. ambas. until his death was governor of Algeria. See life by V. Derrécaigne, 1911.

Pella: 1. anct. tn. of Macedonia, 24 m. N.W. of Salonica. It was the bp. of Philip II. and Alexander the Great, and was the anct. cap. of Macedonia. The vil. of Neochori now stands upon its site. 2. Prefecture of Macedonia, Greece. Pop. 127,000.

Pellagra (It. *pelle*, skin, *agra*, rough), disease characterised by spinal pain, digestive disturbances, and general weakness in the early stages; later a red rash appears on the skin, disappearing in autumn and recurring in the spring of each year; the skin meanwhile becomes dry and yellow. In advanced cases severe nervous disturbances are noticeable, including loss of motor power and mental delusion. P. occurs in Italy, Spain, S. France, Algeria, and Egypt; its presence has also been discovered in America, and Dr. L. W. Sambon described in 1912 some cases which had occurred in the Brit. Isles. The disease was formerly supposed to be due to the use of diseased

maize, but research indicates that P. is due to a deficiency in vitamins, particularly nicotinic acid, one of the substances present in the vitamin B complex.

Pellegrini, Carlo (1839-89), It. caricaturist, b. at Capua, but came to England. His work in *Vanity Fair*, over the signature 'Ape,' consisting of a series of portraits of public men, is one of the best examples of personal caricature extant. He also executed a red plaster statuette of Robert Lowe, Lord Sherbrooke.

Pellegrino, see VALLE, PIETRO DELLA.

Pellow, Sir Edward, see EXMOUTH, VISCOUNT.

Pellow's Group, or Sir Edward Pellow's Islands, small group of Is. in the S.W. of the gulf of Carpentaria, Australia. They lie close to the coast, opposite Port McArthur.

Pellicanus, Conrad (1478-1558), Alsatian scholar and reformer, b. at Ruffach, his real name being Kirschner; educated at Heidelberg. He joined the Franciscan friars at Ruffach, and was later transferred to Tübingen. He also held ecclesiastical positions at Pforzheim and Basle, and became one of the most learned men of his day, especially in Heb. In 1526 he became a Protestant, and in 1527 was made by Zwingli prof. of Heb. at Zurich. He wrote a Heb. grammar (1504; reproduced 1877), an autobiography (ed. in Lat. 1877, and in Ger. 1891), and a *Biblical Commentary* (1532-35) in 5 vols. See life by E. W. Reuss, 1893.

Pellico, Silvio (1788-1854), It. poet, b. at Saluzzo in Piedmont. His tragedies entitled *Ladameia* and *Francesco da Rimini* (1818) gained him an honourable name amongst It. poets. He also trans. the *Manfred* of Byron, with whom he had become acquainted. Having become connected with the secret society of the Carbonari, he suffered ten years' imprisonment, an account of which he pub. under the title *Le mie Prigioni* (1833). See lives by H. Barbiera, 1926; H. Ritter, 1832; and B. Allason, 1944.

Pelileo, bn. of Ecuador, completely destroyed, with others, in the disastrous earthquake of Aug. 1919; 3200 inhab. were killed, 320 survived.

Pellissier-Fontanier, Paul (1621-94), Fr. historian, b. at Beziers, studied law at Toulouse and went to Paris. He became acquainted with the members of the Academy through Valentin Conrart, and was made academic historian. In 1653 he issued *Relation contenant l'histoire de l'Académie française*, which gained him admission to that body. In 1657 he became secretary to Nicolas Fouquet, minister of finance, who in 1659 made him master of accounts at Montpellier. Upon Fouquet's fall in 1661, P. was imprisoned in the Bastille. He was released in 1666, and became historiographer to Louis XIV., of whom he wrote a hist. (*Histoire de Louis XIV. jusqu'à la paix de Nimègue*). He also wrote two defenses of Fouquet.

Pellitory of the Wall (*Parietaria officinalis*), bushy herbaceous plant with reddish brittle stems, hairy leaves, and axillary clusters of small flowers. The stems are very sensitive to touch. It

occurs on walls, and an infusion was a rustic medicine. Tincture of P. is made from *Anacyclus Pyrethrum* of S. Europe.

Pell-mell, see under MAIL, THE.

Pellonia, ornamental creeping plant, with round, oval, or heart-shaped leaves, olive green in colour with violet and white markings. They are cultivated in Britain as greenhouse plants, the chief species being *P. daveana* and *P. pulchra*, the latter with a purplish stem and oblong leaves light green in colour with black veins.

Pelloux, Luigi (1839-1924), It. general and politician, b. at La Roche, in Savoy. After leaving the Military Academy of Turin, he took part in the wars of independence and distinguished himself at Custoza, and at the taking of Rome. His military career was rapid, and in 1885 he reached the rank of general. His political career was also successful; but after the troubles in Sicily and the revolutionary movements of 1898 his violent measures of repression made him very unpopular, and brought about a constitutional crisis, which, however, he skillfully handled. He was made senator in 1896.

Pelopidas (d. 364 B.C.), Theban statesman and general. In 383, when Thebes was taken by the Spartans, he went to Athens to form a party for the liberation of the city. In 379 he forced the Spartan garrison of Thebes to surrender. In 375 he defeated the Spartans at Tegyra, and in 371, in conjunction with Epaminondas, estab. Theban supremacy by the victory of Leuctra. In 367 he went on an embassy to Persia, and in 364 was killed in a successful battle against Alexander of Phœre at Cynoscephalæ.

Peloponnesian War, chiefly between Athens and Sparta, lasted with some intervals from 431 to 401 B.C. The war may be divided into three main periods: (1) from the beginning until the peace of Nicias in 421 B.C.; (2) from the peace of Nicias until 413, when the peace was formally broken by Sparta; (3) from 413 to the capture of Athens in 401 B.C. During the first period Athens was more and more successful up to 424 B.C., when the fortune of war changed. The Athenian leader for the first two and a half years was Pericles, and thenceforward Nicias. The Spartan general Brasidas saved Megara and transferred the war into Thrace. Athens was greatly afraid of the spread of disaffection among her subject cities, and made peace on slightly disadvantageous but not dishonourable terms. During the second period, although nominally at peace, Athens and Sparta were continually employed in plots against each other's interests, and fought in the Peloponnesian and in Sicily. During the third period Alcibiades, who had commanded the Athenian expedition to Sicily, was recalled, and went for a time to Sparta. The Athenians were finally expelled from Sicily with heavy loss, and the war transferred to Asia Minor. Prior to 408 Athens won sev. naval victories, although many of her subject allies revolted. After the battle of Cyzicus in 410 the Spartans

made proposals of peace which were rejected by Athens. The fortunes of the war now gradually went against Athens until after the destruction of her fleet at Argosotami in 405 B.C. and a five months' siege, the city surrendered in April 404. The defences were destroyed and Athens was made subject to Sparta, being handed over to an oligarchy of thirty. See also *Greek History*. See the *History of the Peloponnesian War* by Thucydides a contemporary A.M. Wood ward, 'Excavations at Sparta 1926' in *British School at Athens Annual* 1927. B.W. Henderson *The Great War between Athens and Sparta* 1927.

**Peloponnesus** (*Pelops* and *Penon*, island) is the name of Pelops (q.v.) the ancient name for the peninsula forming the part of Greece connected with central Greece by the Isthmus of Corinth and separated by the gulfs of Lepanto and Patras. It was divided into the dists. of Achaia, Sicyonia, Corinthia, Argolis, Arcadia, Laconia, Messenia and Elis; the chief rivers were the Eurotas and the Alpheus. The earliest inhab. were probably of the Pre-historic race (see ILLUSTRATIONS), it was then occupied by Achaeans and Dorians. The chief cities were Sparta and Argos, the latter holding supremacy until the seventh century B.C. and the former thenceforward to the third century. The modern name of the country is Morea (from its resemblance to a mulberry leaf) but the name P. is still officially used as applying to Greece S. of the Isthmus of Corinth. See also MOREA.

**Pelops**, in Greek legend grandson of Zeus, and son of Tantalus, king of Phrygia and Dione or Eurynome. In order to test the divinity of the gods who visited him, Tantalus is said to have served up a repast to them in which the *puce de resistance* consisted of P. None touched the dish save Demeter who ate a shoulder. Zeus restored P. to life and replaced the missing shoulder by one of ivory. P. then gained in marriage Hippodamia, daughter of King Erichonius of Elis, by defeating the latter in a chariot race. This he accomplished by bribing Myrtilus, the king's charioteer, but when he claimed the promised reward P. threw him into the sea. As he did he cursed the house of P., and his curses were fulfilled. P. was held in high honour among the Greeks, especially at the Olympic games, and a temple was built for him where many sacrifices were made. See Ovid *Metamorphoses* vi 404; Virgil *Georgics* iii 7; Pindar, *Olympian Odes* i 24; Hyginus *Fabularum Liber* vi 5; Phryges *Iliad* 30; Pausanias, v 1, vi 11; Ovidius, vi 45, etc.

**Pelota** (Lat. *pila* < *pel-la*, ball) ball game popular in Spain the Br. Basque dists., and Sp. America. Players wear a curved basket attachment (*cesta*) on the right hand. The hard ball weighs about 4 oz., is made of rubber and wire, and is covered with leather. It is struck with the *cesta* against two walls at right angles.

**Pelotas**, second city in Rio Grande do Sul, Brazil, at the S. of Lake Patos. The chief industry is the preserving of beef, while hides are also exported. There

are glass factories and flour mills. Pop. 72,000.

**Pelists** (Gk. *πελισταί*, from *πῆλις*, a small round shield), species of Gk. troops between heavy and light infantry, having more of the characteristics of the latter class. They wore quilted tunics and leather leggings, and in addition the pelta carried a spear or javelin and a sword. They came into prominence during the early years of the fourth century B.C.

**Peltonen, Viktori**, see LINNAKO-KI, JOHANNES.

**Pelts** see 15.

**Pelusium**, city of Egypt near the Mediterranean Sea at the N.E. point of the Nile delta. This city which is now in ruins was originally a firm stronghold of Egypt.

**Pelvis**, bony basin which supports the abdominal viscera and distributes the weight of the trunk to the two legs. It is formed by the sacrum, the coccyx and the ossa innominata or haunch bones, each of the haunch bones consists of three originally separate bones grown together in the adult. The human pelvis is broader at the junction of these bones is formed which takes the ball end of the femur or thigh bone. The contained vessels are for both sexes the rectum and urinary bladder for the male, the vesiculae seminales and the prostate gland for the female uterus and ovaries. The female P. is in consequence broader but shallower, while having a greater capacity, the bones are more slender the inlet more circular. It is in general modified suitably for the necessity of child bearing.

**Pemba**, is off the E. coast of Africa, 30 m. N.W. of Zanzibar to which protectorate it belongs. A fertile and beautiful spot Arabs call it Al-luthera or the Green Is. Its green hills rise abruptly from the sea. The coast is broken into many deep inlets and the sea penetrates far into the heart of the is. affords many beautiful views. Pools and small lakes of fresh water, edged with grass and covered with water lilies give a sense of coolness after the glare and dust of Zanzibar. The climate is not suitable for continued residence by Europeans. The ruins of P. relate probably to the later Middle Ages when the prosperity of the Arab and Persian settlements of the African coast was at its peak. These ruins are not of course of African origin but were built by Arabs who colonised and traded for ivory, slaves, gold, and tortoise shell. The whole of the W. is devoted to clove growing. Besides the trade in cloves there is a trade in timber, copra, and supplies for shipping. Chaka, the chief town is picturesquely situated, but its approach is made by a very muddy creek. Formerly it must have been impregnable thanks to the creek and the enormous mangrove swamps. Some 11 m. W. of Chaka lies a small inlet in long named Mtsidi, and sometimes called 'Captain Kidd's Bay' owing to the tradition that Kidd buried his treasure there. Burton states that Kidd was here, but others aver that there is no evidence

to that effect (see R. Burton, *Zanzibar: City, Island, and Coast*, 1872, and, for the opposed view, F. B. Pearce, *Zanzibar*, 1930). The only other tn. of any importance is Weti, which has been developed in the hope of finding a substitute for the insalubrious Chaka. The people still retain a kind of bull-fighting. It is said that witchcraft and the cult of devil-worship still prevail in P., and that sorcery and black magic have a hold on the bulk of the people. The few Europeans are gov. officials and members of missions. The gov. maintains a wireless station on the is. P. was sighted by Vasco da Gama on his epoch-making voyage from Lisbon to India in 1497. It has shared the fortunes of the E. coast in its earlier hist.; in 1627 it was involved in the general rising against the Portuguese following a massacre of Christians at Mombasa. Area, 380 sq. m. Pop. 114,900. See J. E. E. Craster, *Pemba: the Spice Island*, 1913.

**Pemberton, Henry** (1694-1771), Eng. physician, chemist, and astronomer, b. in London, pupil and friend of Boerhaave at Leyden. He became prof. of physic at Gresham College, London. P. contributed papers to *Philosophical Transactions* (see vols. xxxii.-lxii.), one of these winning him Newton's friendship. He superintended the third ed. of the *Principia* (1726) for the latter. P.'s works include *View of Newton's Philosophy* (1728); *Lectures on Physiology* (1733); and *Lectures on Chemistry and Physiology* (ed. by J. Wilson, 1771, 1779).

**Pemberton, Sir Max** (1863-1950), Eng. novelist, b. at Hurlingham. He joined the staff of *Vanity Fair* in 1885; ed. *Chums* from 1892 to 1893, and *Cassell's Family Magazine* from 1896 to 1906. *The Diary of a Scoundrel* (1891) was his first novel. Among others are *The Iron Pirate* (1893); *Eto* (1900); *Ero Patra* (1901); *My Sword for Lafayette* (1906); *War and the Woman* (1912). P. also wrote *The Finishing School* (a play) in 1904. Later works: *Prince of the Palus Royal* (1921); *Paulina* (1922); *The Mad King dies* (1928); *Life of Sir Henry Royce* (1931); and *Sixty Years Ago and After* (1936).

**Pemberton, S.W.** suburb of Wigan, Lancashire, England, forming four wards of the city. It is engaged in cotton spinning and coal mining.

**Pembrey**, coastal vil. of Carmarthenshire, S. Wales, 5 m. from Llanelly. Pop. 1700.

**Pembroke, Earl of**, see **AYMER DE VALENCE**.

**Pembroke, Mary**, Countess of (1557-1621), Eng. poetess, b. at Ticknell, near Bewdley, was the sister of Sir Philip Sidney, and became the countess of Pembroke on her marriage with Henry Herbert, earl of Pembroke (c. 1577). It was at her suggestion that Sir Philip Sidney wrote his *Arcadia*, and she was a patroness of Daniel, Ben Jonson, and other poets. She herself was the authoress of sev. poetical works and the translator of *A Discourse of Life and Death* (1592) from the Fr. of P. Moray. See life by F. B. Young, 1912.

**Pembroke, William Herbert**, third Earl of (1580-1630), Eng. court dignitary and patron of letters, b. at Wilton, eldest son of Henry Herbert, second earl of Pembroke. Educated by Samuel Daniel of New College, Oxford, he succeeded as earl in 1601. He was disgraced for an intrigue with Mary Fitton (q.v.). Patron of Ben Jonson, Massinger, Wm. Browne, Inigo Jones, and others, he was also interested in the Virginia, N.W. Passage, Bermuda, and E. India companies. Lord chamberlain, 1615. Member of the Council of New England, 1620. He opposed the foreign policy of James I. and Buckingham. P. was lord chamberlain of the royal household, 1615-25; lord steward, 1626-30; and chancellor of Oxford Univ. from 1617. Pembroke College being named after him; he presented the Barocel library to the Bodleian. He wrote poems, issued with those of Sir Benjamin Rudyerd (1600). To him as lord chamberlain and to his brother Philip, the first folio of Shakespeare's works was dedicated in 1623, the inscription being to the 'incomparable pair of brothers.'

**Pembroke: 1.** Seaport in the co. of Pembrokeshire, Wales, on an inlet of Milford Haven. Its castle, in a good state of preservation, is an interesting building dating from Norman times. P. was formerly a gov. dockyard tn. It is now an R.A.F. flying-boat station and military garrison tn. Pop. 12,000. **2.** Suburb of Dublin, on the S.E. of the city. **3.** Cap. of Renfrew co., Ontario, Canada, on Lake Alhummette in the Ottawa R. Pop. 6000.

**Pembroke College, Cambridge**, founded in 1317 by Marie de St. Paul, widow of Aymer de Valence, earl of Pembroke, and known as Mary Valence Hall or Pembroke Hall. The chapel is the first college chapel in Cambridge; the new structure in the classical style is by Wren. The college has a master and twenty fellows. Past members include Ridley, Whitgift the younger, Pitt, Spencer, and Gray.

**Pembroke College, Oxford**, founded in 1621 on the site of an anct. seminary known as Broadgates Hall, by King James I., at the expense of Thomas Tredale and Richard Wightwick named after the earl of Pembroke, then chancellor of the univ. It has a master and ten fellows, of whom three are honorary. There are thirty-three scholars; the original foundation was for ten. Samuel Johnson was at P. See D. Maclean, *A History of Pembroke College, anciently Broadgates Hall*, 1897.

**Pembrokeshire**, maritime co. of S. Wales, and the westernmost co. of the principality, bounded on the S. by the Bristol Channel, and on the W. and N. by St. George's Channel. The R. Teify separates the co. on the N.E. from that of Cardigan. The chief bays are Milford Haven, St. Bride's, Newport, and Fishguard, with good anchoring ground. Since 1906 Atlantic liners have made Fishguard a port of call. Off St. David's Head, on the W. coast, are a number of rocky islets, called the Bishop and his Clerks. The shores on the S. are wild and in-

hospitable, and fronted by high precipitous cliffs. The surface is undulating; green hills alternate with fertile valleys. The prin. elevations occur in the Prescelly Mts., which traverse the N. of the co. from E. to W., and rise in their highest summit to the height of 1754 ft. The rivs. of the greatest importance are the E. and W. Cleddau, which unite and form a navigable portion of Milford Haven. There are many prehistoric monuments. Coal (principally anthracite), slate, lead, and iron are the only minerals worked. Oats, barley, and potatoes are the prin. crops. Cattle rearing is important. The co. returns one member to Parliament. Cap. Haverfordwest. Area 614 sq. in. Pop. 85,300.

**Fennican**, originally made by N. Amer. Indians and used as a food. It consisted of dried venison, from which all fat was removed. This was made into a paste and afterwards formed into cakes. At present, however, P. is used as a food on Arctic expeditions, and is made from beef instead of venison.

**Pemphigus**, class of skin diseases characterised by blisters. The acute form is a bacterial infection.

**Pen.** The modern pen had its origin in the reed or calamus, which is still used for the purpose in the E. The anc. Egyptians, like the Chinese and Jap. of the present day, used a brush for writing, while the Romans and Gks. used the sharp point of the stylus to scratch their characters on waxen tablets. About the middle of the fourteenth century the quill-feather superseded the reed. Turkey quills were most often used, but swan quills were much valued, and crow quills for fine lines. Owing to the loss of time involved in mending the points of quill nibs, various attempts were made to give durability to them by gilding (Watt in 1818), and by attaching to them horn or tortoiseshell tips (Hawkins and Mordan). The only satisfactory substitute, however, was found to be the complete steel nib, which was first introduced in London in 1803 by Wiese, and came into general use about 1830, when Perry, Mason, and Gilloft, of Birmingham, began to make them by machinery. Sometimes the steel is alloyed with silver, platinum, or rhodium, but this greatly increases the expense, while a gold nib with a ruby at the tip has been found to be of great durability and almost perfect for writing. The fountain pen with a reservoir in its stem and a gold iridium pointed nib is now in general use, while the stylographic pen with a wire point instead of a nib is a development of an earlier pen used for writing music; ball-pointed Ps. are a recent development. The steel is prepared at Sheffield, but Birmingham is the centre of the pen trade in England. See W. Higgins, *Pen Practice*, 1948.

**Penal Servitude.** When transportation (q.v.) beyond the seas was abolished the form of punishment by P. S. was introduced in its place, the substitution, which began in 1853, being complete in 1867. P. S. was imprisonment and compulsory labour as regulated by the Penal Servitude

Acts 1853 to 1891; the term 'imprisonment,' as opposed to P. S., connoted confinement either with hard bodily labour for not less than six nor more than ten hours a day (for males over sixteen stone-breaking at one time or the treadmill, both of which were abolished some years before the abolition of P. S. and hard labour by legislation of 1943). Prisoners undergoing P. S. wore the distinctive broad arrow dress, and the task assigned was merely some form of useful work. The Prevention of Crime Act, 1908, introduced a third opposed term, viz. 'preventive detention,' which might be superadded to P. S. in the case of a 'habitual criminal' (see further under CRIMINAL LAW). The shortest term of P. S. which could be given was three years, which term could, by the Penal Servitude Act of 1891, be awarded in every case in which the court had power to pass a sentence of P. S. The maximum term was for life, but by good conduct some degree of remission might be earned, the convict being then granted a licence or ticket-of-leave. A court of summary jurisdiction (i.e. stipendiary magistrates and justices of the peace) could not, but most other courts having criminal jurisdiction, including bor. and co. sessions courts, could award a sentence of P. S. P. S. (and hard labour) was abolished by the Criminal Justice Act, 1948, the relevant provisions coming into force on April 18, 1949 (see Statutory Instrument, 1949, No. 139: Criminal Procedure, Criminal Justice Act, 1948 (date of commencement) Order, 1949).

**Penal Statutes** are those which impose a pecuniary penalty or some other form of punishment for the breach of their provisions. Sometimes the Crown, sometimes the person aggrieved, and sometimes a common informer may sue for the penalty, e.g. in 1931 an action was successfully brought to recover penalties against a defendant for keeping a cinema theatre open on Sunday. It is a rule of law that a P. S. must be strictly construed, and must not be extended to any case which is not clearly within both the spirit and letter of the enactment. Action under P. S. must, where no time is expressly limited, be brought within six months of the cause of complaint. The term is in particular applied to anti-Catholic measures in England and Ireland during the seventeenth and eighteenth centuries.

**Penance** (Lat. *penitentia*). In eccles. parlance this word is used for four distinct things: (1) a virtue, of which the chief acts or manifestations are contrition or sorrow for sin, and satisfaction or self-inflicted punishment in atonement for sin; (2) a censure, i.e. a punishment imposed by ecclesiastical law, and involving deprivation of spiritual goods; (3) the sacrament of confession (q.v.); (4) the satisfaction imposed by the priest in this sacrament.

**Penang, Pulo Penang, or Prince of Wales Island**, northernmost is. of the Straits Settlements, situated off the W. coast of the Malay Peninsula, at the N.

end of the straits of Malacca, about 360 m. N. of Singapore. It is 15 m. long by 8 m. broad, flat and fertile for over half its area, rising at 'the peak' to 2922 ft. The port and cap. is George Town, or P. on the E. coast. The prin. products, besides tin, which is dug at the base of the mt., are sugar, coffee, rice, pepper, cloves, nutmegs, coco-nuts, and areca nuts. Area 108 sq. m. Pop. (estimated, 1941), 245,200 (Chinese, 165,200; Malays, 41,200; Indians, 2400; and Eurasians, 2300). P. Settlement includes P. Is., the strip of mainland opposite known as Prov. Wellesley (area 280 sq. m.; pop. about 120,000) and, prior to 1935, the Dindings ter. (area 183 sq. m.; pop. 20,000). It is the emporium for much of the trade of Sumatra and the Malay Peninsula. The Is. was ceded to the E. India Company by the rajah of Kedah in 1785. By the pirate-suppression treaty of Pangkor (confirming the cession of Pangkor Is. and the Sembilan Is. to Britain), the strip of ter. on the mainland opposite P., known as the Dindings, also became Brit. and remained a part of the settlement of P. until its retrocession (mainly to secure uniformity of customs procedure) to the state of Perak in 1935. P. was made a separate presidency, of equal rank with Madras and Bombay, in 1805. In 1826 Singapore and Malacca were incorporated with it under Brit. government, P. still remaining the seat of government. (In 1936 the seat of government of the Straits Settlements was transferred to Singapore.) With the estab. of P. the trade of Malacca passed to it. But when Singapore was founded P. in its turn had to yield first place to the port with the superior strategic position and came to depend chiefly on the local trade. Once inconsiderable, that trade has become important with the development of tin mining and rubber planting in the adjacent Malay States, and the development of trade with neighbouring countries. In the Jap. invasion of 1941 P. was abandoned to the enemy in Dec. of that year, but was again in Brit. hands in Sept. 1945.

**Penarth**, seaport tn. of Glamorganshire, Wales, 4 m. S. of Cardiff. It is a pleasure resort, and has a fine esplanade and pier. There is a good harbour, and a trade in coal and oil. Pop. 17,100.

**Penates** were, among the anct. Romans, the gods of the household. They were supposed to be the presiding deities of the family life, and were worshipped by the family, the hearth being their particular shrine. There are generally considered to have been P. of public life also, and they ruled the welfare of the state. See also LARES.

**Pencil**, 1. Name given to the small brushes used by artists, whether made of hog's bristles, camel's hair, fitch, or sable. The larger brushes are sometimes set in a tin tube, and the smaller are generally set in quills of different sizes. The well-known black-lead P. is made of black-lead or plumbago. The finest plumbago is obtained from a mine in Cumberland. Some Ps. are filled with coloured chalk

instead of black-lead. The over-pointed P. is an instrument for using cylindrical pieces of black-lead, which are forced forward in the P. just so far as to allow them to be used without breaking. 2. In optics, the name given to the rays of light which converge to or from a given point. 3. In geometry, the figure formed by a number of lines which meet in one point, as the *axial P.*, the *flat P.*, etc. 4. Term used by sixteenth- and seventeenth-century heralds to describe a small pointed flag.

**P.E.N. Club, The.** Founded in 1921 by C. A. Dawson Scott, Eng. novelist. The first president was John Galsworthy, who was succeeded in 1936 by H. G. Wells. It is a world association of writers, editors, and translators, with centres in most caps., and its aim is 'to promote and maintain friendship and intellectual co-operation between men of letters in all countries in the interests of literature, freedom of expression, and international good will.' International congresses are held annually; the first in London in 1923, subsequently in U.S.A., France, Germany, Belgium, Norway, Austria, Poland, Holland, Hungary, Yugoslavia, Scotland, Catalonia, Argentine, France, Czechoslovakia, England (in 1941 during the Second World War), Sweden, Switzerland, Italy, and Scotland (1950). It has devoted much attention to problems of refugee writers and was appointed by the Home Office to advise on 'enemy alien' writers during the Second World War. International presidents after Wells have been Jules Romains, Maurice Maeterlinck, and Benedetto Croce; Eng. presidents after Wells have been J. B. Priestley, Henry W. Nevins, Storm Jameson, and Desmond MacCarthy. Headquarters in London; secretary of Eng. centre and of the International, Hermon Ould.

**Penda** (c. 577-655), king of Mercia (626-55), the champion of paganism against Christianity; he defeated the W. Saxons at Cirencester (628), annexing much of their land. With Cædwalla, he slew Edwin of Northumbria at Hothfield (633) (identified with Hatfield Chase). P. also conquered and slew Sigebert and Ecgbe, the E. Anglian kings, and Oswald (q.v.) of Northumbria at Maserfield (642). Finally, Oswy, king of Northumbria, killed P. in battle at Winward (655) (unidentified). See Bede's *Ecclesiastical History*; *Anglo-Saxon Chronicle*; T. Hodgkin, *The History of England from the Earliest Times to the Norman Conquest*, 1906; and F. M. Stenton, *Anglo-Saxon England*, 1943.

**Pendant**, long narrow flag, see BANNER; PENNANT.

**Pendant**, in Gothic architecture, an ornamental mass of stone hanging down or descending from the intersections of a groined vaulting. They are especially found in the florid Gothic type, as, for example, in Henry VII's Chapel at Westminster Abbey.

**Pender**, Sir John (1815-96), Scottish manufacturer and director of cable companies, b. in the Vale of Leven. P. was engaged in the manuf. of textiles before

he turned his attention to cables. He eventually took an important part in financing and managing the many companies which arose when the success of the Atlantic cable had shown the world its practical utility. He promoted cable enterprise in all parts of the world, and subsequently controlled companies whose combined capital was over \$15,000,000 and who owned 74,000 nautical m. of cables. He represented Wick Burghs in Parliament for sev. years.

**Pendine**, vil. of Carmarthenshire, Wales, situated on Carmarthen Bay, 5 m. from Laugharne. There is a fine stretch of sand, which is used for motor-car speed tests.

**Pendleton**, formerly a separate tn. of Lancashire, Eng., 2½ m. W. of Manchester, was in 1919 included in Salford. Manufs. silk and cotton.

**Pendulum**, instrument of great value in physics. A simple P. is defined as a heavy particle suspended from a fixed point by a fine, inextensible, massless, rigid thread so that it is free to oscillate in a vertical plane. Naturally an ideal P., its motion is nevertheless of great importance in the investigation of problems concerning real or compound Ps. When Galileo timed the oscillations of a swinging lamp at Pisa by means of his pulse he was observing an approximation to a simple P., and he discovered that the oscillations were isochronous. Mathematical calculation obtains the formula  $t = 2\pi\sqrt{l/g}$  for a complete oscillation of a simple P., where  $t$  is the time,  $l$  the length of the P. and  $g$  the acceleration due to gravity at the place where the P. is situated. This formula is true only for a small arc of swing. From this law, knowing  $g$  at any place, we can construct a pendulum to beat any required time, or can determine what time a given P. will beat, or by arranging length and observing time we can find the value of  $g$ . This last is of great importance:  $g = 980$  when the P. beats secs., or 9.8066 the length of the secs. P.; this must be increased by  $\cos^2 \theta / 289$ ,  $\theta$  = latitude, owing to centrifugal force of rotation of the earth. Thus at London,  $g = 32.121$  (Sabine); New York, 32.160 (Sabine); Edinburgh, 32.204 (Kater); Rawak, 32.088 (Freyinet); Spitzbergen, 32.253 (Sabine). From this and other results it is found that gravity increases towards the poles and is least at the equator; an independent proof of the spheroidal shape of the earth. If  $w$  = loss of weight between equator and pole,  $c$  = centrifugal force at equator, both expressed as fractions of  $g$  at the equator,  $d$  = ellipticity of the planet, then  $d + w = 2\frac{1}{3} \times c$  (Clairaut, 1742), whence  $d = .1$  about.

The density of the earth was found by means of a P. by Maskelyne in 1774; again in 1832 at Arthur's Seat, Edinburgh, by determining the attraction from the vertical due to mt. mass; again by comparing oscillations at surface and bottom of a mine by Ayr in 1856. Conversely, the height of a mt. or the depth of a mine may be determined. If  $r$  = radius of the earth and  $d$  = difference in

number of oscillations per day, the height =  $r.d/864$  ft. Foucault, in 1851, by means of a P., rendered the rotation of the earth visible. The P. appeared to alter its swing direction regularly; the law is: the total angle described by the plane of the P. in a day =  $360^\circ \sin \theta$ , where  $\theta$  is the lat. If a simple P. swings in a horizontal circle, instead of a vertical plane, describing a cone, its time =  $2\pi\sqrt{l/g}$ , where  $l$  = height of cone. No pendulum is mathematically simple, and the determination of length is not easy.

**Kater's pendulum** is a brass tube 4 ft. long, 3 in. diameter, one end weighted. Parallel knife edges are inserted at right angles at equal distances from the ends and the whole apparatus is so adjusted that the times of swing will be equal and not far from one second when swung either end up. The length between the knife edges gives the simple-equivalent P. All Ps. practically used are compound; defined as a rigid body oscillating about a fixed horizontal axis. The time of oscillation

FIG. 1

is given by the formula  $t = 2\pi\sqrt{\frac{k^2 + h^2}{gh}}$ ,

where  $k$  is the radius of gyration of the P. about an axis through its centre of gravity parallel to the axis of oscillation, and  $h$  is the distance between the centre of gravity of the P. and the point of suspension. Thus the length of the simple-equivalent P. is  $\frac{k^2 + h^2}{h}$ . Fig. 1 is a body

(i.e. a compound P.) suspended at O, G its centre of gravity; then K, a point in the line passing through O, such that if K be made the point of suspension the time of oscillation is not changed, is called the centre of oscillation and also the centre of percussion (q.v.). The length OK equals the length of the equivalent simple P.

FIG. 2

**Blackburn's pendulum** (Fig. 2) is a contrivance arranged for tracing, by means of ink trickling from the bob, various harmonic curves. The mass M is suspended at S and S' by a string knotted to two others at K. The mass moves on a curved surface, the prin. curvature at the lowest points being  $l/PM$  and  $l/KM$ ; its motion is therefore compounded of the two simple harmonic motions  $2\pi\sqrt{PM/g}$  and  $2\pi\sqrt{KM/g}$  for small oscillations.

*Balistic pendulum* is a P. formerly used for measuring velocities, such as that of a bullet, and for testing gunpowder. A mass of wood forms the 'bob,' and swings backwards when the bullet is fired into it, so that no jar is given to the pivot or point of suspension. The momentum in the bullet before entering the wood now belongs to the whole mass, of which it becomes a part. A silk ribbon attached to the bob is pulled over the edge of a table or through a moderately tight hole by the swing, and the length pulled through is proportional to the momentum of the bullet before entering the wood. The velocity is obtained by dividing the mass of the bullet into the momentum. The device was invented by Robins (1740) and has been improved. The gun itself may be suspended as a P. and the arc of recoil measured, small arms are thus tested by the 'gun éprouvette.' See also under **HORLOGY**.

See any standard book on dynamics. For elementary work: S. L. Loney, *Elements of Dynamics*, 1893; C. J. L. Wagstaff, *Properties of Matter*, 1920. For advanced work: N. F. Ramsey, *Dynamics*, J. H. Poynting, and J. J. Thomson, *Properties of Matter*, 1903. C. S. Jackson and W. H. Roberts, *First Dynamics*, 1913; and C. J. L. Wagstaff, *Properties of Matter*, 1934.

Penelope, in Gk. mythology, the wife of Odysseus and the mother of Telemachus, who was a baby when Odysseus left home to take part in the war against Troy. During her husband's absence, P. managed to escape persistent suitors by putting forward the excuse that she had to weave a robe for Laertes, her father-in-law, and to lengthen the task she undid by night her work of the day. Odysseus returned in time to save her from further annoyance. She thus figures in the *Odyssey* as the type of faithfulness, although some later writers are at variance with this view.

Penetangore, see **KINGARINE**.

Penge, urb. dist. and par. of Kent, England, 7 m. S.E. of London, on the S. Region Railway. Pop. 25,000.

Penguin, common name of the members of a family Spheniidae, found only in the S. hemisphere, and characterised by the modification of the wings into paddles or flippers. The wing is long and has no covert or quill feathers, and always remains open. The feathers are tiny, with very broad shafts and but little vane or web. The legs of the birds are placed far back and in the water the feet are stretched out straight behind and held motionless, the wings working rapidly as if being used in flight. The position of the legs causes the gait of the birds on land to be very awkward, but on snow slopes they are able to toboggan at a rapid pace, propelling themselves with the powerful legs assisted by the wings. They stand upright, and this characteristic, with their solemn bearing and many curious traits, often gives them a remarkably human appearance. They are essentially aquatic birds, and their coming on shore is chiefly for the breeding

season, when they assemble in rookeries, whose number is estimated as 750,000 at Cape Adare. The nest is often no more than a slight hollow in the ground, but some Ps., especially the Adélie P., put themselves to a great deal of trouble to collect stones, with which they bank the nest round, an occupation which frequently develops thieving habits. Two eggs are laid, and both birds, but chiefly the male, attend to their incubation. Both parents are very devoted to the young, one always staying to guard them, the other bringing them, often at great labour, from the sea crustaceans and other small animals, which the young take by pushing their beaks far down their parent's throat. When they are old

PENGUINS

enough to move away from the nest, the relationships often become hopelessly confused. The moult of Ps. is remarkable in that the short, scale-like feathers are flaked off like the sloughing of a reptile's skin rather than the shedding of plumage. Some species of P. possess a pouch, in the form of a feathered fold of skin near to the feet on the ventral surface, used to shelter the eggs and young. With the exception of a single tropical species which inhabits the Galapagos Is., and a few others, Ps. are almost confined to the colder regions. Large rookeries have been found at very low latitudes. The largest species is the emperor P., which breeds far & during the winter darkness. It is about 3 ft. long, and the plumage is dark slate on the back and white on the underparts, with yellow spots on the head. The king P. occurs on Kerguelen Is., the Falkland Is., and others of about the same lat., 50° S. With it is generally found the Gentoo P., the feet of which, as well as the lower mandible and lower part of the upper mandible, are bright yellow. The eggs are palatable, and are taken in great numbers by sealers and whalers. See also under **ANTARCTIC**

**Penguin Books.** This enterprise was founded in 1935 by Allen Lane (nephew of the famous Victorian publisher, John Lane of the Bodley Head) and his two brothers, John and Richard. Its original aim was to provide low-priced reprints of good fiction in large popular eds. The venture met with rapid success, and within two years more than one hundred titles had been issued as Penguins at a price of sixpence a vol. In 1937 a complementary series, Pelican Books, was begun in order to develop 'the diffusion of knowledge' through cultural and scientific books. This series includes a substantial and increasing proportion of vols. specially written as Pelicans. Many other separate series now appear under various Penguin imprints, among them the illustrated King Penguins, the Penguin Classics (in new translations), the Puffin Books for children, the Penguin Modern Painters (with colour plates), the Penguin Shakespeare, the Penguin Music Scores, etc. More than half the output of P. B. Ltd. consists of vols. written expressly for one or other of the series and not pub. in any other form. In its first fifteen years of existence 1500 titles were issued in an aggregate output exceeding 15,000,000 copies. *Penguin's Progress*, a quarterly, records the activities of the firm.

**Pengwern,** see SHREWSBURY.

**Penicillin.** The name is derived from the green mould or fungus *Penicillium* (Lat. a brush, referring to the appearance of the spore-bearing branches under the microscope); various species of *Penicillium* are common on decaying and damaged fruit such as oranges and on cheese. In 1928 a culture of *Staphylococcus* bacteria growing in the laboratory of Prof. (now Sir) Alexander Fleming (q.v.) was observed by him to be contaminated with a colony of *Penicillium*, later identified as *P. notatum*. Fleming noted that the growth of the bacteria was retarded close to the mould, and subsequent experiments showed that the inhibitory action was exerted on other bacteria, such as the haemolytic *Streptococcus* and the organisms of pneumonia, gonorrhoea, and diphtheria. On the other hand there was no effect, for instance, on the bacteria of tuberculosis, influenza, and *Bacillus coli*. During the Second World War, the effective material P. was obtained in a relatively pure and stable form by the Oxford workers under Sir Howard Florey and Dr. E. Chain, and was produced in the U.S.A. and in England for the treatment of service personnel and later of civilians. In 1918 the chemical composition of various forms of P. was pub., and attempts at synthesis have been made. Fleming's original strain of *P. notatum* remained the commercial source until 1945, when another strain was used. P. is particularly useful as an antibacterial agent since it is non-poisonous even in large doses, in contrast to such drugs as salvarsan and the sulphonamides. Other fungi have since been investigated to ascertain whether they contain similar substances; streptomycin, useful in some kinds of tuberculosis, has been extracted

by Waksman (1944) from *Streptomyces griseus*, and chloromycetin, also from a species of *Streptomyces*. Chloromycetin, synthesised in 1949, is proving of value in the treatment of scrub typhus and other diseases, as is also aureomycin. Fleming's original paper was in the *British Journal of Experimental Pathology*, 1929, 10, 226. See G. Lacken, *The Story of Penicillin*, 1945; Sir A. Fleming, *Penicillin: its Practical Application*, 1946; and National Academy of Sciences, *The Chemistry of Penicillin*, 1949.

#### PFENICILLIN: THE ORIGINAL PLATE

The staphylococci planted on the plate had developed into the fully formed colonies seen at A. The mould C developed from a spore which fell on the plate after the colonies had grown up. The mould produced penicillin which destroyed the staphylococcus colonies in the area B, the nearest ones completely, and those further out remain only as shadowy remnants.

**Peninsula,** piece of land jutting out into, and almost surrounded by, the sea. It differs from a cape in that it is reconnected to the mainland by an isthmus.

**Peninsular and Oriental Steam Navigation Company,** commonly called The P. & O., was incorporated under that title in 1840. Since 1837 the Peninsular Company running to Spain and Portugal had been in operation, and with the inauguration of a regular mail service by the company to India the 'Oriental' was then added. Their first ship was the *William Farwell* of 206 tons, chartered for the purpose, as was the *Royal Tar*, built in 1832. Prior to the opening of the Suez Canal passengers and cargo had to be transported across the isthmus to the steamer waiting them at Suez, and the route, originally opened up by Thomas Waghorn, developed under P. & O. control to an extensive business with special Nile steamers, coaches between Cairo and Suez, with rest houses, and many thousands of camels for the cargo. The Australian

mail service was started in 1852, and other routes extended to China, Japan, and the Black Sea. The opening of the canal in 1869 naturally disrupted the whole elaborate organisation and caused difficulties over the mail contract; but the company continued to prosper, its vessels increasing gradually in size and speed. In the early 1900s they were exceeding 10,000 tons in size. In 1912 came fusion with the Brit. India Steam Navigation Company, who possessed one of the world's largest fleets, and later control of well-known lines like the New Zealand Shipping Company, the Union Company of New Zealand, the General Steam Navigation Company, the Hain Line, and the Strick Line.

To-day many P. & O. ships exceed 20,000 tons, like the well-known *Strath* class, the *Himalaya* of 28,000 tons, put into service in 1949 being the biggest. Heavy war losses from 1939 to 1945 caused great delay in the resumption of normal services, but to-day, by means of a greater sea speed, the company is endeavouring to make up for its lack of ships by faster voyages. Cargo liners of 7000-9000 tons, each taking twelve passengers, are being run at 17 knots, whilst passenger ships are running at from 19 to 22 knots. On Jan. 1, 1950, the P. & O. had twenty-nine ships in service, totalling 386,000 tons, with two ships of 33,000 tons building. The tonnage of the P. & O. group of associated lines totalled over 2,000,000, with 288,000 tons still under construction. See *Boyd Cable, A Hundred Year History of the P. & O., 1837-1937, 1937.*

**Peninsular War (1808-14).** The continental system (*q.v.*) of Napoleon had been accepted by all the nations of Europe with the exception of Portugal, and Napoleon's schemes of oriental conquest required a maritime base. Therefore in Oct. 1807 the emperor concluded the secret treaty of Fontainebleau for the conquest and partition of that country with the king of Spain, no doubt planning the acquisition of the latter state also. In the following month the Fr. army under Junot seized Lisbon, and the Portuguese royal family sailed to Brazil. Before March of the following year, Napoleon had dispatched nearly 160,000 more men into Spain, ostensibly to reinforce Junot; riots then broke out in Madrid against Charles IV., who abdicated in favour of his son Ferdinand VII. The latter, however, left Madrid for France, where he was held a prisoner, and Charles again occupied the throne, until on May 5 he surrendered the crown by the treaty of Bayonne to Napoleon, who bestowed it on his brother Joseph. This led to an insurrection in favour of Ferdinand VII., and in June 1808 Portugal appealed to England for aid. An expedition under Sir Arthur Wellesley sailed for Corunna on July 12, and Joseph quitted Madrid and retired to the R. Ebro. The Eng. troops, assisted by the insurgents, defeated Laborde at Rolica and Junot at Vimeiro, and the latter was compelled to sign the convention of Cintra at Torres Vedras on Aug. 30, by which he evacuated Portugal and retired to France.

Napoleon had meanwhile consolidated an alliance with the tsar, and decided to lead the grand army into Spain in person. This he did, and entered Madrid on Dec. 4, 1808; Spain was, however, by no means subdued, and extensive guerrilla fighting took place. Sir John Moore (*q.v.*) conducted a well-planned diversionary movement, ending in a retreat to his ships at Corunna. Napoleon returned to France, and in the battle of Corunna on Jan. 16, 1809, the Eng. army was victorious, although it embarked afterwards, according to plan, and Sir John Moore was killed. There were now three theatres of war: in the E., in Portugal, and in Andalusia. In the first Lannes and Mortier besieged Saragossa, which surrendered Feb. 21, and St. Cyr invested Girona. In Portugal Soult occupied Oporto, but had to retire into Galicia; the Eng. under Wellington won the battle of Talavera, but Del Parque was defeated by Soult, with Victor, Sebastiani, and Mortier, at Albuera de Torres. During the winter of 1809-10, Wellington built the lines of Torres Vedras, forming an invincible position between the Tagus and the sea. In 1810 Masséna moved against Wellington, but was checked at Busaco, and Wellington retired behind the lines of Torres Vedras. Meantime Ney had captured Ciudad Rodrigo and Almeida. In Andalusia the Fr. took Granada, Málaga, and Seville, and besieged Cadiz. In 1811 Masséna, isolated by 'scorched-earth' tactics and the impregnability of the Torres Vedras position, retreated from his winter quarters at Santarém to Salamanca, pursued by Wellington, who defeated him at Barrosa, and later (May 3 and 5), at the battle of Fuentes de Oñoro. Soult came to the assistance of Masséna and, though defeated at the battle of Albuera (May 16), obliged the allies to raise the siege of Badajoz. In 1812 Wellington had been reinforced, and captured Ciudad Rodrigo on Jan. 19, Badajoz on April 6, and Almaraz Bridge on May 17. After defeating Marmont at Salamanca (*q.v.*), he entered Madrid and then besieged Burgos; Soult, however, raised the siege, and forced Wellington to retreat into Portugal. Meantime, in the E. of the country Suchet had captured all the towns save Alicante and Cartagena between 1810 and 1812, and had defeated Blake at Sagunto in 1811. In 1813 Wellington began to take the offensive, as the withdrawal of troops which was necessitated by the Fr. disaster in Russia left Joseph with only about 72,000 men against 100,000. Joseph was beaten at Vitoria on June 21, and fled into France. Soult immediately returned from France to take command, but could not prevent Wellington from capturing San Sebastian (Sept. 31), crossing the Bidasoa into France (Oct. 7), and taking Pamplona (Oct. 25). From this time the hist. of the war is the gradual weakening and continued defeats of Soult: in Nov. the Nivelle was crossed, in Dec. there was fierce fighting in front of Bayonne, and on April 10 the battle of Toulouse ended in Wellington's capture of the city, whilst on April 18 Soult signed a convention for

the suspension of hostilities. Soult displayed great skill and admirable firmness and tenacity in this last campaign, and was beaten because opposed by a greater general who had better troops.

The reasons for Wellington's success, which are also the reasons for the Fr. failure, may be briefly summarised as follows: Wellington's line tactics proved the answer to the Fr. system of attack in heavy columns; his supply system was superior; the Fr. operations covered too large an area and were not sufficiently controlled by a central authority on the spot; Napoleon's system of conducting the war in Spain from Paris was fundamentally unsound; the guerrillas greatly hampered the Fr. On the other hand, Wellington had to contend against lack of money, Sp. intrigues, and lack of equipment, particularly of engineers for siege work. The P. W. proved a continuous drain upon Fr. resources, as Napoleon himself admitted. Moreover it gave a new hope to the defeated countries of Europe, in that Wellington proved the Fr. system of warfare to be by no means the invincible weapon it had for so long seemed to be. The best hist. of the war is C. W. Oman, *Peninsular War, 1802-1811*. See also W. Napier, *History of the Peninsular War, 1808-40*; Lt.-Col. Gurwood (ed.) *Wellington's Despatches, 1811*; W. Tomkinson, *Diary of a Cavalry Officer, 1811*; A. I. Shand, *The War in the Peninsula, 1808*; J. B. Jourdan, *Mémoires du Maréchal Jourdan (guerre d'Espagne), 1809*; F. Beaton, *With Wellington in the Pyrenees, 1811*; and B. U'Urban, *Peninsula Journal, 1930*.

**Peninsula State**, see FLORIDA.

**Penis**, intromittent organ, or phallus, of the male animal, whereby the sperm, which later fertilise the eggs, are transferred to the vagina of the female during the mating process (coitus or copulation). A P. is present in some invertebrates, such as the common earthworm, and particularly in parasites, as for instance the tapeworm, where it facilitates fertilisation inside the body of the host. Fertilisation is usually external in fishes and amphibians, so that a P. is absent, but in some fishes, such as the viviparous tropical species, and also the common dogfish, a copulatory organ occurs, though it is not usually known as a P. Amongst reptiles a paired P. is found in the snakes and lizards; in birds, such as the domestic fowl, the sperm is transferred by the juxtaposition of the cloacal apertures during coitus, and there is no P. In man, an example of the mammals, the P. is a cylindrical organ which terminates in the glans, the latter covered by the prepuce or foreskin; internally the P. contains three spongy masses: the two corpora cavernosa dorsally and the single corpus spongiosum ventrally. The corpora become engorged with blood and cause the erection of the P. in copulation; the corpus spongiosum is traversed by the urethra, the passage for the urine.

**Penistone**, mkt. tn. in the W. Riding of Yorkshire, England, on the R. Don. 13 m. N.W. of Sheffield. Agriculture and

the manuf. of steel goods are the chief industries. P. is the head of the P. parl. div., and also head of a co. council div. Pop. 6000.

**Penitential Psalms**, seven psalms of a penitential character chosen from the O.T. and usually associated together. They are Psalms vi., xxxii., xxxviii., li., cli., cxxx., cxlii., of which Psalm cli., *Miserere*, is the most striking. Their selection dates back to the third century at least. They are also frequently used as an act of private devotion.

**Penitentiary**, one of the offices of the papal court. The name *Penitentiarius* is also given to the cardinal who presides over this court. The office of the P. is concerned with all questions relating to the confessional and private discipline. It deals with applications for the remission of eccles. censures, and for dispensations from the ordinary marriage laws of the church, and with specially reserved cases of conscience. Meetings for the settlement of these cases are held monthly, and, if necessary, they are then referred directly to the pope. See also PRISON.

**Penkridge**, tn. of Staffordshire, England, 6 m. S. of Stafford. It is generally accepted as the Rom. Pennocrucium. Pop. 2400.

**Penley**, William Sydney (1852-1912), Eng. actor, b. at Margate; began life as a choir-boy, and then became a clerk in a drapery business. In 1871 he went on the stage, and soon after achieved success as the foreman in Gilbert and Sullivan's *Trial by Jury*. His position steadily improved until he played the curate in *The Private Secretary*, when he took his place as the leading London low-comedy actor. In 1892 he produced *Charley's Aunt*, and drew crowds to see the play and his delightfully humorous performance. The play brought him a fortune.

**Penmaenmawr**, seaside resort of Wales, in Carnarvonshire, on Conway Bay, 4 m. W.S.W. of Conway. To the W. of the tn. rises the height of P. (1350 ft.), on whose crest was, until 1920, a hill fort and Druidical remains. Pop. 4500.

**Penn**, Sir William (1621-70), Brit. admiral, b. probably at Bristol, served under Blake in the Dutch war, and was in command of the Blue Squadron at the battle off Portland (1653). In the following year he was appointed general and commander-in-chief of the fleet designed to proceed against the Spaniards in the W. Indies. Together with Gen. Venables, he tried to atone for his failure to take Hispaniola by the capture of Jamaica from the Spaniards (May 1655), the inhab. falling an easy prey to his ragamuffin army of 8000 troops in thirty-eight ships. Appointed naval commander-in-chief at Jamaica, he returned to England without leave and was imprisoned for a short term. He entered into negotiation with the Royalists, and at the Restoration was knighted, and made a commissioner of the navy. He had a command at the battle of Lowestoft (1665), but was not again employed on active service. There is a memoir by Granville P. and a portrait

in the hist. gallery of the Institute of Jamaica (Kingston). See *Penry's Diary*.

**Penna, William** (1644-1718), the Quaker founder of Pennsylvania, *b.* in London, was a son of Adm. Sir Wm. P. He was educated at Christ Church, Oxford, but was sent down from the univ. for non-conformity. He became a Quaker in 1667, and in the following year was imprisoned for publishing his *Sandy Foundation Shaken*. Released from the Tower in 1669 by his father's influence, he was perpetually persecuted for expressing his religious views. His father's death brought him a fortune and a claim against the Crown which he commuted for a grant of land in N. America, where he founded, in

WILLIAM PENN

1682, the colony of Pennsylvania for persecuted religionists. He was in England from 1684 for fifteen years and took an active part in religious controversy. His friendship with James II. brought some advantages to the Quakers. A second visit to his colony (1699-1701) gave it much useful legislation. The closing years of his life were clouded by mental decay. His works were collected in 1726, and ed. with a jour. of his life, by J. Beese. See biography, 1872, by W. H. Dixon, who refutes the charges of scandalous conduct detailed by Macaulay; and lives by S. M. Janney, 1852; J. Stoughton, 1882; A. C. Thomas, 1895; Mrs. C. Grant, 1908; J. W. Graham, 1916; and W. I. Hull, 1937; also H. M. Jenkins, *The Family of William Penn*, 1899, and L. V. Hodgkin, *Guelma, Wife of William Penn*, 1947.

**Penn**, Upper and Lower, two pars. of Staffordshire, England, 2 m. S.W. of Wolverhampton, engaged in the manuf. of hardware. Pop. (Upper) about 3000; (Lower) about 300.

**Pennalism**, see **FAGGING**.

**Penn-names**, see **PSEUDONYM**.

**Pennant, Thomas** (1736-98), Eng. zoologist and traveller, *b.* at Downing in Flintshire. He was educated at Wrexham School and subsequently at Oxford. In 1766 he commenced the pub. of his first great work, the *British Zoology*. In 1765, during the progress of this work, P. made a tour on the Continent. P. in 1771 pub. a *Synopsis of Quadrupeds*. He followed the arrangement conceived by Ray, introducing the genera estab. by Linnaeus. The *Synopsis*, when enlarged, was repub. under the title of *A History of Quadrupeds* (1781). After his return to England, P. commenced a work on *Indian Zoology* (2nd ed. 1790), of which fifteen folio plates were pub. The next work which P. commenced was a systematic catalogue called the *Genera of Birds*, but it was never completed. His last great work was his *Arctic Zoology* (2 vols., 1781-87). He also wrote a number of works of travel, including *Tours in Scotland* (1771-75) and *Wales* (1778-81). See his *Literary Life*, 1793.

**Pennant** (a compromise between 'pendant' and 'pennon'), general name for most pointed flags which are long in the fly as compared with the hoist. A signal P. is 9 ft. long, and tapers from 2 ft. at the mast to 1 ft. at the end. The nautical P. is a swallow-tailed flag, about twice as long as it is broad, flown at the mast-head of a ship in commission. A broad P. is flown to show the ship of a commodore. The paying off P. is a very long streamer with a bladder at the end, and is flown by a ship on its return to port. Special flags flown at church times, meal times, etc., are also called Ps. Ps. were attached to a knight bachelor's lance; later they were used in Brit. lancer regiments, and on section-leaders' vehicles in armoured car regiments. Brit. mail-carrying air-liners also carry Ps.

**Pennatula**, **Sea Pen**, or **Sea Rod**, genus of coral polypes of the order *Alcyonaria*. A fairly common Brit. species is *P. phosphorea*, so called from its phosphorescent character, though this is possessed by other species.

**Pennell, Joseph** (1837-1926), Amer. artist and author, *b.* in Philadelphia. In 1864 he married Elizabeth Robins, with whom he collaborated in producing numerous books of travel and description, amongst which are *Our Sentimental Journey through France and Italy*; *A Canterbury Pilgrimage* (1885); and *Our Journey to the Hebrides*. They were close friends of the artist Whistler, whose biography he pub. in 1908.

**Pennine Alps**, important div. of the Central Alps, which extend from the Great St. Bernard Pass eastward to the Simplon Pass, the Rhone forming their N. boundary. The name Pennine is often not applied to the W. portion, from the Little St. Bernard Pass to Col Ferret, which is called the Chain of Mont Blanc. In the P. A. are the Combin dist., the Arolla dist. (a favourite summer resort for climbers and tourists), the Zermatt dist., and the Saas dist. Amongst the highest

peaks found in the range are Mt. Vélan (12,353 ft.), Grand Combin (14,160 ft.), Mont Blanc de Sallion (12,695 ft.), Tête Blanche (12,300 ft.), Dent d'Hérans (13,710 ft.), Grand Cornier (13,020 ft.), Matterhorn (14,781 ft.), Monte Rosa, highest peak Dufourspitze (16,215 ft.), etc.

Pennine Chain, mt. group of England, beginning to the S. of the Lower Tyne valley and extending to the middle of Derbyshire and the N. of Staffordshire. It is sometimes called the 'backbone of England,' but is more in the nature of a series of uplands than a chain of mts. The chief summits are Cross Fell (2930 ft.), Wharfedale (2414 ft.), Ingleboro (2373 ft.), Pen-y-ghent (2273 ft.), and Kinder Scout (The Peak) (2088 ft.).

Pennisetum, genus of ann. and perennial grasses, some of which bear very decorative inflorescences with long awns or bristles, and an abundance of ornamental foliage. *P. latifolium* and *P. longistylum* are grown in gardens. *P. typhindum*, spiked millet, is an Indian cereal, and *P. cenchroides* a valuable tropical fodder grass.

Pennon, see FLAG; PENNANT.

Pennsylvania, known as the Keystone State, one of the thirteen original states of the U.S.A.; sends to Congress two senators and thirty-four representatives, and is the second largest as regards pop., which was estimated at 10,676,000 in 1948. It is about 160 m. wide and 362 m. long. Gross area, 45,339 sq. m., of which 294 sq. m. is water surface (excluding Lake Erie). Harrisburg is the cap., and P. is bounded on the N. by New York and Lake Erie, on the E. by New York and New Jersey, on the S. by Delaware, W. Virginia, and Maryland, and on the W. by W. Virginia and Ohio. This state is one of the richest mineral regions in the world, and ranks first in the U.S.A. with a production worth \$1,090,781,000 in 1946. There are immense bituminous coal-fields and also large fields of anthracite coal, which together form 80 per cent of the value of mineral products; the great oil-fields lie in the W. of the state. Petroleum was first discovered in 1859; boring for it is one of the great industries of P., ann. production reaching over 12,000,000 barrels. The state leads in the manuf. of pig-iron, Pittsburgh being the centre of the smelting industry. Besides iron and steel products, there are electrical goods and equipment. The state as a whole comes next to New York in its industries, the ann. output reaching a value of \$5,473,000,000 in 1939. It produces nearly half the vast amount of steel made in the U.S.A. The leading manufs. are pig-iron and steel, foundry and machine-shop products, leather and silk, and worsted goods. There are large sugar and molasses refineries, also petroleum. The climate is healthy but subject to extremes of cold and heat. One-fourth of the state is wooded, and lumbering is a source of wealth in the N. In the S. and S.W. are forests of hemlock and virgin beech. The great Cumberland valley is a fine farming dist. The farms are small but well tilled; hay is the great

crop, but wheat and other cereals are grown. Poultry farming is a source of wealth, and horses are raised in this state, and cattle, especially a fine though small breed of cows, similar to the Jersey cows in appearance. Over and above its industries, the state's agric. production has reached \$500,000,000 annually (in 1939 it was \$300,000,000), the farmers being mainly those descendants of Ger. settlers famous as 'P. Dutch.' The Appalachian range crosses P.; a part of the Alleghenies range, with Mt. Knobb as the highest summit, lies in the S.W., and between them and the Blue Ridge or Kittatinny Mts. are fertile valleys. Slate, limestone, and marble quarries abound, especially in the dist. round Philadelphia. The R. Delaware drains the whole of the E. part of the state, and runs into Delaware Bay, the sea entering the riv. for 30 m., thus forming an immense estuary. Other rivs. are the Susquehanna, with tribs., West Branch and Juniata, and in the W. the Allegheny R. and the Monongahela unite forming the Ohio.

The univs. and colleges are the univs. of P. (founded 1740), and of Pittsburgh (1787), P. State College (1855), Swarthmore College (Quaker) (1864), Carnegie Institute of Technology (1900), Temple Univ. of Philadelphia (1884), Drexel Institute (1891), Lafayette College (1832), Bryn Mawr College for Women (1835), and Lehigh Univ. (1866). The prin. religious denominations are Rom. Catholic, United Lutheran, and Jewish.

Charles II. gave to Wm. Penn (q.v.) in 1680 large grants of land in this state, but the first settlers were Swedes, and once it was called New Sweden. The state took an active part in the revolution and the war of 1812, and also in the Civil war of N. and S., when its nearness to the field of action made its situation most dangerous. Had the battle of Gettysburg been a victory, the state would have been invaded by the S. army. Two famous strikes, in 1892 and 1902, had great economic influence on state affairs, and the panic of 1907 had an unfortunate effect in business quarters, and much money was lost and many banks failed.

The P. Railroad Company controls a considerable part of the railways of the state. The station or depot of this company at Philadelphia is over 700 ft. in length, and one of the finest terminals in America. Other railways are the Lehigh Valley, the Philadelphia and Reading, the Pittsburgh, Cincinnati, St. Louis, and Michigan Southern. In 1915 there were 8934 m. of steam railway and 2394 m. of electric. In 1947 there were 158 airports. There are three fine ports: Erie, on Lake Erie, with large domestic trade; Pittsburgh, conducting the Ohio R. trade, and Philadelphia. Prin. towns: Philadelphia (1,931,300), Pittsburgh (671,700), Scranton (140,400), Erie (117,000), Reading (111,600), Allentown (98,900), Wilkes-Barre (86,900), Harrisburg (85,900), Altoona (80,200), Johnstown (66,700), Lancaster (61,300), Chester (59,300), Bethlehem (58,600), Upper Merion (56,900), York (55,800), McKeesport (55,400). See S. W.

**Pennypacker, Pennsylvania in American History**, 1910; A. E. Martin and H. H. Shenk, **Pennsylvania History: Told by Contemporaries**, 1925 (London); G. P. Donehoo, **Pennsylvania, a History**, 4 vols., 1926; A. Pound, **The Penna of Pennsylvania and England**, 1932; S. J. and E. H. Buck, **The Planting of Civilisation in Western Pennsylvania**, 1939; Federal Writers' Project (pub.), **Pennsylvania: a Guide to the Keystone State**, 1940; and O. S. Heckmann (ed.) **What to read about Pennsylvania**, 1942.

**Pennsylvania Railroad**, one of the greatest Amer. railway systems, comprises within its general organisation a main line and fifty subsidiaries with a total mileage of nearly 21,000, of which 1430 m. have been electrified. It was originally incorporated in 1846 for the purpose of building a line from Harrisburg to Pittsburgh within the state of Pennsylvania. This was completed in 1854 and then extended to Philadelphia in 1857. To-day it covers a vast ter. roughly bounded by the Atlantic Ocean and the Mississippi R., its main lines running N. of the Mason and Dixon line, although it also penetrates S. of it. The bulk of the pop. and of the industries of the nation are enclosed in the ter. it serves. Most of the big cities within that ter. are reached by one or more of its lines. The Pennsylvania was one of the first to introduce all-steel cars. Trains enter its terminals (from New Jersey) in New York by a tunnel under the Hudson R.

**Pennsylvania, University of**, situated in the city of Philadelphia, U.S.A., is usually claimed to have been founded by Benjamin Franklin in 1740, though it would be truer to say that he initiated the movements which led to its foundation. To-day it is housed in magnificent buildings, has an endowment of \$17,500,000, has over 9500 students and more than 794 profs. It comprises academic, scientific, engineering, fine arts, medical, legal, and dental schools. Its library, containing more than 700,000 vols., possesses also a priceless collection of the papers of Benjamin Franklin.

**Penny**, most anct. of Eng. coins. First mentioned in the laws of Ine, king of the W. Saxons, it weighed then about  $\frac{1}{16}$  of the Saxon pound weight. The Romans similarly divided the *libra* into 20 *solidi*, and the *solidus* into 12 *denarii*, i.e. 1 *denarius* =  $\frac{1}{12}$  of a *libra* or pound. No halfpennies were comd. before the late ninth century, and no farthings before the time of Edward I., the P. being deeply indented with a cross so that it could be broken into four parts. Under Edward VI. silver farthings ceased, and silver halfpennies under the Commonwealth. In 1662 'milled' edges were introduced to guard against clipping. In 1672 halfpennies and farthings were struck in copper and Ps. weighing one ounce *avordupois* in the same metal in 1797. These copper Ps. had the value of  $\frac{1}{2}$  of an ounce of silver, but the bronze P. introduced in 1860, had only about half this value. The Ger. *pfennig* was also originally silver, and bore the same relation to the Ger. pound of silver

as the Eng. P. to its pound. In the modern Ger. system the *pfennig* is a copper coin. P. is colloquially used for 'cent' in the E. U.S.A.

**Penny Banks**. These were first estab. about 1850, and have since become very numerous, rising from 200 in 1880 to sev. thousand. In 1878 they received legislative sanction to the investment of their funds, and in 1904 came under the control of the Savings Banks Act. Their object is to furnish easy means to the thrifty, and especially children in schools, to accumulate savings from extremely slender resources. Considerable numbers of these banks are now in touch with the Post Office Savings Bank (*q.v.*), and P. B. form a branch of the activities of practically all the missions.

The Yorkshire Penny Bank, which is, however not controlled by the Savings Bank Act, has (1949) share capital authorised £1,750,000; share capital issued, £1,250,000; reserve fund, £1,250,000; and assets £98,572,211.

**Pennyroyal** (*Mentha Pulegium*), fragrant prostrate mint which grows in damp places on Brit. moors. It bears ovate, nearly smooth leaves and axillary whorls of reddish-purple flowers.

**Pennywort**, Wall, or **Pennyleaf**, name commonly given to *Cotyledon Umbilicus*, a succulent glabrous plant with thick round leaves compressed in the centre, where they are attached to the stem, and racemes of pendulous, greenish-yellow flowers. It occurs on walls and rocks. The marsh P. is *Hydrocotyle vulgaris*, a marsh umbellifer with round shining leaves and minute inconspicuous flowers in simple umbels.

**Penobscot**, riv. of Maine, U.S.A., rising in Somerset co., and flowing E. into Chesuncook Lake, and then S. into Penobscot Bay, an inlet of the Atlantic Ocean. It is about 350 m. long and is identified with the mythical riv. Norumbega (*q.v.*).

**Penobscot**, tribe of N. Amer. Indians of Algonquin stock. They sided with the Fr. in the colonial war, but made a treaty with the Eng. in 1749, on whose side they fought during the war of Independence.

**Penology**, study of punishment or crime; or, in other words, that branch of criminology which deals more particularly with the deterrent and reformatory treatment of criminals. (The term is also used to describe the management of prisons.) P. marks a late stage in the hist. of legal codes. In anct. codes, the prevalent remedy is self-redress; all such acts as we should denominate crimes were remediable by private suit; there was nothing analogous to the conception of the vengeance of the community for acts tending to public alarm, nothing of the deterrent element in punishment, and still less of the reformatory or curative. The whole proceedings, even for a murder, were closely assimilated to a private lawsuit. The purpose of the criminal law, as it developed, was to supply the altruistic motives which were thus wanting. Gradually punishment becomes designed to make every offence 'an ill bargain to the offender'

(Locke); but it is only when we come to the time of Bentham (q.v.) and Beccaria (q.v.) that theories of punishment take a settled place in jurisprudence. These theories are generally classified into deterrent, preventive, retributive, and reformative. The last-named, which in process of time tends to occupy a more and more prominent place in the writings of jurists, but only to a limited extent in legislative expression, is the very antithesis of the retributive, which latter may be said to underlie most modern systems of punishment. In England such developments as the growing use of open prisons, and the whole system of Borstals and Approved Schools, as well as the institution of juvenile courts, are all expressions of the reformative element. The morbid theory of crime or, in the language of criminal anthropology, the assumption that every crime is the expression of a diseased mind, thus marks a conflict between law and medicine, and the old feud between the two professions touching the test of insanity (see on this *MORNAUGHTEN'S CASE, RULE IN*) thus threatens to extend to the whole domain of crime. The conflict between the deterrent and reformative may be thus expressed: the deterrent changes the motives, the reformative, the character. Death, according to the reformative theory, can be no fitting remedy; imprisonment is the only important instrument available for its purposes. The strength of the reformative theory lies in the fact that the practice has been to deal with offenders on the assumption that they are ordinary types of humanity (see on this *CRIMINOLOGY*). It may be admitted without reserve that the emotion of retributive indignation, both in its self-regarding and its sympathetic form, is, even yet, the mainspring of the criminal law. The idea that the retributive element should have a place, but subservient to the deterrent, is not the only theory of retributive punishment: some hold that the retributive should be advanced to the first place among the various aspects of punishment: Kant, for example, holds that punishment cannot rightly be inflicted for the sake of any benefit to be derived from it either by the criminal himself or by society, and that the sole and sufficient reason and justification of it lies in the fact that evil has been done by him who suffers it. Kant regards punishment as in itself an evil which can be justified only as the means of attaining a greater good; retribution is itself not a remedy for the mischief, but an aggravation of it. A more definite form of the idea of purely retributive punishment is that of expiation. The expiatory theory conceives satisfaction as being due to the outraged majesty of the law rather than to the victim; but this is merely a further stage in the development of the primitive conception of self-redress and private vengeance. The expiatory theory, like Kant's theory, betrays an imperfect transmutation of redress into punishment. See also *CRIMINAL LAW; CRIMINOLOGY*; and as to the management of prisons,

see *PRISONS*. See Marquess of Beccaria, *Crimes and Punishments*, 1764; Jeremy Bentham, *Punishments and Rewards*, 1811; T. E. Holland, *Elements of Jurisprudence*, 1880 (13th ed., 1924); and Sir J. W. Salmond, *Jurisprudence* (2nd ed. 1907, 10th ed. 1947).

Penomping, see *PNOMPENH*.

Penrhyn, dist. of co. of Carnarvon, N. Wales. The Bethesda slate quarries in this locality yield large quantities of the mineral, and these are shipped from Port P. at Bangor.

Penrith: 1. tn. of Cumberland, England, situated in a picturesque spot, 17 m. S.E. of Carlisle. The tn. stands on the edge of the Lake Dist., 5 m. from Ullswater, and has the ruins of a castle built c. fifteenth century. At the Giants' Grave are twin sculptured crosses of late Saxon date; while the shaft is round, the upper part is square in section, and the type may have been derived from a preaching staff rod. There is also a grammar school. The inhab. are engaged chiefly in agriculture, though tanning and brewing are also carried on. Pop. 10,500. 2. Tn. of Cumberland co., New S. Wales, Australia, in the R. Nepean valley at the foot of the Blue Mts., 34 m. W. of Sydney. Pop. 4000.

Penrose, Elizabeth, see *MARRHAM, MRS.*

Penry, John (1559-93), Welsh Puritan, b. in Breconshire, and a student at both the univs. of Oxford and Cambridge. He was the chief writer of the 'Martin Marprelate' tracts, dealing chiefly with the abuses of the Church of England. He was bound, however, on account of his views, to retire into Scotland in 1590, and on returning to England three years later was condemned to death and hanged. See also *MARPRELATE CONTROVERSY*. See life by W. Pierce, 1923.

Penryn, municipal bor. of Cornwall, England, on Falmouth Harbour, 2½ m. N.W. of Falmouth. It ships granite and trades in coal, cement, grain, timber, etc. It has also boat-repairing yards and light engineering industries. Here is the site of the anct. Glasney College. Pop. 4000.

Pensacola, co. seat and port of entry of Escambia co., Florida, U.S.A., on P. Bay, an inlet of the gulf of Mexico, 50 m. E.N.E. of Mobile. Forts Pickens, McRae, and Barrancas defend the entrance to its excellent harbour. P. is a noted fish-market. Exports include fish, hides, and cotton. There is a naval air station here, one of the world's largest. P. navy yard is at Warrington, near by. The dist. is agro. and produces oranges. Pop. 38,000.

Penshurst, vil. of Kent, England, about 4 m. S.W. of Tonbridge. Sir Philip Sidney was b. at Penshurst Place (1554). The house, parts of which date from the mid-fourteenth century, was granted by Edward VI. to Sir Wm. Sidney in 1553 and it has ever since been the home of the Sidney family. The lofty baron's hall, dating from 1340, has a fine timbered roof supported by ten life-size figures in wood. The Elizabethan long gallery is hung with family portraits. P. Place is rich in portraits, especially of the sixteenth and seventeenth centuries, with

many important examples of the early Eng. school, though in many cases the names of the painters are not known. Among the portraits are those of Sir Philip Sidney and of Dorothy Sidney, afterwards Lady Sunderland, to whom, under the name of Sacharissa, Edmund Waller addressed many verses. Pop. 3000.

**PENSIONS.** The subject of old age P. has been fully dealt with under OLD AGE PENSIONS. This article is concerned with P. and superannuation allowances in the civil service and the Brit. armed services.

**CABINET MINISTERS.**—P. are payable when claimed by ex-Cabinet ministers. First class for those who held higher portfolios, £2000, and second class £1200. No pensions have been claimed since 1924.

**CIVIL LIST PENSIONS** are P. granted to persons distinguished in science, art, and literature, or their dependents in needy circumstances. A sum of £1200 is given each year.

**CIVIL SERVICE.**—P. and superannuation allowances to persons who have held civil offices in the gov. or civil service are regulated for the most part by the Superannuation Acts, 1834, 1859, 1873, 1887, 1892, 1919, and by the minutes and rules made under those Acts. It is to be noted that no civil servant has an absolute right to a pension, for not only does the Act of 1834 expressly save the power of the Treasury and heads of depts. to dismiss any person from the public service without compensation, but it has been judicially decided that a person employed in the public service, whether in a military or civil capacity, holds his appointment during the pleasure of the Crown unless there is some statutory provision to the contrary. The persons entitled to a pension under the above Acts as persons who have served in the permanent civil service are: (1) Persons holding their appointments directly from the Crown (Sec. 17, Act of 1859). (2) Persons admitted into the civil service with a certificate from the civil service commissioners (Sec. 17, Act of 1859). But under the Act of 1884 the Treasury may, on the application by the head of a public dept. make an order relieving any civil servant for want of a certificate where it is not by reason of his fault that he was appointed without one. (3) Persons in the Permanent Colonial Civil Service, in the Indian Civil Service, or serving in any imperial civil capacity in a colony (Acts of 1860 and 1887).

Other persons, though not entitled, may in certain circumstances be granted a 'compassionate gratuity': (1) The Treasury may grant a reasonable gratuity or ann. allowance to a civil servant who is injured without his own default in the actual discharge of his duty, and by some injury specifically attributable to the nature of his duty. If such person dies from injury, the pension may be granted to his widow, his mother if wholly dependent on him at the time of his death, and to his children. (2) The Treasury has a discretionary power to grant an allowance to a civil servant who is removed from his office on the ground of inability to dis-

charge efficiently the duties of his office; but the reasons for making such an allowance must be laid before Parliament in the Treasury minute granting it. (3) The Treasury may, if they think fit, grant a 'compassionate gratuity' not exceeding one pound or one week's pay (whichever is greater) for each year of employment to a civil servant who is not entitled to a pension under the Act of 1859, and who retires or is removed from his employment, and whose employment required him to devote his whole time to it, and whose remuneration was paid entirely out of moneys provided by Parliament; and further, who (a) if removed in consequence of the abolition of his employment or for the purpose of facilitating economical improvements in the organisation of his dept. has served for not less than seven years, or (b) if his retirement is due to mental or physical infirmity permanently incapacitating him from his duties, has served for not less than fifteen years. In regard to (3) the Treasury has power, on the application of the pensioner, to commute the pension by payment of a capital sum calculated according to the estimated duration of the life of the pension-holder.

In the ordinary course, a civil service pension is only payable on retirement at the age of sixty (retirement is only compulsory at the age of sixty-five), and a person superannuated under that age may be required to serve again under pain of losing his pension. This does not apply to any person under sixty who is incapable from mental or physical infirmity of discharging his duties, but such incapacity must be evidenced by a medical certificate and the Treasury must also satisfy itself of the genuineness of the case by independent inquiry.

The scale of P. is as follows: For ten years and under eleven years of service,  $\frac{1}{10}$  of ann. salary and emoluments, for eleven years and under twelve years of service  $\frac{1}{8}$ , and so on up to forty years of service, when the full allowance of  $\frac{1}{2}$  or one half may be granted (plus a lump sum or gratuity). This lump sum for men is computed at  $\frac{1}{10}$  of salary for each year of service, subject to a maximum sum of £1000. For women the pension is  $\frac{1}{10}$  of salary for each year of service, subject to a maximum of £800. The above are the benefits to civil servants who have completed not less than ten years' service and are given (i.) on retirement on reaching the age limit, or (ii.) on retirement for ill health, or (iii.) on retirement on abolition of office. On retirement for inefficiency after ten years or more service, payment may be made of such allowances as may be determined by the Treasury but not exceeding those for normal cases of retirement. There is also statutory provision for payment of benefits to legal personal representatives of civil servants on death in the service after completion of not less than five years' service (one year's salary or  $\frac{1}{10}$  of salary for each year of service, subject to a maximum of £500, whichever is the greater). But under the Act of 1899 the Treasury can, for computing the amount of the pension in certain cases,

add to the years of actual service any number of years not exceeding twenty, or conversely, direct that less than ten years shall qualify for a pension; this can only be done in the case of the appointment of a person holding professional or other special qualifications whom it has been declared by the Treasury to be in the interests of the public to appoint at an age exceeding that at which public service ordinarily begins.

**NAVAL, MILITARY, AND AIR FORCE RETIRED PAY AND PENSIONS.**—*Retired Pay and Service Gratuities for Commissioned Officers of the Armed Forces.*—The pre-1946 arrangements for retired pay and gratuities for commissioned officers were complicated and involved many differences both in rates and conditions of entitlement, not only between one service and another, but also between branches within the same service. It was therefore decided after the Second World War to introduce a new and simplified code of retired pay and gratuities which would be common to all three services and this was effected by the pay code of March 1946 (Cmd. 6750). The rates of retired pay and gratuities provided under the new code are, in general, substantially more favourable than the maximum rates attainable under the previous code (1940). In many branches of the armed forces officers not selected for promotion to the higher ranks have to retire at relatively early ages and retired pay is designed to provide a measure of compensation for such premature termination of career. The 1946 code provides a series of standard rates of retired pay which are granted to officers compulsorily retired, on reaching the compulsory retiring age, or earlier because they have not been selected for further promotion or because no further employment is available for them, subject to the completion of a prescribed period of service for each rank including not less than two years' service in that rank. For officers of the rank of admiral, general, or air chief marshal, the minimum period of service in the rank is only one year.

The full standard rates of retired pay are as follows:

	per year
Lieutenant, R.N., captain, or flight-lieutenant	375
Lieutenant-commander, major, or squadron-leader	475
Commander, R.N., lieutenant-colonel, or wing commander	625
Captain, R.N., with less than 6 years' service in the rank, colonel, or group captain	825
Captain, R.N., after 6 years' service in the rank, brigadier, or air commodore	900
Rear-admiral, major-general, or air vice-marshal	1100
Vice-admiral, lieutenant-general, or air marshal	1300
Admiral, general, or air chief marshal	1500
<i>Half Pay</i>	
Admiral of the fleet, field marshal, or marshal of the R.A.F.	1800

**Conditions of Award of Retired Pay.**—The grant of retired pay, to officers retired otherwise than as invalids, is normally conditional upon completion of twenty years' service, but where in special cases, in the interests of the service, officers are entered at ages above that of the normal entrant, retired pay may be granted on compulsory retirement after not less than fifteen years' service. For invalided officers retired pay will be allowed provided that not less than ten years' service has been given. The minimum periods of total service from the age of twenty-one required for the full standard rate are as follows:

Standard rate appropriate to the rank of:	Minimum service after the age 21 required to qualify for the full standard rate	years
Lieutenant, R.N., captain, or flight-lieutenant		20
Lieutenant-commander, major, or squadron-leader		22
Commander, R.N., lieutenant-colonel, or wing commander		24
Colonel or group captain		26
Captain, R.N., brigadier, or air commodore		28
Rear-admiral, major-general, or air vice-marshal, or above		30

(Where an officer—other than an invalid—has completed less than the requisite minimum period of service in the rank, the rate of retired pay will be as for the next lower rank.)

Where the total service given is less than the period, according to rank, prescribed above, the rate of retired pay shown in column (a) is reduced by a deduction, at the rates shown in column (b), in respect of each year or part of a year by which the total service is less than the minimum period:

	(a)	(b) per year
Above £1000 a year		50
£1000 and above £800 a year		30
£800 and above £400 a year		20
£400 and above £300 a year		15
£300 and above £200 a year		10
£200 and below		5

The scheme outlined in this code does not apply to officers retired otherwise than in the normal course, e.g. for unsuitability, inefficiency, or misconduct, or who are cashiered or dismissed.

**Retirement at own Request.**—For officers permitted to retire at their own request it is not necessary to provide the same measure of compensation for loss of career. Officers allowed to retire at their own request, within six years before the compulsory retiring age for their rank and branch, will receive the rate of retired pay that would have been payable for compulsory retirement in the circumstances described above. Otherwise the rate of retired pay payable to an officer who is

permitted to retire at his own request before the age limit, will be the rate which he would have received on compulsory retirement less a deduction on the scale shown in the third table above for each year by which his age falls short, by more than two years, of the age limit, with a further deduction of 10 per cent of the resultant figure.

**Gratuities.**—Gratuities at the following rates are payable to officers holding permanent commissions who on retirement have completed insufficient service to qualify for the grant of retired pay: on completion of not less than ten years' service, £1000; for each complete year of service in excess of ten years a further £150. The maximum total gratuity is £2,350. Where an officer is permitted to leave the service, except on invaliding, after less than ten years' service, no gratuity is payable.

**Rank.**—Normally only substantive rank held on the active list will be taken into account in assessing retired pay under the new code. War substantive rank granted while on the active list under the special promotion arrangements in operation during the Second World War will, however, be allowed to reckon for this purpose. Provision will also be made for acting and temporary rank one step above substantive rank held under this wartime promotion scheme to qualify, on the lines of the existing arrangements, for increase of retired pay under the new code.

**Service Pensions and Gratuities for members of the Forces below Officer rank.**—The new pay code (Dec. 1945, Cmd. 6715) continued the existing system of granting P. to men discharged with certain minimum periods of service. Previously there was some difference of practice between the three services in regard to the length of service necessary to qualify for the award of a pension. To-day the service required to qualify (though not necessarily the term of a pensionable engagement) is the same, twenty-two years, in all three services (this does not necessarily mean that a man who has completed twenty-two years' service will be allowed to claim discharge to pension before the expiration of his engagement, though special provision is made for cases of invaliding). There is a basic scale of pension, common to all three services, for men completing this service. There is a higher scale of P. for men completing longer periods of service, e.g. thirty years or even thirty-seven years (it is not expected that in the R.N. and Royal Marines any men will serve so long as thirty-seven years; few serve so long as thirty years). This higher scale is common to the three services. The gov.'s aim in the new code was to provide a pension of the order of 34s. a week for the service man discharged to pension, in the rank of petty officer or sergeant, after twenty-two years' service. Men who complete a longer career in the forces will qualify for P. of greater amount in proportion to their length of service. The present P. scale for ratings and other ranks (except aircrew) is as follows.

(Army ranks only are quoted for the sake of brevity)

Rank Element	
Rank	For each year of service
Corporal	4d. per week
Sergeant	6d. " "
Staff-sergeant	9d. " "
W.O. 11.	1s. 0d. " "
W.O. 1.	1s. 3d. " "

Service Element	
Period of Service	For each year of Service
1st to 20th year	1s. 2d. per week
21st to 25th "	1s. 6d. " "
26th to 30th "	2s. 6d. " "
31st year onwards	4s. " "

Maximum Rates	
Leading seaman, corporal	70s. per week
Petty officer, sergeant	80s. " "
Chief petty officer, staff sergeant, flight sergeant	90s. " "
Warrant officer 11. and warrant officer 1. (army), warrant officer (R.A.F.)	100s. " "

Typical Rates	
Sergeant, 22 years' service (including 5 years as a corporal and 12 years as a sergeant)	34s. 0d. per week
Flight sergeant, 30 years' service (including 7 years as a corporal, 7 years as a sergeant and 9 years as a flight sergeant)	55s. 11d. " "
Warrant officer R.A.F., 37 years' service (including 3 years as a corporal, 7 years as a sergeant, 7 years as a flight sergeant, and 13 years as a warrant officer)	97s. 4d. " "

**Gratuities.**—The new code substitutes for the former system of awarding soldiers and airmen a gratuity of £1 for each year of active service, a scheme of gratuities for men discharged or transferred to the reserve, and not eligible for service pension, on completion normally of not less than ten years' service, at the following rates: after ten years' service, £50; for each year in excess of ten years' service, £25; subject to a maximum total of £200. Payment of a gratuity under the new scheme is conditional on the acceptance of a reserve liability, if so required.

**Special Provisions for Airman Aircrew.**—There are special considerations affecting airman aircrew which necessitate separate provisions for the P. and gratuities of this category. Direct entrant pilots and navigators who are discharged on completion of a five-year engagement will receive a gratuity of £200. Pilots and navigators who are re-engaged, on completion of their initial five-year engagement, to complete twenty-two years' service, will be eligible for pension on the normal scale and under the normal

conditions set out above. They will in addition qualify for a special addition to the service element of pension at the rate of 8d. a week for each year of service while employed on aircrew duties. Thus, a pilot or navigator who completes twenty-two years' service will qualify for a special addition of 14s. 8d. a week provided he has been employed throughout on aircrew duties. No similar provision is made for signallers, engineers, and gunners, since these personnel will revert to their trade and will have the opportunity of re-engaging for long service.

*Additions in respect of Age and Good Conduct, etc.*—With the introduction of the new P. scale the existing provision for additions to pension in respect of age, and also the special provision for additions to naval pension in respect of good conduct, were abolished. Also, the new scale will fall to be adjusted, in conformity with any general decision which may be given regarding state service pensioners as a whole, when P. under the National Insurance scheme become issuable concurrently with them; but the minister of national insurance may make regulations modifying the provisions of the National Insurance Act in relation to the members of the forces.

**WAR PENSIONS.**—In the course of the First World War the need for a unified system of administration of P. and grants in respect of disablement or death as a result of service in the armed forces became manifest. Parliament decided, therefore, that a separate dept. should be set up for this purpose and, by the provisions of the Ministry of Pensions Act, 1916, the powers and duties of the service depts. on pension matters were transferred to the newly formed Ministry of Pensions. The war P. provisions were at once reviewed and many improvements were introduced; in particular, the basis of compensation was radically altered, the principle of degree of disablement by war service being substituted for that of loss of earning capacity or wages. This not only ensured equal valuation for equal incapacity but permitted the payment of pension in addition to earnings.

At the outbreak of the Second World War the scope of the war P. provisions was greatly enlarged to include members of the mercantile marine disabled or dying as a result of war at sea or capture by the enemy, members of civil defence organisations injured or killed on duty, and civilians disabled or dying as the result of enemy action. Later, the provisions for the armed forces were extended to members of the Home Guard. Disablement is assessed by a comparison of the disabled person's condition with that of a normal healthy person of the same age and sex and is expressed as a percentage, the maximum assessment being 100 per cent. The claimant is not required to prove that his disablement is connected with war service and he is given the benefit of any reasonable doubt. In cases where a claim to war pension is made over seven years from the end of war service the conditions are slightly more stringent.

Independent P. appeal tribunals have been estab. to hear appeals against decisions of the ministry in regard to entitlement to pension and assessment of disablement. The rate of pension for a private soldier for 100 per cent disablement is 45s. and there are rank additions, ranging in the case of members below officer status from 3s. 4d. to 16s. 8d. a week. Allowances of 10s. a week for a wife (16s. during treatment or when the pensioner is unemployable) and 7s. 6d. for each child are also provided. The allowance for children is payable in addition to any allowances granted under the Family Allowances Act. In certain circumstances children's allowances are continued beyond the normal age limit of sixteen, or eighteen in the case of an officer's child, and provision is also made for education grants up to £80 per annum for each eligible child over five years of age.

Where a pensioner is unemployable on account of his pensioned disability he may be granted a supplement to pension up to 20s. a week inclusive of any National Health Insurance benefit. Where he is partially disabled and his disablement prevents him from resuming his pre-service occupation or one of equivalent standard a special allowance is payable. In cases of severe disablement an allowance ranging from 10s. to 10s. a week is payable where regular attendance is required at home. Exceptional wear and tear of clothing, especially in amputee cases, has been recognised by the grant of an allowance up to £5 a year. Special allowances are also payable during periods of treatment and when a pensioner has to abstain from work following treatment.

Pension is granted to a widow where her husband's death is caused or hastened by war service or is the result of enemy action. There are two scales of pension; the higher basic weekly rate of 35s. which is payable to a widow of forty years of age or over, or with a child eligible for allowances, or incapable of self-support. In other cases the rate is 20s. As in the case of disablement there are additions according to the rank held by the husband. Where the widow of a member below officer status has his children living with her and is paying more than 8s. a week rent, her pension may be supplemented by an amount up to 15s. a week representing the excess rent over 8s. A widow's pension ceases on her remarriage. Children's allowances and education grants may be awarded in respect of children of deceased members on the same basis as in the case of disabled members. The allowance for a child of a member below officer status is 11s. a week and for the child of an officer £36 per annum. If the child is a total orphan the allowance is 13s. 6d. a week increased to 20s. at the age of fifteen. This allowance is further increased to 26s. at the age of eighteen if the orphan is incapable of self-support. Comparable allowances are granted in respect of an officer's child. P. to parents and other dependants of a deceased member may be awarded on the basis of need, broadly interpreted, and the amount of support

which the deceased gave, or might have been expected to give, to the parent or dependant.

**Pensions, Ministry of.** Before the First World War each service dept. administered its own pension questions but owing to the vast numbers involved in the First World War the existing machinery proved to be totally inadequate. Public feeling over this inadequacy was voiced in the House of Commons with the result that the M. of P. was created towards the end of 1916. This dept. deals with P. due to service in the First World War, Royal Irish Constabulary (now disbanded) P., and merchant seamen's war P. The head of the M. of P. is a minister who is not a member of the Cabinet. ('Service pensions' of the forces are administered by the service depts. See under PENSIONS.)

**Pensions, Non-Contributory.** Retirement, and Widows', see under NATIONAL INSURANCE ACT (1946).

**Pensnett,** iron and coal mining vil. of Staffordshire, England, 2 m. S.W. of Dudley. Pop. of eccles. dist. 7000.

**Pentacle, Pentangle, Pentagram, Pentagonon** (obsolete), or **Pentalpha**, figure of five straight lines forming a five-pointed star. Found frequently in early ornamental art, it was used as a mystic symbol by the Pythagoreans, and later by astrologers and necromancers in the Middle

PENTACLE

HEXAGRAM

**Agree.** Together with the sign of the cross, it came to be used on doorways and thresholds as a charm to keep away witches and evil spirits. It should be formed without a break in the drawing. The hexagram (two interlaced equilateral triangles), also used as a mystic symbol, is often confused with it.

**Pentacrinus**, stalked sea lilies (Crinoides, q.v.). Ps. were particularly numerous in the early part of the Liassic period, and are represented by still living species. The joints of the stem are pentagonal in outline. In some cases a pentacrinoid is a larval stage, e.g. that of *Antedon rosacea*. Ps. occur in the floor of the ocean at moderate depths.

**Pentadesma butyracea**, see BUTTER-TREE.

**Pentagon.** The world's largest office building, on the Virginia side of the Potomac R., Washington, U.S.A. It was built (1941-43) to accommodate the increase in Amer. War Dept. personnel, and cost about \$64,000,000. The building brought all three services beneath the same roof, and approximately 32,000 workers were employed there. It is five storeys high, simple in style, and built

round a 5-ac. court, the perimeter of the building being nearly 1 m. There are 17 m. of corridors and it possesses the largest private branch telephone exchange in the world. It is equipped with many cafeterias, a medical service, and a large library.

**Pentamerone, II, or Lo Cunto de li Cunti** ovvero lo trattenimento de li Peccerille, book of peasant fairy stories in Neapolitan dialect, collected and transcribed by Giambattista Basile, and pub. posthumously in 1637. This collection, the first of its kind, is divided into five days each containing ten tales, hence the name. The P. is of priceless interest to folklorists, retaining as it does all the freshness of the originals as heard from the lips of the people. The beste d. is that by B. Croce, *G. Basile ed il Cunto de li Cunti*, 1891. There is an Eng. trans. by Sir R. Burton, 1893.

**Pentane** ( $C_5H_{12}$ ), hydrocarbon of the methane series, existing in three isomeric modifications. Two of these, viz. P. (boiling point  $38^\circ C.$ ) and isopentane (boiling point  $30^\circ C.$ ), occur in petroleum, and are colourless mobile liquids. The third, tetramethylmethane (boiling point  $9.5^\circ C.$ ), is obtained by treating tertiary butyl iodide with zinc methyl. These isomers are volatile, inflammable liquids, which are, chemically, very stable. P. is one of the components of the petroleum ether, gasoline, petrol, etc., used as solvents for resins, oils, and caoutchouc, and for internal combustion motors. P. is also used in the P. lamp as a standard in photometry.

**Pentateuch**, see **HEXATEUCH**.

**Pentecost**, see **WHIT SUNDAY**.

**Pentland Firth**, channel separating the Orkney Is. and Caithness, N. Scotland. It is 14 m. long and from 6 to 8 m. wide. There is a ferry, but strong tidal currents and whirlpools render navigation dangerous. The Pentland Skerries, 5 m. N.E. of Duncansby Head, include two islets, one of which has a lighthouse, and some rocks.

**Pentland Hills**, ridge in the Lowlands of Scotland, extending N.E. from the border of Lanarkshire, through Peeblesshire, to the centre of the co. of Midlothian, and to within 4 m. of the city of Edinburgh. The mean height is upwards of 1000 ft.; the breadth 4 to 6 m. Scald Law (1895 ft.) and Carnethy (1830 ft.) are the highest peaks.

**Pentstemon**, genus of perennial plants (family Scrophulariaceae), natives of N. America, bearing blue, purple, lilac, scarlet, rose, or yellow flowers, and of great value in the garden as border or rockery plants. They are raised from seed sown under cover in spring or from cuttings inserted in early autumn and kept through the winter in a cold frame. Hybrids between *P. Cobaea* and *P. Hartwegii* are the most popular garden sorts.

**Penza:** 1. Region of the R.S.F.S.R. The surface is undulating, intersected by deep ravines, and rising in the S. and S.W. to the watershed between the Don and the Volga (860 ft.). The soil is fertile, watered by the Moksha and Sura, and

yields rye, oats, wheat, hemp, and flax. The chief manufs. are spirits, paper, flour, cloth, rope, leather, and matches. Area 15,000 sq. m. Pop. 2,320,000. 2. Tn. of Russia, cap. of the above region, at the confluence of the P. and the Sura, 492 m. S.E. of Moscow. The chief manufs. are paper, textiles, lumber, matches, leather, soap, wax, and camel's-hair cloths. Pop. 157,000.

**Penzance**, seaport and watering place of Cornwall, England, and centre of an important market-gardening and agric. area, situated at the head of Mount's Bay, 8 m. E.N.E. of Land's End, 20 m. W.S.W. of Truro, and 325 m. from the London terminus of Brit. Railways. There are a good harbour and docks and the place has a very mild climate. It is the nearest port (and only port of departure) to the Isles of Scilly, which are some 40 m. distant to the S.W. P., with Newlyn, now incorporated in the bor., is a fishing centre, especially for pilchards, and it exports tin, copper, and china clay. Woollen yarns and cloths are manufactured. It has a market in the centre of the tn., and near it the four chief streets intersect each other at right angles. Its churches are: St. Mary's, built in 1832 (the chantry of St. Mary's was founded in 1284) of cut granite in the Perpendicular style, with lofty pinnacled tower; St. Paul's (1843) of cut and rubble granite, in thirteenth-century style; and St. John's (1881), of stone, Early Eng. style; and the Rom. Catholic church built in 1847. The present site of St. Mary's church is said to have been occupied by a castle built by the Tyres, owners of the manor of Alverton. The public buildings, built of granite in lt. post-Renaissance style, erected in 1867, include the tn. hall and council chambers, St. John's Hall, and the museum of the Royal Geological Society of Cornwall. The public library is in Morrab Road, and the natural hist. museum and art gallery in Penlee Mansion House in the Penlee Memorial Park, Morrab Road. The market-house, with central dome, was built in 1837 and opened in 1838; in front of it is a marble statue of Sir Humphry Davy (1778-1829), the celebrated chemist, who was b. here. The name P. means 'holy head,' being derived from a chapel dedicated to St. Anthony, which formerly stood on a headland which now forms the base of the old pier. In 1205 Madron par., including P., was appropriated by the Knights Hospitallers. In 1332 Edward III. granted P. a weekly market and a fair of seven days at the festival of St. Peter. In 1513 P. received from Henry VIII. a charter granting it ship dues on condition of the tn. maintaining the quays in repair. The royal grant of its market was received in 1592 from Queen Elizabeth. In 1595 P. was burned and pillaged by the Spaniards and in 1646 and 1648 it was sacked by Fairfax. It was incorporated by James I. (1614). Three m. away is the world-famed St. Michael's Mount, in Mount's Bay, home of the St. Aubyn family and often compared with Mt. St. Michel in France. It is recorded that in the year 1014 Mount's

Bay was inundated by a 'mickle sea-flood,' many tns. and people being lost. The bor. was extended in 1934 and the present pop. is 20,300.

**Peonage**, system of agric. labour prevalent in New Mexico and other parts of Sp. America; abolished in the former state in 1867. The name is derived from Middle Lat. *pedo*, and hence from *pes*, foot. Originally a foot soldier, a *peon* came to mean a day labourer. The Indians, who hired themselves out to Sp. masters, or were bound to work for them because they were debtors or so-called criminal offenders, were called *peons*, but were really slaves.

**Peony**, see **PEONY**.

**People's Banks**, see under **CO-OPERATION**.

**Peoples' Democracies**, phrase denoting the Communist regimes set up after the Second World War in Poland, Hungary, Bulgaria, and other E. European countries. In these states the phrase is used, along with 'Peoples' Republics', as an official designation. A concept of democracy different from that held in W. Europe is of course implied; the word 'peoples' is intended to describe the broad base of popular support on which these regimes are allegedly based.

**People's High Schools** (Denmark), see **FOLK HIGH SCHOOLS**.

**People's Palace**, educational institution in the Mile End Road, London, founded through a bequest of J. E. B. Beaumont (1774-1840) for the recreation and moral and intellectual advancement of the working classes in the E. End of London. The buildings were opened in 1887. They include the Queen's Hall, which was burnt down in 1931, a technical school, now known as the E. London College, attached to London Univ., and other equipment for education and recreation.

'**People**,' Eng. Sunday newspaper, estab. in 1881, now owned by Odhams Press Ltd. It supports Socialism, but politics are not an important feature. It pioneered free insurance for its readers. The sale exceeds 4,671,000.

**Pépin**, or **Pippin**, name of sev. Carolingian rulers, the more important of whom are:

**Pépin the Elder** (d. 639), also known as *Pépin of Landen*, who was mayor of the palace to Dagobert I. of Austrasia. He was canonised and Feb. 21 was dedicated to him.

**Pépin le Gros**, or **Pépin d'Héristal** (d. 714), grandson of St. Arnulf, bishop of Metz and governor of Austrasia; when Dagobert d. (679) P. ruled Austrasia, subject to Thierry III., king of Neustria. During Thierry's reign he revolted, and by the victory of Testry (687) P. became master of the greater part of W. France and was recognised as *major domus* (mayor of the king's palace), which gave him power to rule the state. As mayor he ruled under Thierry, Clovis III., Childbert III., and Louis the Pious. On the death of P. his son, Charles Martel, succeeded to the mayoralty.

**Pépin the Short** (714-68), king of the Franks, was the younger son of Charles Martel and the father of Charlemagne.

From 741 to 747 P. and his elder brother, Carloman, ruled conjointly under the puppet king, Childeric III.; but in 747 Carloman entered a monastery, in 751 Childeric was compelled to abdicate, and P., with the aid of the pope, was crowned first Carolingian king of the Franks. In 754 he aided the pope against Aistulf, king of the Lombards; he forced Aistulf to give up Ravenna to the pope, and by this act, which is known as the 'donation of Pöpin,' laid the foundation of the temporal power of the papacy. He himself was made a 'patrician of Rome.' The rest of his life was spent in wars against the heathen Saxons, whom he tried to convert at the sword's point, against the duke of Aquitaine, against Bavaria, and against the Saracens, from whom he recovered Narbonne.

Pépin (778-810), son of Charlemagne, was crowned king of Italy by Pope Adrian in 781. He fought against the Avars, Slavs, and Saxons, drove the Saracens out of Corsica, and conquered Venice.

Pépin I. (d. 838), son of Louis the Pious, was crowned king of Aquitaine at the age of fourteen. With his brothers he twice revolted against his father, and deposed him, but finally replaced him on his throne.

Pépin II. (d. 870), son of the above, whom he succeeded as king of Aquitaine. He allied himself with Lothaire and took part in the battle of Fontenoy (841). He was deposed in favour of Charles the Bald by the treaty of Verdun, and until his imprisonment at Senlis (864) waged perpetual war against Charles.

See G. Monod, *Études sur les sources de l'histoire carolingienne*, 1894; D. Urkunden, *Die Karolinger*, 1906; and L. Lovell, *Charles et diplômes de l'histoire de France*, 1928; and *Cambridge Medieval History*, vol. II.

Peploe, Samuel John (1871-1935), Scottish painter, b. at Edinburgh, educated at Edinburgh Collegiate School and Univ. At the age of twenty he took up art, and studied in Paris and Edinburgh. His early pictures included still-lives experimenting with tones and sparing use of colour, and portraits whose dark backgrounds derived from Hals and Rembrandt. From 1905 his still-lives and Scottish landscapes acquired a luscious creamy quality; this, however, ended abruptly in 1910. In that year he married and went to France for three years. He was greatly influenced by Cézanne and the Post-Impressionists, and his paintings of Cassis and Antibes began his third style, experimenting in bright colour planes, which he brought to his many later paintings of Iona. He was associate of the Royal Scottish Academy 1917, and full member 1927.

Pepper, John Henry (1821-1900), Eng. chemist, b. at Westminster, associated with the optical illusion known as 'Pepper's Ghost,' (highly illuminated objects placed before plate glass so as to appear as if among less brilliantly lighted objects behind the glass), originally invented by Henry Dircks in connection with a piece by Dickens. P. was educated as a chemist,

and studied analytical work in various laboratories. He wrote on scientific subjects in a popular fashion. Among his works are *The Boys' Playbook of Science* (1878), and *The True History of Pepper's Ghost* (1890).

Pepper, one of the most important spices; it is derived from a creeping vine (*Piper nigrum*) which is a native of the moist low-country forests of Ceylon and S. India and has also been introduced into Malaya, Siam, the Netherlands E. Indies, and Borneo. Both 'black' and 'white' pepper are obtained from the same plant. P. contains an alkaloid (piperine), a volatile oil, an acrid resin, together with starch, gum, and albumin. The ash in ground black P. should not exceed 5 per cent, in white P. 3 per cent. Rice, linseed meal, bone dust, and other adulterants may be readily detected by the microscope. See also CAYENNE PEPPER.

Peppercorn Rent, nominal rent, in theory involving the ann. payment from lessee to lessor of one peppercorn; it was used in connection with long leases as a device for giving a leasehold the practical effect of a freehold.

Peppermint (*Mentha piperita*), small, slender, glabrous mint of the family Labiate, with stalked serrate leaves and short spikes of flowers, the calyx of which is often red. The flowers are gathered in Aug., and after drying are distilled to yield the oil of P., which enters into the composition of P. water, the spirit of P., and P. cordial. Its medicinal value is as a stimulant and as a carminative.

Pepperwort, see PIPERACEÆ.

Peptin, enzyme elaborated in the body by the gastric tubules. It has the property of causing chemical changes by which the proteins of the food material are converted into peptones. The P. itself does not participate in the formation of the final products, and it cannot act except in conjunction with hydrochloric acid, which is also secreted by certain gastric glands. P. is also produced commercially by drying the mucous lining of the stomach of a pig or calf. If such an extract is added to food kept at the body temp., the proteins of the food are peptonized, and the resulting compound constitutes a food easily assimilated by persons of weak digestion.

Pepys, Samuel (1633-1703), Eng. administrator and diarist, was the son of John P., who became a tailor in London. References in his diary show that S. P. was educated at St. Paul's School in London and at Magdalene College, Cambridge. In 1659, through the influence of his father's cousin, Sir Edward Montagu (later earl of Sandwich), he entered the public service as a clerk of the exchequer, becoming clerk of the council in the same year, and began his *Diary*. In July 1680 he became a clerk of the Privy Seal and clerk of the 'Acts of the Navy.' He joined in the social life of the time, and managed to make a fortune out of the perquisites of his office; at the same time he made himself a thorough master of his business, and
